This field applies to execution at any Exception level to which the stage of translation applies. A value of 0 indicates that this control permits execution.

PXN, Privileged execute-never, stage 1 only

Descriptor bit[53], used only for stage 1 of any translation regime for which stage 1 translation can support two VA ranges.

- For stage 1 of a translation regime for which the stage 1 translation supports only a single VA range the stage 1 descriptors define a PXN field that is RES0, meaning it is ignored by hardware.

This field applies only to execution at an Exception level higher than EL0. A value of 0 indicates that this control permits execution.

XN[1:0], Execute-never, stage 2 only

Descriptor bits[54:53], defined as XN[1:0] for:

- Stage 2 translations when [ARMv8.2-TTS2UXN](#) is implemented.

Table D5-29 shows the operation of this control.

Table D5-29 XN[1:0] stage 2 access permissions model

XN[1]	XN[0]	Access
0	0	The stage 2 control permits execution at EL1 and EL0
0	1	The stage 2 control does not permit execution at EL1, but permits execution at EL0
1	0	The stage 2 control does not permit execution at EL1 or EL0
1	1	The stage 2 control permits execution at EL1, but does not permit execution at EL0

———— **Note** —————

For stage 2 translations when [ARMv8.2-TTS2UXN](#) is not implemented, descriptor bit[53] is RES0, meaning it is ignored by hardware.

———— **Note** —————

In an implementation that does not include [ARMv8.1-VHE](#), the only translation regime for which stage 1 translation can support two VA ranges is the EL1&0 translation regime. In an implementation that includes [ARMv8.1-VHE](#):

- When the value of [HCR_EL2.E2H](#) is 1, [TCR_EL2](#) controls the EL2&0 translation regime, and this regime:
 - Supports two VA ranges, corresponding to [TTBR0_EL2](#) and [TTBR1_EL2](#).
 - Always supports both UXN and PXN fields.
- Memory accesses from EL0 are translated using the EL2&0 translation regime only when the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}.

[Table D5-29](#) shows the operation of the stage 2 XN[1:0] control, and for each single-bit execute-never field a value of 1 indicates that, at an exception level to which the control applies, instructions cannot be executed from the target memory region. In addition:

- For a translation regime that applies to EL0 and a higher Exception level, if the value of the AP[2:1] bits is 0b01, permitting write access from EL0, then the PXN field is treated as if it has the value 1, regardless of its actual value.
- In a translation regime with two stages of translation, a region is execute-never if execution is not permitted by the value of the applicable execute-never field in one or both of:
 - The stage 1 translation table descriptor.
 - The stage 2 translation table descriptor.
- For each translation regime, if the value of the corresponding [SCTLR_ELx.WXN](#) field is 1 then any memory region that is writable is treated as XN, regardless of the value of the corresponding UXN, XN, or PXN field. For more information, see [Preventing execution from writable locations on page D5-2466](#).
- The [SCR_EL3.SIF](#) bit prevents execution in Secure state of any instruction fetched from Non-secure memory, see [Restriction on Secure instruction fetch on page D5-2466](#).

The execute-never controls apply to speculative instruction fetching, meaning speculative instruction fetch from a memory region that is execute-never at the current Exception level is prohibited.

———— **Note** —————

- Although the execute-never controls apply to speculative fetching, on a speculative instruction fetch from an execute-never location, no Permission fault is generated unless the PE attempts to execute the instruction that would have been fetched from that location. This means that, if a speculative fetch from an execute-never location is attempted, but there is no attempt to execute the corresponding instruction, a Permission fault is not generated.

- The software that defines a translation table must mark any region of memory that is read-sensitive as execute-never, to avoid the possibility of a speculative fetch accessing the memory region. This means it must mark any memory region that corresponds to a read-sensitive peripheral as execute-never. Hardware does not prevent speculative accesses to a region of any Device memory type unless that region is also marked as execute-never for all Exception levels from which it can be accessed.
- When no stage of address translation for the translation regime is enabled, memory regions cannot have UXN, XN, or PXN attributes assigned. *Behavior of instruction fetches when all associated stages of translation are disabled on page D5-2438* describes how disabling all stages of address translation affects instruction fetching.

The following subsections give more information about the data access permission controls:

- *Stage 1 instruction access and execution permissions.*
- *Stage 2 instruction execution permissions on page D5-2465.*
- *Hierarchical control of instruction fetching on page D5-2465.*
- *Preventing execution from writable locations on page D5-2466.*
- *Restriction on Secure instruction fetch on page D5-2466.*

Stage 1 instruction access and execution permissions

Table D5-30 and Table D5-31 on page D5-2464 include the AP[2:1] read and write permissions shown in Table D5-25 on page D5-2459 and Table D5-26 on page D5-2459. These permissions are shown as:

- R** Indicates Read permission granted.
W Indicates Write permission granted.

Table D5-30 shows the stage 1 access permissions for instruction execution when using a translation regime that applies to EL0 and a higher Exception level.

Table D5-30 Stage 1 access permissions for instruction execution for a translation regime that applies to EL0 and a higher Exception level

UXN	PXN	AP[2:1]	SCTLR_ELx.WXN ^a	Access from higher Exception level	Access from EL0
0	0	00	0	R, W, Executable	Executable
			1	R, W, Not executable ^b	Executable
		01	0	R, W, Not executable ^c	R, W, Executable
			1	R, W, Not executable	R, W, Not executable ^d
		10	x	R, Executable	Executable
		11	x	R, Executable	R, Executable
0	1	00	x	R, W, Not executable	Executable
			01	0	R, W, Not executable
		1		R, W, Not executable	R, W, Not executable ^d
		10	x	R, Not executable	Executable
		11	x	R, Not executable	R, Executable

Table D5-30 Stage 1 access permissions for instruction execution for a translation regime that applies to EL0 and a higher Exception level (continued)

UXN	PXN	AP[2:1]	SCTLR_ELx.WXN ^a	Access from higher Exception level	Access from EL0
1	0	00	0	R, W, Executable	Not executable
			1	R, W, Not executable ^b	Not executable
		01	x	R, W, Not executable ^c	R, W, Not executable
		10	x	R, Executable	Not executable
		11	x	R, Executable	R, Not executable
1	1	00	x	R, W, Not executable	Not executable
		01	x	R, W, Not executable	R, W, Not executable
		10	x	R, Not executable	Not executable
		11	x	R, Not executable	R, Not executable

- Where ELx is the higher Exception level to which the translation regime applies.
- Not executable because of **SCTLR_ELx.WXN** control, because region is writable at ELx.
- Not executable, because AArch64 execution treats all regions writable at EL0 as being PXN.
- Not executable because of **SCTLR_ELx.WXN** control, because region is writable at EL0.

Table D5-31 shows the stage 1 access permissions for instruction execution when using a translation regime that applies to only a single Exception level.

Table D5-31 Access permissions for instruction execution for a translation regime that applies to only a single Exception level

XN	AP[2]	SCTLR_ELx.WXN ^a	Access permission
0	0	0	R, W, Executable
		1	R, W, Not executable ^b
	1	x	R, Executable
1	0	x	R, W, Not executable
	1	x	R, Not executable

- Where ELx is the higher Exception level to which the translation regime applies.
- Not executable because of the **SCTLR_ELx.WXN** control, because region is writable at ELx.

Note

The Access permissions for an AArch64 translation regime that applies to only a single Exception level are consistent with the following fields in the translation table entries being treated as shown:

- **AP** treated as RES1.
- **APTable[0]** treated as RES0.
- **PXN** treated as RES0.
- **PXNTable** treated as RES0.

Stage 2 instruction execution permissions

For the Secure or Non-secure EL1&0, when EL2 is enabled, stage 2 translation, the XN fields in the stage 2 translation table descriptors control the execution permission, and this control is completely independent of the S2AP access permissions:

- When [ARMv8.2-TTS2UXN](#) is not implemented the stage 2 XN field is a 1-bit field that applies to execution at both EL0 and EL1, see [XN, Execute-never](#) on page D5-2461.
- When [ARMv8.2-TTS2UXN](#) is implemented the stage 2 XN field is a 2-bit field that provides independent control of execution from EL0 and execution from EL1, see [XN\[1:0\], Execute-never, stage 2 only](#) on page D5-2461.

See also [Combining the stage 1 and stage 2 instruction execution permissions](#) on page D5-2483.

Hierarchical control of instruction fetching

The VMSAv8-64 translation table format includes mechanisms by which entries at one level of translation table lookup can set limits on the permitted entries at subsequent levels of lookup. This subsection describes how these controls apply to the instruction fetching controls.

———— Note —————

Similar hierarchical controls apply to data accesses, see [Hierarchical control of data access permissions](#) on page D5-2460.

However, in an implementation that includes [ARMv8.1-HPD](#), when the value of a [TCR_ELx.HPD{0}](#) field is 1, or the value of the [TCR_ELx.HPD1](#) field is 1, the hierarchical control of instruction fetching is disabled for the translation stage controlled by that [TCR_ELx](#), and the information in this subsection does not apply.

The restrictions apply only to subsequent levels of lookup at the same stage of translation, and:

- [UXNTable](#) or [XNTable](#) restricts the execute-never control:
 - When the value of the [XNTable](#) bit is 1, the [UXN](#) bit is treated as 1 in all subsequent levels of lookup, regardless of its actual value.
 - When the value of the [UXNTable](#) bit is 1, the [XN](#) bit is treated as 1 in all subsequent levels of lookup, regardless of its actual value.
 - When the value of a [UXNTable](#) or [XNTable](#) bit is 0 the bit has no effect.
- For a translation regime that applies to EL0 and a higher Exception level, [PXNTable](#) restricts the [PXN](#) control:
 - When the value of [PXNTable](#) is 1, the [PXN](#) bit is treated as 1 in all subsequent levels of lookup, regardless of the actual value of the bit.
 - When the value of [PXNTable](#) is 0 it has no effect.

———— Note —————

The [UXNTable](#), [XNTable](#), and [PXNTable](#) settings are combined with the [XN](#), [UXN](#), and [PXN](#) bits in the translation table descriptors accessed at subsequent levels of lookup. They do not restrict or change the values entered in those descriptors.

The [UXNTable](#), [XNTable](#), and [PXNTable](#) controls are provided only for stage 1 translations. The corresponding bits are RES0 in the stage 2 translation table descriptors.

The effect of [UXNTable](#), [XNTable](#), or [PXNTable](#) applies to later entries in the translation table walk, and so its effects can be held in one or more TLB entries. Therefore, a change to [UXNTable](#), [XNTable](#), or [PXNTable](#) requires coarse-grained invalidation of the TLB to ensure that the effect of the change is visible to subsequent memory transactions.

Preventing execution from writable locations

ARMv8 provides control bits that, when corresponding stage 1 address translation is enabled, force writable memory to be treated as **XN**, **PXN**, or **UXN**, regardless of the value of the **XN**, **PXN**, or **UXN** bit:

- For a translation regime that applies to EL0 and a higher Exception value, when the value of the applicable **SCTLR_ELx.WXN** field is 1:
 - All regions that are writable from EL0 at stage 1 of the address translation are treated as **XN**.
 - All regions that are writable from EL1 at stage 1 of the address translation are treated as **PXN**.
- For a translation regime that applies to only a single Exception level, when the value of the applicable **SCTLR_ELx.WXN** field is 1, all regions that are writable at stage 1 of the address translation are treated as **UXN**.

Note

- The **SCTLR_ELx.WXN** controls are intended to be used in systems with very high security requirements.
 - Setting a **WXN** field to 1 changes the interpretation of the translation table entry, overriding a zero value of a **XN**, **UXN**, or **PXN** field. It does not cause any change to the translation table entry.
-

For any given virtual machine, ARM expects **WXN** to remain static in normal operation. In particular, it is IMPLEMENTATION DEFINED whether TLB entries associated with a particular **VMID** reflect the effect of the values of these fields. This means that any change of these fields without a corresponding change of **VMID** might require synchronization and TLB invalidation, as described in *TLB maintenance requirements and the TLB maintenance instructions* on page D5-2515.

Restriction on Secure instruction fetch

EL3 provides a Secure instruction fetch bit, **SCR_EL3.SIF**. When the value of this bit is 1, and execution is using the EL3 translation regime or the Secure EL1&0, when EL2 is disabled, translation regime, any attempt to execute an instruction fetched from Non-secure physical memory causes a Permission fault. TLB entries might reflect the value of this bit, and therefore any change to the value of this bit requires synchronization and TLB invalidation, as described in *TLB maintenance requirements and the TLB maintenance instructions* on page D5-2515.

In an implementation that does not implement EL3, the *Effective value* of this bit is 0.

D5.4.6 The Access flag

The Access flag indicates when a page or section of memory is accessed for the first time since the Access flag in the corresponding translation table descriptor was set to 0.

The AF bit in the translation table descriptors is the Access flag.

In ARMv8.0, the Access flag is managed by software as described in *Software management of the Access flag* on page D5-2467.

From ARMv8.1, the Access flag can be managed by hardware as described in *Hardware management of the Access flag* on page D5-2468.

Note

The support for hardware management of the Access flag applies only to the VMSAv8-64 translation regimes.

D5.4.7 The dirty state

The dirty state indicates whether a page or section of memory is modified.

The dirty state can be managed by hardware as described in *Hardware management of dirty state* on page D5-2469.

Where the dirty state is managed in hardware, the dirty state information is encoded using the access permission bits AP[2] and S2AP[1] in conjunction with the DBM bit.

D5.4.8 Block translation entry

While the nT bit is set, if the implementation meets either level 1 or level 2 support, the PE either:

- Generates a translation fault when using a translation table entry that has the nT bit set. Such an entry is not permitted to be cached within the TLB.
- Guarantees that using a translation table entry that has the nT bit set does not break coherency, ordering guarantees or uniprocessor semantics, or fail to clear the Exclusives monitors when an entry that does not have the nT bit set is translating the same address cached within the TLB.

———— **Note** —————

Using a translation table entry that has the nT bit set might significantly impact the performance of the translation.

For more information, see [Support levels for changing block size on page D5-2517](#).

D5.4.9 Software management of the Access flag

ARMv8.0 requires that software manages the Access flag. This means an Access flag fault is generated whenever an attempt is made to read into the TLB a translation table descriptor entry for which the value of Access flag is 0.

The Access flag mechanism expects that, when an Access flag fault occurs, software resets the Access flag to 1 in the translation table entry that caused the fault. This prevents the fault occurring the next time that memory location is accessed. Entries with the Access flag set to 0 are never held in the TLB, meaning software does not have to flush the entry from the TLB after setting the flag.

———— **Note** —————

If a system incorporates components that can autonomously update translation table entries that are shared with the ARM PE, then the software must be aware of the possibility that such components can update the access flag autonomously.

In such a system, system software should perform any changes of translation table entries with an Access flag of 0, other than changes to the Access flag value, by using an Load-Exclusive/Store-Exclusive loop, to allow for the possibility of simultaneous updates.

D5.4.10 Hardware management of the Access flag and dirty state

ARMv8.1 introduces the following optional features that perform hardware updates to the translation tables:

- [Hardware management of the Access flag on page D5-2468](#).
- [Hardware management of dirty state on page D5-2469](#).

The support for hardware management of the Access flag and dirty state is identified by the feature [ARMv8.1-TTHM](#).

When the hardware management of the Access flag is enabled, in situations where, without this feature, an Access flag fault would be generated, the hardware instead performs an atomic read-modify-write of the appropriate translation table descriptor to update the Access flag from 0 to 1.

When the hardware management of dirty state is enabled, if the Block or Page descriptor in a translation table indicates that a data access does not have write permission, then in situations where, without this feature, a data access would generate a Permission fault only because of this lack of write permission, the hardware checks the value of the DBM field in the Block or Page descriptor. If this field is 1, then instead of generating a Permission fault, the hardware performs an atomic read-modify-write of the translation table descriptor, to change the value of the bit that prohibits the write access.

It is permissible, but not required, that a stage 2 permission failure on the stage 1 translation table walk has priority over the stage 1 abort generated by the stage 1 translation table entry if all the following are true:

- Stage 1 hardware updating of either access or dirty information is enabled.

- A stage 1 translation table entry results in the stage 1 translation table entry having the access or dirty bit updated.
- The stage 1 translation table entry has stage 2 read permission but not stage 2 write permission.
- The stage 1 translation entry generates an abort (which might be one of an address size fault, an alignment fault caused by memory type or a permission fault).

Hardware management of the Access flag

Hardware management of the Access flag is enabled, for the corresponding stage of address translation, by the following configuration fields:

For stage 1 translations

- [TCR_EL1.HA](#).
- [TCR_EL2.HA](#).
- [TCR_EL3.HA](#).

For stage 2 translations

- [VTCR_EL2.HA](#).

Implementations are not required to support the hardware management of the Access flag. If [ARMv8.1-TTHM](#) is not supported, then the HA bit in [TCR_EL1](#), [TCR_EL2](#), [TCR_EL3](#), and [VTCR_EL2](#) is RES0.

When the value of a configuration bit, HA, is 1, then when a memory access is made using a translation table Block or Page descriptor from the corresponding stage of address translation:

- The PE sets the value of the Access flag to 1 in the translation table descriptor in memory, in a coherent manner, by an atomic read-modify-write of the translation table descriptor, if both of the following conditions are true:
 - The descriptor does not generate a Permission fault or an Alignment fault based on the memory type.
 - If the hardware update mechanism was disabled or not implemented, the access would have generated an Access flag fault.

When the PE updates the Access flag in this way no Access flag fault is generated.

- It is **CONSTRAINED UNPREDICTABLE** whether the PE sets the value of the Access flag in the translation table entry in memory to 1, in a coherent manner, by an atomic read-modify-write of the translation table descriptor, if both of the following conditions are true.
 - The descriptor generates a Permission fault or an Alignment fault based on the memory type.
 - If the hardware update mechanism was disabled or not implemented, the access would have generated an Access flag fault.

This means that the value of the Access flag becomes UNKNOWN if the above conditions are all true.

The Access flag might be set to 1 as a result of speculative accesses by the PE.

————— **Note** —————

A consequence of the architectural rules for translation table accesses is that the architecture requires that for any translation to which an architecturally executed memory access occurs, the Access flag is set to 1, except as indicated in [Using break-before-make when updating translation table entries on page D5-2516](#). However, because the architecture permits speculative accesses, the Access flag is permitted to be set to 1, even if there is no architecturally executed memory accesses by the processor.

When hardware updating of the Access flag is enabled, each stage of translation is treated independently. This means that a single memory access can cause a hardware update to either or both:

- The stage 1 Access flag.
- The stage 2 Access flag.

Note

Since speculative accesses are permitted to update the Access flags, it is permissible for:

- The stage 1 Access flag for a translation of a virtual address to be updated in situations where the stage 2 translation of the associated intermediate physical address that is returned by the stage 1 of the virtual address does not permit access.
- The stage 2 Access flag for a translation of an intermediate physical address to be updated in situations where the stage 1 translation of the associated virtual address which returned that intermediate physical address does not permit access.

An address translation instruction for an address is permitted, but not required, to set the Access flag in the translation table entries for that address. Correspondingly, it is IMPLEMENTATION DEFINED whether such an instruction can generate a Data Abort if the Access flag for a stage of translation is updated to be set.

When hardware updates of the Access flag are enabled for a stage of translation an address translation instruction that uses that stage of translation will not report that the address will give rise to an Access flag fault in the PAR, and the result in PAR will be as if the value of the Access flag in the translation table entries for that address was 1.

Hardware management of dirty state

The hardware management of dirty state mechanism can only be enabled if hardware management of the Access flag is enabled. For information on the hardware management of the Access flag, see [Hardware management of the Access flag on page D5-2468](#).

Note

The hardware management of dirty state mechanism uses:

- In a stage 1 translation table access, the AP[2] bit in conjunction with the DBM bit in the translation table descriptors.
- In a stage 2 translation table access, the S2AP[1] bit in conjunction with the DBM bit in the translation table descriptors.

Hardware management of dirty state is enabled, for the corresponding stage of address translation, by the following configuration fields:

For stage 1 translations

- [TCR_EL1.HD](#).
- [TCR_EL2.HD](#).
- [TCR_EL3.HD](#).

For stage 2 translations

- [VTCR_EL2.HD](#).

Implementations are not required to support the dirty state mechanism. If this mechanism is not supported, then the HD bit in [TCR_EL1](#), [TCR_EL2](#), [TCR_EL3](#), and [VTCR_EL2](#) is RES0.

When hardware management of dirty state is enabled, and a memory access is made using a translation table Block or Page descriptor:

- For a stage 1 address translation, if the value of the TCR_ELx.HD field corresponding to the address translation is 1, then the PE sets AP[2] to 0 in the translation descriptor in memory, in a coherent manner by an atomic read-modify-write of the translation table descriptor, if both of the following conditions are true:
 - The value of the DBM field in the descriptor is 1.
 - If the hardware update mechanism was disabled or not implemented, the access using this descriptor would have generated a Permission fault only because the value of the AP[2] field is 1, indicating that the access does not have write permission.

When the PE updates AP[2] in this way no Permission fault is generated because of the value of the AP[2] field.

- For a stage 2 address translation, if the value of the VTCR_EL2.HD field is 1, then the PE sets S2AP[1] to 1 in the translation descriptor in memory, in a coherent manner by an atomic read-modify-write of the translation table descriptor, if both of the following conditions are true:
 - The value of the DBM field in the descriptor is 1.
 - If the hardware update mechanism was disabled or not implemented, the access using this descriptor would have generated a Permission fault only because the value of the S2AP[1] field is 0, indicating that the access does not have write permission.

When the PE updates S2AP[1] in this way no Permission fault is generated because of the value of the S2AP[1] field.

———— **Note** ————

The PE that does the atomic update of the translation table descriptor is expected to ensure that any cached copy of that translation table descriptor for that PE is similarly updated, or removed from the TLB, so that multiple writes from the same thread on the same PE do not lead to multiple updates to the table. This is only a performance expectation.

If, for a write access, the PE finds that a cached copy of the descriptor in a TLB had the DBM bit set to 1 and the AP[2] or S2AP[1] bit set to the value that forbids writes, then the PE must check that the cached copy is not stale with regard to the descriptor entry in memory, and if necessary perform an atomic read-modify-write update of the descriptor in memory. This applies if the cached copy of the descriptor in a TLB is either:

- A stage 1 descriptor in which DBM has the value 1 and AP[2] has the value 1.
- A stage 2 descriptor in which DBM has the value 1 and S2AP[1] has the value 0.

———— **Note** ————

ARM expects that, in many implementations, any atomic update of a translation table entry required by the dirty state management mechanism will cause a translation table walk.

For the hardware updating of the AP[2] and S2AP[1] bits, each translation stage is treated independently. This means a single memory access can update either or both of:

- The stage 1 AP[2] bit.
- The stage 2 S2AP[1] bit.

The architecture does not permit updates to AP[2] and S2AP[1] by the hardware management of dirty state mechanism to occur as a result of speculative accesses by the PE that are not performed architecturally, except that for translation table entries for which the value of DBM is 1:

- A non-speculative access that passes its stage 1 permissions check can update AP[2] and subsequently encounter a stage 2 fault.

———— **Note** ————

This update of AP[2] is permitted even if the transaction subsequently encounters a stage 2 Translation fault or a Permission fault. This avoids a need to update both AP[2] and S2AP[1] as a single atomic update.

- A non-speculative access that generates an Alignment fault only because the memory type accessed is Device memory by a stage of translation can update AP[2] or S2AP[1] of that stage of translation if the memory access would have updated that translation table bit had the memory access not generated the Alignment fault.
- If the stage 2 hardware management of dirty state mechanism is enabled, the S2AP[1] field of a stage 2 translation table entry that is translating a stage 1 translation table without generating a stage 2 MMU fault:
 - Is updated from 0 to 1 as a result of a speculative update of the Access flag in an entry of that stage 1 translation table.
 - Is permitted to be updated speculatively from 0 to 1 as a result of performing a translation table walk using that stage1 translation table, even if the entry in the stage 1 translation table is not updated. The speculative update is permitted to generate a synchronous External abort or an IMPLEMENTATION DEFINED abort caused by the memory type not supporting an atomic read-modify-write.

———— **Note** ————

This applies even if the stage 1 translation table contains entries that are not the final level entries and therefore would not be updated. This relaxation avoids the hardware complexity of having to detect whether the stage 1 entry is a final level entry before deciding to set the stage 2 dirty state information.

- If an instruction that generates more than one single-copy atomic memory access has a fault on some, but not all, of those memory accesses, then AP[2] and S2AP[1] bits associated with accesses from that instruction, which do not fault are permitted to be updated if the associated hardware update of dirty state mechanism is enabled.
- When enabled, the Statistical Profiling Extension can update the AP[2] or S2AP[1] for any Page or Block translation table entry in the Profiling Buffer. See *Hardware management of dirty state and the Access flag by the Statistical Profiling Extension* on page D8-2615.

For a Block or Page translation table descriptor for which the AF bit is 0, the DBM bit is 1, and either the value of the stage 1 AP[2] bit is 1 or the value of the stage 2 S2AP[1] bit is 0, both AF can be set to 1, and either AP[2] set to 0 or S2AP[1] set to 1, in a single atomic read-modify-write operation, as a result of an attempted write to a memory location that uses the translation table entry.

Implications of enabling the dirty state management mechanism

This subsection describes behaviors that result from having the dirty state management mechanism enabled for a particular stage of address translation.

For the final level of lookup in a stage 1 translation:

In the EL3 translation regime

The OA of the lookup is treated as writable if all of the following conditions apply:

- In the descriptor for the final level of lookup, the value of DBM is 1 and the value of AP[2] is 1.
- In the descriptor for every higher level of lookup, the value of APTable[1] is 0.

In this case, if the value of SCTLR_EL3.WXN is 1 then the OA is treated as Execute-never.

In the EL2 or EL2&0 translation regime, when the value of HCR_EL2.{E2H, TGE} is not {1, 1}

———— **Note** ————

When the value of HCR_EL2.E2H is 1, TCR_EL2 controls the EL2&0 translation regime, and otherwise it controls the EL2 translation regime.

The OA of the lookup is treated as writable if all of the following conditions apply:

- In the descriptor for the final level of lookup, the value of DBM is 1 and the value of AP[2] is 1.
- In the descriptor for every higher level of lookup the value of APTable[1] is 0.

In this the value of SCTLR_EL2.WXN is 1 then the OA is treated as Execute-never.

In addition, if the value of HCR_EL2.E2H is 1, the OA is treated as Privileged execute-never if all of the following conditions apply:

- In the descriptor for the final level of lookup, the value of DBM is 1 and the value of AP[2:1] is 0b11.
- In the descriptor for every higher level of lookup, the value of APTable[1:0] is 0b00.

———— **Note** ————

When the value of HCR_EL2.{E2H, TGE} is not {1, 1}, memory accesses from EL0 do not use the EL2, or EL2&0, translation regime.

In the EL2&0 translation regime, when the value of HCR_EL2.{E2H, TGE} is {1, 1}

The OA of the lookup is treated as writable at EL2 and EL0, Privileged execute-never, if all of the following conditions apply:

- In the descriptor for the final level of lookup, the value of DBM is 1 and the value of AP[2:1] is 0b11.
- In the descriptor for every higher level of lookup the value of APTable[1:0] is 0b00.

In this case, if the value of SCTLR_EL2.WXN is 1 then the OA is also treated as Unprivileged execute-never.

The OA of the lookup is treated as writable at EL2 but not writable at EL0 if either:

- Both:
 - In the descriptor for the final level of lookup, the value of DBM is 1 and the value of AP[2:1] is 0b10.
 - In the descriptor for every higher level of lookup the value of APTable[1:0] is 0b0x.

In this case, if the value of SCTLR_EL2.WXN is 1 then the OA is treated as Privileged execute-never.

- Both:
 - In the descriptor for the final level of lookup, the value of DBM is 1 and the value of AP[2:1] is 0b11.
 - In at least one of the descriptors for higher levels of lookup the value of APTable[1:0] is 0b01.

In this case, if the value of SCTLR_EL2.WXN is 1 then the OA is treated as Privileged execute-never.

In the EL1&0 translation regime

The OA of the lookup is treated as writable at EL1 and EL0, Privileged execute-never, if all of the following conditions apply:

- In the descriptor for the final level of lookup, the value of DBM is 1 and the value of AP[2:1] is 0b11.
- In the descriptor for every higher level of lookup the value of APTable[1:0] is 0b00.

In this case, if the value of SCTLR_EL1.WXN is 1 then the OA is treated as Unprivileged execute-never.

The OA of the lookup is treated as writable at EL1 but not writable at EL0 if either:

- Both:
 - In the descriptor for the final level of lookup, the value of DBM is 1 and the value of AP[2:1] is 0b11.
 - In at least one of the descriptors for higher levels of lookup the value of APTable[1:0] is 0b01.

In this case, if the value of SCTLR_EL1.WXN is 1 then the OA is treated as Privileged execute-never.

- Both:
 - In the descriptor for the final level of lookup, the value of DBM is 1 and the value of AP[2:1] is 0b10.
 - In the descriptor for every higher level of lookup the value of APTable[1:0] is 0b0x.

In this case, if the value of SCTLR_EL1.WXN is 1 then the OA is treated as Privileged execute-never.

The OA of a translation table entry where the DBM bit is 1, and the stage 1 AP[2] bit is 1 or the stage 2 S2AP[1] bit is 0, is treated as writable:

- For data cache invalidation instructions that require write permission, that is for the DC IVAC instruction.
- For address translation instructions that require write permission, that is for the AT S12E0W, AT S12E1W, AT S1E0W, AT S1E1W, AT S1E2W, and AT S1E3W instructions.

Cache invalidation and address translation instructions never cause the stage 1 AP[2] bit or the stage 2 S2AP[1] bit in the translation table entry to be updated.

For a Store-Exclusive instruction to a memory location for which the DBM bit is 1 and the stage 1 AP[2] bit is 1, if the Store-Exclusive fails because the Exclusives monitor is not in the exclusive state, it is IMPLEMENTATION DEFINED whether the AP[2] bit in the translation table is updated.

For a Store-Exclusive instruction to a memory location for which the DBM bit is 1, and the stage 2 S2AP[1] bit is 0, if the Store-Exclusive fails because the Exclusives monitor is not in the Exclusive access state, it is IMPLEMENTATION DEFINED whether the S2AP[1] bit in the translation table is updated.

For a store to a memory location for which the DBM bit is 1, and the stage 1 AP[2] bit is 1, it is IMPLEMENTATION DEFINED whether the AP[2] bit in the translation table is updated:

- If the memory location generates a synchronous External abort on a write for a store to a memory location.
- If the memory location generates a watchpoint on a write.

For a store to a memory location for which the DBM bit is 1, and the stage 2 S2AP[1] bit is 0, it is IMPLEMENTATION DEFINED whether the S2AP[1] bit in the translation table is updated:

- If the memory location generates a synchronous External abort on a write for a store to a memory location.
- If the memory location generates a watchpoint on a write.

In the event of a PE setting the stage 1 AP[2] bit to 0, it is not required that all associated entries are removed from the TLBs of other PEs in the system.

In the event of a PE setting the stage 2 S2AP[1] bit to 1, it is not required that all associated entries are removed from the TLBs of other PEs in the system.

For the stage 2 translation tables, it is CONSTRAINED UNPREDICTABLE whether the stage 2 S2AP[1] entry is updated in response to a stage 1 translation table walk where the stage 1 translation system is configured to perform hardware updates to the Access flag or stage 1 AP[2] bit, but the values of the Access flag and AP[2] bit are such that a hardware update to the stage 1 translation table entry being accessed is not required.

In the event of a PE encountering a situation for a data write for which the DBM bit is 1 and the stage 1 AP[2] bit is 1 in a TLB, it is required that the hardware checks that the cached copy is not stale with regards to the translation table entry in memory and performs the atomic read-modify-write update with respect to table entry in memory.

In the event of a PE encountering a situation for a data write for which the DBM bit is 1 and stage 2 S2AP[1] bit is 0 in a TLB, it is required that the hardware checks that the cached copy is not stale with regards to the translation table entry in memory and performs the atomic read-modify-write update with respect to table entry in memory.

For a CAS or CASP instruction to a memory location for which the DBM bit is 1, and the stage 1 AP[2] bit is 1, if the compare fails, and the location is not updated, it is CONSTRAINED UNPREDICTABLE whether the AP[2] bit in the translation table is updated.

For a CAS or CASP instruction to a memory location for which the DBM bit is 1, and the stage 2 S2AP[1] bit is 0, if the compare fails, and the location is not updated, it is CONSTRAINED UNPREDICTABLE whether the S2AP[1] bit in the translation table is updated.

For an atomic instruction to a memory location for which the DBM bit is 1, and the stage 2 S2AP[0:1] is 00, if the instruction generates a stage 2 Permission fault as a result of not having read permission, it is CONSTRAINED UNPREDICTABLE whether the S2AP[1] bit in the translation table is updated.

D5.4.11 Ordering of hardware updates to the translation tables

A hardware update to the translation table that is caused by a load or a store, including an atomic instruction, is guaranteed to be observed, to the extent required by the shareability attributes:

- Before a load or store, including an atomic instruction, to an arbitrary address, other than the address of the translation table entry, that appears in program order after the load or store, including an atomic instruction, causing the update to the translation table entry only if a DSB with the appropriate shareability attributes, where the DSB applies to both loads and stores, is executed between the load or store, including an atomic instruction, that caused the update to the translation table and the subsequent load or store.

- Before a load to the translation table entry that is being updated that appears in program order after the load or store, including an atomic instruction, causing the update to the translation table entry only if a DSB with the appropriate shareability attributes, where the DSB applies to both loads and stores, is executed between the load or store, including an atomic instruction, that caused the update to the translation table and the subsequent load.
- Before a store or atomic access to the translation table entry that is being updated that appears in program order after the load or store, including an atomic instruction, causing the update to the translation table entry.
- Before a cache maintenance instruction to an arbitrary address appearing in program order after the load or store, including an atomic instruction, causing the update to the translation table entry only if a DSB with the appropriate shareability attributes, where the DSB applies to both loads and stores, is executed between the load or store, including an atomic instruction that caused the update to the translation table entry and the subsequent cache maintenance instruction.

An update to the translation table that is caused by a load is not ordered with respect to the load itself.

An update to the translation table that is caused by a store or an atomic access is observed by all observers, to the extent required by the shareability attributes, before the store itself in the case that the store is to the same location as the translation table update.

An update to the translation table that is caused by a store or an atomic access is not ordered with respect to the store itself in the case that the store is not the same location as the translation table update.

D5.4.12 Restriction on memory types for hardware updates on translation tables

Translation tables can be placed in Normal memory with any cacheability, but the hardware updates to the translation tables require an atomic update of memory. The properties of the atomicity can be met only by functionality outside the PE. Some system implementations might not implement this functionality for all regions of memory. This can apply to:

- Any type of memory in the system that does not support hardware cache coherency.
- Non-cacheable memory, or memory that is treated as Non-cacheable, in an implementation that does not support hardware cache coherency.

An implementation can choose which memory type is treated as Non-cacheable.

The memory types for which it is architecturally guaranteed that the hardware updates of the translation tables will be atomic are:

- Inner Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hints and Write allocation hints and not transient.
- Outer Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hints and Write allocation hints and not transient.

If the hardware updates of the translation tables are not atomic in regard to other agents that access memory, then performing a hardware update to such a location can have one or more of the following effects:

- The hardware update generates a synchronous External abort, which is presented as an External abort on a translation table walk.
- The instruction generates a SError interrupt.
- The hardware update generates an Unsupported atomic hardware update MMU fault reported using the Fault status code of:

— `ESR_ELx.DFSC = 110001` for Data Aborts.

— `ESR_ELx.IFSC = 110001` for Instruction Aborts.

For the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, if atomic hardware update is not supported because of the memory type that is defined in the first stage of translation, or the second stage of translation is not enabled, then this exception is a first stage abort and is taken to EL1. Otherwise, the exception is a second stage abort and is taken to EL2.

The priority of this MMU fault for a stage of the translation is immediately before or immediately after the priority of a Permission fault generated by the same stage of translation as the stage of this MMU fault, as determined by an IMPLEMENTATION DEFINED choice.

- The hardware updates are performed, but there is no guarantee that the memory accesses were performed atomically in regard to other agents that access memory. In this case, the instruction might also generate a SError interrupt.

D5.4.13 Use of the Contiguous bit with hardware updates of the translation table entries

Hardware updates of the Access flag, and the AP[2] or S2AP[1] bit, only apply to a single translation table entry. An update to one of these bits in a translation table entry that also has the Contiguous bit set to 1 can give rise to translation table entries that have different Access flag, or different AP[2] or S2AP[1] bits, within the members of a group of contiguous translation table entries.

This is acceptable under the architecture when using hardware updates of the translation table entries. In addition, an access or a write to a location translated by an entry that has the Contiguous bit set might not result in a hardware update of the Access flag or the AP[2] or S2AP[1] bit, if at least one entry in the set of contiguous translation table entries has the Access flag set to 1, or the AP[2] or S2AP[1] bit indicating that the entry is dirty.

———— **Note** —————

- The provision of the Contiguous bit permits, but does not require, the hardware to hold a single entry in a TLB for the set of translation table entries in the group, and to have updated only one or more of the Access flags and the AP[2] bit or S2AP[1] bit for the single translation table entry that gave rise to the TLB entry.
- A consequence of this is that software must combine the Access flag values, and AP[2] or S2AP[1] values, across all translation table entries in a contiguous group to determine whether any of the entries have been accessed or written to.

For more information on the Contiguous bit, see [The Contiguous bit on page D5-2481](#).

D5.5 Memory region attributes

The memory region attribute fields control the memory type, accesses to the caches, and whether the memory region is Shareable and therefore is coherent. This section also describes some additional translation table fields, that this manual groups with the memory region attributes.

In the EL1&0 translation regime, each enabled stage of address translation assigns memory region attributes, as described in this section. When both stages of translation are enabled, [Combining the stage 1 and stage 2 attributes, EL1&0 translation regime on page D5-2482](#) describes how the assignments from the two stages are combined.

———— Note —————

In a virtualization implementation, a hypervisor, executing at EL2, might usefully:

- Reduce the permitted cacheability of a region.
- Increase the required shareability of a region.

The combining of attributes from stage 1 and stage 2 translations supports both of these options.

The following sections describe these attributes:

- [The stage 1 memory region attributes.](#)
- [The stage 2 memory region attributes, EL1&0 translation regime on page D5-2478.](#)
- [Other fields in the VMSAv8-64 translation table format descriptors on page D5-2480.](#)
- [Combining the stage 1 and stage 2 attributes, EL1&0 translation regime on page D5-2482.](#)

———— Note —————

- This section describes the memory region attributes for each of the translation regimes, and for each stage of translation in the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime.
- A translation applies to memory accesses from either:
 - Only a single Exception level, for example the EL3 translation regime.
 - EL0 and one higher Exception level, for example the EL1&0 translation regime.
- In general, attribute assignment is simpler in a regime that applies to only a single Exception level, and in these regimes behavior is consistent with fields in the translation tables being treated as follows:
 - [AP\[1\]](#) is RES1, meaning the PE ignores the value of the bit and behaves as if it is 1.
 - [APTable\[0\]](#) is RES0, meaning the PE ignores the value of the bit and behaves as if it is 0.
 - The [PXN](#) field is RES0, meaning the PE ignores the value of the bit and behaves as if it is 0.
 - The [PXNTable](#) bit is RES0, meaning the PE ignores the value of the bit and behaves as if it is 0.

D5.5.1 The stage 1 memory region attributes

The description of the memory region attributes in a translation descriptor divides into:

Memory type and Cacheability

These are described indirectly, by registers referenced by bits in the table descriptor. This is described as *remapping* the memory type and attribute description. [Stage 1 memory region type and Cacheability attributes](#) describes this encoding.

Shareability The SH[1:0] field in the translation table descriptor encodes shareability information. [Stage 1 Shareability attribute, for Normal memory on page D5-2477](#) describes this encoding.

Stage 1 memory region type and Cacheability attributes

In the VMSAv8-64 translation table format, the AttrIdx[2:0] field in a block or page translation table descriptor for a stage 1 translation indicates the 8-bit field in the [MAIR_ELx](#) that specifies the attributes for the corresponding memory region. The required field is Attr n , where $n = \text{AttrIdx}[2:0]$. For more information about AttrIdx[2:0] see [Attribute fields in stage 1 VMSAv8-64 Block and Page descriptors on page D5-2451](#).

———— **Note** —————

Each MAIR_ELx is a 64-bit register that is architecturally mapped to a pair of AArch32 registers. See the MAIR_ELx register descriptions for more information.

Each MAIR_ELx.Attrn field defines, for the corresponding memory region:

- The memory type, Device or Normal.
- For Device memory, the Device memory type, one of:
 - Device-nGnRnE.
 - Device-nGnRE.
 - Device-nGRE.
 - Device-GRE.
- For Normal memory:
 - The inner and outer cacheability, Non-cacheable, Write-Through, or Write-Back.
 - For Write-Through Cacheable and Write-Back Cacheable regions, the Read-Allocate and Write-Allocate policy hints, each of which is *Allocate* or *No Allocate*, and the Transient allocation hints, if supported.

For more information about the memory type and attributes, see *Memory types and attributes* on page B2-122 and *Cacheability, cache allocation hints, and cache transient hints* on page D4-2356.

Stage 1 Shareability attribute, for Normal memory

When using the VMSAv8-64 translation table format, the SH[1:0] field in a block or page translation table descriptor specifies the Shareability attributes of the corresponding memory region. Table D5-32 shows the encoding of this field.

Table D5-32 SH[1:0] field encoding for Normal memory, VMSAv8-64 translation table format

SH[1:0]	Normal memory
00	Non-shareable
01	Reserved, CONSTRAINED UNPREDICTABLE ^a
10	Outer Shareable
11	Inner Shareable

a. See *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7231 for the permitted CONSTRAINED UNPREDICTABLE behavior.

———— **Note** —————

The shareability field is only relevant if the memory is a Normal Cacheable memory type. All Device and Normal Non-cacheable memory regions are always treated as Outer Shareable, regardless of the translation table shareability attributes

See *Combining the stage 1 and stage 2 shareability attributes for Normal memory* on page D5-2485 for constraints on the Shareability attributes of a Normal memory region that is Inner Non-cacheable, Outer Non-cacheable.

D5.5.2 The stage 2 memory region attributes, EL1&0 translation regime

In the stage 2 translation table descriptors for memory regions and pages, the MemAttr[3:0] and SH[1:0] fields describe the stage 2 memory region attributes:

- [Stage 2 memory region type and Cacheability attributes](#) describes how the MemAttr[3:0] field defines these attributes.
- The SH[1:0] field in the translation table descriptor encodes shareability information. [Stage 2 Shareability attribute, for Normal memory on page D5-2479](#) describes this encoding.

The following sections describe how, when both stages of address translation are enabled, the memory region attributes assigned at stage 2 of the translation are combined with those assigned at stage 1:

- [Combining the stage 1 and stage 2 memory type attributes on page D5-2484.](#)
- [Combining the stage 1 and stage 2 cacheability attributes for Normal memory on page D5-2484.](#)
- [Combining the stage 1 and stage 2 shareability attributes for Normal memory on page D5-2485.](#)

D5.5.3 Stage 2 memory region type and Cacheability attributes

[Table D5-33](#) shows how MemAttr[3:2] gives a top-level definition of the memory type, and of the Outer cacheability of a Normal memory region.

Table D5-33 VMSAv8-64 MemAttr[3:2] encoding, stage 2 translation

MemAttr[3:2]	Memory type	Outer cacheability
00	Device. MemAttr[1:0] encodes the Device memory type.	Not applicable
01	Normal. MemAttr[1:0] encodes the Inner Cacheability.	Outer Non-cacheable
10		Outer Write-Through Cacheable
11		Outer Write-Back Cacheable

The encoding of MemAttr[1:0] depends on the Memory type indicated by MemAttr[3:2]:

- When MemAttr[3:2]==0b00, indicating Device memory, [Table D5-34](#) shows the encoding of MemAttr[1:0].

Table D5-34 MemAttr[1:0] encoding for Device memory

MemAttr[1:0]	Meaning when MemAttr[3:2] == 0b00
00	Region is Device-nGnRnE memory
01	Region is Device-nGnRE memory
10	Region is Device-nGRE memory
11	Region is Device-GRE memory

- When MemAttr[3:2]!=0b00, indicating Normal memory, [Table D5-35](#) shows the encoding of MemAttr[1:0].

Table D5-35 MemAttr[1:0] encoding for Normal memory

MemAttr[1:0]	Meaning when MemAttr[3:2] != 0b00
00	Reserved, CONSTRAINED UNPREDICTABLE ^a

Table D5-35 MemAttr[1:0] encoding for Normal memory (continued)

MemAttr[1:0]	Meaning when MemAttr[3:2] != 0b00
01	Inner Non-cacheable
10	Inner Write-Through Cacheable
11	Inner Write-Back Cacheable

a. See *Reserved values in System and memory-mapped registers and translation table entries on page K1-7231* for the permitted CONSTRAINED UNPREDICTABLE behavior.

Note

- The stage 2 translation does not assign any allocation hints.
- The following stage 2 translation table attribute settings leave the stage 1 settings unchanged:
 - MemAttr[3:2] == 0b11, Normal memory, Outer Write-Back Cacheable.
 - MemAttr[1:0] == 0b11, Inner Write-Back Cacheable.

D5.5.4 Stage 2 Shareability attribute, for Normal memory

When using the VMSAv8-64 translation table format, the SH[1:0] field in a block or page translation table descriptor specifies the Shareability attributes of the corresponding memory region. [Table D5-36](#) shows the encoding of this field.

Table D5-36 SH[1:0] field encoding for Normal memory, VMSAv8-64 translation table format

SH[1:0]	Normal memory
00	Non-shareable
01	Reserved, CONSTRAINED UNPREDICTABLE ^a
10	Outer Shareable
11	Inner Shareable

a. See *Reserved values in System and memory-mapped registers and translation table entries on page K1-7231* for the permitted CONSTRAINED UNPREDICTABLE behavior.

Note

- This encoding is the same as the shareability encoding described in *Stage 1 Shareability attribute, for Normal memory on page D5-2477*.
- The shareability field is only relevant if the memory is a Normal Cacheable memory type. All Device and Normal Non-cacheable memory regions are always treated as Outer Shareable, regardless of the translation table shareability attributes.

See *Combining the stage 1 and stage 2 shareability attributes for Normal memory on page D5-2485* for constraints on the Shareability attributes of a Normal memory region that is Inner Non-cacheable, Outer Non-cacheable.

D5.5.5 Stage 2 memory region type and Cacheability attributes when ARMv8.4-S2FWB is implemented

When [ARMv8.4-S2FWB](#) is implemented and [HCR_EL2.FWB](#) is set to 1, then the MemAttr[5:0] is divided as follows:

- Bit[5] is RES0.

- Bit[4] determines the interpretation of bits [3:2].

When bit[4] is one the effects of bits [3:2] are defined in [Table D5-37](#).

Table D5-37 Effect of bit[4] == 1 on Cacheability and Memory Type

Stage 1 Memory Type and Inner or Outer Cacheability attribute	Stage 2 Block/Descriptor Bits[3:2]	Resultant Memory type and Cacheability attribute
Normal Write-Back	0b11	Normal Write-Back
Normal Write-Through		Normal Write-Through
Normal Non-cacheable		Normal Non-cacheable
Device<attr>		Device<attr>
Normal Write-Back	0b10	Normal Write-Back
Normal Write-Through		
Normal Non-cacheable		
Device<attr>		
Normal Write-Back	0b01	Normal Non-cacheable
Normal Write-Through		
Normal Non-cacheable		
Device<attr>		Device<attr>
-	0b00	RESERVED

When [HCR_EL2.FWB](#) is set to 1 and Bit[4] is 0, then the stage 2 memory type is Device. Bits[3:2] of the Stage 2 page or block descriptor define the Device memory attributes. The Device Memory attributes are defined in [Table D5-38](#).

Table D5-38 Device Memory Attributes when Bit[4] == 0

Stage 2 page/block descriptor bits [3:2]	Device Memory Attribute
0b00	Device-nGnRnE
0b01	Device-nGnRE
0b10	Device-nGRE
0b11	Device-GRE

D5.5.6 Other fields in the VMSAv8-64 translation table format descriptors

The following subsections describe the other fields in the translation table block and page descriptors:

- [The Contiguous bit](#) on page D5-2481.
- [IGNORED fields](#) on page D5-2482.
- [Field reserved for software use](#) on page D5-2482.

The Contiguous bit

When the value of the Contiguous bit is 1, it indicates that the entry is one of a number of adjacent translation table entries that point to a *contiguous output address range*. The required number of adjacent entries depends on the current translation granule size, as follows:

4KB granule 16 adjacent translation table entries point to a contiguous output address range that has the same permissions and attributes. These 16 entries must be aligned in the translation table. If accessing a full-sized 4KB translation table, this means that the top 5 of the 9 input addresses bits that index the descriptor positions in the translation table are the same for all of the entries.

The contiguous output address range must be aligned to size of 16 translation table entries at the same translation table level.

16KB granule This bit indicates that adjacent translation table entries point to contiguous output address range that has the same permissions and attributes. With the 16KB granule, the number of contiguous entries indicated by setting this bit to 1 depends on the lookup level of the translation table:

Level 2 lookup The bit indicates 32 contiguous entries, giving a 1GB block of memory. These entries must be aligned in the translation table. When accessing a full-sized 16KB translation table, this means the top 6 of the 11 input addresses bits that index the descriptor positions in the translation table are the same for all of the entries.

The contiguous output address range must be aligned to size of 32 translation table entries at the same translation table level.

Level 3 lookup The bit indicates 128 contiguous entries, giving a 2MB block of memory. These entries must be aligned in the translation table. When accessing a full-sized 16KB translation table, this means the top 4 of the 11 input addresses bits that index the descriptor positions in the translation table are the same for all of the entries.

The contiguous output address range must be aligned to size of 128 translation table entries at the same translation table level.

64KB granule 32 adjacent translation table entries point to a contiguous output address range that has the same permissions and attributes. These 32 entries must be aligned in the translation table. If accessing a full-sized 64KB translation table, this means that the top 8 of the 13 input addresses bits that index the descriptor positions in the translation table are the same for all of the entries.

The contiguous output address range must be aligned to size of 32 translation table entries at the same translation table level.

Setting this bit to 1 means that the TLB can cache a single entry to cover the contiguous translation table entries.

This section defines the requirements for programming the Contiguous bit. [Possible errors in programming the translation table registers on page D5-2432](#) describes the effect of not meeting these requirements.

The architecture does not require a PE to cache TLB entries in this way. To avoid TLB coherency issues, any TLB maintenance by address must not assume any optimization of the TLB tables that might result from use of the Contiguous bit.

TLB maintenance must be performed based on the size of the underlying translation table entries, to avoid TLB coherency issues.

[Use of the Contiguous bit with hardware updates of the translation table entries on page D5-2475](#) describes the effect of hardware management of the Access flag and dirty state on the Contiguous bit.

Note

When [ARMv8.2-LVA](#) is implemented, the level 1 block size for the 64KB granule does not support the Contiguous bit, and that field is RES0.

IGNORED fields

In the VMSAv8-64 translation table descriptors, the following fields are identified as IGNORED, meaning the architecture guarantees that a PE makes no use of these fields:

- In the stage 1 and stage 2 Table descriptors, bits[58:51] and bits[11:2].
- In the stage 1 and stage 2 Block and Page descriptors, bit[63] and bits[58:55].
- In the stage 1 and stage 2 Block and Page descriptors in an implementation that does not include [ARMv8.2-TTPBHA](#), bits[62:59].

Of these fields:

- In the stage 1 and stage 2 block and page descriptors, bits[58:55] are reserved for software use, see [Field reserved for software use](#).
- In the stage 2 block and page descriptors:
 - Bit[63] is reserved for use by a System MMU.
 - In an implementation that does not include [ARMv8.2-TTPBHA](#), bits[62:59] are reserved for use by a System MMU.

Field reserved for software use

The architecture reserves a 4-bit IGNORED field in the Block and translation table descriptors, bits[58:55], for software use. The definition of IGNORED means the architecture guarantees that hardware makes no use of this field.

———— Note —————

This means there is no need to invalidate the TLB if these bits are changed.

D5.5.7 Combining the stage 1 and stage 2 attributes, EL1&0 translation regime

When EL2 is enabled, the Secure or Non-secure EL1&0 translation regime comprises two stage of translation, each of which can be enabled independently:

- Stage 1 translation is configured and controlled from EL1. When enabled, stage 1 translation can define access permissions independently for access from EL0 and for accesses from EL1.

Stage 1 MMU faults are taken to EL1.

- When stage 2 translation is enabled, the stage 2 access controls defined at EL2:
 - Affect the stage 1 access permissions settings.
 - Take no account of whether the accesses are at EL1 or EL0.
 - Permit software executing at EL2 to assign a write-only attribute to a memory region.

Stage 2 MMU faults are taken to EL2.

———— Note —————

In an implementation of virtualization, the attributes defined in the stage 2 translation tables mean a hypervisor can define additional access restrictions to those defined by a Guest OS in the stage 1 translation tables. For a particular access, the actual access permission is the more restrictive of the permissions defined by:

- The Guest OS, in the stage 1 translation tables.
- The hypervisor, in the stage 2 translation tables.

The effects of the combination of attributes defined by the Hypervisor are functionally transparent to the Guest OS.

If [ARMv8.4-S2FWB](#) is implemented and [HCR_EL2.FWB](#) is set to 0, there is no effect on the combination of stage 1 and stage 2 memory attributes or cacheability attributes.

When [HCR_EL2.FWB](#) is set to 1:

- If the stage 1 page or block descriptor specifies a cacheable memory type, then the specified cacheable memory hint is applied to the final cache allocation hint if the final memory type is cacheable.
- If the stage 1 page or block descriptor does not specify a cacheable memory type, then the final cache allocation hint is Read Allocate, Write Allocate if the final memory type is cacheable.

The effects of [HCR_EL2.FWB](#) apply to both Secure and Non-secure stage 2 translation regime.

When [ARMv8.4-S2FWB](#) is implemented, the architecture requires that [CLIDR_EL1](#).{LOUU, LOIUS} are zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

Combining the stage 1 and stage 2 data access permissions

When both stages of translation are enabled, the following access permissions are combined:

- The stage 1 permissions described in [The AP\[2:1\] data access permissions, for stage 1 translations on page D5-2458](#).
- The stage 2 permissions described in [The S2AP data access permissions, Secure or Non-secure EL1&0, when EL2 is enabled, translation regime on page D5-2460](#).

The stage 1 and stage 2 permissions are combined as follows:

1. If an access is not permitted by the stage 1 permissions, then it generates a stage 1 Permission fault, regardless of the stage 2 permissions.
2. If an access is permitted by the stage 1 permissions, but is not permitted by the stage 2 Permissions, then it generates a stage 2 Permission fault.
3. If an access is permitted by both the stage 1 permissions and the stage 2 permissions, then it does not generate a Permission fault.

Combining the stage 1 and stage 2 instruction execution permissions

When both stages of translation are enabled, the following access permissions are combined:

- The stage 1 permissions described in [Stage 1 instruction access and execution permissions on page D5-2463](#).
- The stage 2 permissions described in [Stage 2 instruction execution permissions on page D5-2465](#).

The stage 1 and stage 2 permissions are combined as follows:

1. If an instruction fetch is not permitted by the stage 1 permissions, then it generates a stage 1 Permission fault, regardless of the stage 2 permissions.
2. If an instruction fetch is permitted by the stage 1 permissions, but is not permitted by the stage 2 Permissions, then it generates a stage 2 Permission fault.
3. If an instruction fetch is permitted by both the stage 1 permissions and the stage 2 permissions, then it does not generate a Permission fault.

Combining the stage 1 and stage 2 memory type attributes

Table D5-39 shows the rules for combining the stage 1 and stage 2 memory type assignments.

Table D5-39 Combining the stage 1 and stage 2 memory type assignments

Rule	If either stage of translation assigns:	The resultant memory type is:
Device has precedence over Normal	Any Device memory type	A Device memory type
non-Gathering has precedence over Gathering	A Device-nGxx memory type	A Device-nGxx memory type
non-Reordering has precedence over Reordering	A Device-nGnRx memory type	A Device-nGnRx memory type
No Early write acknowledge has precedence over Early write acknowledge	The Device-nGnRnE memory type	The Device-nGnRnE memory type

Regardless of any shareability attribute obtained as described in *Combining the stage 1 and stage 2 shareability attributes for Normal memory* on page D5-2485:

- Any location for which the resultant memory type is any type of Device memory is always treated as Outer Shareable.
- Any location for which the resultant memory type is Normal Inner Non-cacheable, Outer Non-cacheable is always treated as Outer Shareable.

For information about how the cacheability attribute is obtained from the attributes assigned at each stage of translation see *Combining the stage 1 and stage 2 cacheability attributes for Normal memory*.

The combining of the memory type attributes from the two stages of translation means a translation table walk for stage 1 translation can be made to a type of Device memory. If this occurs then:

- If the value of `HCR_EL2.PTW` is 0, then the translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be done speculatively.
- If the value of `HCR_EL2.PTW` is 1, then the memory access generates a stage 2 Permission fault.

Combining the stage 1 and stage 2 cacheability attributes for Normal memory

For a Normal memory region, Table D5-40 shows how the stage 1 and stage 2 cacheability assignments are combined. This combination applies, independently, for the Inner cacheability and Outer cacheability attributes.

Table D5-40 Combining the stage 1 and stage 2 cacheability assignments for Normal memory

Assignment in stage 1	Assignment in stage 2	Resultant cacheability
Non-cacheable	Any	Non-cacheable
Any	Non-cacheable	Non-cacheable
Write-Through Cacheable	Write-Through or Write-Back Cacheable	Write-Through Cacheable
Write-Through or Write-Back Cacheable	Write-Through Cacheable	Write-Through Cacheable
Write-Back Cacheable	Write-Back Cacheable	Write-Back Cacheable

Combining the stage 1 and stage 2 shareability attributes for Normal memory

A memory region is treated as Outer Shareable, regardless of any shareability assignments at either stage of translation, if either:

- The resultant memory type attribute, described in *Combining the stage 1 and stage 2 memory type attributes on page D5-2484*, is any type of Device memory.
- The resultant memory type attribute, described in *Combining the stage 1 and stage 2 memory type attributes on page D5-2484*, is Normal memory, and the resultant cacheability, described in *Combining the stage 1 and stage 2 cacheability attributes for Normal memory on page D5-2484*, is Inner Non-cacheable, Outer Non-cacheable.

For a memory region with a resultant memory type attribute of Normal, that is not Inner Non-cacheable, Outer Non-cacheable, [Table D5-41](#) shows how the stage 1 and stage 2 shareability assignments are combined.

Table D5-41 Combining the stage 1 and stage 2 Shareability assignments for Normal memory^a

Assignment in stage 1	Assignment in stage 2	Resultant shareability
Outer Shareable	Any	Outer Shareable
Inner Shareable	Outer Shareable	Outer Shareable
Inner Shareable	Inner Shareable	Inner Shareable
Inner Shareable	Non-shareable	Inner Shareable
Non-shareable	Outer Shareable	Outer Shareable
Non-shareable	Inner Shareable	Inner Shareable
Non-shareable	Non-shareable	Non-shareable

a. Applies only if the Normal memory is not Inner Non-cacheable, Outer Non-cacheable, see text.

D5.6 Virtualization Host Extensions

ARMv8.1 introduces the Virtualization Host Extensions that provide enhanced support for a Type 2 virtualization solution, where there is a Host OS, which is either more privileged than the hypervisor, or is a peer of the hypervisor.

The Virtualization Host Extensions only apply to an implementation that includes EL2 using AArch64.

D5.6.1 State added by the Virtualization Host Extensions

The following state is added as part of the [ARMv8.1-VHE](#):

- A configuration bit, E2H, is added to [HCR_EL2](#).
- New registers:
 - [CONTEXTIDR_EL2](#), which has the same format and contents as [CONTEXTIDR_EL1](#).
 - [TTBR1_EL2](#), which has the same format and contents as [TTBR1_EL1](#).
- An EL2 virtual timer which is accessed using the registers [CNTHV_CTL_EL2](#), [CNTHV_CVAL_EL2](#), and [CNTHV_TVAL_EL2](#). The registers take the same format as [CNTV_CTL_EL0](#), [CNTV_CVAL_EL0](#), and [CNTV_TVAL_EL0](#) respectively. The virtual offset is treated as 0 for this timer.

D5.6.2 Behavior of HCR_EL2.E2H

When the value of [HCR_EL2.E2H](#) is 0:

- There are no changes to the ARMv8 functionality other than the new state described in *State added by the Virtualization Host Extensions*.
- **Note** —————
- This means the translation regime controlled by [TCR_EL2](#) is called the EL2 translation regime.
- The contents of [TTBR1_EL2](#) are ignored by hardware, other than reads by an MRS instruction and writes by an MSR instruction.
 - The Context ID matching breakpoint is disabled at EL2, and uses the value of [CONTEXTIDR_EL1](#) at EL0 and EL1.

When the value of [HCR_EL2.E2H](#) is 1, and EL2 is enabled for the current Security state:

- The translation regime controlled by [TCR_EL2](#) is the EL2&0 translation regime, and the behaviors of this translation regime differ from those of the EL2 translation regime.
- The EL2&0 translation regime behaves in the same way as stage 1 of the EL1&0 translation regime, with an upper address range translated by tables pointed to by [TTBR1_EL2](#). The existing [TTBR0_EL2](#) translates the lower address range of the EL2&0 translation regime and is extended to have the same contents and format as the [TTBR0_EL1](#).
- The translation tables used in the EL2&0 translation regime take the same format as the EL1&0 translation regime. EL2 accesses are treated as privileged in this format.
- Context ID matching can occur at EL2. When executing at EL2, a Context ID matching breakpoint uses [CONTEXTIDR_EL2](#).
- [VMID](#) and [VMID](#) + Context ID matching breakpoints do not match at EL2.
- The virtual offset is treated as 0 when [CNTVCT_EL0](#) is read from EL2.
- The Privileged Access Never mechanism applies to accesses from EL2 to a virtual address which has access permitted in the EL2&0 translation regime.
- The following registers are redefined:
 - [CNTHCTL_EL2](#).

- CPTR_EL2.
- TCR_EL2.

If $\text{HCR_EL2}\{E2H, TGE\} = \{1, 0\}$, then all accesses from EL1 and EL0 are not included in the EL2&0 translation regime.

If $\text{HCR_EL2}\{E2H, TGE\} = \{1, 1\}$:

- The EL2&0 translation regime is used when executing at EL0 as well as when executing at EL2, where EL0 accesses are treated as unprivileged.

———— **Note** —————

Accesses from EL1 are not possible under this configuration.

- In EL2, the unprivileged instructions LDTR, LDTRB, LDTRH, LDTRSB, LDTRSH, LDTRSW, STTR, STTRB, and STTRH act as if they are executing at EL0 for permission and watchpoint checking.
- Except for the purpose of reading the value held in the register, some fields in [HCR_EL2](#) and all fields in [HSTR_EL2](#) are treated as having a specific value.
- [SCTLR_EL2](#) is redefined to include additional fields from [SCTLR_EL1](#), and to apply to execution at EL0.
- The following timer registers, and their equivalent AArch32 registers, are redefined to access the associated [_EL2](#) register, rather than accessing the [_EL0](#) register when in EL0:
 - CNTP_CTL_EL0.
 - CNTP_CVAL_EL0.
 - CNTP_TVAL_EL0.
 - CNTV_CTL_EL0.
 - CNTV_CVAL_EL0.
 - CNTV_TVAL_EL0.

For some information on registers that are redirected, see [System and Special-purpose register redirection](#).

- When executing at EL0, a Context ID matching breakpoint uses [CONTEXTIDR_EL2](#).
- [VMID](#) and [VMID](#) + Context ID matching breakpoints do not match at EL0.
- The [CPACR_EL1](#) register does not cause any instructions to be trapped to EL1, regardless of the contents of [CPACR_EL1](#).
- The [CNTKCTL_EL1](#) register does not cause any instructions to be trapped to EL1, and the event stream event caused by the [CNTKCTL_EL1](#) is disabled, regardless of the contents of [CNTKCTL_EL1](#).
- The virtual offset is treated as 0 when [CNTVCT_EL0](#) is read from EL0 or EL2.
- The TLB maintenance and address translation instructions that apply to the EL1&0 translation regime are redefined to apply to the EL2&0 translation regime. See [A64 System instructions for address translation on page C5-452](#) and [A64 System instructions for TLB maintenance on page C5-479](#).
- When executing at EL2 or EL0, any physical interrupt that is configured to be taken at EL2 is subject to the [PSTATE}\{D, A, I, F}](#) interrupt masks. If the mask bit is set, then the corresponding interrupt will not be taken. If the mask bit is not set, then the corresponding interrupt will be taken. See [Asynchronous exception masking on page D1-2202](#).
- When an exception is taken from EL0 to EL2, the value of the [HCR_EL2.RW](#) bit is not considered when determining the exception vector offset to use. [Table D1-7 on page D1-2172](#) lists the vector offsets used when an exception is taken from EL0.

D5.6.3 System and Special-purpose register redirection

When [ARMv8.1-VHE](#) is implemented, and [HCR_EL2.E2H](#) is set to 1, when executing at EL2, some EL1 System register access instructions are redefined to access the equivalent EL2 register.

Table D5-42 shows the System register access instruction encodings that are redirected to the equivalent EL2 register when the named mnemonic is used.

Table D5-42 System register redirection

System register access instruction encoding					Mnemonic	Equivalent register accessed at EL2
op0	op1	CRn	CRm	op2		
3	0	1	0	0	SCTLR_EL1	SCTLR_EL2
				2	CPACR_EL1	CPTR_EL2
				2	1	TRFCR_EL1
	2	0	0	0	TTBR0_EL1	TTBR0_EL2
				1	TTBR1_EL1	TTBR1_EL2
				2	TCR_EL1	TCR_EL2
	5	1	0	0	AFSR0_EL1	AFSR0_EL2
				1	AFSR1_EL1	AFSR1_EL2
				2	0	ESR_EL1
	6	0	0	FAR_EL1	FAR_EL2	
	10	2	0	0	MAIR_EL1	MAIR_EL2
				3	0	AMAIR_EL1
	12	0	0	VBAR_EL1	VBAR_EL2	
	13	0	1	CONTEXTIDR_EL1	CONTEXTIDR_EL2	
14	1	0	CNTKCTL_EL1	CNTHCTL_EL2		
3	14	2	0	0	CNTP_TVAL_EL0	CNTHP_TVAL_EL2 CNTHPS_TVAL_EL2 ^a
				1	CNTP_CTL_EL0	CNTHP_CTL_EL2 CNTHPS_CTL_EL2 ^a
				2	CNTP_CVAL_EL0	CNTHP_CVAL_EL2 CNTHPS_CVAL_EL2 ^a
				0	CNTV_TVAL_EL0	CNTHV_TVAL_EL2 CNTHVS_TVAL_EL2 ^a
				1	CNTV_CTL_EL0	CNTHV_CTL_EL2 CNTHVS_CTL_EL2 ^a
				2	CNTV_CVAL_EL0	CNTHV_CVAL_EL2 CNTHVS_CVAL_EL2 ^a

a. This register is accessed when [ARMv8.4-SecEL2](#) is implemented and enabled, when the value of [SCR_EL3.EEL2](#) is 1.

Table D5-43 shows the Special-purpose register access instruction encodings that are redirected to the equivalent EL2 register when the named mnemonic is used.

Table D5-43 Special-purpose register redirection

Special-purpose register access instruction encoding			Mnemonic	Equivalent register accessed at EL2
op1	CRm	op2		
0	0	0	SPSR_EL1	SPSR_EL2
		1	ELR_EL1	ELR_EL2

D5.6.4 System and Special-purpose register aliasing

New register encodings, and aliases, are provided so that software executing at EL2 can access the EL1 registers for which accesses from EL2 are redirected as described in [System and Special-purpose register redirection on page D5-2487](#). These aliases can also be used at EL3, but are UNDEFINED at EL1 and EL0.

Table D5-44 shows the System register access instruction encodings that are aliased.

Table D5-44 System register aliases

System register access instruction encoding					Mnemonic	Register accessed		
op0	op1	CRn	CRm	op2				
3	5	1	0	0	SCTLR_EL12	SCTLR_EL1		
				2	CPACR_EL12	CPACR_EL1		
				2	0	ZCR_EL12	ZCR_EL1 ^a	
					1	TRFCR_EL12	TRFCR_EL1	
				2	0	0	TTBR0_EL12	TTBR0_EL1
						1	TTBR1_EL12	TTBR1_EL1
			2			TCR_EL12	TCR_EL1	
			5	1	0	0	AFSR0_EL12	AFSR0_EL1
						1	AFSR1_EL12	AFSR1_EL1
					2	0	ESR_EL12	ESR_EL1
			6	0	0	FAR_EL12	FAR_EL1	
			9	9	0	PMSCR_EL12	PMSCR_EL1	
			10	2	0	0	MAIR_EL12	MAIR_EL1
						3	0	AMAIR_EL12
12	0	0	VBAR_EL12	VBAR_EL1				
13	0	1	CONTEXTIDR_EL12	CONTEXTIDR_EL1				
14	1	0	1	0	CNTKCTL_EL12	CNTKCTL_EL1		
				2	0	CNTP_TVAL_EL02	CNTP_TVAL_EL0	
			2	1	CNTP_CTL_EL02	CNTP_CTL_EL0		
				2	CNTP_CVAL_EL02	CNTP_CVAL_EL0		
3	5	14	3	0	CNTV_TVAL_EL02	CNTV_TVAL_EL0		
				1	CNTV_CTL_EL02	CNTV_CTL_EL0		
				2	CNTV_CVAL_EL02	CNTV_CVAL_EL0		

a. Scalable Vector Extension System register, see *SVE* on page A1-75.

Table D5-45 shows the Special-purpose register aliasing.

Table D5-45 Special-purpose register aliases

Special-purpose register access instruction encoding					Register name	Register accessed
op0	op1	CRn	CRm	op2		
3	5	4	0	0	SPSR_EL12	SPSR_EL1
				1	ELR_EL12	ELR_EL1

D5.7 Nested virtualization

From ARMv8.3, nested virtualization is supported in AArch64 state:

- If [ARMv8.3-NV](#) is implemented, a Host hypervisor executing at EL2 can run a Guest hypervisor at EL1, see [ARMv8.3 nested virtualization functionality](#).
- If [ARMv8.4-NV](#) is implemented, the PE further transforms System register accesses into memory accesses, see [Enhanced support for nested virtualization on page D5-2494](#).

D5.7.1 ARMv8.3 nested virtualization functionality

Note

- When running a Guest hypervisor with [HCR_EL2.E2H](#) == 0, the Host hypervisor must set [HCR_EL2.TVM](#) and [CPTR_EL2.TCPAC](#) to trap any Guest hypervisor accesses to the EL1 System registers that would be accesses from any Guest OS running under the Guest hypervisor
- [ARMv8.3-NV](#) does not introduce any changes to either debug or to the Performance Monitors. ARM assumes that the Host hypervisor will trap accesses to the Breakpoint and Performance Monitors registers to EL2, so that it can process any accesses to these registers made by a Guest hypervisor or by a Guest OS running under the Guest hypervisor.

[ARMv8.3-NV](#) adds the fields [HCR_EL2](#).{NV, NV1, AT}, see:

- [Effect of HCR_EL2.NV, NV1](#).
- [Effect of HCR_EL2.AT on page D5-2494](#).

Effect of [HCR_EL2](#).{NV, NV1}

The following subsections describe the effect of [HCR_EL2](#).{NV, NV1}:

- [Behavior when HCR_EL2.NV==1](#).
- [Additional behavior when HCR_EL2.NV == 1 and HCR_EL2.NV1 == 0 on page D5-2493](#).
- [Additional behaviors when HCR_EL2.NV == 1 and HCR_EL2.NV1 == 1 on page D5-2493](#).
- [Behavior when HCR_EL2.NV == 0 and HCR_EL2.NV1 == 1 on page D5-2493](#).

[HCR_EL2](#).{NV, NV1} are both permitted to be cached in a TLB.

Behavior when [HCR_EL2.NV](#)==1

The following behaviors apply when the value of [HCR_EL2.NV](#) is 1, regardless of the value of [HCR_EL2.NV1](#). At EL1:

- Reads or writes to any allocated and implemented System register or Special-purpose register named *_EL2, *_EL02, or *_EL12 in the MRS or MSR instruction, other than [SP_EL2](#), are trapped to EL2 rather than being UNDEFINED. In this case, [ESR_EL2](#) uses the EC code of 0x18.

Only accesses that are permitted at EL2 are trapped. This means that, for example, if the register is a read-only register at EL2, then an MSR from Non-secure EL1 to the register is not trapped by this mechanism. Instead the register access remains UNDEFINED.

Note

The priority of this trapping relative to other configurable traps follows the standard hierarchy of exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#).

- Reads or writes to [SPSR_irq](#), [SPSR_abt](#), [SPSR_und](#), or [SPSR_fiq](#) using MRS and MSR instructions are trapped to EL2 rather than being UNDEFINED. In this case the exception is reported in [ESR_EL2](#) using the EC code 0x18.

- Reads or writes to `SP_EL1` using the dedicated MRS and MSR instruction for accessing that register are trapped to EL2 rather than being UNDEFINED. In this case the exception is reported in `ESR_EL2` using the EC code `0x18`.
- Execution of the EL2 translation regime Address translation instructions and TLB maintenance instructions are trapped to EL2 rather than being UNDEFINED. In this case the exception is reported in `ESR_EL2` using the EC code `0x18`.
- Execution of the EL1 translation regime Address translation instructions and TLB maintenance instructions that are only accessible from EL2 and above are trapped to EL2 rather than being UNDEFINED. In this case the exception is reported in `ESR_EL2` using the EC code `0x18`.
- The `ERETAA`, `ERETAB`, and `ERET` instructions are trapped to EL2. In this case the exception is reported in `ESR_EL2` using the EC code `0x1A`.

———— **Note** —————

The `ERETAA` and `ERETAB` instructions are only available when `ARMv8.3-PAuth` is implemented.

- A read of `CurrentEL` returns the value `0x2` in bits[3:2].
- If EL3 is not implemented and `HCR_EL2.TSC == 1`, an SMC instruction executed at EL1 is trapped to EL2 rather than being UNDEFINED, and `HCR_EL2.TSC` is not RES0. In this case the exception is reported in `ESR_EL2` using the EC code `0x17`.

Additional behavior when `HCR_EL2.NV == 1` and `HCR_EL2.NV1 == 0`

At EL1, all the behaviors described in *Behavior when `HCR_EL2.NV == 1` on page D5-2492* apply.

In addition, when `HCR_EL2.{NV, NV1} == {1, 0}`, any exception taken from EL1 to EL1 causes `SPSR_EL1.M[3:2]` to be set to `0b10` rather than `0b01`.

Additional behaviors when `HCR_EL2.NV == 1` and `HCR_EL2.NV1 == 1`

At Non-secure EL1, all the behaviors described in *Behavior when `HCR_EL2.NV == 1` on page D5-2492* apply.

In addition, when `HCR_EL2.{NV, NV1} == {1, 1}`:

- Accesses to `VBAR_EL1`, `ELR_EL1`, and `SPSR_EL1` from EL1 are trapped to EL2. In this case the exception is reported in `ESR_EL2` using the EC code `0x18`.
- In the EL1 translation table Block and Page descriptors:
 - Bit[54] holds PXN, not UXN.
 - Bit[53] is RES0.
 - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical permissions are enabled, then in the EL1 translation table Table descriptor:
 - Bit[61] is treated as 0 regardless of the actual value.
 - Bit[60] holds PXNTable, not UXNTable.
 - Bit[59] is RES0.
- When in EL1, `PSTATE.PAN` is treated as 0 for all purposes except reading the value of the bit.
- When executed at EL1, the `LDTR*` behave as the corresponding `LDR*` instructions, and the `STTR*` instructions behave as the equivalent `STR*` instructions.

Behavior when `HCR_EL2.NV == 0` and `HCR_EL2.NV1 == 1`

When `HCR_EL2.{NV, NV1} == {0, 1}`, the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if `HCR_EL2.NV == 1` and `HCR_EL2.NV1 == 1` for all purposes other than reading back the value of the `HCR_EL2.NV` bit.

- Behaving as if `HCR_EL2.NV==0` and `HCR_EL2.NV1==0` for all purposes other than reading back the value of the `HCR_EL2.NV1` bit.
- Behaving as defined for `HCR_EL2.NV==0`, with `HCR_EL2.NV1==1` having the effect of causing accesses to `VBAR_EL1`, `ELR_EL1`, and `SPSR_EL1` from EL1 to be trapped to EL2.

Effect of HCR_EL2.AT

When `ARMv8.3-NV` is implemented, if `HCR_EL2.AT` is 1, then EL1 accesses to `AT S1E0R`, `AT S1E0W`, `AT S1E1R`, `AT S1E1W`, `AT S1E1RP`, and `AT S1E1WP`, are trapped to EL2. In this case the exception is reported in `ESR_EL2` using the EC code `0x18`.

D5.7.2 Enhanced support for nested virtualization

If `ARMv8.4-NV` is implemented, the PE can access the `VNCR_EL2` register and the control bit `HCR_EL2.NV2`.

When `HCR_EL2.NV2` is 1:

- When in EL1, the PE redirects EL2 register accesses to EL1 register accesses, see *Redirection of register accesses from EL2 to EL1*.
- When a Guest hypervisor issues System register access instructions to a Guest OS, the PE transforms the System register access instructions into memory access instructions, see *Loads and stores generated by transforming register accesses*.

When `HCR_EL2.NV2` is 0, the behavior of `HCR_EL2.NV` and `HCR_EL2.NV1` are as described in *ARMv8.3 nested virtualization functionality on page D5-2492*.

Redirection of register accesses from EL2 to EL1

When `HCR_EL2.NV` and `HCR_EL2.NV2` are set to 1, instructions accessing certain Special-purpose EL2 registers executed at EL1 are redefined to access the corresponding EL1 register:

Table D5-46 Redirection of accesses to special-purpose registers at EL2

Special register access instruction ^a	Named EL2 register	Actual register accessed
<code>op1 = 4, CRm=0, op2=0</code>	<code>SPSR_EL2</code>	<code>SPSR_EL1</code>
<code>op1 = 4, CRm=0, op2=1</code>	<code>ELR_EL2</code>	<code>ELR_EL1</code>

a. For further information see *op0==0b11, Moves to and from Special-purpose registers on page C5-348*.

When `HCR_EL2.NV` and `HCR_EL2.NV2` are set to 1, instructions accessing certain System registers executed at EL1 are redefined to access the corresponding EL1 register:

Table D5-47 Redirection of accesses to System registers at EL2

System register access instruction ^a	Named EL2 register	Actual register accessed
<code>op0 = 3, op1=4, CRn=5, CRm=2, op2=0</code>	<code>ESR_EL2</code>	<code>ESR_EL1</code>
<code>op0 = 3, op1=4, CRn=6, CRm=0, op2=0</code>	<code>FAR_EL2</code>	<code>FAR_EL1</code>

a. For further information see *Instructions for accessing non-debug System registers on page D11-2659*.

Loads and stores generated by transforming register accesses

When an MRS or MSR instruction is executed at EL1 and is accessing a register listed in [Table D5-48 on page D5-2495](#), the PE transforms that access into a loads or store, respectively.

When the PE transforms a System register access into a memory accesses, the address of the resulting memory access is defined using a combination of a base address and an offset according to the formula $\text{SignExtend}(\text{VNCR.BADDR} : \text{Offset} \langle 11:0 \rangle, 64)$:

- [VNCR_EL2](#) holds the base memory address used for memory redirection of System register accesses.
- Each register which supports redirection to memory has a unique offset value, see [Table D5-48](#).

Table D5-48 Memory address offsets associated with each transformed register access

Register access		Offset
If $\text{HCR_EL2}\{NV, NV1, NV2\} == \{1, 0, 1\}$	If $\text{HCR_EL2}\{NV, NV1, NV2\} == \{1, 1, 1\}$	
VTTBR_EL2	VTTBR_EL2	0x20
VSTTBR_EL2	VSTTBR_EL2	0x30
VTCR_EL2	VTCR_EL2	0x40
VSTCR_EL2	VSTCR_EL2	0x48

Note

Software should assume that future expansion of the architecture will allocate offset values up to but not including 0x1000.

Registers that affect hypervisor execution by controlling the event stream are not included in [Table D5-48 on page D5-2495](#):

- [CNTHCTL_EL2](#)
- When [HCR_EL2.NV1](#) is 0, [CNTKCTL_EL12](#).
- When [HCR_EL2.NV1](#) is 1, [CNTKCTL_EL1](#).

When a System register access is transformed into a memory access, that memory access has a defined format:

- The address of the memory access is translated by the EL2 translation regime.
- The endianness of the memory access is defined by `SCTLR_EL2.EE`.
- The memory access is 64-bit single-copy atomic aligned to 64 bits.
- The memory access does not have acquire or release semantics.

———— **Note** —————

The value of the transformed System register access is not affected by fields that are defined to be RES0 or RES1 in the associated System register.

- When there is no context synchronizing operation between the read or write of the register and the load or store instruction accessing the address, the PE is permitted, but not required, to reorder the memory accesses with respect to any EL1 reads or writes generated by load or store instructions to the same address.
- The memory accesses behave as if `PSTATE.PAN == 0` regardless of the value of `PSTATE.PAN`.

When a register access instruction targets a register that is not implemented, the PE treats access to that register as UNALLOCATED.

Any attempt to trap a register access instruction is subject to the exception prioritization rules, unless it is trapped by either or both of `HCR_EL2.{NV, NV1}`. When a System register access instruction is trapped by either or both of `HCR_EL2.{NV, NV1}`, then the instruction is transformed into a memory access instruction instead of creating a trap, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*.

Exceptions from transformed register accesses

When `HCR_EL2.{NV2, NV} == {1,1}` any exception taken from EL1 and taken to EL1 causes the `SPSR_EL1.M[3:2]` to be set to `0b10` and not `0b01`.

When the memory access generates a Data Abort, then the resulting fault has a defined format:

- The fault is taken to EL2, using the standard vector offset for exceptions from EL1 to EL2.
- The fault is reported as a Data Abort from the current exception level with the `ESR_EL2.EC` code `0x25`, see *ISS encoding for an exception from a Data Abort on page D12-2792*.
- `FAR_EL2` is updated to hold the faulting address.

When the memory access generates a synchronous External abort, and when External aborts are not configured to be taken to EL3, then the resulting fault has a defined format:

- The fault is taken to EL2 using the standard vector offset for exceptions from EL1 to EL2.
- The fault is reported as a Data Abort from the current Exception level with `ESR_EL2.EC` code `0x25`, see *ISS encoding for an exception from a Data Abort on page D12-2792*.

The VNCR field in `ESR_EL2` and `ESR_EL3` identifies whether the fault came from use of `VNCR_EL2` by EL1, see *ISS encoding for an exception from a Data Abort on page D12-2792*.

Interaction with self-hosted and External debug

When a register access is transformed into a memory access, the PE checks the memory access against the watchpoint registers as an EL2 access.

When the memory access matches an EL2 access in the watchpoint registers, while a watchpoint is linked to a context-aware breakpoint that is programmed to match the value held in `CONTEXTIDR_EL1`, then it is CONSTRAINED UNPREDICTABLE whether there is a watchpoint match.

———— **Note** —————

A breakpoint programmed to match the value held in [CONTEXTIDR_EL1](#) falls under one of four classes of breakpoint:

- [0b0011](#), [Linked Context ID Match breakpoint](#).
- [0b0111](#), [Linked CONTEXTIDR_EL1 Match](#).
- [0b1011](#), [Linked Context ID and VMID Match breakpoint](#).
- [0b1111](#), [Linked Full Context ID Match](#).

If [ARMv8.4-NV](#) is implemented, the hypervisor must use the [0b1101](#), [Linked CONTEXTIDR_EL2 Match breakpoint](#) type to guarantee a linked match.

When there is a watchpoint match, while [EDSCR.HDE](#) is set to 1 and halting is allowed, the watchpoint match generates a Watchpoint debug event.

When there is a watchpoint match, while [EDSCR.HDE](#) is set to 0 and debug exceptions are enabled at EL2, then the watchpoint match generates a Watchpoint exception.

When the watchpoint match generates a Watchpoint exception, the resulting exception has a defined format:

- The exception is taken to EL2.
- The exception is reported as a Watchpoint from the current Exception level with the [ESR_EL2](#).EC code 0x35, see [ISS encoding for an exception from a Watchpoint exception on page D12-2801](#).
- [FAR_EL2](#) is updated to hold the watchpointed address.

The VNCR field in [ESR_EL2](#) identifies whether the Watchpoint exception came from use of [VNCR_EL2](#) by EL1, see [ISS encoding for an exception from a Watchpoint exception on page D12-2801](#).

When in Debug state, or while using performance monitoring, Statistical Profiling, or permission checking, breakpoints, trace, and sampling of operations all treat the read and write of registers as executed at EL1.

When in Debug state, or while using performance monitoring, Statistical Profiling, or permission checking, the MMU and watchpoint unit treat the loads and stores generated by the transformation of reads and writes of registers as an EL2 access.

While using performance monitoring, any MRS or MSR instructions that have been transformed to loads or stores by this mechanism are treated as loads or stores.

When the Statistical Profiling Extension selects the instruction generating the memory access for profiling, [Operation Type packet payload \(Load/store\) on page D9-2639](#) records the operation as a Load/Store operation, with a SUBCLASS value of 0b0000100x, where bit[0] is 0 for a load and 1 for a store

When the Statistical Profiling Extension selects the instruction generating the memory access for profiling while Statistical Profiling is disabled at EL2, the virtual address for the memory access is not recorded.

D5.8 VMSAv8-64 memory aborts

In a VMSAv8-64 implementation, the following mechanisms cause a PE to take an exception on a failed memory access:

Debug exception	An exception caused by the debug configuration, see Chapter D2 AArch64 Self-hosted Debug .
Alignment fault	An Alignment fault is generated if the address used for a memory access does not have the required alignment for the operation. For more information, see Alignment support on page B2-116 .
MMU fault	An MMU fault is a fault generated by the fault checking sequence for the current translation regime. See Types of MMU faults .
External abort	Any memory system fault other than a Debug exception, an Alignment fault, or an MMU fault.

Collectively, these mechanisms are called *aborts*. [Chapter D2 AArch64 Self-hosted Debug](#) and [on page H3-6455](#) describe Debug exceptions, and the remainder of this section describes Alignment faults, MMU faults, and External aborts.

An access that causes an abort is said to be aborted, and uses the *Fault Address Registers* (FARs) and *Exception Syndrome Registers* (ESRs) to record context information.

In AArch64 state MMU faults are synchronous exceptions that are reported as either:

- Data Aborts.
- Instruction Aborts

———— Note —————

Instruction Aborts report any synchronous memory abort on an instruction fetch.

The Exception level that an MMU fault is taken to depends on the translation regime and stage that generated the fault. The fault context saved in the appropriate [ESR_ELx](#), where ELx is the Exception level that the fault is taken to, is dependent on whether:

- The MMU fault is reported as an Instruction or as a Data Abort.
- The exception is taken from the same or a lower Exception level.

For more information, see [Synchronous exception types, routing and priorities on page D1-2190](#).

External aborts can be reported synchronously or asynchronously. Asynchronous External aborts are reported using the SError interrupt. For more information, see [External aborts on page D4-2377](#).

Software stepping, which is a debug feature, and a PC alignment fault exception are the only exceptions that are higher priority than an Instruction Abort. Only watchpoints are at a lower priority than Data Aborts in the exception priority hierarchy. For more information, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#).

The following sections describe the abort mechanisms:

- [Types of MMU faults](#).
- [The MMU fault-checking sequence on page D5-2502](#).
- [AArch64 state prioritization of synchronous aborts from a single stage of address translation on page D5-2506](#).
- [Pseudocode description of the MMU faults on page D5-2508](#).

D5.8.1 Types of MMU faults

This section describes the faults that might be detected during one of the fault-checking sequences described in [The MMU fault-checking sequence on page D5-2502](#). The following list includes all the types of exceptions that can occur:

- Alignment fault on a data access, see [Alignment support on page B2-116](#).

- [Permission fault](#).
- [Translation fault](#).
- [Address size fault](#).
- Synchronous [External abort on a translation table walk](#).
- [Access flag fault](#).
- [TLB conflict abort](#).

When an MMU fault generates an abort for a region of memory, no memory access is made if that region is or could be marked as Device.

The following subsections describe the MMU faults that are not described elsewhere this Manual.

Permission fault

A Permission fault can be generated at any level of lookup, and the reported fault code identifies the lookup level. See [About access permissions on page D5-2456](#) for information about conditions that cause a Permission fault.

A TLB might hold a translation table entry that causes a Permission fault. Therefore, if the handling of a Permission fault results in an update to the associated translation tables, the software that updates the translation tables must invalidate the appropriate TLB entry, to prevent the stale information in the TLB being used on a subsequent memory access.

This maintenance requirement applies to Permission faults in both stage 1 and stage 2 translations.

Cache maintenance instructions cannot generate Permission faults, except that:

- A stage 1 translation table walk performed as part of a cache maintenance instruction can generate a stage 2 Permission fault as described in [Stage 2 fault on a stage 1 translation table walk](#).
- When the value of `SCTLR_EL1.UCI` is 1, enabling EL0 execution of the `DC CVAU`, `DC CVAC`, `DC CVAP`, `DC CIVAC`, and `IC IVAU` instructions:
 - Executing a `DC CVAU`, `DC CVAC`, `DC CVAP`, or `DC CIVAC` instruction at EL0 to a location that does not have read permission at EL0 generates a Permission fault, subject to the constraints described in this section.
 - It is IMPLEMENTATION DEFINED whether executing an `IC IVAU` instruction at EL0 to a location that does not have read permission at EL0 generates a Permission fault.
- A `DC IVAC` instruction requires write permission to the address it invalidates, otherwise it generates a Permission fault, subject to the constraints described in this section.

Note

- Execution of the `DCIMVAC` instruction in AArch32 state does not have this write permission requirement.
- When EL1&0 stage 2 address translation is enabled, a `DC IVAC` instruction executed in Non-secure state performs a cache clean and invalidate, meaning it performs the same invalidation as a `DC CIVAC` instruction, as described in [Effects of virtualization and Security state on the cache maintenance instructions on page D4-2369](#).

In all cases where the execution of a cache maintenance instruction might generate a Permission fault:

- If the Point of Coherency is before any level of cache, it is IMPLEMENTATION DEFINED whether a cache maintenance by VA to the Point of Coherency instruction can generate a Permission fault.
- If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether a data or unified cache clean by VA to the Point of Unification instruction can generate a Permission fault.

The Data Cache Zero instruction, `DC ZVA`, operates as set of stores to each byte within the block being accessed, and therefore it generates a Permission fault if the translation system does not permit writes to these locations.

Translation fault

A Translation fault can be generated at any level of lookup, and the reported fault code identifies the lookup level. A Translation fault is generated if bits[1:0] of a translation table descriptor identify the descriptor as either a Fault encoding or a reserved encoding. For more information, see *VMSAv8-64 translation table format descriptors* on page D5-2444.

In addition, a Translation fault is generated if the input address for a translation either does not map onto an address range of a `TTBR_ELx`, or the `TTBR_ELx` range that it maps onto is disabled. In these cases, the fault is reported as a level 0 Translation fault on the translation stage at which the mapping to a region described by a `TTBR_ELx` failed.

A data or unified cache maintenance by `VA` instruction can generate a Translation fault, except that:

- If the Point of Coherency is before any level of cache, it is IMPLEMENTATION DEFINED whether a data or unified cache maintenance by `VA` instruction can generate a Translation fault.
- If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether a data or unified cache clean by `VA` to the Point of Unification instruction can generate a Translation fault.

It is IMPLEMENTATION DEFINED whether an instruction cache invalidate by `VA` operation can generate a Translation fault.

The architecture guarantees that any translation table entry that causes a Translation fault is not cached, meaning the TLB never holds such an entry. Therefore, when a Translation fault occurs, the fault handler does not have to perform any TLB maintenance instructions to remove the faulting entry.

Address size fault

An Address size fault can be generated at any level of lookup.

An Address size fault is generated if one of the following has nonzero address bits above the output address size, for the current stage of translation:

- The `TTBR_ELx` used for the translation.
- A translation table entry.
- The output address of the translation.

For an Address size fault generated because the `TTBR_ELx` used for the translation has nonzero address bits above the output address size, the reported fault code indicates a fault at level 0. Otherwise, the reported fault code indicates the lookup level at which the fault occurred.

A data or unified cache maintenance by `VA` instruction can generate an Address size fault, except that:

- If the Point of Coherency is before any level of cache, it is IMPLEMENTATION DEFINED whether a data or unified cache maintenance by `VA` instruction can generate an Address size fault.
- If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether a data or unified cache clean by `VA` to the Point of Unification instruction can generate an Address size fault.

It is IMPLEMENTATION DEFINED whether an instruction cache invalidate by `VA` operation can generate an Address size fault.

The architecture guarantees that any translation table entry that causes an Address size fault is not cached, meaning the TLB never holds such an entry. Therefore, when an Address size fault occurs, the fault handler does not have to perform any TLB maintenance instructions to remove the faulting entry.

For more information on Address size faults, see *Output address size* on page D5-2400.

External abort on a translation table walk

An External abort on a translation table walk can be either synchronous or asynchronous. An External abort on a translation table walk is reported:

- If the external abort is synchronous, using:
 - A synchronous Instruction Abort exception if the translation table walk is for an instruction fetch.
 - A synchronous Data Abort exception if the translation table walk is for a data access.
- If the External abort is asynchronous, using the SError interrupt exception.

Behavior of External aborts on a translation table walk caused by address translation instructions

The address translation instructions summarized in [Address translation instructions on page C5-344](#) require translation table walks. An External abort can occur in the translation table walk. This is reported as follows:

- If the External abort is synchronous, using a synchronous Data Abort exception.
- If the External abort is asynchronous, using the SError interrupt exception.

For more information, see [Synchronous faults generated by address translation instructions on page D5-2441](#).

Access flag fault

An Access flag fault can be generated at any level of lookup, and the reported fault code identifies the lookup level. An Access flag fault is generated only if a translation table descriptor with the Access flag bit set to 0 is used.

For more information about the Access flag bit, see [VMSAv8-64 translation table format descriptors on page D5-2444](#).

The architecture guarantees that any translation table entry that causes an Access flag fault is not cached, meaning the TLB never holds such an entry. Therefore, when an Access flag fault occurs, the fault handler does not have to execute any TLB maintenance instructions to remove the faulting entry.

Whether any cache maintenance by VA instructions can generate Access flag faults is IMPLEMENTATION DEFINED.

For more information, see [The Access flag on page D5-2466](#).

D5.8.2 The MMU fault-checking sequence

This section describes the MMU checks made for the memory accesses required for instruction fetches and for explicit memory accesses:

- If an instruction fetch faults, it generates an Instruction Abort.
- If a data memory access faults, it generates a Data Abort.

MMU fault checking is performed for each stage of address translation.

The fault-checking sequence shows a translation from an Input address to an Output address. For more information about this terminology, see [About address translation and supported input address ranges on page D5-2395](#).

———— **Note** —————

The descriptions in this section do not include the possibility that the attempted address translation generates a TLB conflict abort, as described in [TLB conflict aborts on page D5-2513](#).

[Types of MMU faults on page D5-2499](#) describes the faults that an MMU fault-checking sequence can report.

[Figure D5-18 on page D5-2503](#) shows the process of fetching a descriptor from the translation table. For the top-level fetch for any translation, the descriptor is fetched only if the input address passes any required alignment check. As the figure shows, if the translation is stage 1 of the Secure or Non-secure EL1&0 translation regime, when EL2 is enabled, then the descriptor address is in the IPA address space, and is subject to a stage 2 translation to obtain the required PA. This stage 2 translation requires a recursive entry to the fault checking sequence.

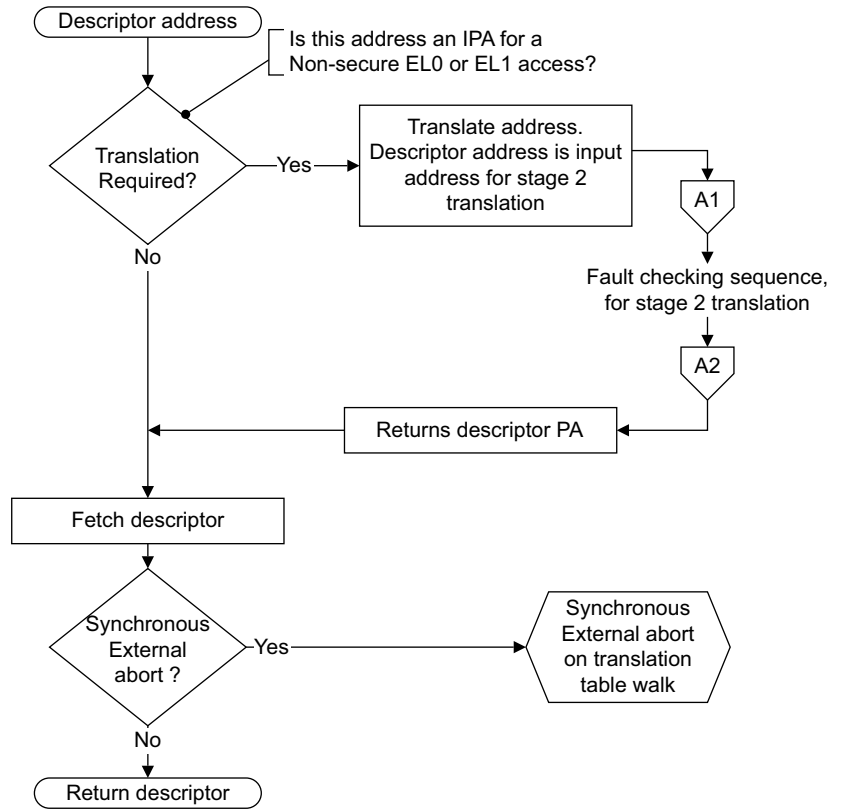

Figure D5-18 Fetching the descriptor in a VMSAv8-64 translation table walk

Figure D5-19 on page D5-2504 shows the full VMSA fault checking sequence, including the alignment check on the initial access.

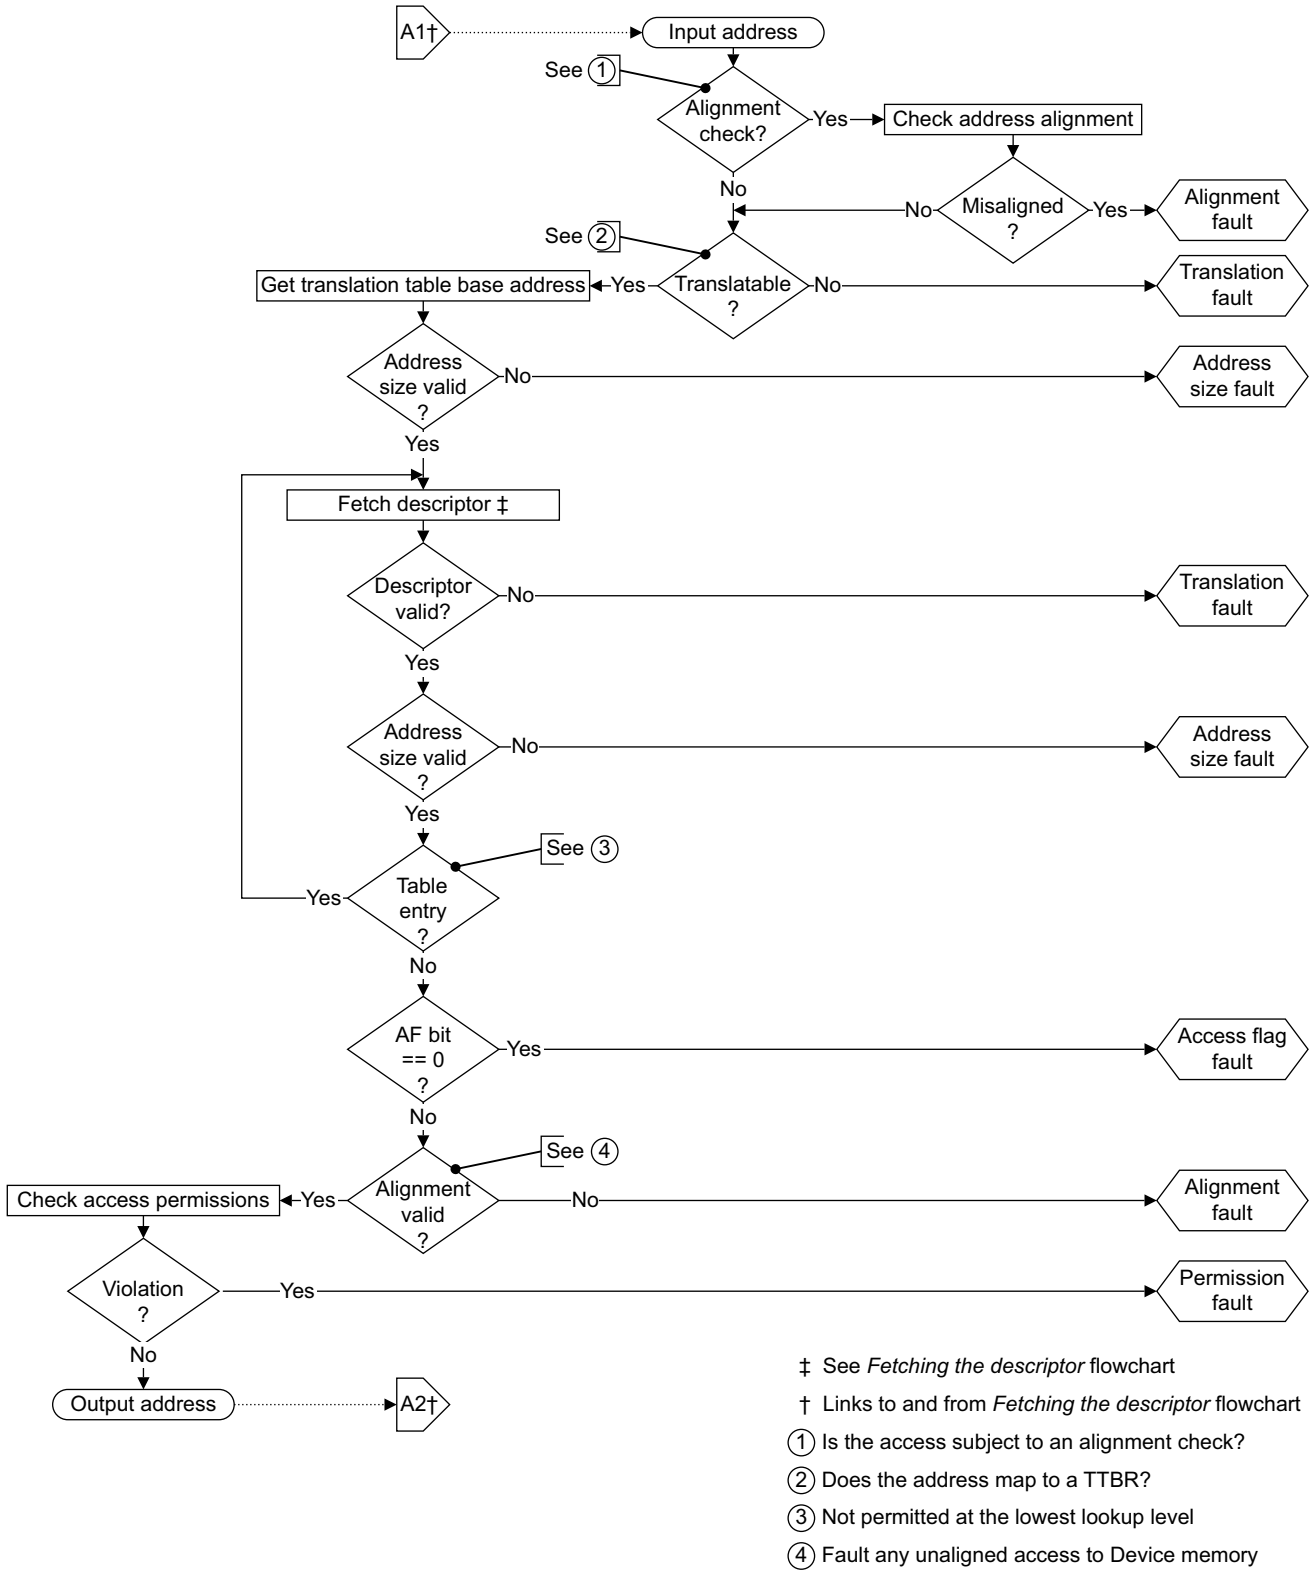

Figure D5-19 VMSAv8-64 fault checking sequence

Stage 2 fault on a stage 1 translation table walk

On performing a translation table walk for the stage 1 translations, the descriptor addresses must be translated from IPA to PA, using a stage 2 translation. This means that a memory access made as part of a stage 1 translation table lookup might generate, on a stage 2 translation:

- A Translation fault, Access flag fault, or Permission fault.
- A synchronous External abort on the memory access.

If SCR_EL3.EA is set to 1, a synchronous External abort is taken to EL3. Otherwise, these faults are reported as stage 2 memory aborts. ESR_EL2.ISS[7] is set to 1, to indicate a stage 2 fault during a stage 1 translation table walk, and the part of the ISS field that might contain details of the instruction is invalid. For more information see *Use of the ESR_EL1, ESR_EL2, and ESR_EL3 on page D1-2172*.

Alternatively, a memory access made as part of a stage 1 translation table lookup might target an area of memory with the Device attribute assigned on the stage 2 translation of the address accessed. When the HCR_EL2.PTW bit is set to 1, such an access generates a stage 2 Permission fault.

———— Note ————

On most systems, such a mapping to Device memory on the stage 2 translation is likely to indicate a Guest OS error, where the stage 1 translation table is corrupted. Therefore, it is appropriate to trap this access to the hypervisor.

A TLB might hold entries that depend on the effect of HCR_EL2.PTW. Therefore, if HCR_EL2.PTW is changed without changing the current VMID, the TLBs must be invalidated before executing in EL1 or EL0 state. For more information, see *Changing HCR_EL2.PTW on page D5-2532*.

A cache maintenance instruction executed at EL1 or EL0 can cause a stage 1 translation table walk that might generate a stage 2 Permission fault as described in this section. However:

- If the Point of Coherency is before any level of cache, it is IMPLEMENTATION DEFINED whether a cache maintenance by VA instruction can generate a Permission fault in this way.
- If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether a data or unified cache clean by VA to the Point of Unification instruction can generate a Permission fault in this way.
- It is IMPLEMENTATION DEFINED whether an instruction cache invalidation by VA instruction can generate a Permission fault in this way.

———— Note ————

This is an exception to the general rule that a cache maintenance instruction cannot generate a Permission fault.

The level associated with MMU faults

For MMU faults, [Table D5-49](#) shows how the LL bits in the ESR_ELx.STATUS fields encode the lookup level associated with the fault.

Table D5-49 Use of LL bits to encode the lookup level at which the fault occurred

LL bits	Meaning
00	Level 0 of translation or translation table base register.
01	Level 1.
10	Level 2.
11	Level 3. When xFSR.STATUS indicates a Domain fault, this value is reserved.

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a level 0 fault.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

Also see [Synchronous External aborts from address translation caching structures](#) on page D5-2508

D5.8.3 AArch64 state prioritization of synchronous aborts from a single stage of address translation

[Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191 describes the prioritization of exceptions taken to an Exception level that is using AArch64. This section gives additional information about the prioritization of MMU faults from VMSAv8-64 translation regimes.

———— **Note** —————

The priority numbering in this list only shows the relative priorities of aborts from a single stage of address translation in a VMSAv8-64 translation regime. This numbering has no global significance and, for example, does not correlate with the equivalent AArch32 list in [AArch32 state prioritization of synchronous aborts from a single stage of address translation](#) on page G5-5555.

For a single stage of translation in a VMSAv8-64 translation regime, the following numbered list shows the priority of the possible memory management faults on a memory access. In this list:

- For memory accesses that undergo two stages of translation, the *italic entries show where the faults from the stage 2 translation can occur*. A stage 2 fault within a stage 1 translation table walk follows the same prioritization of faults:
- For synchronous External aborts from translation table walks, see also [Synchronous External aborts from address translation caching structures](#) on page D5-2508.

The prioritization between the stage 2 permission failure on the stage 1 translation table walk and the stage 1 abort generated by the stage 1 translation table entry is IMPLEMENTATION DEFINED if all the following are true:

- Stage 1 hardware updating of either access or dirty information is enabled.
- A stage 1 translation table entry results in the stage 1 translation table entry having the access or dirty bit updated.
- The stage 1 translation table entry has stage 2 read permission but not stage 2 write permission.
- The stage 1 translation entry generates an abort (which might be one of an address size fault, an alignment fault caused by memory type or a permission fault).

The priority order, from highest priority to lowest priority, is:

1. Alignment fault not caused by memory type. This is possible for a stage 1 translation only.
2. Translation fault due to the input address being out of the address range to be translated or requiring a `TTBR_ELx` that is disabled. This includes `VTCCR_EL2.SL0` being inconsistent with `VTCCR_EL2.T0SZ`, `VSTCCR_EL2.SL0` being inconsistent with `VSTCCR_EL2.T0SZ`, or `SL0` programmed to a reserved value.
3. Address size fault on a `TTBR_ELx` caused by either:
 - The check on `TCR_EL1.IPS`, `TCR_EL2.PS`, `TCR_EL3.PS`, or `VTCCR_EL2.PS`.
 - The `PA` being out of the range implemented.

4. *Second stage abort on a level 0 memory access of a stage 1 table walk. When stage 2 address translation is enabled this includes an Address size fault caused by the PA being out of the range implemented. This is second stage abort during a first stage translation table walk.*
5. Synchronous parity or ECC error on a level 0 lookup of a translation table walk.
6. Synchronous External abort on a level 0 lookup level of a translation table walk.
7. Translation fault on a level 0 translation table entry.
8. Address size fault a level 0 lookup translation table entry caused by either:
 - The check on [TCR_EL1.IPS](#), [TCR_EL2.PS](#), [TCR_EL3.PS](#), or [VTCR_EL2.PS](#).
 - The output address being out of the range implemented.
9. *Second stage abort on a level 1 memory access of a stage 1 table walk. When stage 2 address translation is enabled this includes an Address size fault caused by the PA being out of the range implemented. This is second stage abort during a first stage translation table walk.*
10. Synchronous parity or ECC error on a level 1 lookup of a translation table walk.
11. Synchronous External abort on a level 1 lookup level of a translation table walk.
12. Translation fault on a level 1 translation table entry.
13. Address size fault on a level 1 lookup translation table entry caused by either:
 - The check on [TCR_EL1.IPS](#), [TCR_EL2.PS](#), [TCR_EL3.PS](#), or [VTCR_EL2.PS](#).
 - The output address being out of the range implemented.
14. *Second stage abort on a level 2 memory access of a stage 1 table walk. When stage 2 address translation is enabled this includes an Address size fault caused by the PA being out of the range implemented. This is second stage abort during a first stage translation table walk.*
15. Synchronous parity or ECC error on a level 2 lookup of a translation table walk.
16. Synchronous External abort on a level 2 lookup level of a translation table walk.
17. Translation fault on a level 2 translation table entry.
18. Address size fault on a level 2 lookup translation table entry caused by either:
 - The check on [TCR_EL1.IPS](#), [TCR_EL2.PS](#), [TCR_EL3.PS](#), or [VTCR_EL2.PS](#).
 - The output address being out of the range implemented.
19. *Second stage abort on a level 3 memory access of a stage 1 table walk. When stage 2 address translation is enabled this includes an Address size fault caused by the PA being out of the range implemented. This is second stage abort during a first stage translation table walk.*
20. Synchronous parity or ECC error on a level 3 lookup of a translation table walk.
21. Synchronous External abort on a level 3 lookup level of a translation table walk.
22. Translation fault on a level 3 translation table entry.
23. Address size fault on a level 3 lookup translation table entry caused by either:
 - The check on [TCR_EL1.IPS](#), [TCR_EL2.PS](#), [TCR_EL3.PS](#), or [VTCR_EL2.PS](#).
 - The output address being out of the range implemented.
24. Access Flag fault.
25. Alignment fault caused by the memory type.
26. Permission fault.
27. *A fault from the stage 2 translation of the memory access. When stage 2 address translation is enabled this includes an Address size fault caused by the PA being out of the range implemented.*

28. Synchronous parity or ECC error on the memory access.
29. Synchronous External abort on the memory access.

———— **Note** ————

- The prioritization of TLB Conflict aborts is IMPLEMENTATION DEFINED, as the exact cause of these aborts depends on the form of TLBs implemented. However, the TLB conflict abort must have higher priority than any abort that depends on a value held in the TLB.
- The prioritization of IMPLEMENTATION DEFINED MMU faults for a Load-Exclusive or Store-Exclusive to an unsupported memory type is IMPLEMENTATION DEFINED.

Synchronous External aborts from address translation caching structures

A caching structure used for caching translation table walks might support:

- An arbitrary number of levels of translation table lookup.
- One or more stages of translation, that might not correspond to the stages of an address translation lookup.

This might mean that, on a synchronous External aborts arising from the caching structure, including parity or ECC errors, the PE cannot precisely determine one or both of the translation stage and level of lookup at which the error occurred. In this case:

- If the PE cannot determine precisely the translation stage at which the error occurred, it is reported and prioritized as a stage 1 error.
- If the PE cannot determine precisely the lookup level at which the error occurred, the level is reported and prioritized as either:
 - The lowest-numbered level that could have given rise to the error.
 - Level 0 if the PE cannot determine any information about the level.

D5.8.4 Pseudocode description of the MMU faults

The following functions generate fault records that describe MMU faults:

- `AArch64.AccessFlagFault()`.
- `AArch64.AddressSizeFault()`.
- `AArch64.PermissionFault()`.
- `AArch64.TranslationFault()`.

Abort exceptions on page D4-2382 describes how fault records are used.

D5.9 Translation Lookaside Buffers (TLBs)

Translation Lookaside Buffers (TLBs) reduce the average cost of a memory access by caching the results of translation table walks. TLBs behave as caches of the translation table information, and the VMSA provides TLB maintenance instructions for the management of TLB contents.

———— **Note** —————

The ARM architecture permits TLBs to hold any translation table entry that does not directly cause a Translation fault, an Address size fault, or an Access flag fault.

The following sections describe the architectural requirements for Translation Lookaside Buffers (TLBs) and their maintenance:

- [Use of ASIDs and VMIDs to reduce TLB maintenance requirements.](#)
- [About ARMv8 Translation Lookaside Buffers \(TLBs\) on page D5-2511.](#)
- [TLB maintenance requirements and the TLB maintenance instructions on page D5-2515.](#)

In these descriptions, TLB entries for a translation regime for a particular Exception level are *out of context* when executing at a higher Exception level.

———— **Note** —————

In addition to the functions described in this section, the TLB might cache information from control registers that are described as being “permitted to be cached in a TLB”, even when any or all of the stages of translation are disabled. This caching of information gives rise to the maintenance requirements described in [General TLB maintenance requirements on page D5-2515](#).

D5.9.1 Use of ASIDs and VMIDs to reduce TLB maintenance requirements

To reduce the need for TLB maintenance on context switches, the lookups from some translation regimes can be associated with an ASID, or with an ASID and a VMID, as follows:

ASID For stage 1 of a translation regime that can support two VA ranges the VMSA can distinguish between *Global pages* and *Process-specific pages*. The *Address Space Identifier (ASID)* identifies pages associated with a specific process and provides a mechanism for changing process-specific tables without having to maintain the TLB structures.

For these stage 1 translations, each of [TTBR0_ELx](#) and [TTBR1_ELx](#) has a valid ASID field, and [TCR_ELx.A1](#) determines which of these holds the current ASID.

———— **Note** —————

The selected ASID applies regardless of which set of translation tables are used. For example, when the value of [TCR_ELx.A1](#) is 0, any translation table lookup using this stage of translation is associated with the ASID from [TTBR0_ELx.ASID](#), regardless of whether the translation lookup uses [TTBR0_ELx](#) or [TTBR1_ELx](#).

See also [ASID size on page D5-2510](#) and [Global and process-specific translation table entries on page D5-2512](#).

For a symmetric multiprocessor cluster where a single operating system is running on the set of processing elements, the ARM architecture requires all ASID values to be assigned uniquely within any single Inner Shareable domain. In other words, each ASID value must have the same meaning to all processing elements in the system.

VMID For the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, the *virtual machine identifier (VMID)* identifies the current virtual machine, with its own independent [ASID](#) space. The TLB entries include this VMID information, meaning TLBs do not require explicit invalidation when changing from one virtual machine to another if the virtual machines have different VMIDs. [VTTBR_EL2.VMID](#) holds the current VMID.

Common not private translations

In an implementation that includes [ARMv8.2-TTCNP](#), multiple PEs in the same Inner Shareable domain can use the same translation table entries for a given stage of translation in a particular translation regime. This sharing is enabled by the [TTBR_ELx.CnP](#) field for the stage of address translation.

When the value of a [TTBR_ELx.CnP](#) field is 1, translation table entries pointed to by that [TTBR_ELx](#) are shared with all other PEs in the Inner Shareable domain for which for which the following conditions are met:

- The corresponding [TTBR_ELx.CnP](#) field has the value 1.
- That [TTBR_ELx](#) relates to the same translation regime.

————— Note —————

- For [TTBR0_EL1](#) the current Security state determines whether the register relates to the Secure EL1&0, when EL2 is disabled, translation regime, or to the Non-secure EL1&0, when EL2 is enabled, translation regime.
- For [TTBR0_EL2](#) the value of [HCR_EL2.E2H](#) determines whether the register relates to the EL2 translation regime, or to the EL2&0 translation regime.

- If an ASID applies to the stage of translation corresponding to that [TTBR_ELx](#) then the current ASID value must be the same for all of the PEs that are sharing entries for any translation table entry that is not global or leaf level.
- If a VMID applies to the stage of translation corresponding to that [TTBR_ELx](#) then the current VMID value must be the same for all of the PEs that are sharing entries.

Where a TLB combines information from stage 1 and stage 2 translation table entries into a single entry, this entry can be shared between different PEs only if the value of the [TTBR_ELx.CnP](#) bit is 1 for both stage 1 and stage 2 of the translation table walk.

The [TTBR_ELx.CnP](#) bit can be cached in a TLB.

For a given [TTBR_ELx](#), if the value of [TTBR_ELx.CnP](#) is 1 on multiple PEs in the same Inner Shareable domain, and those PEs meet the other conditions for sharing translation table entries as defined in this section, but those [TTBR_ELxs](#) do not point to the same translation table entries, then the system is misconfigured, and performing an address translation using that [TTBR_ELx](#):

- Might generate multiple hits in the TLB, and as a result generate an exception that is reported using the TLB conflict fault code, see [TLB conflict aborts on page D5-2513](#).
- Otherwise, has a **CONSTRAINED UNPREDICTABLE** result, as described in [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218](#).

ASID size

In VMSAv8-64, the [ASID](#) size is an IMPLEMENTATION DEFINED choice of 8 bits or 16 bits, and [ID_AA64MMFR0_EL1.ASIDBits](#) identifies the supported size.

When an implementation supports a 16-bit [ASID](#), [TCR_ELx.AS](#) selects whether the top 8 bits of the [ASID](#) are used.

When the value of [TCR_ELx.AS](#) is 0, [ASID\[15:8\]](#):

- Are ignored by hardware for every purpose other than direct reads of [TTBR0_ELx.ASID](#) and [TTBR1_ELx.ASID](#).
- Are treated as if they are all zeros when used for allocating and matching entries in the TLB.

Note

VMSAv8-32 uses an 8-bit [ASID](#). For backwards compatibility, when executing using translations controlled from an Exception level that is using AArch32, the [ASID](#) size remains at 8 bits. If the implementation supports 16-bit [ASIDs](#), the 8-bit [ASID](#) used is zero-extended to 16 bits.

VMID size

From ARMv8.1, the [VMID](#) size is an IMPLEMENTATION DEFINED choice of 8 bits or 16 bits, and [ID_AA64MMFR1_EL1.VMIDBits](#) identifies the supported size.

When [ARMv8.1-VMID16](#) is implemented, [VTTBR_EL2\[63:48\]](#) contains the 16-bit [VMID](#).

When an implementation supports a 16-bit [VMID](#), [VTCR_EL2.VS](#) selects whether the top 8 bits of the [VMID](#) are used.

When the value of [VTCR_EL2.VS](#) is 0, [VMID\[63:56\]](#):

- Are ignored by hardware for every purpose other than reads of [ID_AA64MMFR1_EL1](#).
- Are treated as if they are all zeros when used for allocating and matching entries in the TLB.

[ARMv8.1-VMID16](#) is only supported when EL2 is using AArch64.

D5.9.2 About ARMv8 Translation Lookaside Buffers (TLBs)

Translation Lookaside Buffers (TLBs) are an implementation technique that caches translations or translation table entries. TLBs avoid the requirement for every memory access to perform a translation table walk in memory. The ARM architecture does not specify the exact form of the TLB structures for any design. In a similar way to the requirements for caches, the architecture only defines certain principles for TLBs:

- The architecture has a concept of an entry locked down in the TLB. The method by which lockdown is achieved is IMPLEMENTATION DEFINED, and an implementation might not support lockdown.
- The architecture does not guarantee that an unlocked TLB entry remains in the TLB.
- The architecture guarantees that a locked TLB entry remains in the TLB. However, a locked TLB entry might be updated by subsequent updates to the translation tables. Therefore, when a change is made to the translation tables, the architecture does not guarantee that a locked TLB entry remains incoherent with an entry in the translation table.
- The architecture guarantees that a translation table entry that generates a Translation fault, an Address size fault, or an Access flag fault is not held in the TLB. However a translation table entry that generates a Permission fault might be held in the TLB.
- When address translation is enabled, any translation table entry that does not generate a Translation fault, an Address size fault, or an Access flag fault and is not from a translation regime for an Exception level that is lower than the current Exception level can be allocated to a TLB at any time. The only translation table entries guaranteed not to be held in a TLB are those that generate a Translation fault, an Address size fault, or an Access flag fault.

Note

A TLB can hold a translation table entry that does not itself generate a Translation fault but that points to a subsequent table in the translation table walk. This is referred to as *intermediate caching* of TLB entries.

- Software can rely on the fact that between disabling and re-enabling a stage of address translation, entries in the TLB relating to that stage of translation have not have been corrupted to give incorrect translations.

The following sections give more information about TLB implementation:

- [Global and process-specific translation table entries on page D5-2512](#).
- [TLB matching on page D5-2512](#).
- [TLB behavior at reset on page D5-2513](#).

- [TLB lockdown on page D5-2513](#).
- [TLB conflict aborts on page D5-2513](#).

See also [TLB maintenance requirements and the TLB maintenance instructions on page D5-2515](#).

Global and process-specific translation table entries

In a VMSA implementation, system software can divide the virtual memory map used by a stage of translation that can support two VA ranges into global and non-global regions, indicated by the nG bit in the translation table descriptors:

- nG == 0** The translation is global, meaning the region is available for all processes.
- nG == 1** The translation is non-global, or process-specific, meaning it relates to the current [ASID](#), as defined by:
- [TTBR0_ELx.ASID](#), if the value of [TCR_ELx.A1](#) is 0.
 - [TTBR1_ELx.ASID](#), if the value of [TCR_ELx.A1](#) is 1.

As indicated by the nG field definitions, each non-global region has an associated [ASID](#). These identifiers mean different translation table mappings can co-exist in a caching structure such as a TLB. This means that software can create a new mapping of a non-global memory region without removing previous mappings.

———— Note ————

- The selected [ASID](#) applies to the translation of any address for which the value of the nG bit is 1, regardless of whether the address is translated based on [TTBR0_ELx](#) or on [TTBR1_ELx](#).
- In an implementation that does not include [ARMv8.1-VHE](#), the only stage of translation that can support two VA ranges is stage 1 of the EL1&0 translation regime. In an implementation that includes [ARMv8.1-VHE](#) stage 1 of the EL2&0 translation regime also can support two VA ranges.

[ASIDs](#) are supported only when stage 1 translations can support two VA ranges. Stage 2 translations, and stage 1 translations that can support only a single VA range do not support [ASIDs](#), and all descriptors in these regimes are treated as global.

In a translation regime that supports global and non-global translations, translation table entries from lookup levels other than the final level of lookup are treated as being non-global, regardless of the value of the nG bit.

When a PE is using the VMSAv8-64 translation table format, and is in Secure state, a translation must be treated as non-global, regardless of the value of the nG bit, if NSTable is set to 1 at any level of the translation table walk.

For more information, see [Control of Secure or Non-secure memory access on page D5-2455](#).

TLB matching

A TLB is a hardware caching structure for translation table information. Like other hardware caching structures, it is mostly invisible to software. However, there are some situations where it can become visible. These are associated with coherency problems caused by an update to the translation table that has not been reflected in the TLB. Use of the TLB maintenance instructions described in [TLB maintenance requirements and the TLB maintenance instructions on page D5-2515](#) can prevent any TLB incoherency becoming a problem.

A particular case where the presence of the TLB can become visible is if the translation table entries that are in use under a particular [ASID](#) and [VMID](#) are changed without suitable invalidation of the TLB. This can occur only if the architecturally-required break-before-make sequence described in [Using break-before-make when updating translation table entries on page D5-2516](#) is not used. If the break-before make sequence is not used, the TLB can hold two mappings for the same address, and this:

- Might generate an exception that is reported using the TLB conflict fault code, see [TLB conflict aborts on page D5-2513](#).

- Might lead to CONSTRAINED UNPREDICTABLE behavior. In this case, behavior will be consistent with one of the mappings held in the TLB, or with some amalgamation of the values held in the TLB, but cannot give access to regions of memory with permissions or attributes that could not be assigned by valid translation table entries in the translation regime being used for the access. For more information, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218](#).

TLB behavior at reset

The ARM architecture does not require a reset to invalidate the TLBs. The architecture recognizes that an implementation might require caches, including TLBs, to maintain their contents over a system reset. Possible reasons for doing so include power management and debug requirements.

Therefore, for ARMv8:

- All TLBs reset to an IMPLEMENTATION DEFINED state that might be UNKNOWN.
- All TLBs are disabled from reset. All stages of address translation are disabled from reset, and the contents of the TLBs have no effect on address translation. For more information, see [Controlling address translation stages on page D5-2397](#).
- An implementation can require the use of a specific TLB invalidation routine, to invalidate the TLB arrays before they are enabled after a reset. The exact form of this routine is IMPLEMENTATION DEFINED, but if an invalidation routine is required it must be documented clearly as part of the documentation of the device.
ARM recommends that if an invalidation routine is required for this purpose, the routine is based on the TLB maintenance instructions described in [TLB maintenance instructions on page D5-2518](#).

Similar rules apply to cache behavior, see [Behavior of caches at reset on page D4-2359](#).

TLB lockdown

The ARM architecture recognizes that any TLB lockdown scheme is heavily dependent on the microarchitecture, making it inappropriate to define a common mechanism across all implementations. This means that:

- VMSAv8-64 does not require TLB lockdown support.
- If TLB lockdown support is implemented, the lockdown mechanism is IMPLEMENTATION DEFINED. However, key properties of the interaction of lockdown with the architecture must be documented as part of the implementation documentation.

This means that a region of the System instruction encoding space is reserved for IMPLEMENTATION DEFINED functions, see [Reserved encodings for IMPLEMENTATION DEFINED registers on page D11-2671](#). An implementation might use some of these encodings to implement TLB lockdown functions. These functions might include:

- Unlock all locked TLB entries.
- Preload into a specific level of TLB. This is beyond the scope of the PLI and PLD hint instructions.

In an implementation that includes EL2, exceptions generated as a result of TLB lockdown when executing in EL1 or EL0 state can be routed to either:

- EL1, as a Data Abort exception.
- EL2, as a Hyp Trap exception.

For more information, see [Traps to EL2 of EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page D1-2225](#).

TLB conflict aborts

If an address matches multiple entries in the TLB, it is IMPLEMENTATION DEFINED whether a TLB conflict abort is generated.

Note

An address can hit multiple entries in the TLB if the TLB has been invalidated inappropriately, for example if TLB invalidation required by the architecture has not been performed.

An implementation can generate TLB conflict aborts on either or both instruction fetches and data accesses. A TLB conflict abort:

- On an instruction fetch is reported as an Instruction Abort, see *ISS encoding for an exception from an Instruction Abort on page D12-2790*.
- On a data access is reported as a Data Abort, see *ISS encoding for an exception from a Data Abort on page D12-2792*.

ARMv8 defines the Fault status encoding of 0b110000 for TLB conflict aborts. On a TLB conflict abort, the returned syndrome includes the address that generated the fault. That is, it includes the address that was being looked up in the TLB.

It is IMPLEMENTATION DEFINED whether a TLB conflict abort is a stage 1 abort or a stage 2 abort.

Note

A stage 2 abort cannot be generated if stage 2 of the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime is disabled.

The priority of the TLB conflict abort is IMPLEMENTATION DEFINED, because it depends on the form of a TLB that can generate the abort. However, the TLB conflict abort must have higher priority than any abort that depends on a value held in the TLB.

If an address matches multiple entries in the TLB and no TLB conflict abort is generated, the resulting behavior is CONSTRAINED UNPREDICTABLE, see *CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218*. The CONSTRAINED UNPREDICTABLE behavior must not permit access to regions of memory with permissions or attributes that mean they cannot be accessed in the current Security state at the current Exception level.

D5.10 TLB maintenance requirements and the TLB maintenance instructions

Translation Lookaside Buffers (TLBs) are an implementation mechanism that caches translations or translation table entries. The ARM architecture does not specify the form of any TLB structures, but defines the mechanisms by which TLBs can be maintained. The following sections describe the VMSA TLB maintenance instructions:

- [General TLB maintenance requirements](#).
- [TLB maintenance instructions on page D5-2518](#).

See also:

- [Maintenance requirements on changing System register values on page D5-2531](#).
- [Atomicity of register changes on changing virtual machine on page D5-2405](#).

D5.10.1 General TLB maintenance requirements

TLB maintenance instructions provide a mechanism for invalidating entries from TLB caching structures to ensure that changes to the translation tables are reflected correctly in those TLB caching structures.

The architecture permits the caching of any translation table entry that has been returned from memory without a fault, provided that the entry does not, itself, cause a Translation fault, an Address size fault, or an Access Flag fault. This means that the entries that can be cached include:

- Entries in translation tables that point to subsequent tables to be used in that stage of translation.
- Stage 2 translation table entries used as part of a stage 1 translation table walk
- Stage 2 translation table entries used to translate the output address of the stage 1 translation.

Such entries might be held in intermediate TLB caching structures that are used during a translation table walk and that are distinct from the data caches in that they are not required to be invalidated as the result of writes of the data. The architecture makes no restriction of the form of these intermediate TLB caching structures.

The architecture does not intend to restrict the form of TLB caching structures used for holding translation table entries, and in particular for a translation regime that involves two stages of translation, it is recognized that such caching structures might contain:

- Entries containing information from stage 1 translation table entries, at any level of the translation table walk.
- Entries containing information from stage 2 translation table entries, at any level of the translation table walk.
- Entries that combine information from stage 1 and stage 2 translation table entries, at any level of the translation table walk.

Note

For the purpose of TLB maintenance, the term *TLB entry* denotes any structure, including temporary working registers in translation table walk hardware, that holds a translation table entry.

Where a TLB maintenance instruction is:

- Required to apply to stage 1 entries, then it must apply to any cached entries in caching structures that include any stage 1 information that are used to translate the address being invalidated.

Note

- Where stage 1 information has been cached in multiple TLB entries, as could occur from splintering a page when caching in the TLB, then the invalidation must apply to each cached entry containing stage 1 information from the page that is used to translate the address being invalidated, regardless of whether or not that cached entry would be used to translate the address being invalidated.
 - As stated in [Global and process-specific translation table entries on page D5-2512](#), translation table entries from levels of translation other than the final level are treated as being non-global. ARM expects that, in at least some implementations, cached copies of levels of the translation table walk other than the last level are tagged with their *ASID*, regardless of whether the final level is global. This means that TLB invalidations that involve the *ASID* require the *ASID* to match such entries to perform the required invalidation.
-

- Required to apply to stage 2 entries only, then:
 - It is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.
 - It must apply to caching structures that contain information only from stage 2 translation table entries.
- Required to apply to both stage 1 and stage 2 entries, then it must apply to any entry in the caching structures that includes information from either a stage 1 translation table entry or a stage 2 translation table entry, including any entry that combines information from both stage 1 and stage 2 translation table entries.

Whenever translation tables entries associated with a particular **VMID** or **ASID** are changed, the corresponding entries must be invalidated from the TLB to ensure that these changes are visible to subsequent execution, including speculative execution, that uses the changed translation table entries.

Some System register field descriptions state that the effect of the field is permitted to be cached in a TLB. This means that all TLB entries that might be affected by a change of the field must be invalidated whenever that field is changed, to ensure that the effect of the change of that control field is visible to subsequent execution, including speculative execution, that uses that control field. This invalidation is required in addition to, and after, the normal synchronization of the System registers described in [Synchronization requirements for AArch64 System registers on page D12-2675](#), and applies to any stage of address translation that is implemented for the translation regime, and **VMID** and **ASID** as appropriate, that is affected by that control field. A control field that is permitted to be cached in a TLB requires this maintenance even when all stages of address translation are disabled.

In addition to any TLB maintenance requirement, when changing the cacheability attributes of an area of memory, software must ensure that any cached copies of affected locations are removed from the caches. For more information see [Cache maintenance requirement created by changing translation table attributes on page D5-2535](#).

Because a TLB never holds any translation table entry that generates a Translation fault, an Address size fault, or an Access Flag fault, a change from a translation table entry that causes a Translation, Address size, or Access flag fault to one that does not fault, does not require any TLB invalidation. However, a [Context synchronization event](#) is required to ensure that instruction fetches are affected by a completed change to translation table entries that, before the change, generated a Translation, Address size, or Access flag fault.

Special considerations apply to translation table updates that change the memory type, cacheability, or output address of an entry, see [Using break-before-make when updating translation table entries](#).

Using break-before-make when updating translation table entries

To avoid possibly creating multiple TLB entries for the same address, and to avoid the effects of TLB caching possibly breaking coherency, ordering guarantees or uniprocessor semantics, or possibly failing to clear the Exclusives monitors, the architecture requires the use of a break-before-make sequence when changing translation table entries whenever multiple threads of execution can use the same translation tables and the change to the translation table entries involves any of:

- A change of the memory type.
- A change of the cacheability attributes.
- A change of the output address (OA), if the OA of at least one of the old translation table entry and the new translation table entry is writable, including if the DBM bit is set and hardware updates to the dirty bits are enabled.
- A change to the size of block used by the translation system. This applies both:
 - When changing from a smaller size to a larger size, for example by replacing a table mapping with a block mapping in a stage 2 translation table.
 - When changing from a larger size to a smaller size, for example by replacing a block mapping with a table mapping in a stage 2 translation table.
- Creating a global entry when there might be non-global entries in a TLB that overlap with that global entry.

A break-before-make sequence on changing from an old translation table entry to a new translation table entry requires the following steps:

1. Replace the old translation table entry with an invalid entry, and execute a DSB instruction.
2. Invalidate the translation table entry with a broadcast TLB invalidation instruction, and execute a DSB instruction to ensure the completion of that invalidation.
3. Write the new translation table entry, and execute a DSB instruction to ensure that the new entry is visible.

This sequence ensures that at no time are both the old and new entries simultaneously visible to different threads of execution, and therefore the problems described at the start of this subsection cannot arise.

In ARMv8.1, with the introduction of hardware updates to the translation table entries, the effects of not following the break-before-make rules are extended.

If the break-before-make rules are not followed for changing the translation table entries, the ARMv8.1 architecture permits that the following failures associated with the hardware updates of the translation table entries could occur:

- The Access flag is not set on such a translation table entry despite the fact that the memory location associated with that entry was accessed.
- The AP[2] or S2AP[1] bit is modified by the hardware on such a translation table entry despite the fact that the memory location associated with that entry was not written to.
- The AP[2] or S2AP[1] bit is not modified by the hardware on such a translation table entry despite the fact that the memory location associated with that entry was written to.
- The ordering required between hardware updates to such a translation table entry and stores appearing later in program order is not followed.

Support levels for changing block size

If [ARMv8.4-TTRem](#) is implemented, the PE provides three levels of support when changing block size, without changing any other parameters that require break-before-make:

- Level 0** Software must use break-before-make to avoid breaking coherency, ordering guarantees or uniprocessor semantics, or failing to clear the Exclusives monitors when changing block size. See [Using break-before-make when updating translation table entries on page D5-2516](#).
- Level 1** Software can use the level 0 approach, or software can use the nT block translation entry to avoid breaking coherency, ordering guarantees or uniprocessor semantics, or failing to clear the Exclusives monitors when changing block size. See [Block translation entry on page D5-2467](#).
- Level 2** Software can use the level 0 or level 1 approach and, in addition, changing block size does not break coherency, ordering guarantees or uniprocessor semantics, or fail to clear the Exclusives monitors. If there has not been a TLB invalidation of the entries that have changed since the writes that changed those entries were completed, this change might cause Conflict aborts. This is because multiple translation entries might exist within the TLB for the same input address.

In addition, an implementation that uses the level 1 or level 2 approach supports the following without breaking coherency, ordering guarantees or uniprocessor semantics, or failing to clear the Exclusives monitors:

- A change to a set of blocks or pages from having the Contiguous bit set to having the Contiguous bit not set.
- A change to a set of blocks or pages from having the Contiguous bit not set to having the Contiguous bit set.

If multiple translation entries exist within the TLB for the same input address, this change might cause Conflict aborts when translating the address.

If a Conflict abort is detected in a translation regime for which stage 2 translations are enabled, the Conflict abort is reported to EL2.

Clearing entries associated with a Conflict abort

While using level 1 or level 2 support, on a Conflict abort, the following instructions are guaranteed to clear the entries associated with the conflict:

- For the EL1&0 Translation regime, while stage 2 translations are in use: TLBI VMALLS12E1, TLBI ALLE1.
- For the EL1&0 Translation regime, while stage 2 translations are not in use: TLBI VMALLE1, TLBI ALLE1.
- For the EL2&0 Translation regime: TLBI VMALLE1, TLBI ALLE1.
- For the EL2 Translation regime: TLBI ALLE2.
- For the EL3 Translation regime: TLBI ALLE3.

D5.10.2 TLB maintenance instructions

The architecture defines TLB maintenance instructions, that provide the following:

- Invalidate all entries in the TLB.
- Invalidate a single TLB entry by [ASID](#) for a non-global entry.
- Invalidate all TLB entries that match a specified [ASID](#).
- Invalidate all TLB entries that match a specified [VA](#), regardless of the [ASID](#).
- Invalidate all TLB entries within a range of addresses.

Each instruction can be specified as applying only to the PE that executes the instruction, or as applying to all PEs in the same shareability domain as the PE that executes the instruction.

The following subsections describe these instructions:

- [TLB maintenance instruction syntax](#).
- [Operation of the TLB maintenance instructions on page D5-2522](#).
- [Scope of the A64 TLB maintenance instructions on page D5-2523](#).
- [TLB range maintenance instructions on page D5-2526](#).
- [Invalidation of TLB entries from stage 2 translations on page D5-2527](#).
- [Broadcast TLB maintenance between AArch32 and AArch64 on page D5-2528](#).
- [Broadcast TLB maintenance with different translation granule sizes on page D5-2529](#).
- [Ordering and completion of TLB maintenance instructions on page D5-2530](#).
- [TLB maintenance in the event of TLB conflict on page D5-2530](#).
- [The interaction of TLB lockdown with TLB maintenance instructions on page D5-2531](#).

[TLB maintenance instructions on page C5-344](#) describes the encoding of the TLB maintenance instructions.

TLB maintenance instruction syntax

The A64 syntax for TLB maintenance instructions is:

```
TLBI <operation>{, <Xt>}
```

Where:

<operation> Is one of ALLE1, ALLE2, ALLE3, ALLE1IS, ALLE2IS, ALLE3IS, ALLE1OS, ALLE2OS, ALLE3OS, VMALLE1, VMALLE1IS, VMALLE1OS, VMALLS12E1, VMALLS12E1IS, VMALLS12E1OS, ASIDE1, ASIDE1IS, ASIDE1OS, {R}VA{L}E1, {R}VA{L}E2, {R}VA{L}E3, {R}VA{L}E1IS, {R}VA{L}E2IS, {R}VA{L}E3IS, {R}VA{L}E1OS, {R}VA{L}E2OS, {R}VA{L}E3OS, {R}VAA{L}E1, {R}VAA{L}E1IS, {R}VAA{L}E1OS, {R}IPAS2{L}E1, {R}IPAS2{L}E1IS, or {R}IPAS2{L}E1OS.

<operation> has a structure of {R}<type><level><shareability> where:

R When present, indicates that the function applies to all TLBs that are within a determined address range, see [TLB range maintenance instructions on page D5-2526](#). When not present, indicates that the function applies to all TLBs at a single address that contain entries that could be used by the PE that executes the TLBI instruction.

<type> Is one of:

ALL All translations used at <level>.

	For the scope of ALL instructions see ALL on page D5-2523 . The ALL instructions are valid for all values of <level>.
VMALL	All stage 1 translations used at <level> with the current VMID, if appropriate. For the scope of the VMALL instructions see VMALL on page D5-2523 . The VMALL instructions are valid only when level == E1.
VMALLS12	All stage 1 and stage 2 translations used at EL1 with the current VMID, if appropriate. For the scope of the VMALLS12 instructions see VMALLS12 on page D5-2523 . The VMALLS12 instructions are valid only when level == E1.
ASID	All translations used at EL1 with the supplied ASID. For the scope of the ASID instructions see ASID on page D5-2524 . The ASID instructions are valid only when level == E1.
VA{L}	Translations used at <level> for the specified address and, if appropriate, the specified ASID. For the scope of the VA instructions see VA on page D5-2524 . For the scope of the VAL instructions see VAL on page D5-2524 . The VA{L} instructions are valid for all values of <level>.
VAA{L}	Translations used at <level> for the specified address, for all ASID values, if appropriate. For the scope of the VAA instructions see VAA on page D5-2525 . For the scope of the VAAL instructions see VAAL on page D5-2525 . The VAA{L} instructions are valid only when level == E1.
IPAS2{L}	Translations used at <level> for the specified IPA that are held in stage 2 only caching structures. For the scope of the IPAS2 instructions see IPAS2 on page D5-2525 . For the scope of the IPAS2L instructions see IPAS2L on page D5-2525 . The IPAS2{L} instructions are valid only when level == E1.
	In the VA{L}, VAA{L}, and IPAS2{L} types:
L	An optional parameter that indicates that the invalidation only applies to caching of entries returned from the final lookup level of the translation table walk.
<level>	Defines the Exception level of the translation regime that the invalidation applies to. Is one of:
E1	EL1.
E2	EL2.
E3	EL3.
	An instruction that applies to the translation regime of an Exception level higher than the Exception level at which the instruction is executed is UNDEFINED. TLBI ALLE1{IS}, TLBI IPAS2{L}E1{IS} and TLBI VMALLS12E1{IS} are UNDEFINED at EL1.
Note	
All TLB maintenance instructions are UNDEFINED at EL0.	
<shareability>	Is one of:
IS	When present, it indicates that the function applies to all TLBs in the Inner Shareable shareability domain.
OS	When present, it indicates that the function applies to all TLBs in the Outer Shareable shareability domain.

<blank> When no shareability is present, it indicates that the function applies to all TLBs that contain entries that could be used by the PE that executes the TLBI instruction.

———— **Note** —————

When a TLB entry has been invalidated for one PE, it is not consistent with the architecture to allow another PE to refill that TLB entry where the new entry might give the appearance to software that the invalidation has not occurred.

<Xt> Passes one or both of an address and an [ASID](#) as an argument, where required. <Xt> is required for the TLB ASID, TLB VA{L}, TLB VAA{L}, and TLB IPAS2{L} instructions.

If EL2 is not implemented, the TLBI VA{L}E2, TLBI VA{L}E2IS, TLBI ALLE2, and TLBI ALLE2IS instructions are UNDEFINED.

VMSAv8-64 TLB maintenance instructions that take a register argument that holds a [VA](#), an [ASID](#), or both, and that do not apply to a range of addresses, use the register argument format:

Bits[63:48] ASID. These bits are RES0 if the instruction does not require an [ASID](#) argument.

Bits[47:44] TTL. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated, see [Translation table level hints on page D5-2521](#). This field is RES0 if the instruction does not require an [VA](#) argument, or if [ARMv8.4-TTL](#) is not implemented.

Bits[43:0] [VA](#)[55:12]. For an instruction that requires a [VA](#) argument, the treatment of the low-order bits of this field depends on the translation granule size, as follows:

4KB granule size All bits are valid and used for the invalidation.

16KB granule size Bits[1:0] RES0 and ignored when the instruction is executed, because [VA](#)[13:12] have no effect on the operation of the instruction.

64KB granule size Bits[3:0] are RES0 and ignored when the instruction is executed, because [VA](#)[15:12] have no effect on the operation of the instruction.

These bits are RES0 if the instruction does not require a [VA](#) argument.

For TLB maintenance instructions that take an address argument, hardware interprets [VA](#)[63:56] as each having the same value as [VA](#)[55].

If a TLB maintenance instruction targets a translation regime that is using AArch32, meaning the [VA](#) is only 32-bit, then software must treat [VA](#)[55:32] as RES0, and these bits are ignored when the instruction is executed.

If the implementation supports 16 bits of [ASID](#) then the upper 8 bits of the [ASID](#) are RES0 when the context being invalidated only uses 8 bits.

VMSAv8-64 TLB maintenance instructions that take a register argument that holds an [IPA](#), and that do not apply to a range of addresses, use the register argument format:

Bits[63:48] RES0.

Bits[47:44] TTL. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated, see [Translation table level hints on page D5-2521](#). This field is RES0 if the instruction does not require an [IPA](#) argument, or if [ARMv8.4-TTL](#) is not implemented.

Bits[43:36] RES0.

Bits[35:0] [IPA](#)[47:12]. For an instruction that requires a [VA](#) argument, the treatment of the low-order bits of this field depends on the translation granule size, as follows:

4KB granule size All bits are valid and used for the invalidation.

16KB granule size Bits[1:0] RES0 and ignored when the instruction is executed, because [IPA](#)[13:12] have no effect on the operation of the instruction.

64KB granule size Bits[3:0] are RES0 and ignored when the instruction is executed, because [IPA](#)[15:12] have no effect on the operation of the instruction.

For the register argument format of TLB instructions that apply to a range of addresses, see [TLB range maintenance instructions on page D5-2526](#).

Translation table level hints

When [ARMv8.4-TTL](#) is implemented, the TTL field indicates the level of page table walk holding the leaf entry for the address being invalidated. Hardware can use this information to determine if there was a risk of splintering.

If an incorrect value for the entry being invalidated by the instruction is specified in the TTL field, then no entries are required by the architecture to be invalidated from the TLB.

The TTL field in TLB maintenance instructions that take a register argument that holds a [VA](#) or an [IPA](#), and that do not apply to a range of addresses, use the encodings in [Table D5-50](#).

Table D5-50 TTL field encodings in TLB instructions that apply to a single address

TTL[3:2]	TTL[1:0]	Information supplied
00	RES0	No information supplied about the translation level. Hardware must assume that the entry can be from any level.
01	00	The entry comes from a 4KB translation granule. This value is reserved, and hardware should treat this as if TTL[3:2] is 0b00.
	01	The entry comes from a 4KB translation granule. The leaf entry for the address being invalidated is on level 1 of the page table walk.
	10	The entry comes from a 4KB translation granule. The leaf entry for the address being invalidated is on level 2 of the page table walk.
	11	The entry comes from a 4KB translation granule. The leaf entry for the address being invalidated is on level 3 of the page table walk.
10	00	The entry comes from a 16KB translation granule. This value is reserved, and hardware should treat this as if TTL[3:2] is 0b00.
	01	The entry comes from a 16KB translation granule. This value is reserved, and hardware should treat this as if TTL[3:2] is 0b00.
	10	The entry comes from a 16KB translation granule. The leaf entry for the address being invalidated is on level 2 of the page table walk.
	11	The entry comes from a 16KB translation granule. The leaf entry for the address being invalidated is on level 3 of the page table walk.
11	00	The entry comes from a 64KB translation granule. This value is reserved, and hardware should treat this as if TTL[3:2] is 0b00.
	01	The entry comes from a 64KB translation granule. The leaf entry for the address being invalidated is on level 1 of the page table walk.
	10	The entry comes from a 64KB translation granule. The leaf entry for the address being invalidated is on level 2 of the page table walk.
	11	The entry comes from a 64KB translation granule. The leaf entry for the address being invalidated is on level 3 of the page table walk.

The TTL field in TLB maintenance instructions that take a register argument that holds a VA or an IPA, and that do not apply to a range of addresses, use the encodings in Table D5-51.

Table D5-51 TTL field encodings in TLB instructions that apply to multiple addresses

TTL	Information supplied
00	The entries in the range can be using any level for the translation table entries.
01	When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. When using a 16KB translation granule, this value is reserved, and hardware should treat the TTL field as 0b00.
10	All entries to invalidate are Level 2 translation table entries.
11	All entries to invalidate are Level 3 translation table entries.

Operation of the TLB maintenance instructions

Any TLB maintenance instruction can affect any TLB entries that are not locked down.

The TLB maintenance instructions specify the Exception level of the translation regime to which they apply.

———— **Note** ————

Because there is no guarantee that an unlocked TLB entry remains in the cache, architecturally it is not possible to tell whether a TLB maintenance instruction has affected any TLB entries that were not specified by the instruction.

If a TLB maintenance instruction specifies a VA, and a data or instruction access to that VA would generate an MMU abort, the TLB maintenance instruction does not generate an abort. VAs for which a TLB maintenance instruction does not generate an abort include VAs that are not in the range of VAs that can be translated.

When EL3 is implemented:

- The TLB maintenance instructions that apply to the EL1&0 translation regime take account of the current Security state, as part of the address translation required for the TLB operation.
- **SCR_EL3.NS** modifies the effect of the TLB maintenance instructions as follows:
 - For instructions that apply to the EL1&0 translation regime, the **SCR_EL3.NS** bit identifies whether the maintenance instructions apply to the Secure or Non-secure EL1&0 translation regime.

———— **Note** ————

If EL3 is not implemented, then there is only a single EL1&0 translation regime.

- When **SCR_EL3.EEL2** is 0 instructions that apply to the EL2 translation regime, or to the EL2&0 translation regime, the **SCR_EL3.NS** bit must be 1 or the instruction is UNDEFINED.
- For instructions that apply to the EL3 translation regime, the **SCR_EL3.NS** bit has no effect.

———— **Note** ————

- An address-based TLB maintenance instruction that applies to the Inner Shareable domain or the Outer Shareable domain does so regardless of the Shareability attributes of the address supplied as an argument to the instruction.
- Previous versions of the ARM architecture included TLB maintenance instructions that operated only on instruction TLBs, or only on data TLBs. From the introduction of ARMv7, ARM deprecated any use of these instructions. In ARMv8:
 - AArch64 state does not include any of these instructions.
 - AArch32 state includes some of these instructions, but ARM deprecates their use.

The ARM architecture does not dictate the form in which the TLB stores translation table entries. However, when a TLB maintenance instruction is executed, the minimum size of the table entry that is invalidated from the TLB must be at least the size that appears in the translation table entry.

———— **Note** ————

The Contiguous bit does not affect the minimum size of entry that must be invalidated from the TLB.

Scope of the A64 TLB maintenance instructions

The TLB invalidation instruction <type> affects the different possible cached entries in the TLB as follows:

ALL The invalidation applies to all cached copies of the stage 1 and stage 2 translation table entries from any level of the translation table walk required to translate any address at the specified Exception level, that would be used with the state specified by [SCR_EL3.NS](#) and [SCR_EL3.EEL2](#).

For entries from the Secure or Non-secure EL1&0 translation regime, when EL2 is enabled, ALL applies to entries with any [VMID](#).

For entries from a translation regime for which an [ASID](#) is valid, the invalidation applies to:

- All entries above the final level of lookup.
- All entries at the final level of lookup.

———— **Note** ————

This means the invalidation applies to both:

- Global entries.
- Non-global entries with any [ASID](#).

VMALL The invalidation applies to all cached copies of the stage 1 translation table entries, from any level of the translation table walk required to translate any address at the specified Exception level, that would be used with all of:

- The Security state specified by [SCR_EL3.NS](#) and [SCR_EL3.EEL2](#).
- For the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, the current [VMID](#).

For entries from a translation regime for which an [ASID](#) is valid that meet the other specified conditions, the invalidation applies to:

- All entries above the final level of lookup.
- All entries at the final level of lookup.

———— **Note** ————

This means the invalidation applies to both:

- Global entries.
- Non-global entries with any [ASID](#).

VMALL is valid for:

- EL1.
- EL2, when [HCR_EL2](#).{E2H, TGE} is {1, 1}.

VMALLS12 The invalidation applies to all cached copies of the stage 1 and stage 2 translation table entries from any level of the translation table walk required to translate any address at the specified Exception level, that would be used with all of:

- The Security state specified by [SCR_EL3.NS](#) and [SCR_EL3.EEL2](#).
- For the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, the current [VMID](#).

For entries from a translation regime for which an [ASID](#) is valid that meet the other specified conditions, the invalidation applies to:

- All entries above the final level of lookup.

- All entries at the final level of lookup.

———— **Note** ————

This means the invalidation applies to both:

- Global entries.
- Non-global entries with any [ASID](#).

VMALLS12 is valid for EL1.

If EL2 is not implemented, or if the TLBI VMALLS12 instruction is executed when the value of [SCR_EL3.NS](#) is 0 and EL2 is disabled, the instruction is not UNDEFINED but it has the same effect as TLBI VMALL. This is because there are no stage 2 translations to invalidate.

ASID The invalidation applies to all cached copies of the stage 1 translation table entries from any level of the translation table walk required to translate any address at the specified Exception level, that would be used with all of:

- The Security state specified by [SCR_EL3.NS](#) and [SCR_EL3.EEL2](#).
- For the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, the current [VMID](#).

For entries from a translation regime for which an [ASID](#) is valid that meet the other specified conditions, the invalidation applies only if either:

- The entry is from a level of lookup above the final level and matches the specified [ASID](#).
- The entry is a non-global entry from the final level of lookup and matches the specified [ASID](#).

ASID is valid for:

- EL1.
- EL2, when [HCR_EL2](#).{E2H, TGE} is {1, 1}.

VA The invalidation applies to all cached copies of the stage 1 translation table entries from any level of the translation table walk required to translate the address specified in the invalidation instruction at the specified Exception level that would be used with all of:

- The Security state specified by [SCR_EL3.NS](#) and [SCR_EL3.EEL2](#).
- For the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, the current [VMID](#).

For entries from a translation regime for which an [ASID](#) is valid that meet the other specified conditions, the invalidation applies only if one of the following applies:

- The entry is from a level of lookup above the final level and matches the specified [ASID](#).
- The entry is a global entry from the final level of lookup.
- The entry is a non-global entry from the final level of lookup that matches the specified [ASID](#).

VAL The invalidation applies to all cached copies of the stage 1 translation table entry from the final level of the translation table walk required to translate the address specified in the invalidation instruction at the specified Exception level, that would be used with all of:

- The Security state specified by [SCR_EL3.NS](#) and [SCR_EL3.EEL2](#).
- For the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, the current [VMID](#).

For entries from a translation regime for which an [ASID](#) is valid that meet the other specified conditions, the invalidation applies only if either:

- The entry is a global entry from the final level of lookup.
- The entry is a non-global entry from the final level of lookup that matches the specified [ASID](#).

- VAA The invalidation applies to all cached copies of the stage 1 translation table entries from any level of the translation table walk required to translate the address specified in the invalidation instruction at the specified Exception level that would be used with all of:
- The Security state specified by [SCR_EL3.NS](#) and [SCR_EL3.EEL2](#).
 - For the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, the current [VMID](#).
- For entries from a translation regime for which an [ASID](#) is valid that meet the other specified conditions, the invalidation applies to all of:
- All entries above the final level of lookup.
 - All entries at the final level of lookup.
- **Note** —————
- This means the invalidation applies to both:
- Global entries.
 - Non-global entries with any [ASID](#).
-
- VAA The invalidation applies to all cached copies of the stage 1 translation table entry from the final level of the translation table walk required to translate the address specified in the invalidation instruction at the specified Exception level that would be used with all of:
- The Security state specified by [SCR_EL3.NS](#) and [SCR_EL3.EEL2](#).
 - For the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, the current [VMID](#).
- For entries from a translation regime for which an [ASID](#) is valid that meet the other specified conditions, the invalidation applies to all entries at the final level of lookup.
- **Note** —————
- This means the invalidation applies to both:
- Global entries.
 - Non-global entries with any [ASID](#).
-
- IPAS2 The invalidation applies to all cached copies of the stage 2 translation table entries from any level of the translation table walk required to translate the specified [IPA](#), that both:
- Are held in TLB caching structures holding stage 2 only entries.
 - Would be used with the current [VMID](#).
- It is not required that this instruction invalidates TLB caching structures holding entries that combine stage 1 and stage 2 of the translation.
- The only translation regime to which this instruction can apply is the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime.
- When executed with the [SCR_EL3.NS](#) == 0, or in an implementation that does not implement EL2, this instruction is a NOP.
- For more information about the architectural requirements for the IPAS2 instruction see [Invalidation of TLB entries from stage 2 translations on page D5-2527](#).
- IPAS2L The invalidation applies to cached copies of the stage 2 translation table entry from the final level of the stage 2 translation table walk required to translate the specified [IPA](#), that both:
- Are held in TLB caching structures holding stage 2 only entries.
 - Would be used with the current [VMID](#).
- It is not required that this instruction invalidates TLB caching structures holding entries that combine stage 1 and stage 2 of the translation.
- The only translation regime to which this instruction can apply is the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime.
- When executed with the [SCR_EL3.NS](#) == 0, or in an implementation that does not implement EL2, this instruction is a NOP.

For more information about the architectural requirements for the IPAS2L instruction see [Invalidation of TLB entries from stage 2 translations on page D5-2527](#).

The entries that the invalidations apply to are not affected by the state of any other control bits involved in the translation process. Therefore, the following is a non-exhaustive list of control bits that do not affect how a TLB maintenance instruction updates the TLB entries:

In AArch64 state

[SCTLR_EL1.M](#), [SCTLR_EL2.M](#), [SCTLR_EL3](#).{M, RW}, [HCR_EL2](#).{VM, RW},
[TCR_EL1](#).{TG1, EPD1, T1SZ, TG0, EPD0, T0SZ, AS, A1}, [TCR_EL2](#).{TG0, T0SZ},
[TCR_EL3](#).{TG0, T0SZ}, [VTCR_EL2](#).{SL0, T0SZ}, [TTBR0_EL1.ASID](#), [TTBR1_EL1.ASID](#).

In AArch32 state

[SCTLR.M](#), [HCR.VM](#), [TTBCR](#).{EAE, PD1, PD0, N, EPD1, T1SZ, EPD0, T0SZ, A1},
[HTCR.T0SZ](#), [VTCR](#).{SL0, T0SZ}, [TTBR0.ASID](#), [TTBR1.ASID](#), [CONTEXTIDR.ASID](#).

———— Note ————

- ARM expects most TLB maintenance performed by an operating system to occur to the last level entries of the stage 1 translation table walks, and the purpose of the address-based TLB invalidation instructions where the invalidation need only apply to caching of entries returned from the last level of translation table walk of stage 1 translation is to avoid unnecessary loss of the intermediate caching of the translation table entries. Similarly, for stage 2 translations ARM expects that most TLB maintenance performed by a hypervisor for a given Guest operation system will affect only the last level entries of the stage 2 translations. Therefore, similar capability is provided for instructions that invalidate single stage 2 entries.
- The architecture permits the invalidation of entries in TLB caching structures at any time, so for each of these instructions the definition is in terms of the minimum set of entries that must be invalidated from TLB caching structures, and an implementation might choose to invalidate more entries. In general, for best performance, ARM recommends not invalidating entries that are not required to be invalidated.
- Dependencies on the [VMID](#) for the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime apply even when the value of [HCR_EL2.VM](#) is 0. The [VTTBR_EL2.VMID](#) field resets to a value that is architecturally UNKNOWN, and therefore [VTTBR_EL2.VMID\[7:0\]](#) must be set to a known value, that might be zero, as part of the PE initialization sequence, even if stage 2 translation is not in use.

TLB range maintenance instructions

Specific TLB invalidation instructions apply to a range of input addresses rather than a single address. All TLB range maintenance instructions invalidate TLB entries that are within the address range determined by the formula: $[BaseADDR \leq input_address < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

———— Note ————

The set of masters containing TLBs that can be affected by the TLB range maintenance instructions are defined by the system architecture. This means that all masters in a system might not contain TLBs within the defined shareability domains.

VMSAv8-64 TLB range maintenance instructions that take a register argument that holds a [VA](#), or a [VA](#) and an [ASID](#), use the following register argument format:

- Bits[63:48]** ASID. These bits are RES0 if the instruction does not require an [ASID](#) argument.
- Bits[47:46]** TG. This field gives the translation granule size for the translations that are being invalidated. If the translations use a different translation granule size than the one specified, then the architecture does not require that the instruction invalidates any entries.
- Bits[45:44]** SCALE. This field gives the exponent element of the calculation that is used to produce the upper range.
- Bits[43:39]** NUM. This field gives the base element of the calculation that is used to produce the upper range.

- Bits[38:37]** TTL level hint, see *Translation table level hints* on page D5-2521. This field is RES0 if the instruction does not require a VA argument, or if ARMv8.4-TTL is not implemented.
- Bits[36:0]** BaseADDR. This field gives the starting address for the range of the maintenance instruction.
- | | |
|--------------------------|------------------|
| 4KB granule size | BaseADDR[48:12]. |
| 16KB granule size | BaseADDR[50:14]. |
| 64KB granule size | BaseADDR[52:16]. |

VMSAv8-64 TLB range maintenance instructions that take a register argument that holds an IPA, use the following register argument format:

- Bits[63]** NS. This bit is RES0 if the instruction is executed in Non-secure state.
- Bits[62:48]** RES0.
- Bits[47:46]** TG. This field gives the translation granule size for the translations that are being invalidated. If the translations use a different translation granule size than the one specified, then the architecture does not require that the instruction invalidates any entries.
- Bits[45:44]** SCALE. This field gives the exponent element of the calculation that is used to produce the upper range.
- Bits[43:39]** NUM. This field gives the base element of the calculation that is used to produce the upper range.
- Bits[38:37]** TTL level hint, see *Translation table level hints* on page D5-2521. This field is RES0 if the instruction does not require a VA argument, or if ARMv8.4-TTL is not implemented.
- Bits[36:0]** BaseADDR. This field gives the starting address for the range of the maintenance instruction.
- | | |
|--------------------------|------------------|
| 4KB granule size | BaseADDR[48:12]. |
| 16KB granule size | BaseADDR[50:14]. |
| 64KB granule size | BaseADDR[52:16]. |

The range of addresses invalidated is UNPREDICTABLE when:

- When a 4K translation granule used, if the TTL field is 0b01 and BaseADDR[29:12] does not equal 0b000000000000000000.
- When a 4K translation granule used, if the TTL field is 0b10 and BaseADDR[20:12] does not equal 0b0000000000.
- When a 16K translation granule used, if the TTL field is 0b10 and BaseADDR[24:12] does not equal 0b000000000000.
- When a 64K translation granule used, if the TTL field is 0b01 and BaseADDR[41:16] does not equal 0b00000000000000000000000000000000.
- When a 64K translation granule used, if the TTL field is 0b10 and BaseADDR[28:16] does not equal 0b0000000000000000.

Invalidation of TLB entries from stage 2 translations

The architectural requirements of the IPAS2 instruction are that:

1. The following code is sufficient to invalidate all cached copies of the stage 2 translation of the IPA held in Xt for the current VMID, with the corresponding requirement for the broadcast versions of the instructions:

```
TLBI IPAS2E1, Xt
DSB
TLBI VMALLE1
```
2. The following code is sufficient to invalidate all cached copies of the stage 2 translations of the IPA held in Xt used to translate the VA (and the specified ASID when executing TLBI VAE1) held in Xt2, with the corresponding requirement for the broadcast versions of the instructions:

```
TLBI IPAS2E1, Xt
DSB
TLBI VAE1, Xt2 ; or TLBI VAAE1, Xt2
```

3. The following code is sufficient to invalidate all cached copies of the stage 2 translations of the [IPA](#) held in Xt used to translate the [IPA](#) produced by the last level of stage 1 translation table lookup for the [VA](#) (and [ASID](#) when executing TLBI VAE1) held in Xt2, with the corresponding requirement for the broadcast versions of the instructions:

```
TLBI IPAS2E1, Xt
DSB
TLBI VALE1, Xt2 ; or TLBI VAALE1, Xt2
```

———— **Note** —————

Depending on the invalidation required, software must use the entire sequence 1, 2, or 3, even when Secure or Non-secure EL1&0, when EL2 is enabled, stage 1 translation is disabled.

Equivalent architectural requirements apply to the IPAS2L instruction, except that the only TLB entries that must be invalidated by an IPAS2L instruction are those that come from the final level of the translation table lookup.

Broadcast TLB maintenance between AArch32 and AArch64

In most cases, a TLB maintenance instruction affecting the Inner Shareable shareability domain executed by a PE in an Exception level that is using AArch64 also affects any other PE in the same Inner Shareable domain that is executing at the same Exception level and is using AArch32, provided that the address, qualify the scope of the [ASID](#) and [VMID](#) matching requirements of the original instruction are met, as specified in [Scope of the A64 TLB maintenance instructions on page D5-2523](#).

———— **Note** —————

The requirement to match means that the invalidation only occurs on the PE that is using AArch32 if, for the PE that executed the TLB maintenance instruction at an Exception level that is using AArch64, both of the following apply:

- If [VA](#) matching is required, the [VA](#) is 0x0000FFFFFFFF or lower in the memory map.
- If [ASID](#) matching is required and the PE is using a 16-bit [ASID](#), then the top 8 bits of the [ASID](#) are zero.

Except for the cases identified here, a TLB maintenance instruction affecting the Inner Shareable shareability domain executed by a PE in an Exception level that is using AArch32 also affects any other PE in the same Inner Shareable domain that is executing at the same Exception level and is using AArch64, provided that the address, [ASID](#), and [VMID](#) matching requirements of the original instruction are met, as specified in [Scope of the A64 TLB maintenance instructions on page D5-2523](#). In addition, for the instruction executed in AArch32 state:

- For a TLBIMVAAIS, TLBIMVAALIS, TLBIMVAHIS, TLBIMVAIS, TLBIMVALHIS, or TLBIMVALIS instruction, the [VA](#) supplied as an argument is zero-extended.
- For a TLBIIPAS2IS or TLBIIPAS2LIS instruction, the [IPA](#) supplied as an argument is zero-extended.
- For a TLBIASIDIS, TLBIMVAIS, or TLBIMVALIS instruction, the [ASID](#) supplied as an argument is zero-extended if the PE executing in AArch64 state is using a 16-bit [ASID](#).

The [VA](#) from the instruction executed in AArch32 state is zero-extended, and the [ASID](#) is zero-extended if the PE executing in AArch64 state is using a 16-bit [ASID](#).

The exceptions to these general rules are as follows:

1. An ARMv7 PE in the same Inner Shareable domain is treated in the same way as an ARMv8 PE for which EL3 is using AArch32, except that if an ARMv8 PE issues a broadcast instruction that is not defined in ARMv7, then that instruction is not required to have an effect on the TLBs of the ARMv7 PE. The instructions that do not exist in ARMv7 include the following TLB maintenance instructions that ARMv8 adds to the T32 and A32 instruction sets:
 - The following instructions that operate on TLB entries for the final level of translation table walk for stage 1 translations:
TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, and TLBIMVALH.
 - The following instructions that operate by IPA on TLB entries for stage 2 translations:
TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, and TLBIIPAS2L.
2. The number of Exception levels in Secure state depends on whether EL3 is using AArch32 or EL3 is using AArch64. This means that, within the Inner Shareable domain, there might be PEs with different numbers of Exception levels in Secure state. Therefore, the following exceptions are made to the general rules:
 - If a PE with EL3 using AArch32 issues a broadcast AArch32 TLB maintenance instruction affecting Secure entries, and the Inner Shareable domain also contains PEs with EL3 using AArch64, then the architecture does not require that the broadcast AArch32 TLB maintenance instruction has any effect on either:
 - The EL3 translation regime of the PEs with EL3 using AArch64.
 - The Secure or Non-secure EL1&0, when EL2 is disabled, translation regime of the PEs with EL3 using AArch64, regardless of whether the Secure or Non-secure EL1&0, when EL2 is disabled, translation regime is using AArch64 or AArch32.
 - If a PE with EL3 using AArch64 issues a broadcast AArch64 TLB maintenance instruction affecting EL3 entries, and the Inner Shareable domain also contains PEs with EL3 using AArch32, then the architecture does not require that the broadcast AArch64 TLB maintenance instruction has any effect on the EL3 translation regime of the PEs with EL3 using AArch32.
 - If a PE with EL3 using AArch64 issues a broadcast AArch64 TLB maintenance instruction affecting Secure EL1 entries, and the Inner Shareable domain also contains PEs with EL3 using AArch32 then the architecture does not require that the broadcast AArch64 TLB maintenance instruction has any effect on the EL3 translation regime of the PEs with EL3 using AArch32.

Note

While the exceptions to the general rule mean the architecture does not require the specified TLB invalidations, the architecture also does not require that entries in the TLB remain in the TLB at any time, and so it is permissible that such broadcast instructions affect these translation regimes.

Broadcast TLB maintenance with different translation granule sizes

In the following cases, a broadcast TLB maintenance instruction is not required to perform any invalidation on the recipient PE:

- The TLB maintenance instruction specifying a VA and affecting the EL2 translation regime, the EL2&0 translation regime, or the EL3 translation regime is broadcast from a PE using one translation granule size for that translation regime to a PE using a different translation granule size for that same translation regime
- The TLB maintenance instruction specifying a VA and affecting the EL1&0 translation regime is broadcast from a PE using one stage 1 translation granule size for that translation regime for a particular ASID (if applicable), VMID (if applicable), and Security state, to a PE where EL1 for the same ASID (if applicable), VMID (if applicable), and Security state, is using a different stage 1 translation granule size.
- The TLB maintenance instruction specifying a VA and affecting the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime is broadcast from a PE using one stage 2 translation granule size for a particular ASID (if applicable) and VMID, to a PE where EL1 for the same ASID (if applicable) and VMID is using a different stage 2 translation granule size.

- The TLB maintenance instruction specifying an [IPA](#) and affecting the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime is broadcast from a PE using one stage 2 translation granule size for a particular [VMID](#) to a PE where EL1 for the same [VMID](#) is using a different stage 2 translation granule size.

Ordering and completion of TLB maintenance instructions

For AArch64 execution, a TLB maintenance instruction can be executed in any order relative to:

- Any load or store instruction, unless a DSB is executed between the load or store and the TLB maintenance instruction.

———— **Note** —————

In the ARM architecture, a translation table walk is considered to be a separate observer, and a store to the translation tables can be observed by that separate observer at any time after the instruction has been executed, but is only guaranteed to be observable after the execution of a DSB instruction by the PE that executed the store to the translation tables.

- Another TLB maintenance instruction, unless a DSB is executed between the instructions.
- A data or instruction cache maintenance instruction, unless a DSB is executed between the instructions.

For AArch64 execution, the completion rules are:

- A TLB invalidate instruction is complete when all memory accesses using the TLB entries that have been invalidated are complete.
After the TLB invalidate instruction is complete, no new memory accesses using the invalidated TLB entries will be architecturally performed by any observer that is affected by the TLB invalidation.

———— **Note** —————

This requirement does not mean that speculative memory accesses cannot be performed using those entries if it is impossible for software running on any observer to tell that those memory accesses have been performed.

- A TLB maintenance instruction can complete at any time after it is issued, but is only guaranteed to be complete after the execution of DSB by the PE that executed the TLB maintenance instruction.
- The effects of a completed TLB maintenance instruction are only guaranteed to be visible on the PE that executed the instruction after the execution of a [Context synchronization event](#) by the PE that executed the TLB maintenance instruction.

In all cases in this section where a DMB or DSB is referred to, it refers to a DMB or DSB whose required access type is both loads and stores. A DSB NSH is sufficient to ensure completion of TLB maintenance instructions that apply to a single PE. A DSB ISH is sufficient to ensure completion of TLB maintenance instructions that apply to PEs in the same Inner Shareable domain.

TLB maintenance in the event of TLB conflict

In the event that multiple entries in the TLB are being used to translate a given address (which implies that an attempt to access the given address might give rise to a TLB Conflict abort), it is IMPLEMENTATION DEFINED as to the form of TLB maintenance operation that the software must perform in order to be guaranteed that all TLB entries associated with the given address and translation regime have been invalidated. In all cases, an ALL or VMALL form of TLB maintenance operation that targets the given translation regime is guaranteed to remove all entries within that regime, even if there are multiple, conflicting TLB entries for any given address within that regime.

The interaction of TLB lockdown with TLB maintenance instructions

The precise interaction of TLB lockdown with the TLB maintenance instructions is IMPLEMENTATION DEFINED. However, the architecturally-defined TLB maintenance instructions must comply with these rules:

- The effect on a locked TLB entry of a TLB invalidate all operation that would invalidate that entry if the entry was not locked must be one of the following, and it is IMPLEMENTATION DEFINED which behavior applies:
 - The operation has no effect on entries that are locked down.
 - The operation generates an IMPLEMENTATION DEFINED Data Abort exception if an entry is locked down, or might be locked down.
Any such exceptions taken from Non-secure EL1 can be trapped to EL2, see [Traps to EL2 of EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page D1-2225](#).

———— **Note** —————

These options permit a usage model for TLB invalidate routines, where the routine invalidates a large range of addresses, without considering whether any entries are locked in the TLB.

- The effect on a locked TLB entry of a TLB invalidate by VA or invalidate by ASID match operation that would invalidate that entry if the entry was not locked must be one of the following, and it is IMPLEMENTATION DEFINED which behavior applies:
 - The locked entry is invalidated in the TLB.
 - The operation has no effect on any locked entry in the TLB. In the case of an invalidate single entry by VA, this means the PE treats the operation as a NOP.
 - The operation generates an IMPLEMENTATION DEFINED Data Abort exception if it operates on an entry that is locked down, or might be locked down.

The exception syndrome definitions include a fault code for cache and TLB lockdown faults, see [ESR_EL1, Exception Syndrome Register \(EL1\) on page D12-2770](#).

———— **Note** —————

Any implementation that uses an abort mechanism for entries that can be locked down but are not actually locked down must:

- Document the IMPLEMENTATION DEFINED instruction sequences that perform the required operations on entries that are not locked down.
- Implement one of the other specified alternatives for the locked entries.

ARM recommends that, when possible, such IMPLEMENTATION DEFINED instruction sequences use the architecturally-defined operations. This minimizes the number of customized operations required.

In addition, an implementation that uses an abort mechanism for handling the effect of TLB maintenance instructions on entries that can be locked down but are not actually locked down must provide an IMPLEMENTATION DEFINED mechanism that ensures that no TLB entries are locked.

Similar rules apply to cache lockdown, see [The interaction of cache lockdown with cache maintenance instructions on page D4-2375](#).

The architecture does not guarantee that any unlocked entry in the TLB remains in the TLB. This means that, as a side effect of any TLB maintenance instruction, any unlocked entry in the TLB might be invalidated.

D5.10.3 Maintenance requirements on changing System register values

The TLB contents can be influenced by control bits in a number of System registers. This means the TLB entries associated with a translation regime affected by these control bits must be invalidated after any changes to these bits, unless the changes are accompanied by a change to the VMID or ASID, if appropriate depending on the translation regime, that defines the context to which the bits apply. The general form of the required invalidation sequence is as follows:

```
; Change control bits in System registers
ISB      ; Synchronize changes to the control bits
; Perform TLB invalidation of all entries that might be affected by the changed control bits
```

The System register changes that maintenance requirement applies to are:

- Any change to the [MAIR_EL1](#), [MAIR_EL2](#), or [MAIR_EL3](#) registers.
- Any change to the [AMAIR_EL1](#), [AMAIR_EL2](#), or [AMAIR_EL3](#) registers.
- Any change to [SCTLR_EL1.EE](#), [SCTLR_EL2.EE](#), or [SCTLR_EL3.EE](#).
- Any change to [SCTLR_EL1.WXN](#), [SCTLR_EL2.WXN](#), or [SCTLR_EL3.WXN](#).
- Any change to any of the [SCR_EL3](#).{RW, SIF} bits.
- Any change to any of the [HCR_EL2](#).{RW, DC, PTW, VM, NV1, NV, E2H} bits. See also [Changing HCR_EL2.PTW](#).
- Any changes to the registers that control address translation:
 - Any change to any of the [TCR_EL1](#), [TCR_EL2](#), [TCR_EL3](#), or [VTCR_EL2](#) registers.
 - Any change to the [TTBR0_EL1](#), [TTBR1_EL1](#), [TTBR1_EL2](#), [TTBR0_EL2](#), [TTBR0_EL3](#), or [VTTBR_EL2](#) registers.

Changing HCR_EL2.PTW

When the value of the Protected table walk bit, [HCR_EL2.PTW](#), is 1, a stage 1 translation table access in the Secure or Non-secure EL1&0, when EL2 is enabled, translation regime, to an address that is mapped to any type of Device memory by its stage 2 translation, generates a stage 2 Permission fault. A TLB associated with a particular [VMID](#) might hold entries that depend on the effect of [HCR_EL2.PTW](#). Therefore, if the value of [HCR_EL2.PTW](#) is changed without a change to the [VMID](#) value, all TLB entries associated with the current [VMID](#) must be invalidated before executing software at Non-secure EL1 or EL0. If this is not done, behavior is **CONSTRAINED UNPREDICTABLE**, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218](#).

D5.11 Caches in a VMSAv8-64 implementation

The ARM architecture describes the required behavior of an implementation of the architecture. As far as possible it does not restrict the implemented microarchitecture, or the implementation techniques that might achieve the required behavior.

In particular, maintaining this level of abstraction is difficult when describing the relationship between memory address translation and caches, especially regarding the indexing and tagging policy of caches. This section:

- Summarizes the architectural requirements for the interaction between caches and address translation.
- Gives some information about the likely implementation impact of the required behavior.

The following sections give this information:

- [Data and unified caches](#).
- [Instruction caches](#).

In addition, [Cache maintenance requirement created by changing translation table attributes on page D5-2535](#) describes the cache maintenance required after updating the translation tables to change the attributes of an area of memory.

For more information about cache maintenance see [A64 Cache maintenance instructions on page D4-2364](#), that describes the cache maintenance instructions in the A64 instruction set.

D5.11.1 Data and unified caches

For data and unified caches, the use of address translation is entirely transparent to any data access other than as described in [Mismatched memory attributes on page B2-132](#).

This means that the behavior of accesses from the same observer to different VAs, that are translated to the same PA with the same memory attributes, is fully coherent. This means these accesses behave as follows, regardless of which VA is accessed:

- Two writes to the same PA occur in program order.
- A read of a PA returns the value of the last successful write to that PA.
- A write to a PA that occurs, in program order, after a read of that PA, has no effect on the value returned by that read.

The memory system behaves in this way without any requirement to use barrier or cache maintenance instructions.

In addition, if cache maintenance is performed on a memory location, the effect of that cache maintenance is visible to all aliases of that physical memory location.

These properties are consistent with implementing all caches that can handle data accesses as *Physically-indexed, physically-tagged* (PIPT) caches.

D5.11.2 Instruction caches

In the ARM architecture, an instruction cache is a cache that is accessed only as a result of an instruction fetch. Therefore, an instruction cache is never written to by any load or store instruction executed by the PE.

The ARM architecture permits different behaviors for instruction caches. These are identified by descriptions of the associated expected implementation. The following subsections describe the behavior associated with these cache types, including any occasions where explicit cache maintenance is required to make the use of address translation transparent to the instruction cache:

- [PIPT \(Physically-indexed, physically-tagged\) instruction caches on page D5-2534](#).
- [VPIPT \(VMID-aware PIPT\) instruction caches on page D5-2534](#).
- [VIPT \(Virtually-indexed, physically-tagged\) instruction caches on page D5-2534](#).
- [The IVIPT Extension on page D5-2535](#).

The `CTR_EL0.L1Ip` field identifies the form of the instruction caches.

Note

For software to be portable between implementations that might use any of PIPT instruction caches, VPIPT instruction caches, or VIPT instruction caches, software must invalidate the instruction cache whenever any condition occurs that would require instruction cache maintenance for at least one of the instruction cache types.

PIPT (*Physically-indexed, physically-tagged*) instruction caches

For a PIPT instruction cache:

- The use of memory address translation is entirely transparent to all instruction fetches other than as described in *Mismatched memory attributes* on page B2-132.
- If cache maintenance is performed on a memory location, the effect of that cache maintenance is visible to all aliases of that physical memory location.

An implementation that provides PIPT instruction caches implements the IVIPT Extension, see *The IVIPT Extension* on page D5-2535.

VPIPT (*VMID-aware PIPT*) instruction caches

An ARMv8.2 implementation can implement VPIPT instruction caches. If it does so then it is described as implementing *ARMv8.2-VPIPT*.

The *CTR_EL0.L1Ip* field identifies the implemented cache type, meaning it identifies whether ARMv8.2-VPIPT is implemented.

For a VPIPT instruction cache:

- Instruction fetches from Non-secure EL1 and Non-secure EL0 are only permitted to hit in the cache if the instruction fetch is made using the VMID that was used when the entry in the instruction cache was fetched.
- An instruction cache maintenance instruction executed at Non-secure EL0 or at Non-secure EL1 is required to have an effect on entries in the instruction cache only if those entries were fetched using the VMID that is current when the cache maintenance instruction is executed.

All other requirements for the use of cache maintenance instructions are the same as for *PIPT (Physically-indexed, physically-tagged) instruction caches*.

An implementation that provides VPIPT instruction caches implements the IVIPT Extension, see *The IVIPT Extension* on page D5-2535.

VIPT (*Virtually-indexed, physically-tagged*) instruction caches

For a VIPT instruction cache:

- The use of memory address translation is transparent to all instruction fetches other than for the effect of memory address translation on instruction cache invalidate by address operations or as described in *Mismatched memory attributes* on page B2-132.

Note

Cache invalidation is the only cache maintenance that can be performed on an instruction cache.

- If instruction cache invalidation by address is performed on a memory location, the effect of that invalidation is visible only to the *VA* supplied with the operation. The effect of the invalidation might not be visible to any other aliases of that physical memory location.

The only architecturally-guaranteed way to invalidate all aliases of a *PA* from a VIPT instruction cache is to invalidate the entire instruction cache.

An implementation that provides VIPT instruction caches implements the IVIPT Extension, see *The IVIPT Extension* on page D5-2535.

The IVIPT Extension

In ARMv8, any permitted instruction cache implementation can be described as implementing the *IVIPT Extension* to the ARM architecture.

The formal definition of the ARM IVIPT Extension is that it reduces the instruction cache maintenance requirement to the following condition:

- Instruction cache maintenance is required only after writing new data to a [PA](#) that holds an instruction.

Note

Previous versions of the ARM architecture have permitted an instruction cache option that does not implement the ARM IVIPT Extension.

D5.11.3 Cache maintenance requirement created by changing translation table attributes

Any change to the translation tables to change the attributes of an area of memory can require maintenance of the translation tables, as described in [General TLB maintenance requirements on page D5-2515](#). If the change affects the cacheability attributes of the area of memory, including any change between Write-Through and Write-Back attributes, software must ensure that any cached copies of affected locations are removed from the caches, typically by cleaning and invalidating the locations from the levels of cache that might hold copies of the locations affected by the attribute change. Any of the following changes to the inner cacheability or outer cacheability attribute creates this maintenance requirement:

- Write-Back to Write-Through
- Write-Back to Non-cacheable
- Write-Through to Non-cacheable
- Write-Through to Write-Back.

The cache clean and invalidate avoids any possible coherency errors caused by mismatched memory attributes.

Similarly, to avoid possible coherency errors caused by mismatched memory attributes, the following sequence must be followed when changing the shareability attributes of a cacheable memory location:

1. Make the memory location Non-cacheable, Outer Shareable.
2. Clean and invalidate the location from them cache.
3. Change the shareability attributes to the required new values.

Chapter D6

The Performance Monitors Extension

This chapter describes the ARMv8 implementation of the ARM Performance Monitors, that are an optional non-invasive debug component. It describes version 3 of the *Performance Monitor Unit* (PMU) architecture, PMUv3. It contains the following sections:

- *About the Performance Monitors* on page D6-2538.
- *Accuracy of the Performance Monitors* on page D6-2540.
- *Behavior on overflow* on page D6-2542.
- *Attributability* on page D6-2544.
- *Effect of EL3 and EL2* on page D6-2545.
- *Event filtering* on page D6-2547
- *Performance Monitors and Debug state* on page D6-2549.
- *Counter enables* on page D6-2550.
- *Counter access* on page D6-2551.
- *PMU events and event numbers* on page D6-2553.
- *Performance Monitors Extension registers* on page D6-2585.

Note

[Table K13-2 on page K13-7396](#) disambiguates the general register references used in this chapter.

D6.1 About the Performance Monitors

In ARMv8-A, the Performance Monitors Extension is an OPTIONAL feature of an implementation, but ARM strongly recommends that ARMv8-A implementations include version 3 of the Performance Monitors Extension, PMUv3.

———— **Note** —————

No previous versions of the Performance Monitors Extension can be implemented in ARMv8.

The basic form of the Performance Monitors is:

- A 64-bit cycle counter, see [Time as measured by the Performance Monitors cycle counter on page D6-2539](#).
- A number of 32-bit event counters. The event counted by each counter is programmable. ARMv8 provides space for up to 31 counters. The actual number of counters is IMPLEMENTATION DEFINED, and the specification includes an identification mechanism.

———— **Note** —————

ARM recommends that at least two counters are implemented, and that hypervisors provide at least this many counters to guest operating systems.

- When EL2 is implemented and enabled in the current Security state, the required controls to partition the implemented counters into the following sets:
 - A set which is available for use by the guest operating system.
 - A set which is available for use by the hypervisor.

———— **Note** —————

ARMv8.3-NV does not introduce any changes to the Performance Monitors, see [Nested virtualization on page D5-2492](#).

- Controls for:
 - Enabling and resetting counters.
 - Flagging overflows.
 - Enabling interrupts on overflow.

Monitoring software can enable the cycle counter independently of the event counters.

The PMU architecture uses event numbers to identify an event. It:

- Defines event numbers for common events, for use across many architectures and microarchitectures.

———— **Note** —————

Implementations that include PMUv3 must, as a minimum requirement, implement a subset of the common events. See [Common event numbers on page D6-2558](#).

- Reserves a large event number space for IMPLEMENTATION DEFINED events.

The full set of events for an implementation is IMPLEMENTATION DEFINED. ARM recommends that implementations include all of the events that are appropriate to the architecture profile and microarchitecture of the implementation.

When an implementation includes the Performance Monitors Extension, ARMv8 defines the following possible interfaces to the Performance Monitors Extension registers:

- A System register interface. This interface is mandatory.

———— **Note** —————

In AArch32 state, the interface is in the (coproc==0b1111) encoding space.

- An external debug interface which optionally supports memory-mapped accesses. Implementation of this interface is OPTIONAL. See [Chapter 13 Recommended External Interface to the Performance Monitors](#).

An operating system can use the System registers to access the counters.

Also, if required, the operating system can enable application software to access the counters. This enables an application to monitor its own performance with fine-grain control without requiring operating system support. For example, an application might implement per-function performance monitoring.

To enable interaction with external monitoring, an implementation might consider additional enhancements, such as providing:

- A set of events, from which a selection can be exported onto a bus for use as external events.
- The ability to count external events. This enhancement requires the implementation to include a set of external event input signals.

The Performance Monitors Extension is common to AArch64 operation and AArch32 operation. This means the ARMv8 architecture defines both AArch64 and AArch32 System registers to access the Performance Monitors. For example, the Performance Monitors Cycle Count Register is accessible as:

- When executing in AArch64 state, [PMCCNTR_EL0](#).
- When executing in AArch32 state, [PMCCNTR](#).

D6.1.1 Time as measured by the Performance Monitors cycle counter

The Performance Monitors cycle counter, accessed through [PMCCNTR_EL0](#) or [PMCCNTR](#), increments from the hardware processor clock, not PE clock cycles.

The relationship between the count recorded by the Performance Monitors cycle counter and the passage of real time is IMPLEMENTATION DEFINED.

———— Note —————

- This means that, in an implementation where PEs are multithreaded, the counter continues to increment across all PEs, rather than only counting cycles for which the current PE is active.
- Although the architecture requires that direct reads of [PMCCNTR_EL0](#) or [PMCCNTR](#) occur in program order, there is no requirement that the count increments between two such reads. Even when the counter is incrementing on every clock cycle, software might need check that the difference between two reads of the counter is nonzero.

The architecture requires that an indirect write to the [PMCCNTR_EL0](#) or [PMCCNTR](#) is observable to direct reads of the register in finite time. The counter increments from the hardware processor clock are indirect writes to these registers.

D6.1.2 Interaction with trace

It is IMPLEMENTATION DEFINED whether the implementation exports counter events to a PE Trace Unit, or other external monitoring agent, to provide triggering information. The form of any exporting is also IMPLEMENTATION DEFINED. If implemented, this exporting might be enabled as part of the performance monitoring control functionality.

ARM recommends system designers include a mechanism for importing a set of external events to be counted, but such a feature is IMPLEMENTATION DEFINED. When implemented, this feature enables the PE Trace Unit to pass in events to be counted.

D6.1.3 Interaction with power saving operations

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions.

D6.2 Accuracy of the Performance Monitors

The Performance Monitors:

- Are a non-invasive debug component. See *Non-invasive behavior*.
- Must provide broadly accurate and statistically useful count information.

However, the Performance Monitors allow for:

- A reasonable degree of inaccuracy in the counts to keep the implementation and validation cost low. See *A reasonable degree of inaccuracy*.
- IMPLEMENTATION DEFINED controls, such as those in ACTLR registers, to put the PE in an operating state that might do one or both of the following:
 - Change the level of non-invasiveness of the Performance Monitors so that enabling an event counter can impact the performance or behavior of the PE.
 - Allow inaccurate counts. This includes, but is not limited to, cycle counts.

D6.2.1 Non-invasive behavior

The Performance Monitors are a non-invasive debug feature. A non-invasive debug feature permits the observation of data and program flow. Performance Monitors, PC Sample-based Profiling and Trace are non-invasive debug features.

Non-invasive debug components do not guarantee that they do not make any changes to the behavior or performance of the processor. Any changes that do occur must not be severe however, as this will reduce the usefulness of event counters for performance measurement and profiling. This does not include any change to program behavior that results from the same program being instrumented to use the Performance Monitors, or from some other performance monitoring process being run concurrently with the process being profiled in a multitasking operating system. As such, a reasonable variation in performance is permissible.

———— **Note** —————

Power consumption is one measure of performance. Therefore, a reasonable variation in power consumption is permissible.

ARM does not define a *reasonable variation in performance*, but recommends that such a variation is kept within 5% of normal operating performance, when averaged across a suite of code that is representative of the application workload.

———— **Note** —————

For profiles other than A-profile, there is the potential for stronger requirements. Ultimately, performance requirements are determined by end-users, and not set by the architecture.

For some common architectural events, this requirement to be non-invasive can conflict with the requirement to present an accurate value of the count under normal operating conditions. Should an implementation require more performance-invasive techniques to accurately count an event, there are the following options:

- If the event is optional, define an alternative implementation defined event that accurately counts the event and document the impact on performance of enabling the event.
- Provide an implementation defined control that disables accurate counting of the event to restore broadly accurate performance, and document the impact on performance of accurate counting.

D6.2.2 A reasonable degree of inaccuracy

The Performance Monitors provide broadly accurate and statistically useful count information. To keep the implementation and validation cost low, a reasonable degree of inaccuracy in the counts is acceptable. ARM does not define a *reasonable degree of inaccuracy* but recommends the following guidelines:

- Under normal operating conditions, the counters must present an accurate value of the count.

- In exceptional circumstances, such as a change in Security state or other boundary condition, it is acceptable for the count to be inaccurate.
- Under very unusual, non-repeating pathological cases, the counts can be inaccurate. These cases are likely to occur as a result of asynchronous exceptions, such as interrupts, where the chance of a systematic error in the count is very unlikely.

———— **Note** —————

An implementation must not introduce inaccuracies that can be triggered systematically by the execution of normal pieces of software. For example, it is not reasonable for the count of branch behavior to be inaccurate when caused by a systematic error generated by the loop structure producing a dropping in branch count.

However, dropping a single branch count as the result of a rare interaction with an interrupt is acceptable.

The permitted inaccuracy limits the possible uses of the Performance Monitors. In particular, the architecture does not define the point in a pipeline where the event counter is incremented, relative to the point where a read of the event counters is made. This means that pipelining effects can cause some imprecision.

A change of Security state can also affect the accuracy of the Performance Monitors, see [Interaction with EL3 on page D6-2545](#).

In addition to this, entry to and exit from Debug state can disturb the normal running of the PE, causing further inaccuracy in the Performance Monitors. Disabling the counters while in Debug state limits the extent of this inaccuracy. An implementation can employ methods to limit this inaccuracy, for example by promptly disabling the counters during the Debug state entry sequence.

An implementation must document any particular scenarios where significant inaccuracies are expected.

D6.3 Behavior on overflow

All events are counted in 32-bit wrapping counters, that overflow when they wrap. The cycle counter, [PMCCNTR](#), is a 64-bit wrapping counter, that is configured by [PMCR.LC](#) to either:

- Signal an overflow when bit [PMCCNTR\[63\]](#) overflows.
- Signal an overflow when bit [PMCCNTR\[31\]](#) overflows into bit [PMCCNTR\[32\]](#).

On a Performance Monitors counter overflow:

- An overflow status bit is set to 1. See [PMOVSCLR](#).
- An interrupt request is generated if the PE is configured to generate counter overflow interrupts. For more information, see [Generating overflow interrupt requests](#).
- The counter continues counting events.

D6.3.1 Generating overflow interrupt requests

Software can program the Performance Monitors so that an overflow interrupt request is generated when a counter overflows. See [PMINTENSET](#) and [PMINTENCLR](#).

———— **Note** ————

- The mechanism by which an interrupt request from the Performance Monitors generates an FIQ or IRQ exception is IMPLEMENTATION DEFINED.
- ARM recommends that the overflow interrupt requests:
 - Translate into a **PMUIRQ** signal, so that they are observable to external devices.
 - Connect to inputs on an IMPLEMENTATION DEFINED generic interrupt controller as a *Private Peripheral Interrupt* (PPI) for the originating processor. See the *ARM Generic Interrupt Controller Architecture Specification* for information about PPIs.
 - Connect to a *Cross Trigger Interface* (CTI), see [Chapter H5 The Embedded Cross-Trigger Interface](#).
- ARM strongly discourages implementations from connecting overflow interrupt requests from multiple PEs to the same *System Peripheral Interrupt* (SPI) identifier.
- From GICv3, the *ARM® Generic Interrupt Controller Architecture Specification* recommends that the *Private Peripheral Interrupt* (PPI) with ID 23 is used for overflow interrupt requests.

Counter overflow when counting one or more events generates an unsigned carry out. Software can write to the counters to control the frequency at which interrupt requests occur. For counters other than the cycle counter, the counter is always a 32-bit unsigned wrapping value. For example, software might set a counter to `0xFFFF0000`, to generate another counter overflow after 65 536 increments, and reset it to this value every time an overflow interrupt occurs.

———— **Note** ————

If an event can occur multiple times in a single clock cycle, then counter overflow can occur without the counter registering a value of zero.

The overflow interrupt request is a level-sensitive request. The PE signals a request for:

- Any given PMNx counter, when the value of [PMOVSSET\[x\]](#) is 1, the value of [PMINTENSET\[x\]](#) is 1, and one of the following is true:
 - EL2 is not implemented and the value of [PMCR.E](#) is 1.
 - EL2 is implemented, *x* is less than the value of [HDCR.HPMN](#), and the value of [PMCR.E](#) is 1.
 - EL2 is implemented, *x* is greater than or equal to the value of [HDCR.HPMN](#), and the value of [HDCR.HPME](#) is 1.
- The cycle counter, when the values of [PMOVSSET\[31\]](#), [PMINTENSET\[31\]](#), and [PMCR.E](#) are all 1.

The overflow interrupt request is active in both Secure and Non-secure states. In particular, if EL3 and EL2 are both implemented, overflow events from PMNx where *x* is greater than or equal to the value of [HDCR.HPMN](#) can be signaled from all modes and states but only if the value of [HDCR.HPME](#) is 1.

The interrupt handler for the counter overflow request must cancel the interrupt request, by writing to [PMOVSCLR\[x\]](#) to clear the overflow bit to 0.

Pseudocode description of overflow interrupt requests

See [Chapter J1 ARMv8 Pseudocode](#) for a pseudocode description of overflow interrupt requests. The [AArch64.CheckForPMUOverflow\(\)](#) and [AArch32.CheckForPMUOverflow\(\)](#) pseudocode functions signal PMU overflow interrupt requests to an interrupt controller and PMU overflow trigger events to the cross-trigger interface.

D6.4 Attributability

An event caused by the PE counting the event is Attributable. If an agent other than the PE that is counting the events causes an event, these events are Unattributable.

An event is defined as being either Attributable or Unattributable. If the event is Attributable, it is further defined whether it is Attributable to:

- The current Security state of the PE.
- The current Exception level of the PE.
- When the PE is in Debug state, operations issued to the PE by the debugger through the external debug interface.

In a multithreaded implementation, an event might be Attributable either to the current Exception level alone, or to both the Exception level and the Security state of another PE with the same values for [affinity](#) level 1 and higher.

———— **Note** —————

- In an implementation containing multiple PEs, each PE is identified by a unique *affinity* value reported by `MPIDR_EL1` {Aff3, Aff2, Aff1, Aff0}, where the value of affinity level 0 is the most significant for determining the PE behavior, and the values of higher affinity levels are less significant. Affinity level 3 is only supported in AArch64 state.
- An implementation is described as multithreaded when the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. In this section, when referring to a multithreaded implementation, *thread* is used to mean processing elements with different affinity level 0 values and the same values for affinity level 1 and higher.

An event can be defined as the combination of multiple subevents, which can be either Attributable or Unattributable.

All architecturally defined events are Attributable, unless otherwise stated.

Unattributable events might be counted when Attributable events are not counted. See:

- [Interaction with EL3 on page D6-2545](#).
- [Event filtering on page D6-2547](#).
- [Performance Monitors and Debug state on page D6-2549](#).

These sections are summarized by [Table D6-1](#) for events Attributable to the processor, and Unattributable events.

Table D6-1 Counting events

Counter and PMU enabled	State	Allowed or prohibited	Filtered	Event type		
				If Attributable to:	Then	Else
Yes	Non-debug	Allowed	Not filtered	X	Count	Count
			Filtered	Current Exception level	Do not count	IMPLEMENTATION DEFINED
		Prohibited	X	Current Security state	Do not count	IMPLEMENTATION DEFINED
	Debug	X	X	Debugger operations or raw cycles	Do not count	IMPLEMENTATION DEFINED
No	X	X	X	X	Do not count	Do not count

D6.5 Effect of EL3 and EL2

This section describes the effects of implementing EL3 and EL2 on the Performance Monitors. It contains the following subsections:

- [Interaction with EL3](#).
- [Interaction with EL2 on page D6-2546](#).

D6.5.1 Interaction with EL3

While counting events is never prohibited in Non-secure state, there are some restrictions on counting events in Secure state. From reset, counting events Attributable to Secure state is prohibited in Secure state. When executing in AArch32 state, software can set [SDCR.SPME](#) to 1 to permit event counting in Secure state. In AArch64 state, software can set [MDCR_EL3.SPME](#) to 1 to permit event counting in Secure state.

———— **Note** —————

This enables a Secure Monitor to permit profiling within Secure state without having to configure an IMPLEMENTATION DEFINED debug authentication interface.

The system can use the external authentication interface to override SPME.

If EL3 is not implemented, the behavior is as if the value of [SDCR.SPME](#) or [MDCR_EL3.SPME](#) is 1, as appropriate.

Counting Attributable events in Secure state is prohibited unless any one of the following is true:

- EL3 is not implemented.
- EL3 is implemented, is using AArch64, and the value of [MDCR_EL3.SPME](#) is 1.
- EL3 is implemented, is using AArch32, and the value of [SDCR.SPME](#) is 1.
- EL3 is implemented, EL3 or EL1 is using AArch32, executing at EL0, and the value of [SDER32_EL3.SUNIDEN](#) is 1.
- In ARMv8.0 and ARMv8.1 implementations, EL3 is implemented, and counting is permitted by an IMPLEMENTATION DEFINED authentication interface, `ExternalSecureNoninvasiveDebugEnabled() == TRUE`.

———— **Note** —————

Software can read the Authentication Status register, [DBGAUTHSTATUS](#), to determine the state of an IMPLEMENTATION DEFINED authentication interface.

Software executing at EL3 can trap attempts by lower Exception levels to access the PMU. This means that the Secure monitor can identify any software which is using the PMU and switch contexts, if required.

The cycle counter, [PMCCNTR](#), counts even when event counting is prohibited, unless [PMCR.DP](#) is set to 1 or the PE is in Debug state.

The Performance Monitors registers are always accessible regardless of the values of the authentication signals and the [SDER.SUNIDEN](#) bit. Authentication controls whether the counters count events, it does not control access to the Performance Monitors registers.

For each Unattributable event, it is IMPLEMENTATION DEFINED whether it is counted when counting Attributable events is prohibited.

———— **Note** —————

- Additional controls in [PMCR](#), [HDCR](#), [PMCNTENSET](#), and [PMCNTENCLR](#) can also disable the event counters and the cycle counter.
- Controls in [PMEVTYPER<n>](#) and [PMCCFILTR](#) can also disable counting based on Exception level and Security state.

See [AArch64.CountEvents\(\)](#) and [AArch32.CountEvents\(\)](#) in [Chapter J1 ARMv8 Pseudocode](#) for more information. The [CountEvents\(\)](#) functions return TRUE if PMNx counts events or the cycle counter counts cycles at the current Exception level and state. However, these functions do not completely describe the behavior for Unattributable events.

In AArch32 state, the Performance Monitors registers are Common registers, see [Classification of System registers on page G5-5586](#).

The Performance Monitors are intended to be broadly accurate and statistically useful, see [Accuracy of the Performance Monitors on page D6-2540](#). Some inaccuracy is permitted at the point of changing Security state, however. To avoid the leaking of information from the Secure state, the permitted inaccuracy is that transactions that are not prohibited can be uncounted. Where possible, prohibited transactions must not be counted, but if they are counted, then that counting must not degrade security.

Multithreaded implementations

If an implementation is multithreaded and the value of [PMEVTYPER<n>.MT == 1](#), then the PE does not count an event that is Attributable to Secure state on another thread if counting events Attributable to Secure state is prohibited in Secure state on the PE that is counting the events.

Example D6-1 The effect of having [PMEVTYPER<n>.MT == 1](#)

If the value of [MDCR_EL3.SPME](#) is 0 on one thread, then it does not count events Attributable to Secure state on another thread, even if one or both of the following applies:

- This thread is in Non-secure state.
- [MDCR_EL3.SPME == 1](#) on the other thread.

Otherwise:

- When the current configuration prohibits counting of events Attributable to Secure state in Secure state, it is implementation defined whether:
 - Counting events Attributable to Secure state on this PE in Non-secure state is permitted.
 - Counting Unattributable events related to other secure operations in the system is permitted.
- Otherwise, counting events in Non-secure state is permitted.

D6.5.2 Interaction with EL2

When EL2 is implemented and enabled in the current Security state, software executing at EL2 can:

- Trap any attempt by the Guest OS to access the PMU. This means the hypervisor can identify which Guest OSs are using the PMU and intelligently employ switching of the PMU state.
- Trap accesses to the [PMCR](#), so that it can fully virtualize the PMU identity registers, [PMCR.IMP](#) and [PMCR.IDCODE](#).
- Reserve the highest-numbered counters for its own use by overriding the value of [PMCR.N](#) seen by the Guest OS. The PE does not permit a Guest OS to access the reserved counters.

[HDCR](#) controls Performance Monitors virtualization.

For more information, see:

- [Counter enables on page D6-2550](#).
- [Counter access on page D6-2551](#).

D6.6 Event filtering

The PMU can filter events by various combinations of Exception level and Security state. This gives software the flexibility to count events across multiple processes.

D6.6.1 Filtering by Exception level and PE state

In AArch64 state:

- For each event counter `PMEVTYPER<n>_EL0` specifies the Exception levels in which the counter counts events Attributable to Exception levels.
- `PMCCFILTR_EL0` specifies the Exception levels in which the cycle counter counts.

In an implementation that supports multithreading:

- When the value of `PMEVTYPER<n>_EL0.MT` is 1, if an event is Attributable to another thread, then the specified filtering applies to the current Exception level and PE state of the thread to which the event is attributable, regardless of the Exception level and state of the counting thread.
- When the value of `PMEVTYPER<n>_EL0.MT` is 0, the event only counts events that are attributable to the counting thread, and the filtering applies to the Exception level and PE state of the counting state, see [Example D6-2](#).

Example D6-2 Example of the effect of the `PMEVTYPER<n>_EL0.MT` control

If the value of `PMEVTYPER<n>_EL0.U` is 0 on the current thread, then it does not count events Attributable to EL0 on the other thread, even if this thread is not executing at EL0.

Otherwise, for each Unattributable event, it is IMPLEMENTATION DEFINED whether the filtering applies.

In AArch32 state, the filtering controls are provided by the `PMEVTYPER<n>` and `PMCCFILTR` registers.

For more information, see the individual register descriptions.

D6.6.2 Accuracy of event filtering

The PMU architecture does not require event filtering to be accurate.

For most events, it is acceptable that, during a transition between states, events generated by instructions executed in one state are counted in the other state. The following sections describe the cases where event counts must not be counted in the wrong state:

- [Exception-related events](#).
- [Software increment events on page D6-2548](#).

Exception-related events

The PMU must filter events related to exceptions and exception handling according to the Exception level in which the event occurred. These events are:

- `EXC_TAKEN`, Exception taken.
- `EXC_RETURN`, Instruction architecturally executed, Condition code check pass, exception return.
- `CID_WRITE_RETIRED`, Instruction architecturally executed, Condition code check pass, write to `CONTEXTIDR`.
- `TTBR_WRITE_RETIRED`, Instruction architecturally executed, Condition code check pass, write to translation table base.

The PMU must not count an exception after it has been taken because this could systematically report a result of zero exceptions at EL0. Similarly, it is not acceptable for the PMU to count exception returns or writes to [CONTEXTIDR](#) after the return from the exception.

Software increment events

The PMU must filter software increment events according to the Exception level in which the software increment occurred. Software increment counting must also be precise, meaning the PMU must count every architecturally executed software increment event, and must not count any [Speculatively executed](#) software increment.

Software increment events must also be counted without the need for explicit synchronization. For example, two software increments executed without an intervening [Context synchronization event](#) must increment the event counter twice.

For more information, see [SW_INCR](#), [Instruction architecturally executed](#), [Condition code check pass](#), software increment.

Pseudocode description of event filtering

See [AArch64.CountEvents\(\)](#) and [AArch32.CountEvents\(\)](#) in [Chapter J1 ARMv8 Pseudocode](#) for a pseudocode description of event filtering. However, this function does not completely describe the behavior for Unattributable events.

D6.7 Performance Monitors and Debug state

Events that count cycles are not counted in Debug state.

Events Attributable to the operations issued by the debugger through the external debug interface are not counted in Debug state.

In an implementation that supports multithreading, when the value of `PMEVTYPER<n>_EL0.MT` is 1, if an event is Attributable to an operation issued by the debugger through the external debug interface to another thread that is in Debug state, then the event is not counted, and it is implementation defined whether the event is counted when the counting thread is in Debug state.

For each Unattributable event, it is IMPLEMENTATION DEFINED whether it is counted when the counting PE is in Debug state. If the event might be counted, then the rules in [Filtering by Exception level and PE state on page D6-2547](#) apply for the current Security state in Debug state.

D6.8 Counter enables

Table D6-2 shows an implementation that does not include EL2, and where the `PMCR.E` bit is a global counter enable bit, and `PMCNTENSET` provides an enable bit for each counter.

Table D6-2 Event counter enables when an implementation does not include EL2

<code>PMCR.E</code>	<code>PMCNTENSET[x] == 0</code>	<code>PMCNTENSET[x] == 1</code>
0	PMNx disabled	PMNx disabled
1	PMNx disabled	PMNx enabled

If the implementation includes EL2, then in addition to the `PMCR.E` and `PMCNTENSET` enable bits:

- `HDCR.HPME` overrides the value of `PMCR.E` for counters configured for access in Hyp mode.
- `HDCR.HPMN` specifies the number of performance counters that the Guest OS can access. The minimum permitted value of `HDCR.HPMN` is 1, meaning there must be at least one counter that the Guest OS can access.

Table D6-3 shows the combined effect of all the counter enable controls.

Table D6-3 Event counter enables when an implementation includes EL2

<code>HDCR.HPME</code>	<code>PMCR.E</code>	<code>PMCNTENSET[x] == 0</code>	<code>PMCNTENSET[x] == 1</code>	
			<code>x < HDCR.HPMN</code>	<code>x ≥ HDCR.HPMN</code>
0	0	PMNx disabled	PMNx disabled	PMNx disabled
0	1	PMNx disabled	PMNx enabled	PMNx disabled
1	0	PMNx disabled	PMNx disabled	PMNx enabled
1	1	PMNx disabled	PMNx enabled	PMNx enabled

Note

- The effect of `HDCR.{HPME, HPMN}` on the counter enables applies at all Exception levels and in both Security states.
- The value returned for `PMCR.N` is not affected by `HDCR.HPMN` at:
 - EL3.
 - EL2.
 - Secure EL1, if `ARMv8.4-SecEL2` is not implemented and enabled.
 - EL0, if `ARMv8.4-SecEL2` is not implemented and enabled.

EL2 does not affect the enabling of `PMCCNTR`. Table D6-4 shows the `PMCCNTR` enables, for all implementations.

Table D6-4 Cycle counter enables

<code>PMCR.E</code>	<code>PMCNTENSET[31] == 0</code>	<code>PMCNTENSET[31] == 1</code>
0	<code>PMCCNTR</code> disabled	<code>PMCCNTR</code> disabled
1	<code>PMCCNTR</code> disabled	<code>PMCCNTR</code> enabled

D6.9 Counter access

All implemented counters are accessible in EL3, Secure EL1 and EL2. If EL2 is implemented the hypervisor uses `HDCR.HPMN` to reserve an event counter, with the effect that software cannot access that counter and its associated state from Non-secure EL1 or from Non-secure EL0.

———— **Note** ————

This section describes a counter as being accessible from a particular Exception level and state. However, access to the registers is subject to the access permissions described in *Configurable instruction enables and disables, and trap controls on page D1-2208*. In particular, accesses from EL0 might be UNDEFINED and accesses might be trapped to EL1 or EL2.

D6.9.1 PMNx event counters

For an implementation that includes EL2 and EL3, [Table D6-5](#) shows how the values of the `HDCR.HPMN` field control the behavior of accesses to the PMNx event counter registers. In this table:

- NS The *Effective value* of `SCR_EL3.NS`.
- EEL2 The *Effective value* of `SCR_EL3.EEL2`.

Table D6-5 Result of PMNx event counter accesses

Condition	NS	EEL2	Access at Exception level			
			EL3	EL2	EL1	EL0
$x < \text{HDCR.HPMN}$	X	X	Succeeds	Succeeds if EL2 is implemented and enabled in the current Security state	Succeeds	Succeeds
$x \geq \text{HDCR.HPMN}$	0	0	Succeeds	n/a	Succeeds	Succeeds
		1	Succeeds	Succeeds	No access	No access
	1	X	Succeeds	Succeeds	No access	No access

Where [Table D6-5](#) shows no access:

- If `PMSELR.SEL` is n then:
 - A direct read of `PMXEVTYPER` or `PMXVCNTR` is CONstrained UNPREDICTABLE.
 - A direct write to `PMXEVTYPER` or `PMXVCNTR` is CONstrained UNPREDICTABLE.
- A direct read of `PMEVTYPER<n>` or `PMEVCNTR<n>` is CONstrained UNPREDICTABLE.
- A direct write of `PMEVTYPER<n>` or `PMEVCNTR<n>` is CONstrained UNPREDICTABLE.
- For direct reads and direct writes, `PMOVSCLR[n]`, `PMOVSSET[n]`, `PMCNTENSET[n]`, `PMCNTENCLR[n]`, `PMINTENSET[n]`, and `PMINTENCLR[n]` are RAZ/WI.
- Direct writes to `PMSWINC[n]` are ignored.
- A direct write of 1 to `PMCR.P` does not reset `PMNn`.

For more information on the CONstrained UNPREDICTABLE behavior of the Performance Monitor Extension, see:

- For AArch32, *The Performance Monitors Extension on page K1-7201*.
- For AArch64, *The Performance Monitors Extension on page K1-7220*.

———— **Note** ————

The value returned for `PMCR.N` is not affected by `HDCR.HPMN` at:

- EL3.
- EL2.
- Secure EL1, if [ARMv8.4-SecEL2](#) is not implemented and enabled.

- EL0, if [ARMv8.4-SecEL2](#) is not implemented and enabled.
-

D6.9.2 Cycle counter

The PMU does not provide any control that a hypervisor can use to reserve the cycle counter for its own use. The only control over the cycle counter is an access permission control for EL0. See [Configurable instruction enables and disables, and trap controls](#) on page D1-2208.

D6.10 PMU events and event numbers

The following sections describe the events that can be counted and their associated event numbers, and the mnemonics for the events:

- [Definitions](#).
- [The PMU event number space and common events on page D6-2557](#).
- [Common event numbers on page D6-2558](#).
- [Cycle event counting on multithreaded implementations on page D6-2581](#).
- [Meaningful ratios between common microarchitectural events on page D6-2582](#).
- [Required events on page D6-2582](#).
- [IMPLEMENTATION DEFINED event numbers on page D6-2583](#).

D6.10.1 Definitions

The following subsections give more information about terms used in the event definitions:

- [Definition of terms](#).
- [Levels of caches and TLBs on page D6-2556](#).
- [Shared caches and buses on page D6-2556](#).

Definition of terms

Instruction architecturally executed

Instruction architecturally executed is a class of event that counts for each instruction of the specified type. Architecturally executed means that the program flow is such that the counted instruction would be executed in a *Simple sequential execution* of the program. Therefore an instruction that has been executed and retired is defined to be *architecturally executed*. When a PE can perform speculative execution, an instruction is not architecturally executed if the PE discards the results of the speculative execution.

If an instruction that would be executed in a *Simple sequential execution* of the program generates a synchronous exception, it is IMPLEMENTATION DEFINED whether the instruction is counted.

Each architecturally executed instruction is counted once, even if the implementation splits the instruction into multiple operations. Instructions that have no visible effect on the architectural state of the PE are architecturally executed if they form part of the architecturally executed program flow. The point where such instructions are retired is IMPLEMENTATION DEFINED.

Examples of instructions that have no visible effect are:

- A NOP.
- A conditional instruction that fails its Condition code check.
- A Compare and Branch on Zero, CBZ, instruction that does not branch.
- A Compare and Branch on Nonzero, CBNZ, instruction that does not branch.

The point at which an event causes an event counter to be updated is not defined.

Unless otherwise stated, all instructions of the specified type are counted even if they have no visible effect on the architectural state of the PE. This includes a conditional instruction that fails its Condition code check.

For events that count only the execution of instructions that update context state, such as writes to the **CONTEXTIDR**, if such an instruction is executed twice without an intervening *Context synchronization event*, it is CONstrained UNPREDICTABLE whether the first instruction is counted.

Instruction architecturally executed, Condition code check pass

Instruction architecturally executed, Condition code check pass is a class of events that explicitly do not occur for:

- A conditional instruction that fails its Condition code check.
- A Compare and Branch on Zero, CBZ, instruction that does not branch.
- A Compare and Branch on Nonzero, CBNZ, instruction that does not branch.

- A Test and Branch on Zero, TBZ, instruction that does not branch.
- A Test and Branch on Nonzero, TBNZ, instruction that does not branch.
- A Store-Exclusive instruction that does not write to memory.

Otherwise, the definition of architecturally executed is the same as for [Instruction architecturally executed](#).

Instruction memory access

A PE acquires instructions for execution through instruction fetches. Instruction fetches might be due to:

- Fetching instructions that are architecturally executed.
- The result of the execution of an instruction preload instruction, PLI.
- Speculation that a particular instruction might be executed in the future.

The relationship between the fetch of an individual instruction and an instruction memory access is IMPLEMENTATION DEFINED. For example, an implementation might fetch many instructions including a non-integer number of instructions in a single instruction memory access.

Memory-read operations

A PE accesses memory through memory-read operations and [Memory-write operations](#). A memory-read operation might be due to:

- The result of an architecturally executed memory-reading instructions.
- The result of a [Speculatively executed](#) memory-reading instructions.
- A translation table walk.

For levels of cache hierarchy beyond the Level 1 caches, memory-read operations also include accesses made as part of a refill of another cache closer to the PE. Such refills might be due to:

- Memory-read operations or [Memory-write operations](#) that miss in the cache
- The execution of a data preload instruction.
- The execution of an instruction preload instruction on a unified cache.
- The execution of a cache maintenance instruction.

———— Note —————

A preload instruction or cache maintenance instruction is not, in itself, an access to that cache. However, it might generate cache refills which are then treated as memory-read operations beyond that cache.

- Speculation that a future instruction might access the memory location.

This list is not exhaustive.

The relationship between memory-read instructions and memory-read operations is IMPLEMENTATION DEFINED. For example, for some implementations an LDP instruction that reads two 64-bit registers might generate one memory-read operation if the address is quadword-aligned, but for other addresses it generates two or more memory-read operations.

Memory-write operations

Memory-write operations might be due to:

- The result of an architecturally executed memory-writing instructions.
- The result of a [Speculatively executed](#) memory-writing instructions.

———— Note —————

[Speculatively executed](#) memory-writing instructions that do not become architecturally executed must not alter the architecturally defined view of memory. They can, however, generate a memory-write operation that is later undone in some implementation specific way.

For levels of cache hierarchy beyond the Level 1 caches, memory-write operations also include accesses made as part of a write-back from another cache closer to the PE. Such write-backs might be due to:

- Evicting a dirty line from the cache, to allocate a cache line for a cache refill, see [Memory-read operations](#).
- The execution of a cache maintenance instruction.

———— **Note** ————

A cache maintenance instruction is not in itself an access to that cache. However, it might generate write-backs which are then treated as memory-write operations beyond that cache.

- The result of a coherency request from another PE.

This list is not exhaustive.

The relationship between memory-writing instructions and memory-write operations is IMPLEMENTATION DEFINED. For example, for some implementations an STP instruction that writes two 64-bit registers might generate one memory-write operation if the address is quadword-aligned, but for other addresses it generates two or more memory-write operations. In some implementations, the result of two STR instructions that write to adjacent memory might be merged into a single memory-write operation.

———— **Note** ————

The data written back from a cache that is shared with other PEs might not be data that was written by the PE that performs the operation that leads to the write-back. Nevertheless, the event is counted as a write-back event for that PE.

Microarchitectural operation

It is permissible for an implementation of a PE to break down instructions into separate, smaller, operations. The use of Microarchitectural operations (micro-ops) is IMPLEMENTATION DEFINED.

Slot

An implementation of a PE might be able to execute multiple micro-ops in a single processor cycle. The maximum number of micro-ops that can be executed might vary at different points in the execution pipeline.

To allow profiling of the utilization of the resource of the PE, an implementation specific point in the execution pipeline is chosen where the maximum number of micro-ops that can be executed is an IMPLEMENTATION DEFINED fixed value.

Each possible micro-op that can be executed at that point in a cycle is called a Slot. The maximum number of micro-ops that can be executed is defined by [PMMIR.SLOTS](#).

Speculatively executed

Many events relate to speculatively executed operations. Here, speculatively executed means the PE did some work associated with one or more instructions but the instructions were not necessarily architecturally executed.

An instruction might create one or more micro-ops at any point in the execution pipeline. For the purpose of event counting, the micro-ops are counted. The definition of a micro-op is implementation specific. An architecture instruction might create more than one micro-op for each instruction. micro-ops might also be removed or merged in the execution stream, so an architecture instruction might create no micro-ops for an instruction. Any arbitrary translation of instructions to an equivalent sequence of micro-ops is permitted.

This means there is no architecturally guaranteed relationship between a speculatively executed micro-op and an architecturally executed instruction. The results of such an operation can also be discarded, if it transpires that the operation was not required, such as a mispredicted branch. Therefore, ARMv8-A defines these events as *operation speculatively executed*, where appropriate.

Note

The definition of *speculatively executed* does not mean only those operations that are executed speculatively and later abandoned, for example due to a branch misprediction or fault. That is, speculatively executed operations must count operations on both false and correct execution paths.

The counting of operations can indicate the workload on the PE. However, there is no requirement for operations to represent similar amounts of work, and direct comparisons between different microarchitectures are not meaningful.

For example, an implementation might split an A32 or T32 LDM instruction of six registers into six micro-ops, one for each load, and a seventh address-generation operation to determine the base address or writeback address. Also, for doubleword alignment, the six load micro-ops might combine into four operations, that is, a word load, two doubleword loads, and a second word load. This single instruction can then be counted as five, or possibly six, events:

- Four (Operation speculatively executed - Load) events.
- One (Operation speculatively executed - Integer data processing) event.
- One (Operation speculatively executed - Software change of the PC) event if the PC was one of the six registers in the LDM instruction.

Different groups of events can have different IMPLEMENTATION DEFINED definitions of speculatively executed. Such groups share a common base type, which the event name denotes. Each of the events in the previous example is of the base type, operation speculatively executed.

For groups of events with a common base type, speculatively executed operations are all counted on the same basis, which normally means at the same point in the pipeline. It is possible to compare the counts and make meaningful observations about the program being profiled.

Within these groups, events are commonly defined with reference to a particular architecture instruction or group of instructions. In the case of speculatively executed operations this means operations with semantics that map to that type of instruction.

Levels of caches and TLBs

The mapping of different levels of cache or TLB to the PMU events is determined by the implementation. Although the [CLIDR_EL1](#), or the AArch32 [CLIDR](#), defines the implemented levels of cache, the architecture does provide any way of determining implemented levels of TLB. Also, many implementations include structures that provide some caching at a higher level than the level 1 caches or TLBs. Typically, these structures, that might be called Level 0 caches, or mini caches, or microcaches, are invisible to software. The implementation-specific nature of cache and TLB implementations mean that, in general, PMU event counts cannot be used reliably to make direct comparisons between different implementations.

Shared caches and buses

There is no architectural concept of a *shared* component. However, when a cache, a bus, or any other system component that might generate countable events is implemented, and:

- The extent of the first-order effects due to an event from that component are only applicable to a single PE, then the event is not shared.
- Otherwise, the event is shared.

Second-order effects are not considered when determining if an event is shared.

Example D6-3 First and second order effects of a cache miss in a multiple-PE implementation

In an implementation that consists of two PEs, each with its own L1 cache, a cache miss by one of the PEs is a first-order effect of an access to its cache. Any snoop that is performed on the L1 cache of the other PE in the implementation as a result of that cache miss is a second order effect.

———— **Note** ————

Shared events are inherently linked to microarchitectures and so the implementer must make an informed decision about how such events are implemented.

D6.10.2 The PMU event number space and common events

In ARMv8.0, the event number space is 10 bits. ARMv8.1 extends the event number space, and therefore the `PMEVTYPER<n>_EL0.evtCount` field to 16 bits, and is allocated as [Table D6-6](#) shows. For more information about the entries in the *Allocation* column see the text that follows this table:

Table D6-6 Allocation of the PMU event number space

Event numbers	Allocation
In all versions of ARMv8	
0x0000-0x003F	Common architectural and microarchitectural events.
0x0040-0x00BF	ARM-recommended common architectural and microarchitectural events.
0x00C0-0x03FF	IMPLEMENTATION DEFINED events.
From ARMv8.1	
0x0400-0x3FFF	IMPLEMENTATION DEFINED events.
0x4000-0x403F	Common architectural and microarchitectural events.
0x4040-0x40BF	ARM-recommended common architectural and microarchitectural events.
0x40C0-0x7FFF	IMPLEMENTATION DEFINED events.
0x8000-0x80FF	Common SVE events and ARM-recommended common SVE events.
0x8100-0xBFFF	Reserved.
0xC000-0xC0BF	Reserved.
0xC0C0-0xFFFF	IMPLEMENTATION DEFINED events.

The meaning of the entries in the *Allocation* column of [Table D6-6](#) is as follows:

Common architectural and microarchitectural events

ARM defines the use of these event numbers. For more information see [Common event numbers on page D6-2558](#).

ARM-recommended common architectural and microarchitectural events

The use of these event numbers is IMPLEMENTATION DEFINED. For more information see:

- [IMPLEMENTATION DEFINED event numbers on page D6-2583](#).
- [Appendix K3 Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events](#).

IMPLEMENTATION DEFINED event numbers

For more information about the use of these event numbers see [IMPLEMENTATION DEFINED event numbers on page D6-2583](#).

D6.10.3 Common event numbers

The event numbers of the common architectural and microarchitectural events are reserved for the specified events. Each of these event numbers must either:

- Be used for its assigned event.
- Not be used.

However, see [Required events on page D6-2582](#).

When an implementation supports monitoring of an event that is assigned a common architectural or microarchitectural event number, ARM strongly recommends that it uses that number for the event. However, software might encounter implementations where an event assigned a number in this range is monitored using an event number from an IMPLEMENTATION DEFINED range.

———— **Note** —————

ARM might define other common architectural and microarchitectural event numbers. This is one reason why software must not assume that an event with an assigned common architectural or microarchitectural event number is never monitored using an event number from the IMPLEMENTATION DEFINED range.

[Table D6-7](#) lists the PMU common architectural and microarchitectural event numbers in event number order. The entries in the *Event mnemonic* column link to the event description in [Common architectural events on page D6-2562](#) or [Common microarchitectural events on page D6-2566](#).

Table D6-7 PMU common architectural and microarchitectural event numbers

Event number	Event type	Event mnemonic	Description
0x0000	Architectural	SW_INCR	Instruction architecturally executed, Condition code check pass , software increment
0x0001	Microarchitectural	L1I_CACHE_REFILL ^a	Level 1 instruction cache refill
0x0002	Microarchitectural	L1I_TLB_REFILL ^a	Attributable Level 1 instruction TLB refill
0x0003	Microarchitectural	L1D_CACHE_REFILL ^a	Level 1 data cache refill
0x0004	Microarchitectural	L1D_CACHE	Level 1 data cache access
0x0005	Microarchitectural	L1D_TLB_REFILL ^a	Attributable Level 1 data TLB refill
0x0006	Architectural	LD_RETIRED	Instruction architecturally executed, Condition code check pass , load
0x0007	Architectural	ST_RETIRED	Instruction architecturally executed, Condition code check pass , store
0x0008	Architectural	INST_RETIRED	Instruction architecturally executed
0x0009	Architectural	EXC_TAKEN	Exception taken
0x000A	Architectural	EXC_RETURN	Instruction architecturally executed, Condition code check pass , exception return
0x000B	Architectural	CID_WRITE_RETIRED	Instruction architecturally executed, Condition code check pass , write to CONTEXTIDR
0x000C	Architectural	PC_WRITE_RETIRED	Instruction architecturally executed, Condition code check pass , software change of the PC
0x000D	Architectural	BR_IMMED_RETIRED	Instruction architecturally executed , immediate branch

Table D6-7 PMU common architectural and microarchitectural event numbers (continued)

Event number	Event type	Event mnemonic	Description
0x000E	Architectural	BR_RETURN_RETIRED	Instruction architecturally executed, Condition code check pass, procedure return
0x000F	Architectural	UNALIGNED_LDST_RETIRED	Instruction architecturally executed, Condition code check pass, unaligned load or store
0x0010	Microarchitectural	BR_MIS_PRED	Mispredicted or not predicted branch <i>Speculatively executed</i>
0x0011	Microarchitectural	CPU_CYCLES	Cycle
0x0012	Microarchitectural	BR_PRED	Predictable branch <i>Speculatively executed</i>
0x0013	Microarchitectural	MEM_ACCESS	Data memory access
0x0014	Microarchitectural	L1I_CACHE	Attributable Level 1 instruction cache access
0x0015	Microarchitectural	L1D_CACHE_WB	Attributable Level 1 data cache write-back
0x0016	Microarchitectural	L2D_CACHE	Level 2 data cache access
0x0017	Microarchitectural	L2D_CACHE_REFILL ^a	Level 2 data cache refill
0x0018	Microarchitectural	L2D_CACHE_WB	Attributable Level 2 data cache write-back
0x0019	Microarchitectural	BUS_ACCESS	Bus access
0x001A	Microarchitectural	MEMORY_ERROR	Local memory error
0x001B	Microarchitectural	INST_SPEC	Operation <i>Speculatively executed</i>
0x001C	Architectural	TTBR_WRITE_RETIRED	Instruction architecturally executed, Condition code check pass, write to TTBR
0x001D	Microarchitectural	BUS_CYCLES	Bus cycle
0x001E	Architectural	CHAIN	For odd-numbered counters, increments the count by one for each overflow of the preceding even-numbered counter. For even-numbered counters, there is no increment.
0x001F	Microarchitectural	L1D_CACHE_ALLOCATE	Attributable Level 1 data cache allocation without refill
0x0020	Microarchitectural	L2D_CACHE_ALLOCATE	Attributable Level 2 data cache allocation without refill
0x0021	Architectural	BR_RETIRED	Instruction architecturally executed, branch
0x0022	Microarchitectural	BR_MIS_PRED_RETIRED	Instruction architecturally executed, mispredicted branch
0x0023	Microarchitectural	STALL_FRONTEND	No operation issued due to the frontend
0x0024	Microarchitectural	STALL_BACKEND	No operation issued due to backend
0x0025	Microarchitectural	L1D_TLB	Attributable Level 1 data or unified TLB access
0x0026	Microarchitectural	L1I_TLB	Attributable Level 1 instruction TLB access
0x0027	Microarchitectural	L2I_CACHE	Attributable Level 2 instruction cache access
0x0028	Microarchitectural	L2I_CACHE_REFILL ^a	Attributable Level 2 instruction cache refill

Table D6-7 PMU common architectural and microarchitectural event numbers (continued)

Event number	Event type	Event mnemonic	Description
0x0029	Microarchitectural	L3D_CACHE_ALLOCATE	Attributable Level 3 data or unified cache allocation without refill
0x002A	Microarchitectural	L3D_CACHE_REFILL ^a	Attributable Level 3 data cache refill
0x002B	Microarchitectural	L3D_CACHE	Attributable Level 3 data cache access
0x002C	Microarchitectural	L3D_CACHE_WB	Attributable Level 3 data or unified cache write-back
0x002D	Microarchitectural	L2D_TLB_REFILL ^a	Attributable Level 2 data or unified TLB refill
0x002E	Microarchitectural	L2I_TLB_REFILL ^a	Attributable Level 2 instruction TLB refill
0x002F	Microarchitectural	L2D_TLB	Attributable Level 2 data or unified TLB access
0x0030	Microarchitectural	L2I_TLB	Attributable Level 2 instruction TLB access
0x0031	Microarchitectural	REMOTE_ACCESS	Attributable access to another socket in a multi-socket system
0x0032	Microarchitectural	LL_CACHE	Attributable Last Level data cache access
0x0033	Microarchitectural	LL_CACHE_MISS ^a	Attributable Last level data or unified cache miss
0x0034	Microarchitectural	DTLB_WALK ^a	Attributable data or unified TLB access with at least one translation table walk
0x0035	Microarchitectural	ITLB_WALK ^a	Attributable instruction TLB access with at least one translation table walk
0x0036	Microarchitectural	LL_CACHE_RD	Attributable Last Level cache memory read
0x0037	Microarchitectural	LL_CACHE_MISS_RD ^a	Attributable Last Level cache memory read miss
0x0038	Microarchitectural	REMOTE_ACCESS_RD ^a	Attributable memory read access to another socket in a multi-socket system
0x0039	Microarchitectural	L1D_CACHE_LMISS_RD	Level 1 data cache long-latency read miss
0x003A	Microarchitectural	OP_RETIRED	Micro-operation architecturally executed
0x003B	Microarchitectural	OP_SPEC	Micro-operation <i>Speculatively executed</i>
0x003C	Microarchitectural	STALL	No operation sent for execution
0x003D	Microarchitectural	STALL_SLOT_BACKEND	No operation sent for execution on a <i>Slot</i> due to the backend
0x003E	Microarchitectural	STALL_SLOT_FRONTEND	No operation sent for execution on a <i>Slot</i> due to the frontend
0x003F	Microarchitectural	STALL_SLOT	No operation sent for execution on a <i>Slot</i>
0x0040	Microarchitectural	L1D_CACHE_RD	Level 1 data cache read
0x4000	Microarchitectural	SAMPLE_POP	Sample Population
0x4001	Microarchitectural	SAMPLE_FEED	Sample Taken
0x4002	Microarchitectural	SAMPLE_FILTRATE	Sample Taken and not removed by filtering

Table D6-7 PMU common architectural and microarchitectural event numbers (continued)

Event number	Event type	Event mnemonic	Description
0x4003	Microarchitectural	SAMPLE_COLLISION	Sample collided with previous sample
0x4004	Microarchitectural	CNT_CYCLES	Constant frequency cycles
0x4005	Microarchitectural	STALL_BACKEND_MEM	Memory stall cycles
0x4006	Microarchitectural	L1I_CACHE_LMISS	Level 1 instruction cache long-latency miss
0x4009	Microarchitectural	L2D_CACHE_LMISS_RD	Level 2 data cache long-latency read miss
0x400A	Microarchitectural	L2I_CACHE_LMISS	Level 2 instruction cache long-latency miss
0x400B	Microarchitectural	L3D_CACHE_LMISS_RD	Level 3 data cache long-latency read miss
0x8002	Architectural	SVE_INST_RETIRED	SVE Instructions architecturally executed
0x8006	Microarchitectural	SVE_INST_SPEC	SVE Instructions speculatively executed

a. For more information, see [Meaningful ratios between common microarchitectural events on page D6-2582](#).

The supported common architectural and microarchitectural events are identified by:

- The [PMCEID0_EL0](#) and [PMCEID1_EL0](#) registers in AArch64 state.
- The [PMCEID0](#), [PMCEID1](#), [PMCEID2](#), and [PMCEID3](#) registers in AArch32 state.

ARM recommends that the value of 0 is used for the [PMCEID0_EL0](#) or [PMCEID1_EL0](#) bit corresponding to any event that an implementation never generates, even if the implementation is considered to support but never count the event.

———— **Note** —————

- For example, if an implementation never generates the [L1D_CACHE_ALLOCATE](#) event, event 31, ARM recommends that [PMCEID0_EL0\[31\]](#) is RAZ.
- In an implementation that supports both Execution states, each bit in the AArch64 [PMCEID0_EL0](#) and [PMCEID1_EL0](#) registers corresponds to a single bit in the AArch32 [PMCEID0](#), [PMCEID1](#), [PMCEID2](#), and [PMCEID3](#) registers, and corresponding bits must have the same behavior.

However, for some implementations, an event in the common events range might be generated by the system, meaning behavior can vary between systems. In such a case, the corresponding [PMCEID_n_EL0](#) bit might be RAO.

Event numbers that [Table D6-6 on page D6-2557](#) shows as allocated for common architectural and microarchitectural events that are not shown in [Table D6-7 on page D6-2558](#) are reserved. Future revisions of this manual, or of the architecture, might assign these reserved values to additional common events. Events that do not require additional features in the PMU can be implemented retrospectively, meaning an implementation of a particular version of the PMU specification might support common events that are first defined in a later version of the PMU specification.

———— **Note** —————

- The requirement that an event that is implemented retrospectively *does not require additional features in the PMU* means that it must be possible to represent the event *n* in the [PMEVTYPER<n>_EL0.evtCount](#) field. This means, for example, that an implementation with a 12-bit [PMEVTYPER<n>_EL0.evtCount](#) field can only implement events with event numbers [0x000-0xFFF](#).
- This means that, for example, an ARMv7 PMUv2 implementation, for which the [evtCount](#) field is 8 bits, can include support for any of the event numbers that [Table D6-7 on page D6-2558](#) defines in the range [0x00-0xFF](#).

Common architectural events

This section describes the use of the defined common architectural event numbers.

For the common features, normally the counters must increment only once for each event. The event descriptions include any exceptions to this rule.

In these definitions, the term *architecturally executed* means that the instruction flow is such that the counted instruction would have been executed in a *Simple sequential execution* model.

The events corresponding to the common architectural event numbers are:

0x0000, SW_INCR, **Instruction architecturally executed, Condition code check pass, software increment**

The counter increments on writes to the PMSWINC register.

If the PE performs two architecturally executed writes to the PMSWINC register without an intervening *Context synchronization event*, then the counter is incremented twice.

If PMEVTYPER<n>_EL0.evtCount is set to 0x000, then in AArch64 state, counts MSR writes to PMSWINC_EL0 with bit [n] set to 1.

If the value of PMEVTYPER<n>_EL0.MT is 1 then, in a multithreaded implementation, this counts writes by all PEs that have the same *affinity* at level 1 and above.

0x0006, LD_RETIRE, **Instruction architecturally executed, Condition code check pass, load**

The counter increments for every executed memory-reading instruction.

———— Note ————

This event 0x006 does not count the return status value of a Store-Exclusive instruction.

Whether the preload instructions PRFM, PLD, PLDW, PLI, count as memory-reading instructions is IMPLEMENTATION DEFINED. ARM recommends that if the instruction is not implemented as a NOP then it is counted as a memory-reading instruction.

0x0007, ST_RETIRE, **Instruction architecturally executed, Condition code check pass, store**

The counter increments for every executed memory-writing instruction.

DC ZVA is counted as a store.

The counter does not increment for a Store-Exclusive instruction that fails.

0x0008, INST_RETIRE, **Instruction architecturally executed**

The counter increments for every architecturally executed instruction.

0x0009, EXC_TAKEN, **Exception taken**

The counter increments for each exception taken. See *Exception-related events* on page D6-2547.

———— Note ————

The counter counts the PE exceptions described in:

- For exceptions taken to an Exception level using AArch64, *Exception entry* on page D1-2170.
- For exceptions taken to an Exception level using AArch32, *AArch32 state exception descriptions* on page G1-5274.

0x000A, EXC_RETURN, **Instruction architecturally executed, Condition code check pass, exception return**

The counter increments for each executed exception return instruction. See also *Exception-related events* on page D6-2547. The following sections define the counted instructions:

- For an exception return from an Exception level using AArch64, *Exception return* on page D1-2179.
- For an exception return from an Exception level using AArch32, *Exception return instructions* on page G1-5261.

However, is **CONSTRAINED UNPREDICTABLE** whether this event counts the execution of an exception return instruction if either:

- Execution of the instruction is, itself, **CONSTRAINED UNPREDICTABLE**.

———— **Note** —————

Examples of when an exception return instruction is **CONSTRAINED UNPREDICTABLE** are if the instruction is executed at EL0, or in AArch32 state in System mode.

- Execution of the instruction sets **PSTATE.IL** and does not generate an exception return.

———— **Note** —————

A particular consequence of this **CONSTRAINED UNPREDICTABLE** behavior is that an implementation that does not support AArch32 state at EL1 or higher does not have to treat AArch32 **MOVS PC**, **LR** instructions, and related instructions, as exception return instructions.

0x000B, CID_WRITE_RETIRED, Instruction architecturally executed, Condition code check pass, write to CONTEXTIDR

The counter increments for every write to **CONTEXTIDR**. See *Exception-related events on page D6-2547*.

If the PE performs two architecturally-executed writes to **CONTEXTIDR** without an intervening *Context synchronization event*, it is **CONSTRAINED UNPREDICTABLE** whether the first write is counted.

When ARMv8.1-VHE is implemented, the counter is:

- Incremented as a result of the retirement of an instruction accessing the named register **CONTEXTIDR_EL1**, even when executing at EL2.
- Not incremented as a result of the retirement of an instruction accessing the named **CONTEXTIDR_EL12**.

———— **Note** —————

The event is defined by the name used to access the register. The counter does not count writes to the named register **CONTEXTIDR_EL2**.

0x000C, PC_WRITE_RETIRED, Instruction architecturally executed, Condition code check pass, software change of the PC

The counter increments for every software change of the PC. This includes all:

- Branch instructions.
- Memory-reading instructions that explicitly write to the PC.
- Data-processing instructions that explicitly write to the PC.
- Exception return instructions, **ERET** and **RET**.

It is **IMPLEMENTATION DEFINED** whether the counter increments for any or all of:

- **BRK** and **BKPT** instructions.
- An exception generated because an instruction is **UNDEFINED**.
- The exception-generating instructions, **SVC**, **HVC**, and **SMC**.

It is **IMPLEMENTATION DEFINED** whether an **ISB** is counted as a software change of the PC.

The counter does not increment for exceptions other than those explicitly identified in these lists.

———— **Note** —————

Conditional branches are only counted if the branch is taken.

0x000D, BR_IMMED_RETIRED, Instruction architecturally executed, immediate branch

The counter counts all immediate branch instructions that are architecturally executed.

In AArch32 state, the counter increments each time the PE executes one of the following instructions:

- B{<c>} <label>.
- BL{<c>} <label>.
- BLX{<c>} <label>.
- CBZ <Rn>, <label>.
- CBNZ <label>.

In AArch64 state, the counter increments each time the PE executes an immediate branch instructions:

- B <label>.
- B.cond <label>.
- BL <label>.
- CBZ <Rn>, <label>.
- CBNZ <Rn>, <label>.
- TBZ <Rn>, <label>.
- TBNZ <Rn>, <label>.

————— **Note** —————

Conditional branches are always counted, regardless of whether the branch is taken.

If an ISB is counted as a software change of the PC instruction, then it is IMPLEMENTATION DEFINED whether an ISB is counted as an immediate branch instruction.

0x000E, BR_RETURN_RETIRED, Instruction architecturally executed, Condition code check pass, procedure return

In AArch32 state, the counter counts the following procedure return instructions:

- BX R14.
- MOV PC, LR.
- POP {..., PC}.
- LDR PC, [SP], #offset.

————— **Note** —————

The counter counts only the listed instructions as procedure returns. For example, it does not count the following as procedure return instructions:

- BX R0, because Rm != R14.
- MOV PC, R0, because Rm != R14.
- LDM SP, {..., PC}, because writeback is not specified.
- LDR PC, [SP, #offset], because this specifies the wrong addressing mode.

In AArch64 state, the counter counts all architecturally executed RET instructions.

0x000F, UNALIGNED_LDST_RETIRED, Instruction architecturally executed, Condition code check pass, unaligned load or store

The counter counts each memory-reading instruction or memory-writing instruction access that would generate an Alignment fault when Alignment fault checking is enabled.

This event does not count accesses that would generate an SP alignment fault exception if the applicable stack pointer alignment check is enabled, unless that access would also generate an Alignment fault Data Abort exception if Alignment fault checking is enabled.

It is IMPLEMENTATION DEFINED whether this event counts accesses that generate an exception, including accesses that do generate Alignment fault Data Abort exceptions.

See [SP alignment checking on page D1-2164](#) for more information.

See [Unaligned data access on page E2-3580](#) for more information.

0x001C, **TTBR_WRITE_RETIRED**, **Instruction architecturally executed, Condition code check pass**, write to **TTBR**

The counter counts writes to **TTBR0_EL1** and **TTBR1_EL1** in AArch64 state and **TTBR0** and **TTBR1** in AArch32 state. When EL3 is implemented and using AArch32, this includes counting writes to both banked copies of **TTBR0** and **TTBR1**. See *Exception-related events on page D6-2547*.

If the PE executes two writes to the same **TTBR**, without an intervening *Context synchronization event*, it is CONSTRAINED UNPREDICTABLE whether the first write to the **TTBR**, is counted.

If EL3 is implemented and using AArch64, the counter does not count writes to **TTBR0_EL3**.

If EL2 is implemented and using AArch64, the counter does not count writes to **TTBR0_EL2** and to **VTTBR_EL2**.

If EL2 is implemented and using AArch32, the counter does not count writes to **HTTBR** and to **VTTBR**.

When ARMv8.1-VHE is implemented, the counter is:

- Incremented as a result of the retirement of an instruction accessing the named registers **TTBR0_EL1** and **TTBR1_EL1**.
- Not incremented as a result of the retirement of an instruction accessing the named registers **TTBR0_EL12** and **TTBR1_EL12**.

0x001E, **CHAIN**

For an odd-numbered counter, increments when an overflow occurs on the preceding even-numbered counter on the same PE. Even-numbered counters never increment as a result of this event. This means the **CHAIN** event links the odd-numbered counter with the preceding even-numbered counter to provide a 64-bit counter.

———— **Note** —————

- The **CHAIN** event means a system can provide N 32-bit counters, $N/2$ 64-bit counters, or a mixture of 32-bit counters and 64-bit counters.
- The **CHAIN** event only counts overflows from the preceding even-numbered counter on the same PE. This means it is unaffected by the value of **PMEVTYPER<n>_EL0.MT**.

To filter the Exception levels and Security states in which the event is counted, software must:

- Program **PMEVTYPER<n>_EL0** to count the event in the required conditions.
- Program **PMEVTYPER<n+1>_EL0** to count the **CHAIN** event in all Exception levels and states.

This allows, (but does not require) hardware to ignore the filter settings for the **CHAIN** event and behave as if they are set to count in all Exception levels and states.

If software does not program the event in this way, the count becomes UNPREDICTABLE.

There is no atomic access to a pair of counters, so if software reads a counter-pair that is enabled, it must use a high-low-high read sequence, or employ reasonable heuristics, to avoid tearing.

Similarly, if using **CHAIN** events, when disabling the counters software must take care that the result is not torn by the low counter overflowing at the same time as the counters are disabled

[Example D6-4](#) shows suitable sequences for disabling and enabling **CHAIN** counters.

Example D6-4 Usage examples for 64-bit counters

An example high-low-high read sequence for a 64-bit counter is:

```

MRS W2,PMEVCNTR1_EL0    ;; read high counter, must be odd-numbered
retry:
  ISB                    ;; force ordering
  MRS W0,PMEVCNTR0_EL0  ;; read low counter
                        ;; must return the previous counter to PMEVCNTR1_EL0
  ISB                    ;; force ordering

```

```
MRS W1, PMEVCNTR1_EL0    ;; read high counter
CMP W1, W2
BNE retry                ;; if the high counter has changed, then retry
```

When disabling a pair of counters that are paired by a CHAIN event, software must:

1. Disable the low counter, by setting `PMEVCNTR<n>_EL0[n]` to 1.
Typically, software uses a read-modify-write sequence to update `PMCNTENCLR_EL0`.
2. Execute an ISB instruction, or perform another *Context synchronization event*.
3. Disable the high counter, by setting `PMCNTENCLR_EL0[n+1]` to 1, or setting `PMCR_EL0.E` to 0.

When enabling a pair of counters that are paired by a CHAIN event, software must:

1. Enable the high counter, by setting `PMCNTENCLR_EL0[n+1]` to 0 and, if necessary, setting `PMCR_EL0.E` to 1.
2. Execute an ISB instruction, or perform another *Context synchronization event*.
3. Enable the low counter by setting `PMCNTENCLR_EL0[n]` to 0.

When using 64-bit counters, the architecture does not define the latency between the first counter overflowing and the second counter incrementing the CHAIN event. There is no requirement for updates to occur synchronously, but software reading or enabling the counter pair using a *low-ISB-high* sequence, as shown in [Example D6-4 on page D6-2565](#), must not observe the low counter incrementing and overflowing for the event and the high counter not incrementing for the resulting CHAIN event. This means that the ISB executed after reading the low counter must ensure the completion of the update of the high counter by the CHAIN event.

0x0021, **BR_RETIRE**D, **Instruction architecturally executed, branch**

The counter counts all branches on the architecturally executed path that would incur cost if mispredicted.

- Counts all branch instructions, memory-reading and data-processing instructions that explicitly write to the PC, at retirement.
- Counts both taken and not-taken branches.
- It is implementation defined whether this includes each of:
 - Unconditional direct branch instructions.
 - Exception-generating instructions.
 - Exception return instructions.
 - Context synchronization instructions.

0x8006, **SVE_INST_RETIRE**D, **Instruction architecturally executed, SVE**

This event counts architecturally executed SVE instructions. It is IMPLEMENTATION DEFINED whether this event counts non-SIMD SVE instructions.

Common microarchitectural events

This section describes the use of the defined common microarchitectural event numbers.

The common microarchitectural events are features that are likely to be implemented across a wide range of implementations. Unlike the common architectural events, there can be some IMPLEMENTATION DEFINED variation between definitions on different implementations.

Unless otherwise stated, the common microarchitectural features relate only to events resulting from the operation of the PE counting the events. Events resulting from the operation of other PEs that might share a resource must not be counted. Where a resource can be subject to events that do not result from the operation of any of the PEs that share it, ARM recommends that the resource implements its own event counters. An example of a resource that might require its own event counters is a shared Level 2 cache that is subject to accesses from a system coherency port on that cache.

The event definitions relating to Level 2 caches generally assume the Level 2 cache is shared. The event definitions relating to Level 1 caches generally assume the Level 1 cache is not shared.

The events corresponding to the common microarchitectural event numbers are:

0x0001, L1I_CACHE_REFILL, Level 1 instruction cache refill

The counter counts each access counted by [L1I_CACHE](#) that causes a demand refill of any of the Level 1 caches outside the Level 1 caches of this PE.

A refill includes any access that causes data to be fetched from outside the cache, even if the data is ultimately not allocated into the cache. For example, data might be fetched into a buffer but then discarded, rather than being allocated into a cache. These buffers are treated as part of the cache.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted by this event.

See also:

- [Attributability on page D6-2544.](#)
- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x0002, L1I_TLB_REFILL, Attributable Level 1 instruction TLB refill

The counter counts Attributable instruction memory accesses that cause a TLB refill of at least the Level 1 instruction TLB. This includes each [Instruction memory access](#) that causes an access to a level of memory system due to a translation table walk or an access to another level of TLB caching. It is IMPLEMENTATION DEFINED whether the count increments when:

- A refill results in a Translation fault.
- A refill is not allocated in the TLB.

The counter does not count:

- A TLB miss that does not cause a refill but does generate a translation table walk.
- TLB maintenance instructions.

See also:

- [Attributability on page D6-2544.](#)
- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x0003, L1D_CACHE_REFILL, Level 1 data cache refill

The counter counts each access counted by [L1D_CACHE](#) that causes a demand refill of at least the Level 1 data or unified cache from outside the Level 1 cache. Each access to a cache line that causes a new linefill is counted, including those from instructions that generate multiple accesses, such as load or store multiples, and PUSH and POP instructions. In particular, the counter counts accesses to the Level 1 cache that cause a refill that is satisfied by another Level 1 data or unified cache, or a Level 2 cache, or memory.

A refill includes any access that causes data to be fetched from outside the cache, even if the data is ultimately not allocated into the cache. For example, data might be fetched into a buffer but then discarded, rather than being allocated into a cache. These buffers are treated as part of the cache.

The counter does not count:

- A miss that does not cause a new refill but is satisfied by the refill of a previous miss, even if that previous refill is not complete at the time of the miss.
- A miss that does not generate a refill, such as a write through the cache.
- If [ARMv8.4-PMU](#) is not implemented, cache maintenance instructions.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted by this event.

See also:

- [Attributability on page D6-2544.](#)
- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x0004, L1D_CACHE, Level 1 data cache access

The counter counts each [Memory-read operation](#) or [Memory-write operation](#) that causes a cache access to at least the Level 1 data or unified cache. If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted.

Each access to a cache line is counted including the multiple accesses of instructions, such as LDM or STM. Each access to other Level 1 data or unified memory structures, for example refill buffers, write buffers, and write-back buffers, is also counted.

If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

See also [Attributability](#) on page D6-2544.

0x0005, L1D_TLB_REFILL, Attributable Level 1 data TLB refill

The counter counts each Attributable [Memory-read operation](#) or Attributable [Memory-write operation](#) that causes a TLB refill of at least the Level 1 data or unified TLB. It counts each read or write that causes a refill, in the form of a translation table walk or an access to another level of TLB caching. It is IMPLEMENTATION DEFINED whether the count increments when:

- A refill results in a Translation fault.
- A refill is not allocated in the TLB.

The counter does not count:

- A TLB miss that does not cause a refill but does generate a translation table walk.
- TLB maintenance instructions.

See also:

- [Attributability](#) on page D6-2544.
- [Meaningful ratios between common microarchitectural events](#) on page D6-2582.

0x0010, BR_MIS_PRED, Mispredicted or not predicted branch [Speculatively executed](#)

The counter counts each correction to the predicted program flow that occurs because of a misprediction from, or no prediction from, the branch prediction resources and that relates to instructions that the branch prediction resources are capable of predicting.

If no program-flow prediction resources are implemented, ARM recommends that the counter counts all branches that are not taken.

0x0011, CPU_CYCLES, Cycle

The counter increments on every cycle.

All counters are subject to changes in clock frequency, including when a WFI or WFE instruction stops the clock. This means that it is CONstrained UNPREDICTABLE whether or not CPU_CYCLES continues to increment when the clocks are stopped by WFI and WFE instructions.

———— Note —————

Unlike [PMCCNTR](#), this count is not affected by [PMCR.DP](#), [PMCR.D](#), or [PMCR.C](#):

- The counter is not incremented in prohibited regions, so is not affected by [PMCR.DP](#).
- The counter increments on every cycle, regardless of the setting of [PMCR.D](#).
- The counter is reset when event counters are reset by [PMCR.P](#), never by [PMCR.C](#).

In a multithreaded implementation, CPU_CYCLES counts each cycle for the processor for which this PE thread was active and could issue an instruction. For more information, see [Cycle event counting on multithreaded implementations](#) on page D6-2581.

0x0012, BR_PRED, Predictable branch [Speculatively executed](#)

The counter counts every branch or other change in the program flow that the branch prediction resources are capable of predicting.

If all branches are subject to prediction, for example a BTB or BTAC, then all branches are predictable branches.

If branches are decoded before the predictor, so that the branch prediction logic dynamically predicts only some branches, for example conditional and indirect branches, then it is IMPLEMENTATION DEFINED whether other branches are counted as predictable branches. ARM recommends that all branches are counted.

An implementation might include other structures that predict branches, such as a loop buffer that predicts short backwards direct branches as taken. Each execution of such a branch is a predictable branch. Terminating the loop might generate a misprediction event that is counted by [BR_MIS_PRED](#).

If no program-flow prediction resources are implemented, this event is optional, but ARM recommends that BR_PRED counts all branches.

0x0013, MEM_ACCESS, Data memory access

The counter counts [Memory-read operations](#) and [Memory-write operations](#) that the PE made. The counter increments whether the access results in an access to a Level 1 data or unified cache, a Level 2 data or unified cache, or neither of these.

The counter does not increment as a result of:

- Instruction memory accesses, see [Definition of terms on page D6-2553](#).
- Translation table walks.
- Write-back from any cache.
- Refilling of any cache.

If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

0x0014, L1I_CACHE, Attributable Level 1 instruction cache access

The counter counts Attributable instruction memory accesses that access at least the Level 1 instruction or unified cache. Each access to other Level 1 instruction memory structures, such as refill buffers, is also counted.

See also [Attributability on page D6-2544](#).

0x0015, L1D_CACHE_WB, Attributable Level 1 data cache write-back

The counter counts every write-back of data from the Level 1 data or unified cache. The counter counts each write-back that causes data to be written from the Level 1 cache to outside of the Level 1 cache. For example, the counter counts the following cases:

- A write-back that causes data to be written to a Level 2 cache or memory.
- A write-back of a recently fetched cache line that has not been allocated to the Level 1 cache.
- Transfer of data from the Level 1 cache to outside of this cache made as a result of a coherency request. The conditions determining which of these are counted for transfers to other Level 1 caches within the same multiprocessor cluster are IMPLEMENTATION DEFINED.

Each write-back is counted once, even if multiple accesses are required to complete the write-back.

Whether write-backs made as a result of cache maintenance instructions are counted is IMPLEMENTATION DEFINED.

The counter does not count:

- The invalidation of a cache line without any write-back to a Level 2 cache or memory.
- Writes from the PE that write through the Level 1 cache to outside of the Level 1 cache.

An Unattributable write-back event occurs when a requestor outside the PE makes a coherency request that results in write-back. If the cache is shared, then an Unattributable write-back event is not counted. If the cache is not shared, then the event is counted. See [Attributability on page D6-2544](#).

It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache, is counted. For example, this applies when the PE determines streaming writes to memory and does not allocate lines to the cache, or by a DC ZVA operation.

See also [Attributability on page D6-2544](#).

0x0016, L2D_CACHE, Level 2 data cache access

The counter counts each [Memory-read operation](#) or [Memory-write operation](#) that causes a cache access to at least the Level 2 data or unified cache. If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted.

Each access to a cache line is counted including refills of and write-backs from the Level 1 data, instruction, or unified caches. Each access to other Level 2 data or unified memory structures, such as refill buffers, write buffers, and write-back buffers, is also counted.

If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

See also [Attributability](#) on page D6-2544.

0x0017, L2D_CACHE_REFILL, Level 2 data cache refill

The counter counts each access counted by [L2D_CACHE](#) that causes a refill of a demand refill of any of the Level 1 or Level 2 caches from outside the Level 1 and Level 2 caches of the PE.

A refill includes any access that causes data to be fetched from outside the cache, even if the data is ultimately not allocated into the cache. For example, data might be fetched into a buffer but then discarded, rather than being allocated into a cache. These buffers are treated as part of the cache.

For example, the counter counts:

- Accesses to the Level 2 cache that cause a refill that is satisfied by another Level 2 cache, a Level 3 cache, or memory.
- Refills of and write-backs from any Level 1 data, instruction or unified cache that cause a refill from outside the Level 1 and Level 2 caches.
- Accesses to the Level 2 cache that cause a refill of a Level 1 cache from outside of the Level 1 and Level 2 caches, even if there is no refill of the Level 2 cache.

The counter does not count, as events on this PE:

- A miss that does not cause a new refill but is satisfied by the refill of a previous miss, even if that previous refill is not complete at the time of the miss.
- A miss that does not generate a refill, such as a write through the cache.
- If [ARMv8.4-PMU](#) is not implemented, cache maintenance instructions.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted by this event.

See also:

- [Attributability](#) on page D6-2544.
- [Meaningful ratios between common microarchitectural events](#) on page D6-2582.

0x0018, L2D_CACHE_WB, Attributable Level 2 data cache write-back

The counter counts every write-back of data from the Level 2 data or unified cache that occurs as a result of an operation by this PE. It counts each write-back that causes data to be written from the Level 2 cache to outside the Level 1 and Level 2 caches. For example, the counter counts:

- A write-back that causes data to be written to a Level 3 cache or memory.
- A write-back of a recently fetched cache line that has not been allocated to the Level 2 cache.

Each write-back is counted once, even if it requires multiple accesses to complete the write-back.

It is IMPLEMENTATION DEFINED whether the counter counts:

- A transfer of data from the Level 2 cache to outside the Level 1 and Level 2 cache made as a result of a coherency request.
- Write-backs made as a result of Cache maintenance instructions.

The counter does not count:

- The invalidation of a cache line without any write-back to a Level 3 cache or memory.

- Writes from the PE or Level 1 data or unified cache that write through the Level 2 cache to outside the Level 1 and Level 2 caches.
- Transfers of data from the Level 2 cache to a Level 1 cache, to satisfy a Level 1 cache refill.

An Unattributable write-back event occurs when a requestor outside the PE makes a coherency request that results in write-back. If the cache is shared, then an Unattributable write-back event is not counted. If the cache is not shared, then the event is counted.

It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache, is counted. For example, this applies when the PE determines streaming writes to memory and does not allocate lines to the cache, or by a DC ZVA operation.

See also [Attributability](#) on page D6-2544.

0x0019, **BUS_ACCESS, Attributable Bus access**

The counter counts [Memory-read operations](#) and [Memory-write operations](#) that access outside of the boundary of the PE and its closely-coupled caches. Where this boundary lies with respect to any implemented caches is IMPLEMENTATION DEFINED.

The definition of a bus access is IMPLEMENTATION DEFINED but physically is a single beat rather than a burst. That is, for each bus cycle for which the bus is active.

Bus accesses include refills of and write-backs from data, instruction, and unified caches. Whether bus accesses include operations that do use the bus but not explicitly transfer data is IMPLEMENTATION DEFINED.

An Unattributable bus access occurs when a requestor outside the PE makes a request that results in a bus access, for example, a coherency request. If the bus is shared, then an Unattributable bus access is not counted. If the bus is not shared, then the event is counted.

If the bus is shared, then only Attributable bus accesses are counted. If the bus is not shared, then all bus accesses are counted.

Where an implementation has multiple buses at this boundary, this event counts the sum of accesses across all buses.

If a bus supports multiple accesses per cycle, for example through multiple channels, the counter increments once for each channel that is active on a cycle, and so it might increment by more than one in any given cycle.

The maximum increment in any given cycle is implementation defined.

See also:

- [Attributability](#) on page D6-2544.
- [Meaningful ratios between common microarchitectural events](#) on page D6-2582.

0x001A, **MEMORY_ERROR, Local memory error**

The counter counts every occurrence of a memory error signaled by a memory closely coupled to this PE. The definition of local memories is IMPLEMENTATION DEFINED but includes caches, tightly-coupled memories, and TLB arrays.

Memory error refers to a physical error detected by the hardware, such as a parity or ECC error. It includes errors that are correctable and those that are not. It does not include errors as defined in the architecture, such as MMU faults.

0x001B, **INST_SPEC, Operation Speculatively executed**

The counter counts instructions that are [Speculatively executed](#) by the PE. This includes instructions that are subsequently not architecturally executed. The definition of [Speculatively executed](#) is IMPLEMENTATION DEFINED.

0x001D, **BUS_CYCLES, Bus cycle**

The counter increments on every cycle of the interface at the boundary of the PE and its closely-coupled caches. Where this boundary lies with respect to any implemented caches is IMPLEMENTATION DEFINED.

Note

If the implementation clocks the external memory interface at the same rate as the processor hardware, the counter counts every cycle.

See also [Meaningful ratios between common microarchitectural events](#) on page D6-2582.

0x001F, L1D_CACHE_ALLOCATE, Attributable Level 1 data cache allocation without refill

The counter increments on every Attributable write that writes an entire line into the Level 1 cache without fetching from outside the Level 1 cache, for example:

- A write from a coalescing buffer of a full cache line.
- A DC ZVA operation.

See also [Attributability](#) on page D6-2544.

0x0020, L2D_CACHE_ALLOCATE, Attributable Level 2 data cache allocation without refill

The counter increments on every Attributable write that writes an entire line into the Level 2 cache without fetching from outside the Level 1 or Level 2 caches, for example:

- A write-back from a Level 1 to Level 2 cache.
- A write from a coalescing buffer of a full cache line.
- A DC ZVA operation.

See also [Attributability](#) on page D6-2544.

0x0022, BR_MIS_PRED_RETIRE, Instruction architecturally executed, mispredicted branch

The counter counts all instructions counted by BR_RETIRE that were not correctly predicted.

If no program-flow prediction resources are implemented, this event counts all retired not-taken branches.

0x0023, STALL_FRONTEND, No operation issued due to the frontend

The counter counts every cycle counted by the CPU_CYCLES event on which no operation was issued because there are no operations available to issue for this PE from the frontend.

The division between frontend and backend is IMPLEMENTATION DEFINED. STALL, STALL_FRONTEND, and STALL_BACKEND events must count at the same point in the pipeline.

Note

- For a simplified pipeline model of Fetch → Decode → Issue → Execute → Retire, ARM recommends that the events are counted when instructions are dispatched from Decode to Issue.
- On a given cycle, both events might be counted if the backend is unable to accept any operations and there are no operations available to issue from the frontend.

For more information, see [Cycle event counting on multithreaded implementations](#) on page D6-2581.

0x0024, STALL_BACKEND, No operation issued due to the backend

The counter counts every cycle counted by the CPU_CYCLES event on which no operation was issued because either:

- The backend is unable to accept any of the operations available for issue for this PE.
- The backend is unable to accept any operations.

For example, the back end might be unable to accept operations because of a resource conflict or non-availability.

The division between frontend and backend is IMPLEMENTATION DEFINED. STALL, STALL_FRONTEND, and STALL_BACKEND events must count at the same point in the pipeline. See STALL_FRONTEND for more information.

For more information, see [Cycle event counting on multithreaded implementations](#) on page D6-2581.

0x0025, L1D_TLB, Attributable Level 1 data or unified TLB access

The counter counts each Attributable [Memory-read operation](#) or Attributable [Memory-write operation](#) that causes a TLB access to at least the Level 1 data or unified TLB. Each access to a TLB record is counted including the multiple accesses of instructions, such as LDM or STM.

The counter does not count TLB maintenance instructions.

See also [Attributability on page D6-2544](#).

0x0026, L1I_TLB, Attributable Level 1 instruction TLB access

The counter counts each Attributable [Instruction memory access](#) that causes a TLB access to at least the Level 1 instruction or unified TLB.

The counter does not count TLB maintenance instructions.

See also [Attributability on page D6-2544](#).

0x0027, L2I_CACHE, Attributable Level 2 instruction cache access

The counter counts Attributable instruction memory accesses that access at least the Level 2 instruction or unified cache. Each Attributable access to other Level 2 instruction memory structures, such as refill buffers, is also counted.

See also [Attributability on page D6-2544](#).

0x0028, L2I_CACHE_REFILL, Attributable Level 2 instruction cache refill

The counter counts each access counted by [L2I_CACHE](#) that causes a demand refill of any of the Level 1 or 2 caches outside the Level 1 or 2 caches of this PE.

A refill includes any access that causes data to be fetched from outside the cache, even if the data is ultimately not allocated into the cache. For example, data might be fetched into a buffer but then discarded, rather than being allocated into a cache. These buffers are treated as part of the cache.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted by this event.

See also:

- [Attributability on page D6-2544](#).
- [Meaningful ratios between common microarchitectural events on page D6-2582](#).

0x0029, L3D_CACHE_ALLOCATE, Attributable Level 3 data cache allocation without refill

The counter increments on every Attributable write that writes an entire line into the Level 3 cache without fetching from outside the Level 1, Level 2, or Level 3 cache, for example:

- A write-back from a Level 2 to Level 3 cache.
- A write from a coalescing buffer of a full cache line.
- A DC ZVA operation.

See also [Attributability on page D6-2544](#).

0x002A, L3D_CACHE_REFILL, Attributable Level 3 data cache refill

The counter counts each access counted by [L3D_CACHE](#) which causes a demand refill of any of the Level 1, Level 2, or Level 3 caches from outside the Level 1, Level 2, and Level 3 caches.

A refill includes any access that causes data to be fetched from outside the cache, even if the data is ultimately not allocated into the cache. For example, data might be fetched into a buffer but then discarded, rather than being allocated into a cache. These buffers are treated as part of the cache.

The counter does not count as events on this PE:

- A miss that does not cause a new refill but is satisfied by the refill of a previous miss, even if that previous refill is not complete at the time of the miss.
- A miss that does not generate a refill, such as a write through the cache.
- If [ARMv8.4-PMU](#) is not implemented, cache maintenance instructions.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted by this event.

See also:

- [Attributability on page D6-2544](#).
- [Meaningful ratios between common microarchitectural events on page D6-2582](#).

0x002B, L3D_CACHE, Attributable Level 3 data cache access

The counter counts each [Memory-read operation](#) or [Memory-write operation](#) that causes a cache access to at least the Level 3 data or unified cache. If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted.

Each access to a cache line is counted including refills of and write-backs from the Level 1 or Level 2 data, instruction, or unified caches. Each access to other Level 3 data or unified memory structures, such as refill buffers, write buffers, and write-back buffers, is also counted.

If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

See also [Attributability on page D6-2544](#).

0x002C, L3D_CACHE_WB, Attributable Level 3 data cache write-back

The counter counts every write-back of data from the Level 3 data or unified cache that occurs as a result of an operation by this PE. It counts each write-back that causes data to be written from the Level 3 cache to outside of the Level 1, Level 2, and Level 3 caches. For example, the counter counts the following cases:

- A write-back that causes data to be written to a Level 4 cache, or to memory.
- A write-back of a recently fetched cache line that has not been allocated to the Level 3 cache.

Each write-back is counted once, even if multiple accesses are required to complete the write-back.

It is IMPLEMENTATION DEFINED whether the counter counts:

- A transfer of data from the Level 3 cache to outside the Level 1, Level 2, and Level 3 caches made as a result of a coherency request.
- A write-back made as a result of a Cache maintenance instruction.

The counter does not count:

- The invalidation of a cache line without any write-back to a Level 4 cache or memory.
- Writes from the PE, Level 1, or Level 2 data or unified cache, that write through the Level 3 cache to outside of the Level 3 cache.
- Transfers of data from the Level 3 cache to a Level 1 or Level 2 cache, to satisfy a Level 1 or Level 2 cache refill.

An Unattributable write-back event occurs when a requestor outside the PE makes a coherency request that results in write-back. If the cache is shared, then Unattributable write-back events are not counted. If the cache is not shared, then Unattributable write-back events are counted.

It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache, is counted. For example, this applies when the PE determines streaming writes to memory and does not allocate lines to the cache, or by a DC ZVA operation.

See also [Attributability on page D6-2544](#).

0x002D, L2D_TLB_REFILL, Attributable Level 2 data TLB refill

The counter counts each Attributable [Memory-read operation](#) or Attributable [Memory-write operation](#) that causes a TLB refill of at least the Level 2 data or unified TLB. It counts each Attributable read or Attributable write that causes a refill, in the form of a translation table walk or an access to another level of TLB caching. It is IMPLEMENTATION DEFINED whether the count increments when:

- A refill results in a Translation fault.
- A refill is not allocated in the TLB.

The counter does not count:

- A TLB miss that does not cause a refill but does generate a translation table walk.
- TLB maintenance instructions.

See also:

- [Attributability on page D6-2544](#).
- [Meaningful ratios between common microarchitectural events on page D6-2582](#).

0x002E, L2I_TLB_REFILL, Attributable Level 2 instruction TLB refill

The counter counts Attributable instruction memory accesses that cause a TLB refill of at least the Level 2 instruction TLB. This includes each Attributable [Instruction memory access](#) that causes an access to a level of memory system due to a translation table walk or an access to another level of TLB caching. It is IMPLEMENTATION DEFINED whether the count increments when:

- A refill results in a Translation fault.
- A refill is not allocated in the TLB.

The counter does not count:

- A TLB miss that does not cause a refill but does generate a translation table walk.
- TLB maintenance instructions.

See also:

- [Attributability on page D6-2544](#).
- [Meaningful ratios between common microarchitectural events on page D6-2582](#).

0x002F, L2D_TLB, Attributable Level 2 data or unified TLB access

The counter counts each Attributable memory read operation or Attributable memory write operation that causes a TLB access to at least the Level 2 data or unified TLB. Each access to a TLB record is counted, including the multiple accesses of instructions such as LDM or STM.

The counter does not count TLB maintenance instructions.

See also [Attributability on page D6-2544](#).

0x0030, L2I_TLB, Attributable Level 2 instruction TLB access

The counter counts each Attributable memory read operation or Attributable memory write operation that causes a TLB access to at least the Level 2 instruction or unified TLB.

The counter does not count TLB maintenance instructions.

See also [Attributability on page D6-2544](#).

0x0031, REMOTE_ACCESS, Access to another socket in a multi-socket system

The counter counts each Attributable memory read operation or memory write operation that causes an access to another socket in a multi-socket system.

It is IMPLEMENTATION DEFINED whether an access that causes a snoop into another socket but does not return data from or pass data to the remote socket is counted.

See also [Attributability on page D6-2544](#).

0x0032, LL_CACHE, Last Level cache access

The counter counts each [Memory-read operation](#) or [Memory-write operation](#) that causes a cache access to at least the Last Level data or unified cache. If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted.

If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

See also [Attributability on page D6-2544](#).

0x0033, LL_CACHE_MISS, Last Level cache miss

The Counter counts each Attributable [Memory-read operation](#) or [Memory-write operation](#) that causes a cache access to at least the Last Level data or unified cache, but is not completed by the Last Level cache. That is, either of the following:

- A memory read operation that does not return data from the Last Level cache.
- A memory write operation that does not update the Last Level cache.

The counter does not count operations that are completed by a cache above the Last Level cache.

If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

See also:

- [Attributability on page D6-2544.](#)
- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x0034, DTLB_WALK, Access to data TLB causes a translation table walk

The counter counts each Attributable memory read or memory write operation that causes a refill of a data or unified TLB involving at least one translation table walk access. This includes each complete or partial translation table walk that causes an access to memory, including to data or translation table walk caches.

The counter does not count TLB maintenance instructions.

See also:

- [Attributability on page D6-2544.](#)
- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x0035, ITLB_WALK, Access to instruction TLB that causes a translation table walk

The counter counts each Attributable [Instruction memory access](#) that causes a refill of an instruction TLB, involving at least one translation table walk access. This includes each complete or partial translation table walk that causes an access to memory, including to data or translation table walk caches.

The counter does not count TLB maintenance instructions.

See also:

- [Attributability on page D6-2544.](#)
- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x0036, LL_CACHE_RD, Attributable Last level cache memory read

As [LL_CACHE](#), but counts only memory read accesses.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted by this event.

See also:

- [Attributability on page D6-2544.](#)
- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x0037, LL_CACHE_MISS_RD, Last level cache miss, read

As [LL_CACHE_MISS](#), but counts only memory read operations.

If [ARMv8.4-PMU](#) is not implemented, the counter does not count cache maintenance instructions. If [ARMv8.4-PMU](#) is implemented, it is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

See also:

- [Attributability on page D6-2544.](#)
- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x0038, REMOTE_ACCESS_RD, Access to another socket in a multi-socket system, read

As [REMOTE_ACCESS](#), but counts only memory read operations.

See also:

- [Attributability](#) on page D6-2544.
- [Meaningful ratios between common microarchitectural events](#) on page D6-2582.

0x0039, L1D_CACHE_LMISS_RD, Level 1 data cache long-latency read miss

The counter counts each memory read access counted by [L1D_CACHE](#) that incurs additional latency because it returns data from outside the Level 1 data or unified cache of this PE.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. It is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

The event indicates to software that the access missed in the Level 1 data or unified cache and might have a significant performance impact compared to the latency of an access that hits in the Level 1 data or unified cache.

This counter does not count:

- Access where the additional latency is unlikely to be significantly performance-impacting. For example, if the access hits in another cache in the same local cluster, and the additional latency is small when compared against a miss in all Level 1 caches that the access looks up in that results in an access being made to a Level 2 cache or elsewhere beyond the Level 1 data and unified cache.
- A miss that does not cause a new cache refill but is satisfied from a previous miss.

An implementation is not required to measure the latency nor to track the access to determine whether the additional latency had a performance impact. An implementation can extend the definition of this event with additional scenarios where a memory read access counted by [L1D_CACHE](#) might have a significant performance impact due to additional latency for the address.

See also [Attributability](#) on page D6-2544.

0x003A, OP_RETIRED, Micro-operation architecturally executed

The counter counts each operation counted by [OP_SPEC](#) that would be executed in a [Simple sequential execution](#) of the program.

0x003B, OP_SPEC, Micro-operation Speculatively executed

The counter counts the number of operations executed by the PE, including those that are executed speculatively and would not be executed in a [Simple sequential execution](#) of the program.

0x003C, STALL, No operation sent for execution

The counter counts every Attributable cycle on which no Attributable instruction or operation was sent for execution on this PE.

If the implementation is multi-threaded:

- When [PMEVTYPEPER<n>_EL0.MT](#) = 0b0, the counter counts cycles for which only instructions or operations Attributable to other PEs are sent for execution when this PE is eligible to execute instructions or operations on that cycle. The counter does not count cycles when this PE of the multi-threaded operation is not eligible to execute instructions or operations.
- When [PMEVTYPEPER<n>_EL0.MT](#) = 0b1, the counter counts all cycles when no instructions or operations for any PE of the multi-threaded operation are sent for execution.

The division between frontend and backend is IMPLEMENTATION DEFINED. [STALL](#), [STALL_FRONTEND](#), and [STALL_BACKEND](#) events must count at the same point in the pipeline. For more information, see [STALL_FRONTEND](#).

See also:

- [Attributability](#) on page D6-2544.

- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x003D, STALL_SLOT_BACKEND, No operation sent for execution on a Slot due to the backend

Counts each Slot counted by STALL_SLOT where no Attributable instruction or operation was sent for execution because the backend is unable to accept one of:

- The instruction operation available for the PE on the Slot.
- Any operations on the Slot.

The division between frontend and backend is IMPLEMENTATION DEFINED. STALL_SLOT, STALL_SLOT_FRONTEND, and STALL_SLOT_BACKEND events must count at the same point in the pipeline. The maximum value that STALL_SLOT_FRONTEND and STALL_SLOT_BACKEND events can count in a single-cycle is IMPLEMENTATION DEFINED. For more information, see STALL_SLOT.

See also [Attributability on page D6-2544.](#)

0x003E, STALL_SLOT_FRONTEND, No operation sent for execution on a Slot due to the frontend

Counts each Slot counted by STALL_SLOT where no Attributable instruction or operation was sent for execution because there was no Attributable instruction or operation available to issue from the PE from the frontend for the Slot.

The division between frontend and backend is IMPLEMENTATION DEFINED. STALL_SLOT, STALL_SLOT_FRONTEND, and STALL_SLOT_BACKEND events must count at the same point in the pipeline. The maximum value that STALL_SLOT_FRONTEND and STALL_SLOT_BACKEND events can count in a single-cycle is implementation defined. For more information, see STALL_SLOT.

———— **Note** —————

ARM recommends that STALL_SLOT_FRONTEND counts instructions that have been decoded and, if applicable, split into micro-operations.

See also [Attributability on page D6-2544.](#)

0x003F, STALL_SLOT, No operation sent for execution on a Slot

The counter counts on each Attributable cycle the number of instruction or operation Slots that were not occupied by an instruction or operation Attributable to the PE.

If the implementation is multi-threaded:

- When $PMEVTYPEPER<n>_EL0.MT = 0b0$, the counter counts instruction or operation Slots for which those Slots are occupied by instructions or operations Attributable to other PEs of the multi-threaded implementation only when the PE was eligible to execute instruction or operations in that cycle. The counter does not count any instruction or operation Slots on cycles when this PE was not eligible to execute instructions or operations.
- When $PMEVTYPEPER<n>_EL0.MT = 0b1$, for every cycle the counter counts all instruction or operation Slots not occupied by any instruction or operation for any PE of the multi-threaded implementation.

If ARMv8.4-PMU is implemented:

- If STALL_SLOT is not implemented, it is IMPLEMENTATION DEFINED whether the PMMIR System registers are implemented.
- If STALL_SLOT is implemented, then the PMMIR System registers are implemented.

See also [Attributability on page D6-2544.](#)

0x0040, L1D_CACHE_RD, Level 1 data cache memory read

As L1D_CACHE, but counts only memory read accesses.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted.

See also:

- [Attributability on page D6-2544.](#)

- [Meaningful ratios between common microarchitectural events on page D6-2582.](#)

0x4000, SAMPLE_POP, Sample Population

The counter increments for each operation that might be sampled, whether or not the operation was sampled. Operations that are executed at an Exception level or Security state in which the Statistical Profiling Extension is disabled are not counted.

0x4001, SAMPLE_FEED, Sample Taken

The counter increments each time the sample interval counter reaches zero and is reloaded, and the sample does not collide with the previous sample. Samples that are removed by filtering, or discarded, and not written to the Profiling Buffer are counted.

0x4002, SAMPLE_FILTRATE, Sample taken and not removed by filtering

The counter increments each time that a completed sample record is checked against the filters and not removed. Sample records that are not removed by filtering, but are discarded before being written to the Profiling Buffer because of a Profiling Buffer management event, are counted.

0x4003, SAMPLE_COLLISION, Sample collided with a previous sample

The counter increments for each sample record that is taken when the previous sampled operation has not completed generating its sample record.

0x4004, CNT_CYCLES, Constant frequency cycles

This event is defined identically to [CNT_CYCLES](#) in the [AMUv1](#) architecture.

0x4005, STALL_BACKEND_MEM, Memory stall cycles

This event is defined identically to [STALL_BACKEND_MEM](#) in the [AMUv1](#) architecture.

0x4006, L1I_CACHE_LMISS, Level 1 instruction cache long-latency read miss

The counter counts each access counted by [L1I_CACHE](#) that incurs additional latency because it returns instructions from outside the Level 1 instruction cache.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. It is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

The event indicates to software that the access missed in the Level 1 instruction cache and might have a significant performance impact due to the additional latency, compared to the latency of an access that hits in the Level 1 instruction cache.

This counter does not count:

- Access where the additional latency is unlikely to be significantly performance-impacting. For example, if the access hits in another cache in the same local cluster, and the additional latency is small when compared against a miss in all Level 1 caches that the access looks up in that results in an access being made to a Level 2 cache or elsewhere beyond the Level 1 data and unified cache.
- A miss that does not cause a new cache refill but is satisfied from a previous miss.

An implementation is not required to measure the latency nor to track the access to determine whether the additional latency had a performance impact. An implementation can extend the definition of this event with additional scenarios where a memory read access counted by [L1I_CACHE](#) might have a significant performance impact due to additional latency for the address.

0x4009, L2D_CACHE_LMISS_RD, Level 2 data cache long-latency read miss

The counter counts each memory read access counted by [L2D_CACHE](#) that incurs additional latency because it returns data from outside the Level 2 data or unified cache of this PE.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. It is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

The event indicates to software that the access missed in the Level 2 data or unified cache and might have a significant performance impact compared to the latency of an access that hits in the Level 2 data or unified cache.

This counter does not count:

- Access where the additional latency is unlikely to be significantly performance-impacting. For example, if the access hits in another cache in the same local cluster, and the additional latency is small when compared against a miss in all Level 2 caches that the access looks up in that results in an access being made to a Level 3 cache or elsewhere beyond the Level 2 data and unified cache. This might be counted as a Level 1 cache miss.
- A miss that does not cause a new cache refill but is satisfied from a previous miss.

An implementation is not required to measure the latency nor to track the access to determine whether the additional latency had a performance impact. An implementation can extend the definition of this event with additional scenarios where a memory read access counted by [L2D_CACHE](#) might have a significant performance impact due to additional latency for the address.

See also [Attributability](#) on page D6-2544.

0x400A, L2I_CACHE_LMISS, Level 2 instruction cache long-latency read miss

The counter counts each access counted by [L2I_CACHE](#) that incurs additional latency because it returns instructions from outside the Level 2 instruction cache.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. It is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

The event indicates to software that the access missed in the Level 2 instruction cache and might have a significant performance impact due to the additional latency, compared to the latency of an access that hits in the Level 2 instruction cache.

This counter does not count:

- Access where the additional latency is unlikely to be significantly performance-impacting. For example, if the access hits in another cache in the same local cluster, and the additional latency is small when compared against a miss in all Level 2 caches that the access looks up in that results in an access being made to a Level 3 cache or elsewhere beyond the Level 2 data and unified cache. This might be counted as a Level 1 cache miss.
- A miss that does not cause a new cache refill but is satisfied from a previous miss.

An implementation is not required to measure the latency nor to track the access to determine whether the additional latency had a performance impact. An implementation can extend the definition of this event with additional scenarios where a memory read access counted by [L2I_CACHE](#) might have a significant performance impact due to additional latency for the address.

0x400B, L3D_CACHE_LMISS_RD, Level 3 data cache long-latency read miss

The counter counts each memory read access counted by [L3D_CACHE](#) that incurs additional latency because it returns data from outside the Level 3 data or unified cache of this PE.

If the cache is shared, only events Attributable to this PE are counted. If the cache is not shared, all events are counted. It is IMPLEMENTATION DEFINED whether accesses that result from cache maintenance instructions are counted.

The event indicates to software that the access missed in the Level 3 data or unified cache and might have a significant performance impact compared to the latency of an access that hits in the Level 3 data or unified cache.

This counter does not count:

- Access where the additional latency is unlikely to be significantly performance-impacting. For example, if the access hits in another cache in the same local cluster, and the additional latency is small when compared against a miss in all Level 3 caches that the access looks up in that results in an access being made to a Level 4 cache or elsewhere beyond the Level 3 data and unified cache. This might be counted as a Level 2 cache miss.

- A miss that does not cause a new cache refill but is satisfied from a previous miss.

An implementation is not required to measure the latency nor to track the access to determine whether the additional latency had a performance impact. An implementation can extend the definition of this event with additional scenarios where a memory read access counted by [L3D_CACHE](#) might have a significant performance impact due to additional latency for the address.

See also [Attributability on page D6-2544](#).

0x8006, SVE_INST_SPEC, **Speculatively executed SVE instruction**

This event counts speculatively executed operations due to SVE instructions. It is IMPLEMENTATION DEFINED whether this event counts non-SIMD SVE instructions

D6.10.4 Cycle event counting on multithreaded implementations

For most events, the event is only counted when it is attributable to the counting PE or thread, see [Attributability on page D6-2544](#).

Multithreaded implementations can have various forms, some examples of these are:

- *Simultaneous Multithreading* (SMT), where every PE thread is active on every cycle.
- *Fine-grained Multithreading* (FGMT), also known as a Barrel processor, where one PE thread is active on each cycle, and this changes regularly.
- *Switch on Event Multithreading* (SoEMT), also known as *Coarse-grained Multithreading* (CGMT), where high latency events cause the processor to switch the active PE thread.

In the above examples, active means that the PE might execute the instructions. A PE can be active but not executing instructions when no instruction is available or because of limited execution resources.

When the [PMEVTYPER<n>_EL0.MT](#) bit is set to 0, the [CPU_CYCLES](#) event only counts cycles on which the thread was active. For the example multithreaded implementations, this means that:

- For an SMT implementation, the [CPU_CYCLES](#) event counts every cycle.
- For a particular FGMT implementation, that alternates between two threads on each cycle, the [CPU_CYCLES](#) event counts every other cycle.
- For a particular SoEMT implementation, that is waiting for a long latency operation, the [CPU_CYCLES](#) event does not count cycles, as the PE thread is not active.

If the [PMEVTYPER<n>_EL0.MT](#) bit is set to 1, the processor counts each cycle, and can only count a maximum of one cycle each cycle.

In addition, the [STALL_FRONTEND](#) and [STALL_BACKEND](#) events only count cycles that are counted by the [CPU_CYCLES](#) event, and so have the same limitation. For example, in an SMT implementation, if a PE thread cannot issue an instruction because of contention with other PE threads, these are counted as [STALL_BACKEND](#) cycles.

If the [PMEVTYPER<n>_EL0.MT](#) bit is set to 1, the PE only counts cycles on which no operation is issued from any thread.

———— **Note** —————

The [PMCCNTR](#) register counts every processor cycle.

D6.10.5 Meaningful ratios between common microarchitectural events

The architecture highlights some meaningful ratios that can be derived from the common microarchitectural events. Table D6-8 lists the highlighted ratios.

Table D6-8 REFILL events and associated access events

Numerator	Denominator	Ratio
0x0001 L1I_CACHE_REFILL	0x0014 L1I_CACHE	Attributable Level 1 instruction cache refill rate
0x0002 L1I_TLB_REFILL	0x0026 L1I_TLB	Attributable Level 1 instruction TLB refill rate
0x0003 L1D_CACHE_REFILL	0x0004 L1D_CACHE	Attributable Level 1 data or unified cache refill rate
0x0005 L1D_TLB_REFILL	0x0025 L1D_TLB	Attributable Level 1 data or unified TLB refill rate
0x0017 L2D_CACHE_REFILL	0x0016 L2D_CACHE	Attributable Level 2 data or unified cache refill rate
0x0028 L2I_CACHE_REFILL	0x0027 L2I_CACHE	Attributable Level 2 instruction cache refill rate
0x002A L3D_CACHE_REFILL	0x002B L3D_CACHE	Attributable Level 3 data or unified cache refill rate
0x002D L2D_TLB_REFILL	0x002F L2D_TLB	Attributable Level 2 data or unified TLB refill rate
0x002E L2I_TLB_REFILL	0x0030 L2I_TLB	Attributable Level 2 instruction TLB refill rate
0x0019 BUS_ACCESS	0x001D BUS_CYCLES	Attributable Bus accesses per cycle
0x0033 LL_CACHE_MISS	0x0032 LL_CACHE	Attributable Last Level data or unified cache refill rate
0x0034 DTLB_WALK	0x0025 L1D_TLB	Attributable data TLB miss rate
0x0035 ITLB_WALK	0x0026 L1I_TLB	Attributable instruction TLB miss rate
0x0037 LL_CACHE_MISS_RD	0x0036 LL_CACHE_RD	Attributable memory read operation miss rate
0x0038 REMOTE_ACCESS_RD	0x0031 REMOTE_ACCESS	Attributable read accesses to another socket in a multi-socket system

D6.10.6 Required events

PMUv3 requires that an implementation includes the following common events:

- 0x0000, [SW_INCR](#), Instruction architecturally executed, [Condition code check pass](#), software increment.
- 0x0003, [L1D_CACHE_REFILL](#), Level 1 data cache refill.

———— **Note** ————

Event 0x0003 is only required if the implementation includes a Level 1 data or unified cache.

- 0x0004, [L1D_CACHE](#), Level 1 data cache access.

———— **Note** ————

Event 0x0004 is only required if the implementation includes a Level 1 data or unified cache.

- 0x0010, [BR_MIS_PRED](#), Mispredicted or not predicted branch [Speculatively executed](#).

———— **Note** ————

Event 0x0010 is only required if the implementation includes program-flow prediction. However, ARM strongly recommends that the event is implemented as described in [Common microarchitectural events on page D6-2566](#).

- 0x0011, [CPU_CYCLES](#), Cycle.
- 0x0012, [BR_PRED](#), Predictable branch [Speculatively executed](#).

———— **Note** —————

Event 0x0012 is only required if the implementation includes program-flow prediction. However, ARM recommends that the event is implemented as described in [Common microarchitectural events on page D6-2566](#).

- At least one of:
 - 0x0008, [INST_RETIRED](#), Instruction architecturally executed.
 - 0x001B, [INST_SPEC](#), Operation Speculatively executed.

———— **Note** —————

ARM strongly recommends that event 0x008 is implemented.

- When [ARMv8.1-PMU](#) is implemented:
 - 0x0023, [STALL_FRONTEND](#), No operation issued due to the frontend.
 - 0x0024, [STALL_BACKEND](#), No operation issued due to the backend.
- When [SVE](#) is implemented:
 - 0x8002, [SVE_INST_RETIRED](#), SVE instruction architecturally retired.
 - 0x8006, [SVE_INST_SPEC](#), SVE instruction speculatively executed.
- When the Statistical Profiling Extension is implemented:
 - 0x4000, [SAMPLE_POP](#), Sample Population.
 - 0x4001, [SAMPLE_FEED](#), Sample Taken.
 - 0x4002, [SAMPLE_FILTRATE](#), Sample Filtered.
 - 0x4003, [SAMPLE_COLLISION](#), Sample Collision.
- When [ARMv8.4-PMU](#) is implemented:
 - 0x003C, [STALL](#), No operation sent for execution.
 - 0x0039, [L1D_CACHE_LMISS_RD](#), Level 1 data cache long-latency read miss.
 - 0x4006, [L1I_CACHE_LMISS](#), Level 1 instruction cache long-latency miss.
 - 0x0040, [L1D_CACHE_RD](#), Level 1 data cache read.

When any of the following common events are implemented, all three of them are implemented:

- 0x003D, [STALL_SLOT_BACKEND](#), No operation sent for execution on a [Slot](#) due to the backend,
- 0x003E, [STALL_SLOT_FRONTEND](#), No operation sent for execution on a [Slot](#) due to the frontend.
- 0x003F, [STALL_SLOT](#), No operation sent for execution on a [Slot](#).

ARM strongly recommends that the following events are implemented:

- [BR_RETIRED](#).
- [BR_MIS_PRED_RETIRED](#).
- [STALL_SLOT](#).
- [STALL_SLOT_BACKEND](#).
- [STALL_SLOT_FRONTEND](#).
- [OP_SPEC](#).
- [OP_RETIRED](#).

D6.10.7 IMPLEMENTATION DEFINED event numbers

For IMPLEMENTATION DEFINED event numbers, each counter is defined, independently, to either:

- Increment only once for each event.
- Count the duration for which an event occurs.

ARM recommends that implementers establish a standardized numbering scheme for their IMPLEMENTATION DEFINED events, with common definitions, and common count numbers, applied to all of their implementations. In general, the recommended approach is for standardization across implementations with common features. However, ARM recognizes that attempting to standardize the encoding of microarchitectural features across too wide a range of implementations is not productive.

ARM strongly recommends that at least the following classes of event are identified in the IMPLEMENTATION DEFINED events:

- Separating each of the `STALL_FRONTEND` and `STALL_SLOT_FRONTEND` events to count holes in instruction availability.
- Separating each of the `STALL_BACKEND` and `STALL_SLOT_BACKEND` events, to count, for example, cumulative duration of stalls, unavailability of execution resources, or missed superscalar issue opportunities.
- Miss rates for additional levels of caches and TLBs.
- Any external events passed to the PE through an IMPLEMENTATION DEFINED mechanism.
- Cumulative duration of a `PSTATE.{A, I, F}` interrupt mask set to 1.
- Cumulative occupancy for resource queues, such as data access queues, and entry/exit counts, so that average latencies can be determined, separating out counts for key resources that might exist. An implementation might also provide registers in the IMPLEMENTATION DEFINED space to further extend such counts, for example by specifying a minimum latency for an event to be counted.
- Any other microarchitectural features that the implementer considers are valuable to count.

The range of possible IMPLEMENTATION DEFINED event numbers is described in *The PMU event number space and common events* on page D6-2557. Appendix K3 *Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events* lists the ARM recommended standardized numbering scheme for these events.

D6.11 Performance Monitors Extension registers

Further information on the Performance Monitors Extension Registers can be found in the following sections:

- [Table K13-2 on page K13-7396](#) lists the Performance Monitors register names for AArch32 and AArch64 states.
- [Performance monitors registers on page K13-7415](#) summarizes the Performance Monitors Extension registers in AArch64 state.
- [Performance monitors registers on page K13-7437](#) summarizes the Performance Monitors Extension registers in AArch32 state.

Chapter D7

The Activity Monitors Extension

This chapter describes the ARMv8 implementation of version 1 of the *Activity Monitor Unit* (AMU) architecture, AMUv1, an optional non-invasive component. It contains the following sections:

- [About the Activity Monitors Extension on page D7-2588.](#)
- [Properties and behaviour of the activity monitors on page D7-2589.](#)
- [AMU events and event numbers on page D7-2591.](#)

———— **Note** —————

[Table K13-3 on page K13-7397](#) disambiguates the general register references used in this chapter.

D7.1 About the Activity Monitors Extension

The Activity Monitors Extension is an optional extension to the ARMv8.4 architecture.

The Activity Monitors Extension implements version 1 of the Activity Monitors architecture, AMUv1, and interfaces to the registers defined by AMUv1, the Activity Monitors registers.

Version 1 of the Activity Monitors architecture implements:

- A counter group of four architected 64-bit event counters. The events counted by the architected event counter are fixed and architecturally defined.

———— **Note** —————

The Activity Monitors architecture provides space for up to 16 architected event counters. Future versions of the Activity Monitors architecture may use this space to implement additional architected event counters.

- A counter group of up to 16 auxiliary 64-bit event counters. The event counted for each auxiliary event counter may be fixed or programmable, and whether it is fixed or programmable is IMPLEMENTATION DEFINED. When the event counted by an auxiliary event counter is fixed, this event is IMPLEMENTATION DEFINED.
- Controls for enabling and disabling counters.
- When the event counted by an auxiliary event counter is programmable, controls for assigning an event to the counter.
- Controls that determine whether the activity monitor counters continue to count while the PE is halted in Debug state.

The read-only registers [AMCFGR](#) and [AMCGCR](#) provide information about features supported by the Activity Monitors Extension, the number of counter groups implemented, the total number of counters implemented, the number of counters implemented within each group, and the size of the counters.

The Activity Monitors Extension provides:

- A mandatory System register interface to the Activity Monitors registers, for both AArch64 and AArch32 states.
[Base system registers on page K13-7421](#) lists the AArch64 Activity Monitors registers, and [Base system registers on page K13-7442](#) lists the AArch32 Activity Monitors registers. [Table K13-3 on page K13-7397](#) shows the relationship between the AArch64 and the AArch32 Activity Monitors register.
- Controls that allow software to enable or disable access by software running at lower Exception levels to the Activity Monitors registers.
- An optional external interface providing read-only memory-mapped access to the Activity Monitors registers.
[Alphabetical index of memory-mapped registers on page K13-7446](#) lists the Activity Monitors memory-mapped registers. For more information on the recommended external interface, see [Chapter I4 Recommended External Interface to the Activity Monitors](#).

D7.2 Properties and behaviour of the activity monitors

D7.2.1 Basic characteristics of the activity monitor event counters

Every activity monitor event counter is a 64-bit wrapping counter. When an activity monitor event counter wraps, the counter overflows.

———— **Note** —————

The Activity Monitor architecture does not provide support for overflow status indication or interrupts.

The state of the authentication signals do not affect counting.

Any change in clock frequency, including when a WFI and WFE instruction stops the clock, can affect any counter.

D7.2.2 Counter configuration and controls

For each architected event counter [AMEVCNTR0<n>](#), there is a corresponding event type register [AMEVTYPER0<n>](#) which provides information on the event counted by that counter. The event type registers [AMEVTYPER0<n>](#) are read-only.

For each auxiliary event counter [AMEVCNTR1<n>](#), there is a corresponding event type register [AMEVTYPER1<n>](#) which provides information on the event counted by that counter. When the event counted by an auxiliary event counter is fixed, the corresponding event type register [AMEVTYPER1<n>](#) is read-only. When the event counted by an auxiliary event counter is programmable, the corresponding event type register [AMEVTYPER1<n>](#) is read/write.

For each counter group, there is a pair of separate controls to enable and disable the counters in that counter group. [AMCNTENCLR0](#) and [AMCNTENSET0](#) are used to disable and enable the architected event counters. [AMCNTENCLR1](#) and [AMCNTENSET1](#) are used to disable and enable the auxiliary event counters.

While the PE is halted in Debug state, [AMCR.HDBG](#) controls whether activity monitor counting is halted.

[AMUSERENR.EN](#) controls access from EL0 to the Activity Monitor Extension System registers. [CPTR_EL2.TAM](#) and [HCPTR.TAM](#) control access from EL0 and EL1 to the Activity Monitor Extension System registers. [CPTR_EL3.TAM](#) control access from EL0, EL1, and EL2 to the Activity Monitor Extension System registers.

———— **Note** —————

These controls obey the priority order described in [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) and [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#).

[AMUSERENR.EN](#) is configurable at EL1, EL2, and EL3. All other controls, as well as the value of the counters, are configurable only at the highest implemented Exception level.

D7.2.3 Power and reset domains

The power domain of the activity monitoring unit is IMPLEMENTATION DEFINED.

The reset domain of the activity monitoring unit is IMPLEMENTATION DEFINED.

When a Cold reset of the power domain of the activity monitoring unit occurs, the activity monitoring unit is reset and the counters are reset to zero. When the PE is not in reset, the activity monitoring unit is available.

D7.2.4 Accuracy and non-invasive behaviour

The activity monitors are a non-invasive component which must provide broadly accurate and statistically useful count information.

The implementation of an architecturally required event might create a conflict between the requirement to be non-invasive and the requirement to present an accurate value of the count under normal operating conditions. An implementation might provide an IMPLEMENTATION DEFINED control that disables accurate count of the event to restore performance and document the impact on performance of accurate counting. The expectations for non-invasive behaviour and the degree of inaccuracy of the activity monitors are otherwise as described for the Performance Monitors architecture.

———— **Note** —————

For information on the expectations for non-invasive behaviour and the degree of inaccuracy of the Performance Monitors, see *Non-invasive behavior* on page D6-2540 and *A reasonable degree of inaccuracy* on page D6-2540.

D7.3 AMU events and event numbers

The Activity Monitors architecture uses the event number space defined by the Performance Monitors architecture to identify events.

The Activity Monitors architecture defines additional events and adds them to the event number space defined by the Performance Monitors architecture for common events.

When a common event is available to both the Performance Monitors architecture and the Activity Monitors architecture within one implementation, both architectures use the same event number.

D7.3.1 Architected event counters

Version 1 of the Activity Monitors architecture, AMUv1, requires four events to be counted by the architected activity monitor event counters.

The events required to be counted are:

0x0011, CPU_CYCLES, Processor frequency cycles

This event is defined identically to [CPU_CYCLES](#) in the PMUv3 architecture.

When the PE is in WFI or WFE, this counter does not increment. When in a multithreaded implementation, regardless of which PE is currently active, this counter continues to count for all PEs not in WFI or WFE.

This event is counted by [AMEVCNTR0<n>](#), where n is 0.

0x4004, CNT_CYCLES, Constant frequency cycles

The constant frequency cycles counter increments at a constant frequency equal to the rate of increment of the System counter, [CNTPCT_EL0](#).

When the PE is in WFI or WFE, this counter does not increment. When in a multithreaded implementation, regardless of which PE is currently active, this counter continues to count for all PEs not in WFI or WFE.

This event is counted by [AMEVCNTR0<n>](#), where n is 1.

0x0008, INST_RETIRED, Instructions retired

This event is defined identically to [INST_RETIRED](#) in the PMUv3 architecture.

This event is counted by [AMEVCNTR0<n>](#), where n is 2.

0x4005, STALL_BACKEND_MEM, Memory stall cycles

The counter counts cycles in which the PE is unable to dispatch instructions from the frontend to the backend of the PE due to a backend stall caused by a miss in the last level of cache within the PE clock domain.

This event is counted by [AMEVCNTR0<n>](#), where n is 3.

D7.3.2 Auxiliary event counters

Auxiliary event counters can count events defined by the Performance Monitors architecture and IMPLEMENTATION DEFINED events defined specifically for activity monitoring.

Arm strongly recommends that implementations do not re-use an IMPLEMENTATION DEFINED event number for different hardware events across the Performance Monitors architecture and the Activity Monitors architecture.

Chapter D8

The Statistical Profiling Extension

This chapter describes the Statistical Profiling Extension. It contains the following sections:

- *About the Statistical Profiling Extension* on page D8-2594.
- *Defining the sample population* on page D8-2596.
- *Controlling when an operation is sampled* on page D8-2598.
- *Enabling profiling* on page D8-2601.
- *Filtering sample records* on page D8-2602.
- *The profiling data* on page D8-2604.
- *The Profiling Buffer* on page D8-2609.
- *Profiling Buffer management* on page D8-2613.
- *Synchronization and Statistical Profiling* on page D8-2617.

D8.1 About the Statistical Profiling Extension

Statistical profiling is a four stage process.

1. An operation is chosen from a sample population, at a programmable interval that might have some random, or pseudorandom, perturbation.
2. A trace of the sampled operation is taken. This includes the PC, events, timings, and data addresses, related to the sampled operation. This is the profiling operation.
3. Before a sample record is created, it is possible to filter out potential sample records generated by the profiling operation by reference to, any or all of the following:
 - a. The type of operation.
 - b. The Exception level.
 - c. Event and latency.
4. A sample record is created that contains the traced information. Sample records that meet the criteria of the filter are written to and stored in a memory buffer. These sample records can be processed by software when the memory buffer is full.

D8.1.1 Non-invasive behavior

Statistical Profiling is a non-invasive debug operation:

- While profiling is enabled, the operation and performance of the processing element (PE) must not be significantly impacted between sampled operations, that is, other than for writing out sample records and processing Profiling Buffer management interrupts.
- The performance of the sampled operation and the performance of the PE in general must not be significantly impacted. The sample records are not written to memory until after the sampled operation has completed. However, this does not apply when the user selects a collection of physical addresses for data access operations. In this case, the impact is IMPLEMENTATION DEFINED.
- The profiling operation to write sample records must not be excessively impactful on the performance of the sampled operation or the performance of the PE generally.

D8.1.2 PMU extensions

If the Statistical Profiling and Performance Monitoring Extensions are implemented, then the following PMU events must be implemented:

- [SAMPLE_POP](#).
- [SAMPLE_FEED](#).
- [SAMPLE_FILTRATE](#).
- [SAMPLE_COLLISION](#).

———— **Note** —————

These events are discoverable through a read of [PMCEID0_ELO](#)[35:32].

D8.1.3 Multithreaded implementations

In a multithreaded implementation:

- Statistical Profiling is implemented per-thread.
- The sample interval counter counts only operations for the thread that is being profiled.
- Latency and other cycle counters count each cycle for the PE for which the thread was active and could issue an operation.

The architecture does not define features for inter-thread profiling and does not support sharing the Profiling Buffer between threads.

———— **Note** —————

An implementation is described as multithreaded when the lowest level of [affinity](#) consists of logical processors that are implemented using a multi-threading type approach. That is, the performance of processors at the lowest affinity level is very interdependent. On such an implementation, the value of [MPIDR_EL1.MT](#), when read at the highest implemented Exception level, is 1.

D8.2 Defining the sample population

All samples are taken from a *population of operations*. The population is dynamic rather than static. That is, if a program executes the same operation multiple times (for example, because of loops and subroutines) then that operation appears multiple times in the population.

The operations are an IMPLEMENTATION DEFINED choice between:

- Architecture instructions.
- IMPLEMENTATION DEFINED microarchitectural operations (micro-ops).

Architecture instruction means a single instruction that is defined by the ARMv8 instruction set architecture in AArch64 state.

An architecture instruction might create one or more micro-ops at any point in the execution pipeline. The definition of a micro-op is implementation specific. An architecture instruction might create more than one micro-op for each instruction. A micro-op might also be removed or merged with another micro-op in the execution stream, so an architecture instruction might create no micro-ops for an instruction.

Any arbitrary translation of architecture instructions to an equivalent sequence of micro-ops is permitted. In some implementations, the relationship between architecture instructions and micro-ops might vary over time.

———— **Note** —————

Sampling from architecture instructions does not require that the instruction is architecturally executed.

D8.2.1 Operations that might be excluded from the sample population

It is IMPLEMENTATION DEFINED whether each of the following operations is part of the sample population:

- Operations on misspeculated paths.
- Operations (specifically micro-ops) that do not relate to any architecture instruction.
- Operations that generate non-architectural exceptions.

If the operation is not part of the sample population, the operation does not cause the sample interval counter to decrement, is not counted by the [SAMPLE_POP](#) event and therefore is never sampled.

If the operation is part of the sample population, the operation causes the sample interval counter to decrement, is counted by the [SAMPLE_POP](#) event, and might be sampled and counted by the [SAMPLE_FEED](#) event.

D8.2.2 Misspeculation and non-architectural operations

It is IMPLEMENTATION DEFINED whether the sample record for a sampled misspeculated operation or a sampled operation generating a non-architectural exception is written to the Profiling Buffer:

- If a sample record of a misspeculated operation or an operation generating a non-architectural exception is written to the Profiling Buffer, then neither event 0 (generated exception) nor event 1 (architecturally retired) are set in the record [Events packet](#).
- If a sample record of a misspeculated operation or an operation generating a non-architectural exception is not captured into the Profiling Buffer, then no event packets are output and the sample is not counted by the [SAMPLE_FILTRATE](#) event.

———— **Note** —————

It is IMPLEMENTATION DEFINED whether such operations can be sampled. See [Operations that might be excluded from the sample population](#).

If such an operation is not part of the sample population

The operation does not cause the sample counter to decrement, is not counted by the [SAMPLE_POP](#) event, and hence is never sampled.

If such an operation is part of the sample population

The operation causes the sample counter to decrement, is counted by the [SAMPLE_POP](#) event, and might be sampled and counted by the [SAMPLE_FEED](#) event.

It is IMPLEMENTATION DEFINED whether the sample record for such an operation, if sampled, is captured in the Profiling Buffer:

- If such a sample record is captured in the Profiling Buffer then some information for the operation might not be present. However, the [Events packet](#) and either the [End packet](#) or the [Timestamp packet](#) is always output. Neither event 0 (generated exception) nor event 1 (architecturally retired) will be set in the [Events packet](#).
- If such a sample record is not captured into the Profiling Buffer then no packets are output and the sample is not counted by the [SAMPLE_FILTRATE](#) event.

If the sample record for an operation on a misspeculated path is captured into the Profiling Buffer, then the record must not contain information that cannot be accessed by privileged software of the owning Exception level.

———— **Note** —————

If the Owning Exception level passes this data to less privileged software for processing, it can set [PMSFCR_EL1.FE](#) to 1 and [PMSEVFR_EL1\[1\]](#) to 1 to prevent speculative instructions from being recorded in the Profiling Buffer.

—————

D8.3 Controlling when an operation is sampled

The sample interval counter, `PMSICR_EL1.COUNT` controls when an operation is selected for sampling. In some implementations, a secondary sample interval counter, `PMSICR_EL1.ECOUNT`, is also used.

The following sections describe the operation of the sample interval counters.

Details of the random or pseudorandom number generator used when `PMSIRR_EL1.RND` is set to 1 are IMPLEMENTATION DEFINED. See *Generating random numbers for sampling*.

D8.3.1 Operation sampling

A sample operation is as follows:

1. A sampling interval is written to `PMSICR_EL1.COUNT` by software. The interval is measured in operations.
2. The sample interval counter is decremented by hardware for each operation when sampling is enabled.
3. When the sample interval counter reaches zero, then:
 - a. If random perturbation is enabled, the PE continues to count for a random number of further operations while sampling is enabled.
 - b. An operation is chosen for profiling.

———— **Note** ————

The choice of operation around the sampling point is arbitrary. The chosen operation might be the operation for which the sample interval counter reached 0, or the next operation. The choice must be applied consistently so as not to introduce sampling bias.

4. The sample interval counter is reloaded and the process loops to step 2. It is IMPLEMENTATION DEFINED whether the sample interval counter is reloaded before step 3.a) or at step 3.b). That is, before or after counting the random number of further operations.
5. The chosen operation is marked as the sampled operation. The PE collects information about the sampled operation as it executes by a profiling operation.
6. When the sampled operation is completed, the sample record is created.

D8.3.2 Generating random numbers for sampling

The random number generator is IMPLEMENTATION DEFINED. Implementations might use a pseudorandom number. The random number generator must be reset into a useable state. An implementation might include IMPLEMENTATION DEFINED registers to further configure the random number generator.

It is IMPLEMENTATION DEFINED whether the PE adds the random number to the sample interval counter prior to counting down the interval, or after the counter reaches zero and the counter has been reloaded.

D8.3.3 Initializing the one or more sample interval counters

When the PE moves from a state where profiling is disabled to a state where profiling is enabled:

- If `PMSICR_EL1` is nonzero, then sampling restarts from the current values in `PMSICR_EL1`.
- If `PMSICR_EL1` is zero, then it is loaded with an initial value. The behavior depends on `PMSIRR_EL1.RND` and an IMPLEMENTATION DEFINED choice discoverable by a read of `PMSIDR_EL1.ERnd`.
- If `PMSIRR_EL1.RND` is 0:
 - `PMSICR_EL1.COUNT[31:8]` is set to `PMSIRR_EL1.INTERVAL`.
 - `PMSICR_EL1.COUNT[7:0]` is set to `0x00`.
- If `PMSIRR_EL1.RND` is 1 and `PMSIDR_EL1.ERnd` is 0:
 - `PMSICR_EL1.COUNT[31:8]` is set to `PMSIRR_EL1.INTERVAL`.
 - `PMSICR_EL1.COUNT[7:0]` is set to a random or pseudorandom value in the range `0x00` to `0xFF`.
- If `PMSIRR_EL1.RND` is 1 and `PMSIDR_EL1.ERnd` is 1:
 - `PMSICR_EL1.COUNT[[31:8]` is set to `PMSIRR_EL1.INTERVAL`.
 - `PMSICR_EL1.COUNT[7:0]` is set to a random or pseudorandom value in the range `0x00` to `0xFF`.

- If `PMSIRR_EL1.RND` is 1 and `PMSIDR_EL1.ERnd` is 1:
 - `PMSICR_EL1.COUNT[31:8]` is set to `PMSIRR_EL1.INTERVAL`.
 - `PMSICR_EL1.COUNT[7:0]` is set to `0x00`.

D8.3.4 Behavior of the sample interval counter while profiling is enabled

While profiling is enabled, the counters control when an operation is selected for sampling. The behavior depends on `PMSIRR_EL1.RND` and an IMPLEMENTATION DEFINED choice discoverable in `PMSIDR_EL1.ERnd`.

If `PMSIRR_EL1.RND` is cleared to 0:

While nonzero, the sample interval counter decrements by 1 for each member of the sample population. When the counter reaches zero:

- A member of the sampling population is selected for sampling.
- The counter is set as follows:
 - `PMSICR_EL1.COUNT[31:8]` is set to `PMSIRR_EL1.INTERVAL`.
 - `PMSICR_EL1.COUNT[7:0]` is set to `0x00`.

———— **Note** —————

Because the counter counts down to zero, when `PMSIRR_EL1.RND` is cleared to 0 the interval between operations being selected for sampling is $(INTERVAL \times 256 + 1)$.

If `PMSIRR_EL1.RND` is 1 and `PMSIDR_EL1.ERnd` is 0

While nonzero, the sample interval counter decrements by 1 for each member of the sample population. When the counter reaches zero:

- A member of the sampling population is selected for sampling.
- The counter is set as follows:
 - `PMSICR_EL1.COUNT[31:8]` is set to `PMSIRR_EL1.INTERVAL`.
 - `PMSICR_EL1.COUNT[7:0]` is set to a random or pseudorandom value in the range `0x00` to `0xFF`.

———— **Note** —————

When `PMSIRR_EL1.RND` is set to 0 and `PMSIDR_EL1.ERnd` is 1, the mean interval between operations being selected for sampling is $(INTERVAL \times 256 + 128)$, if the random number generator is uniform.

If `PMSIRR_EL1.RND` is 1 and `PMSIDR_EL1.ERnd` is 1

While nonzero, the primary sample interval counter decrements by 1 for each member of the sample population. When the primary counter reaches zero:

- The primary sample interval counter is reloaded.
- The secondary sample interval counter, `PMSICR_EL1.ECOUNT`, is set to a random or pseudorandom value in the range `0x00` to `0xFF`.

While the secondary sample interval counter is nonzero, the secondary sample interval counter decrements by 1 for each member of the sample population. The primary sample interval counter also continues to decrement because it is also nonzero.

When the secondary sample interval counter reaches zero, an operation is selected for sampling.

———— **Note** —————

When `PMSIRR_EL1.RND` is set to 1 and `PMSIDR_EL1.ERnd` is 1, the mean interval between operations being selected for sampling is $(INTERVAL \times 256 + 1)$, if the random number generator is uniform.

D8.3.5 Behavior of the sample interval counter while profiling is disabled

When profiling is disabled:

- No operations are selected for sampling.
- No sample records are collected.
- The sample interval counters retain their values and do not decrement.

D8.3.6 Where operations are sampled

The exact point in the sampled lifespan of operations at which operations are chosen for profiling is IMPLEMENTATION DEFINED.

———— **Note** —————

ARM recommends that the point at which operations are sampled is linked to the definition of the Performance Monitoring Extension (PMU) [STALL_FRONTEND](#) and [STALL_BACKEND](#) events, so that sampling records information for [STALL_BACKEND](#) stalls.

D8.3.7 Sample collisions

The maximum number of sampled operations that a PE can support simultaneously is IMPLEMENTATION DEFINED. If the maximum number of simultaneous sampled operations has been reached at the point when a new operation must be sampled, the new sample is said to have collided with a previous sampled operation.

The PE records the fact that a sampled operation has collided with another sampled operation. Software can also count the number of collisions and gauge the impact of the collisions.

On a sample collision:

- The PMU event [SAMPLE_COLLISION](#) is generated.
- [PMBSR_EL1.COLL](#) is set to 1.
- The new operation is not sampled.

Following a context synchronization event an indirect write to [PMBSR_EL1.COLL](#) is guaranteed to be visible to instructions in program order after the sampled operation that collided. There is no guarantee of visibility without a context synchronization event. For more information see [Synchronization and Statistical Profiling on page D8-2617](#).

———— **Note** —————

This means that following a context synchronization event [PMBSR_EL1.COLL](#) will not change on entry to a state where profiling is disabled.

D8.4 Enabling profiling

Profiling is disabled if the Profiling Buffer is disabled, including when:

- [PMBLIMITR_EL1.E](#) is cleared to 0 or [PMBSR_EL1.S](#) is set to 1.
- Executing at a higher Exception level than the Profiling Buffer owning Exception level.
- Executing in the Security state that is not the Security state of the owning Exception level.
- The PE is in Debug state.

———— **Note** ————

The owning Exception level is controlled by [MDCR_EL3.NSPB](#) and [MDCR_EL2.E2PB](#).

[PMSCR_EL1](#).{E1SPE, E0SPE} and [PMSCR_EL2](#).{E2SPE, E0HSPE} enable sampling by Exception level:

- In a guest operating system or Secure state, [PMSCR_EL1.E1SPE](#) enables profiling at EL1 and [PMSCR_EL1.E0SPE](#) at EL0.
- In a hypervisor or host operating system, [PMSCR_EL2.E2SPE](#) enables profiling at EL2 and [PMSCR_EL2.E0HSPE](#) at EL0.
- Sampling is always disabled at EL3.

[Table D8-1](#) defines the valid combinations of the **Effective values** of [PMBSR_EL1.S](#), [PMBLIMITR_EL1.E](#), [SCR_EL3.NS](#), [SCR_EL3.EEL2](#), [MDCR_EL3.NSPB](#), [MDCR_EL2.E2PB](#), and [HCR_EL2.TGE](#) that define when sampling is enabled.

In [Table D8-1](#):

- D** Disabled.
- E2SPE** Enabled if [PMSCR_EL2.E2SPE](#) == 1, disabled otherwise.
- E1SPE** Enabled if [PMSCR_EL1.E1SPE](#) == 1, disabled otherwise.
- E0HSPE** Enabled if [PMSCR_EL2.E0HSPE](#) == 1, disabled otherwise.
- E0SPE** Enabled if [PMSCR_EL1.E0SPE](#) == 1, disabled otherwise.

Table D8-1 Enabling by Exception level and Security state (for all Exception levels using AArch64 state)

		Controls				Sampling enabled at				
NS	STE	NSPB	E2PB	EEL2	TGE	EL3	EL2	EL1	EL0	
1	X	0b0X	X	X	X	D	D	D	D	
			0b1X	0b1X	X	0	D	D	E1SPE	E0SPE
		0b00	0b1X	X	1	D	D	n/a	D	
			0b00	X	0	D	E2SPE	E1SPE	E0SPE	
			0b00	X	1	D	E2SPE	n/a	E0HSPE	
0	0	X	X	X	X	D	D	D	D	
			1	0b1X	X	X	X	D	D	D
	1	0b0X	0b1X	X	0	X	D	n/a	E1SPE	E0SPE
				0b1X	1	0	D	D	E1SPE	E0SPE
			0b00	0b1X	1	1	D	D	n/a	D
				0b00	1	0	D	E2SPE	E1SPE	E0SPE
				0b00	1	1	D	E2SPE	n/a	E0HSPE

This is described in the pseudocode functions [ProfilingBufferEnabled\(\)](#) and [CheckStatisticalProfilingAccess\(\)](#).

D8.5 Filtering sample records

[PMSFCR_EL1.FT](#) enables filtering by operation type. When enabled [PMSFCR_EL1](#).{ST, LD, B} define the collected types:

- ST enables collection of store sampled operations, including all atomic operations.
- LD enables collection of load sampled operations, including atomic operations that return a value to a register.
- B enables collection of branch sampled operations, including direct and indirect branches and exception returns.

———— **Note** —————

When micro-op sampling is implemented, filtering is based on the micro-op type.

[Table D8-2](#) summarizes the controls for filtering by operation type. In this table:

- Load Atomic** Refers to atomic operations which return a value to a general-purpose register. Other atomic operations are classed as Store.
- D** Indicates that the operation is discarded.
- C** Indicates that the operation is collected.

Table D8-2 Filtering by Operation type

PMSFCR_EL1 field				Operation type				
FT	LD	ST	B	Load	Load Atomic	Store	Branch	Other
0	X	X	X	C	C	C	C	C
1	0	0	0	D	D	D	D	D
			1	D	D	D	C	D
		1	0	D	C	C	D	D
			1	D	C	C	C	D
	1	0	0	C	C	D	D	D
			1	C	C	D	C	D
		1	0	C	C	C	D	D
			1	C	C	C	C	D

[PMSFCR_EL1.FE](#) enables filtering by a set of events that are defined by [PMSEVFR_EL1](#). When enabled, only sampled operations with all the events in the filter set are recorded and written to the Profiling Buffer.

[PMSFCR_EL1.FL](#) enables filtering by total latency. [PMSLATFR_EL1.MINLAT](#) defines the minimum latency. When enabled, only sampled operations with a total latency greater than or equal to the minimum latency are recorded and written to the Profiling Buffer.

These controls combine together as a logical AND.

Example D8-1 Collection of sampled operations

If [PMSFCR_EL1.FE](#) is set to 1, [PMSFCR_EL1.FT](#) is set to 1, and [PMSFCR_EL1.FL](#) is set to 1, then only sampled operations that meet all of the following criteria are recorded and written to the Profiling Buffer:

- The sampled operation is one of the selected operation types.

- The operation has all of the events in the filter set.
- The total latency is equal to or greater than the minimum latency.

This is described in the pseudocode function `CollectRecord()`.

D8.6 The profiling data

Unless otherwise stated all sample records that are generated by a profiling operation contain:

- A timestamp, if enabled. This is one of:
 - `CNTPCT_EL0`.
 - `CNTVCT_EL0`.

It is IMPLEMENTATION DEFINED how this timestamp relates to the sampled operation. It might be the time when the sampled operation was taken or any later time during the lifetime of the sampled operation, that is, up to the time when the sampled operation is completed.

If the Generic Timer system counter is disabled and timestamps are enabled, then it is IMPLEMENTATION DEFINED whether:

- The Statistical Profiling Extension behaves as if timestamps are disabled.
- The timestamp that is collected in the sample record is UNKNOWN.

———— **Note** —————

This behavior describes when `CNTEN.EN` is cleared to 0. This behavior does not apply when the Generic Timer system counter is enabled but not accessible at the current Exception level.

- The context, if enabled, which is one or more of:
 - `CONTEXTIDR_EL1`.
 - `CONTEXTIDR_EL2`.
 - The Exception level.
 - The Security state.
- Information about whether the sampled operation generated an exception:
 - The target address for an exception generating operation is not collected.
- Information about whether the sampled operation completed execution.

If the sampled operation completes execution and does not generate an exception, the sample record also contains:

- The PC virtual address for the sampled operation.
- Information about whether the sampled operation is a branch, a load, a load atomic, a store, or other.
- Information about whether the sampled operation is conditional, conditional select, or not.
- The total latency, a cycle count of the lifetime of the sampled operation. For more information see *Lifespan of a sampled operation on page D8-2607*.
- The issue latency, a cycle count from the start of the sampled operation up to the point when at least one part of the sampled operation starts executing. A sampled operation might be delayed, for example, because the input operands were not available.

If the sampled operation does not complete execution or generates an exception it is UNPREDICTABLE whether the record contains all or any of this information and the other information about the operation listed in this section and the following subsections. For information on exceptions being taken in sampled operations see *Exceptions on page D8-2607*.

The architecture defines a set of additional data that is collected in the sample record for each sampled operation. This is described in the following subsections, and comprises:

- Events.
- Cycle counters. Cycle count values as described in this architecture, which, for a particular implementation, are fixed with an IMPLEMENTATION DEFINED value, might be omitted from the sample record.
- Addresses.

In addition, the architecture permits IMPLEMENTATION DEFINED events, counters, and addresses to be collected.

D8.6.1 Additional information for each profiled branch or exception return

For a completed branch or exception return sampled operation, the profiling operation must record:

- The sampled operation type as an unconditional branch or a conditional branch. Sampled exception returns are treated as unconditional branches by the Statistical Profiling Extension.

- The target virtual address of the branch. The target virtual address includes the Exception level and Security state of the target.

———— **Note** —————

If the sampled operation is an illegal exception return, it is IMPLEMENTATION DEFINED whether the context information recorded in the target virtual address is the actual target context, or the target context that is described by the [SPSR](#).

- If the PE implements branch prediction, whether the branch was correctly predicted or mispredicted.
- Whether the branch was taken or not taken.
- Whether the branch was direct or indirect.

———— **Note** —————

A sampled operation that generates an exception is not treated as a branch.

D8.6.2 Additional information for each profiled memory access operation

For a completed load, store, or atomic sampled operation that does not generate an exception, the profiling operation must record:

- The data virtual and, if enabled, physical addresses being accessed.
 - If the applicable Top Byte Ignore (TBI) bit is set to one, the virtual address includes any top-byte tag.
 - The physical address is the address the PE accesses in the physical address space, and so includes the Secure Address Space Identifier.
- The sampled operation type, which includes:
 - Whether the sampled operation is a load, store, or atomic.
 - Whether the sampled operation is Load-Exclusive, Store-Exclusive or Load-acquire, Store-release.
 - Whether the sampled operation accesses the general-purpose or SIMD&FP registers.
- The translation latency. This is defined as an IMPLEMENTATION DEFINED choice between:
 - The count of cycles for which at least a part of a load or store operation is waiting for the MMU to complete an address translation, and no part of the operation is accessing memory.
 - The count of cycles for which at least a part of a load or store operation is waiting for the MMU to complete an address translation.
- Whether the sampled operation accessed the Level 1 data cache and resulted in a hit.
- Whether the sampled operation accessed the data TLB and resulted in a hit.
- An optional, IMPLEMENTATION DEFINED, record of whether the sampled operation accessed Last Level data cache and resulted in a hit.
- An optional, IMPLEMENTATION DEFINED, record of whether the sampled operation accessed *another socket* in a multi-socket system.
- An optional, IMPLEMENTATION DEFINED, indicator of the data source for a load.

For each of the Last level cache and another socket indicators, it is IMPLEMENTATION DEFINED whether this information is present only for load accesses, only for store accesses, for neither, or for both.

———— **Note** —————

A store might be marked as not accessing a cache or another socket because it completed before doing so. For example, the write was held in a write buffer. This behavior is IMPLEMENTATION DEFINED, and such events must be interpreted with care.

If architecture instructions are sampled, for a sampled load/store operation that is not single-copy atomic, the data addresses are the lowest address that is accessed by the sampled operation regardless of whether architecture instructions are sampled or not.

Otherwise the information is for the micro-op that is sampled.

Example D8-2 Sampling of micro-ops

If an architectural load instruction is split into an address generation micro-op and a load micro-op, then when generating the sample record and filtering based on operation type:

- If the address generation micro-op is sampled, the sampled operation is treated as *other*.
 - If the load micro-op is sampled, the sampled operation is treated as a load.
-

D8.6.3 Additional information for each profiled conditional instruction (including conditional branches)

For a completed conditional branch, conditional select, conditional move, or conditional increment sampled operation, the profiling operation must record:

- That the sampled operation was conditional.
- Whether the condition passed or failed.

If a conditional instruction fails its condition code test, it is IMPLEMENTATION DEFINED whether any of the information for the sampled operation that is generated by executing the sampled operation is recorded. Any value that is recorded and is the result of executing the sampled operation is UNKNOWN.

Example D8-3 Conditional branches

A conditional branch operation fails its condition code test. It is IMPLEMENTATION DEFINED whether the sample record contains a branch target [Address packet](#). If the sample record contains a branch target [Address packet](#), the value in the packet is UNKNOWN.

D8.6.4 Additional information for other operations

For cache maintenance operations by virtual address, cache prefetch, or address translation instructions, the profiling operation:

- Captures an IMPLEMENTATION DEFINED subset of the information captured for a load instruction.
- Treats the operation type as *other* when generating the sample record and filtering based on operation type.

See [Filtering sample records on page D8-2602](#) and [Operation Type packet](#).

D8.6.5 Controlling the data that is collected

Certain data in sample records is only collected if permitted by one or both of EL1 and EL2. This is to restrict exposure of data to a lower Exception level or to Non-secure state.

[CONTEXTIDR_EL1](#) is collected only if [PMSCR_EL1.CX](#) is set to 1 and all of the following are true:

- The PE is executing at EL1 or EL0.
- The PE is executing in Secure state and [ARMv8.4-SecEL2](#) is not implemented, or the Effective value of [HCR_EL2.TGE](#) is 0.

[CONTEXTIDR_EL2](#) is collected only if the Effective value of [PMSCR_EL2.CX](#) is 1 and EL2 is implemented and enabled for the current Security state.

This is described in the pseudocode functions [CollectContextIDR1\(\)](#) and [CollectContextIDR2\(\)](#).

Timestamps are collected only if one of the following is true:

- [PMSCR_EL1.TS](#) is set to 1 and the Profiling Buffer is owned by EL1.
- [PMSCR_EL2.TS](#) is set to 1 and the Profiling Buffer is owned by EL2.

The timestamp is a choice between:

- Physical time, which is defined by the value of [CNTPCT_EL0](#).

- Virtual time, as defined by the value of `CNTVCT_EL0`. That is, the physical time minus the virtual offset, `CNTVOFF_EL2`. However, the virtual offset is treated as zero if a read of `CNTVCT_EL0` at the current Exception level would treat the virtual offset as zero.

Physical time is collected if any of the following is true:

- `PMSCR_EL1.PCT` is set to 1 and the Profiling Buffer is owned by Secure EL1 and EL2 is disabled or is not implemented.
- `PMSCR_EL2.PCT` is set to 1 and the Profiling Buffer is owned by Secure or Non-secure EL2.
- `PMSCR_EL1.PCT` is set to 1 and `PMSCR_EL2.PCT` is set to 1 and the Profiling Buffer is owned by Non-secure EL1, or the Profiling Buffer is owned by Secure EL1 and Secure EL2 is enabled.

Virtual time is collected otherwise. If EL2 is not implemented, `PMSCR_EL1.PCT` is RES1. This is described by the pseudocode function `CollectTimeStamp()`.

Physical data addresses are collected only if one of the following is true:

- `PMSCR_EL1.PA` is set to 1 and the Profiling Buffer is owned by Secure EL1 and EL2 is disabled or is not implemented.
- `PMSCR_EL2.PA` is set to 1 and the Profiling Buffer is owned by Secure or Non-secure EL2.
- `PMSCR_EL1.PA` is set to 1 and `PMSCR_EL2.PA` is set to 1 and either the Profiling Buffer is owned by Non-secure EL1, or the Profiling Buffer is owned by Secure EL1 and Secure EL2 is enabled.

If EL2 is not implemented or is disabled for the current Security state, the PE behaves as if `PMSCR_EL2.PA` is set to 1, other than for a direct read of the register.

Enabling collection of the physical data addresses has an IMPLEMENTATION DEFINED impact on the sampled operation. This is described by the pseudocode function `CollectPhysicalAddress()`.

D8.6.6 Lifespan of a sampled operation

The sampled lifespan of an operation:

- Starts with the decoded architectural instruction or micro-op is dispatched for issue.
- Completes when one of:
 - The instruction or micro-op is committed to the architectural state of the PE (including completion by generating a synchronous exception).
 - The speculative instruction or micro-op is discarded because of misspeculation. For more information see *Misspeculation and non-architectural operations* on page D8-2596.
 - The instruction or micro-op is replayed, on some microarchitectures. For more information see *Non-architectural exceptions* on page D8-2608.

D8.6.7 Exceptions

All sample records written to the Profiling Buffer contain the Events packet and either the [End packet](#) or the [Timestamp packet](#).

If the sampled operation generates an exception, it is UNPREDICTABLE whether the sample record contains any other information.

Where a sampled operation generates an exception and the type of exception means that a particular item is not computed by the sampled operation, that information is not collected by the profiling operation. For more information see *Synchronization and Statistical Profiling* on page D8-2617.

Example D8-4 Translation Faults

If a sampled operation generates a Translation Fault, the physical address for the sampled operation was not generated by the MMU and cannot be recorded.

Non-architectural exceptions

An implementation might include exceptions that are not architectural exceptions. That is, in executing an operation, the PE performs some exceptional behavior that does not take an exception as defined by the architecture. These non-architectural exceptions are usually not visible to software.

The use on non-architectural exceptions are IMPLEMENTATION DEFINED.

If a sampled operations generates a non-architectural exception, the sample might include handling of the non-architectural exception. If the sample does not include handling of the non-architectural exception, then the sampled operation does not complete because of the non-architectural exception and it is recorded using $E[1] = 0$ (operation did not retire) in the [Events packet](#). Bit $E[0]$ (operation generated an exception) might be used to indicate the operation did not complete because of the non-architectural exception.

D8.7 The Profiling Buffer

The profile data is collected in a memory *Profiling Buffer*. The Profiling Buffer is defined by:

- `PMBPTR_EL1`, the current write pointer.
- `PMBLIMITR_EL1`, the write limit pointer.

The Profiling Buffer starts at the current write pointer and extends to the current limit pointer minus one. The write limit pointer must be aligned to the smallest implemented translation granule size. The alignment of the current write pointer is IMPLEMENTATION DEFINED.

`PMBLIMITR_EL1` and `PMBPTR_EL1` are virtual addresses in the stage 1 translation regime of the owning Exception level. This is called the *owning translation regime*.

———— Note ————

The translation of virtual addresses to physical addresses is identical to that for any other virtual address in the owning Exception level. For example, `PMBPTR_EL1[63:56]` are ignored by address translation if the respective TBI bit is set to 1.

D8.7.1 Restrictions on the current write pointer

This section describes the software rules on setting the current write pointer, `PMBPTR_EL1`. If these rules are not followed, the value returned for a direct read of `PMBPTR_EL1` is UNKNOWN, the behavior is UNPREDICTABLE, and the PE might do any of the following at any point after profiling is enabled:

- Write sample records to any writeable address in memory that is writable at the owning Exception level.
- Generate a Profiling Buffer management event, with or without indicating data loss, for one of the following reasons:
 - The Profiling Buffer is full.
 - Any MMU Fault.

When profiling becomes enabled, all the following must be true:

- The current write pointer must be at least one sample record below the write limit pointer. That is: $\text{UInt}(\text{PMBPTR_EL1.PTR}) \leq \text{UInt}(\text{PMBLIMITR_EL1.LIMIT} : \text{Zeros}(12)) - 2^{\text{PMSIDR_EL1.MaxSize}}$.
- `PMBPTR_EL1.PTR[63:56]` must equal `PMBLIMITR_EL1.LIMIT[63:56]`.

When the Profiling Buffer is first configured, `PMBPTR_EL1.PTR` must be aligned to `PMBIDR_EL1.Align`. That is, if `PMBIDR_EL1.Align` is nonzero, `PMBPTR_EL1.PTR [UInt(PMBIDR_EL1.Align)-1:0]` must be all zeros.

However, the current write pointer can usually be restored to the saved write pointer value it had when profiling was disabled, providing a `PSB_CSINC` and a context synchronization event were executed before reading `PMBPTR_EL1`:

- If no Profiling Buffer management event was signaled then profiling can be restarted from the saved write pointer. In this case, the saved write pointer points within one sample record of the write limit pointer.
- If a Profiling Buffer management event was signaled then:
 - If `PMBSR_EL1.S` is restored to 1, then profiling is not being enabled, and there are no constraints on the value written to `PMBPTR_EL1`.
 - If `PMBSR_EL1.S` is restored to 0, and the Profiling Buffer management event was caused by an MMU fault, profiling can be restarted from the saved write pointer; if `PMBSR_EL1.{EA, DL}` did not also indicate an external abort or data loss, and the saved write pointer is at least one sample record below the write limit pointer.

———— Note ————

If a signaled MMU fault has not been corrected, the Statistical Profiling Extension generates a new MMU fault Profiling Buffer management event when it next tries to write a sample record.

- If `PMBSR_EL1.S` is restored to 0, and the Profiling Buffer management event was caused by a buffer full event, the Profiling Buffer can be extended and profiling restarted from the saved write pointer; if `PMBSR_EL1.{EA, DL}` did not also indicate an external abort or data loss and the saved write pointer is at least one sample record below the extended write limit pointer.

The current write pointer must not be restored from the saved write pointer following a Profiling Buffer management event if `PMBSR_EL1.DL` was set to 1.

The saved write pointer might not be aligned to `2PMBIDR_EL1.Align` and might point to within one sample record of the write limit pointer.

For more information see [Synchronization and Statistical Profiling on page D8-2617](#).

D8.7.2 The owning Exception level

The owning Exception level is:

- Non-secure EL1, if all of the following are true:
 - Either EL3 is not implemented and the PE is executing in Non-secure state, or `MDCR_EL3.NSPB` is set to either `0b10` or `0b11`.
 - Either EL2 is not implemented and the PE is executing in Non-secure state, or `MDCR_EL2.E2PB` is set to either `0b10` or `0b11`.
- Non-secure EL2, if all of the following are true:
 - EL2 is implemented.
 - Either EL3 is not implemented or `MDCR_EL3.NSPB` is set to either `0b10` or `0b11`.
 - `MDCR_EL2.E2PB` is set to `0b00`.
- Secure EL1, if any of the following are true:
 - EL3 is not implemented and the PE is executing in Secure state.
 - `MDCR_EL3.NSPB` is set to either `0b00` or `0b01`.
- Secure EL2, if all of the following are true:
 - EL2 is implemented and `SCR_EL3.EEL2` is 1.
 - `HCR_EL2.{TGE,E2H}` are set to `{1,1}`.
 - `SCR_EL3.NS` is 0.
 - Either EL3 is not implemented and the PE is executing in Non-secure state, or `MDCR_EL3.NSPB` is set to either `0b00` or `0b01`.

When the owning Exception level is Non-secure EL1

The Profiling Buffer addresses are in the Non-secure EL1&0 translation regime using the current ASID from `TTBRx_EL1`. This is a two-stage translation using the current VMID if EL2 is implemented and `HCR_EL2.VM` is set to 1.

If EL3 is implemented, then the Profiling Buffer is disabled in Secure state.

If EL2 is implemented, then profiling is disabled at EL2 and at Non-secure EL0 when `HCR_EL2.TGE` is set to 1.

When the owning Exception level is Non-secure EL2

The Profiling Buffer addresses are in the EL2 translation regime. If both `HCR_EL2.E2H` is set to 1 and `HCR_EL2.TGE` is set to 1, this is an EL2&0 translation regime using the current EL2&0 translation regime ASID from `TTBRx_EL2`.

If EL3 is implemented, then the Profiling Buffer is disabled in Secure state.

———— Note —————

If either `HCR_EL2.E2H` is cleared to 0 or `HCR_EL2.TGE` is cleared to 0, and the PE is executing at EL1 or EL0, the EL2 translation regime is not the current stage 1 translation regime because the current stage 1 translation regime is EL1&0.

When the owning Exception level is Secure EL1

The Profiling Buffer addresses are in the Secure EL1&0 translation regime using the current ASID from `TTBRx_EL1`.

If EL3 is implemented, then the buffer is disabled in Non-secure state.

The Profiling Buffer is disabled if any of the following are true:

- [SCR_EL3.NS](#) indicates the other Security state to the owning Exception level.
- The owning Exception level is using AArch32 state.
- [PMBLIMITR_EL1.E](#) is cleared to 0.

When the owing Exception level is Secure EL2

The Profiling Buffer addresses are in the Secure EL1&0 translation regime using the current ASID from TTBRx_EL1.

If EL3 is implemented, then the buffer is disabled in Non-secure state.

The Profiling Buffer is disabled if any of the following are true:

- [SCR_EL3.NS](#) or [SCR_EL3.EEL2](#) indicates the other Security state to the owning Exception level.
- The owning Exception level is using AArch32 state.
- [PMBLIMITR_EL1.E](#) is cleared to 0.

[Table D8-3](#) summarizes the owning translation regime.

Table D8-3 Summary of owning translation regime (for all Exception levels using AArch64 state)

PMBLIMITR_EL1.E	SCR_EL3.NS	SCR_EL3.EEL2	MDCR_EL3.NSPB	MDCR_EL2.E2PB	Owning translation regime	
0	X	X	X	X	Disabled	
1	1	0	0b1x	0b1x	Non-secure EL1&0	
				0b00	Non-secure EL2 or EL2&0 ^a	
			0b0x	X	Disabled	
	0	0	0	0b0x	X	Secure EL1&0
				0b0x	0b1x	Secure EL1&0
					0b00	Secure EL2 or EL2&0 ^a
		X	0b1x	X	Disabled	

a. Depending on the values of [HCR_EL2](#).{E2H,TGE}.

D8.7.3 Memory access types and coherency

The Statistical Profiling Extension acts as a separate observer in the system and is subject to the rules regarding coherency.

The memory type that is used for a write by the Statistical Profiling Extension to the Profiling Buffer is taken from the translation table entries for the virtual address being written to. That is:

- The writes are treated as coming from an observer that is coherent with all observers in the Shareability domain that is defined by the translation tables.
- There is no requirement to manage coherency for observers in the same Shareability domain but coherency for other observers in the system might require explicit management.

For more information see [Synchronization and Statistical Profiling on page D8-2617](#).

D8.7.4 TLB operations

Translations might be cached in a TLB. TLB maintenance operations (including TLB maintenance operations that are broadcast from other PEs) operate on these cached translations.

Any TLB maintenance operation followed by a [DSB](#) (including an operation broadcast from another PE and a following [DSB](#) on that other PE):

- Does not complete until all sample records previously translated using an invalidated translation have been written to the Profiling Buffer.
- Any remaining sample records are guaranteed not to use an invalidated translation.

For such operations, the [DSB](#) must apply to both loads and stores. Although the Statistical Profiling Extension acts as another observer in the system, for determining the Shareability domain of this [DSB](#) or TLB maintenance operation, the writes of sample records are treated as coming from the PE that is being profiled.

———— **Note** —————

Completion of the [DSB](#) does not guarantee that all buffered profiling data has written out. See [Synchronization and Statistical Profiling on page D8-2617](#).

D8.7.5 Effect on the exclusive monitors

If an operation between Load-Exclusive and Store-Exclusive instructions is sampled, then the Store-Exclusive must be guaranteed not to fail, even though the sample record is written to an unrelated address.

D8.8 Profiling Buffer management

A Profiling Buffer management event occurs:

- On a fault, see *Faults and watchpoints* on page D8-2614.
- On an external abort, see *External aborts* on page D8-2615.
- When the Profiling Buffer fills, see *Buffer full event* on page D8-2614.

On a Profiling Buffer management event:

- The service bit, `PMBSR_EL1.S`, is set to 1.
- The data loss bit, `PMBSR_EL1.DL`, is set as described in the event description.
- The Profiling Buffer management interrupt request signal, `PMBIRQ`, is asserted:
 - `PMBIRQ` is a level-sensitive interrupt request driven by `PMBSR_EL1.S`. This means that a direct write that sets `PMBSR_EL1.S` to 1 causes the interrupt to be asserted, and `PMBIRQ` remains asserted until software clears `PMBSR_EL1.S` to 0.
 - If a Generic Interrupt Controller (GIC) is implemented, `PMBIRQ` must be configured as a Private Peripheral Interrupt (PPI) in a multiprocessor system. `PMBIRQ` is signaled by the PE that implements the Statistical Profiling Extension.

———— **Note** ————

A standard PPI number is allocated by the *ARM® Server Base System Architecture (SBSA)*.

- Additional syndrome for the event is written to `PMBSR_EL1.MSS`. Unless otherwise stated in the event description, other `PMBSR_EL1` fields are unchanged.

While `PMBSR_EL1.S` is set to 1:

- The buffer is disabled and profiling is disabled.
- All remaining buffered sample records are discarded.
- The values in `PMBPTR_EL1` are retained and `PMSICR_EL1` does not decrement.

Buffer full events and MMU fault Profiling Buffer management events are reported synchronously.

———— **Note** ————

Reported synchronously means that profiling is disabled before the SPE samples further operations. The interrupt exception resulting from asserting the Profiling Buffer interrupt request is an asynchronous exception.

It is IMPLEMENTATION DEFINED whether external aborts are reported to the Statistical Profiling Extension synchronously or asynchronously. If external aborts are reported as asynchronous:

- The external abort might not be received until after a first Profiling Buffer management event has set `PMBSR_EL1.S` to 1.
- Writes to the buffer might generate a second Profiling Buffer management event after the external abort has set `PMBSR_EL1.S` to 1.

The architecture does not require that a sample record is written sequentially by the Statistical Profiling Extension, only that:

- The Statistical Profiling Extension never writes past the `PMBLIMITR_EL1` limit pointer.
- On a Profiling Buffer management interrupt, `PMBSR_EL1.DL` indicates whether `PMBPTR_EL1` points to the first byte after the last complete sample record.
- On an MMU fault or synchronous external abort, `PMBPTR_EL1` serves as a Fault Address Register.

———— **Note** ————

- This means that it must not be assumed that:
 - There is ever any valid data beyond the current `PMBPTR_EL1` write pointer.
 - The PE has not written a valid sample record between the current `PMBPTR_EL1` write pointer and the `PMBLIMITR_EL1` limit pointer.
 - If `PMBSR_EL1.DL` is set to 1 on a Profiling Buffer management interrupt, that there is any valid data between the end of the last complete sample record and the current `PMBPTR_EL1` write pointer.

- Any valid data has been written to the Profiling Buffer if an external abort is reported asynchronously to the Statistical Profiling Extension.
- The last complete sample record must end at most $2^{(PMSIDR_EL1.MaxSize)}$ bytes below `PMBPTR_EL1`.

D8.8.1 Prioritization of Profiling Buffer management events

Where multiple synchronous Profiling Buffer management events occur on writing a sample record, the PE prioritizes them as follows (from highest to lowest priority):

1. Synchronous fault.
2. Synchronous external abort.
3. Buffer full event.

Asynchronous external aborts are not prioritized with respect to other events.

———— **Note** —————

Prioritization of Profiling Buffer management interrupt requests is managed by the interrupt controller. Profiling Buffer management events are prioritized internally by the PE.

D8.8.2 Buffer full event

If, after writing a sample record, there is not sufficient space in the Profiling Buffer for a sample record of the size indicated by `PMSIDR_EL1.MaxSize`, and `PMBSR_EL1.S` is 0, a Profiling Buffer management event is generated:

- `PMBSR_EL1.EC` is set to `0b000000`, other buffer management event.
- The BSC field of `PMBSR_EL1.MSS` is set as follows:
 - `PMBSR_EL1.BSC` is set to `0b000001`, buffer filled.
- `PMBPTR_EL1` is set to the first byte after the last complete sample record. `PMBSR_EL1.DL` is unchanged.
- The other `PMBSR_EL1` fields are unchanged.

That is, the Profiling Buffer management event is generated when the PE writes past the write limit pointer minus $2^{(PMSIDR_EL1.MaxSize)}$. The Statistical Profiling Extension never writes beyond the write limit pointer.

For more information see [Restrictions on the current write pointer on page D8-2609](#).

D8.8.3 Faults and watchpoints

[Table D8-4](#) lists the faults that might be generated by a write to the Profiling Buffer by the Statistical Profiling Extension.

Writes to the Profiling Buffer never generate watchpoints.

Table D8-4 Faults

Fault	Conditions
Translation	The translation of a virtual address to a physical address might generate a Translation fault.
Address Size	The translation of a virtual address to a physical address might generate an Address Size fault.
Alignment	If <code>PMBPTR_EL1</code> is not aligned to an IMPLEMENTATION DEFINED minimum alignment, the behavior is UNPREDICTABLE and a write to the Profiling Buffer by the Statistical Profiling Extension might generate an Alignment fault. For more information see Restrictions on the current write pointer on page D8-2609 .
Permission	Writes to the Profiling Buffer are made as privileged writes. If the write does not have write permission, a Permission fault is generated. The value of <code>PSTATE.PAN</code> is ignored and treated as zero.

Table D8-4 Faults (continued)

Fault	Conditions
Unsupported Access	If hardware management of the Dirty Bit is enabled and the Dirty Bit is not set, it is IMPLEMENTATION DEFINED whether an Unsupported Access fault is generated or the write sets the Dirty Bit in the translation table. For more information see Hardware management of dirty state on page D5-2469 .
Access Flag	If hardware management of the Access Flag is enabled and the Access Flag is not set, it is IMPLEMENTATION DEFINED whether an Access Flag fault is generated or the write sets the Access Flag in the translation table. For more information see Hardware management of the Access flag on page D5-2468 .
TLB Conflict fault	IMPLEMENTATION DEFINED.

If a write to the Profiling Buffer generates a fault and `PMBSR_EL1.S` is 0, then a Profiling Buffer management event is generated:

- `PMBSR_EL1.S` is set to 1.
- `PMBSR_EL1.EC` is set to one of:
 - `0b100100`, stage 1 Data Abort on write to the Profiling Buffer.
 - `0b100101`, stage 2 Data Abort on write to the Profiling Buffer.
- The FSC field of `PMBSR_EL1.MSS` is set as follows:
 - `PMBSR_EL1.FSC` is set to indicate the type of the fault.
- `PMBPTR_EL1` is set to the address that generated the fault.
- If `PMBPTR_EL1` is not the address of the first byte after the last complete sample record written by the Statistical Profiling Extension, then `PMBSR_EL1.DL` is set to 1. Otherwise, `PMBSR_EL1.DL` is unchanged.
- The other `PMBSR_EL1` fields are unchanged.

———— **Note** —————

Each of these faults gives rise to a Profiling Buffer management interrupt, not an actual MMU fault exception. The ESR and FAR registers are unchanged.

For more information see [The MMU fault-checking sequence on page D5-2502](#).

Hardware management of dirty state and the Access flag by the Statistical Profiling Extension

It is IMPLEMENTATION DEFINED whether address translations performed by the Statistical Profiling Extension manage dirty state and the Access flag. This is discoverable by software using `PMBIDR_EL1.F`. See [Hardware management of dirty state on page D5-2469](#) and [Hardware management of the Access flag on page D5-2468](#).

If hardware management of dirty state by the Statistical Profiling Extension is implemented, and hardware management of dirty state is enabled for the owning translation regime, then the Statistical Profiling Extension can speculatively update the translation table descriptor for any Page or Block in the Statistical Profiling buffer before writing data to it, if the write is otherwise permitted. This includes the case where a buffer management event means the Statistical Profiling Extension stops writing data before the page or block is written to.

D8.8.4 External aborts

A write to the Profiling Buffer might generate an external abort, including an external abort on a translation table walk or translation table update. It is an IMPLEMENTATION DEFINED choice whether such an external abort:

- Is reported to the Statistical Profiling Extension and treated as a Profiling Buffer management event.
- Generates an SError interrupt exception.

If a write to the Profiling Buffer generates an external abort that is reported to the Statistical Profiling Extension:

- The external abort bit, `PMBSR_EL1.EA`, is set to 1.

- The Statistical Profiling Extension stops writing sample records to the Profiling Buffer. It is implementation defined whether an external abort on a write to the Profiling Buffer is reported as synchronous or asynchronous:
 - The external abort is reported as *synchronous* if `PMBPTR_EL1` is set to the address that was externally aborted.
 - The external abort is reported as *asynchronous* if `PMBPTR_EL1` is not guaranteed to be set to the address that was externally aborted.
- If the external abort is reported as asynchronous or `PMBPTR_EL1` is not the address of the first byte of the sample record being written by the Statistical Profiling Extension, then `PMBSR_EL1.DL` is set to 1. Otherwise `PMBSR_EL1.DL` is unchanged.

———— **Note** —————

Following an external abort reported asynchronously to the Statistical Profiling Extension, software must not assume that any valid data has been written to the Profiling Buffer.

- The other `PMBSR_EL1` fields are unchanged.

If a write to the Profiling Buffer generates an external abort that is taken as an SError interrupt exception, the PE takes the SError interrupt exception as normal, and `PMBSR_EL1` fields are unchanged.

———— **Note** —————

Treating the external abort as a Profiling Buffer management event:

- Sets `PMBSR_EL1.S` to 1 and so disables the Statistical Profiling Extension.
- Allows error recovery software to isolate the event to the actions of the Statistical Profiling Extension.

Taking an SError interrupt:

- Means that the Statistical Profiling Extension will only be disabled if the SError interrupt is taken to an Exception level where the Statistical Profiling Extension is disabled.
- Might not allow error recovery software to isolate the event and error containment.

D8.9 Synchronization and Statistical Profiling

The profiling operation of the Statistical Profiling Extension:

- Makes indirect reads and indirect writes of System registers.
- Writes to memory.
- Makes further indirect writes to `PMBPTR_EL1` as a result of an external abort on a write to memory.

The indirect reads of the `PMSCR_EL1`.{E1SPE, E0SPE} and `PMSCR_EL2`.{E2SPE, E0HSPE} controls when determining whether to select an operation for profiling are treated as indirect reads made by the instruction being executed, and subject to the standard requirements for synchronization.

Otherwise, although the profiling operation is generated by a sampled operation, the profiling operation executes independently of the instructions that are executed on the PE, and acts as a separate memory observer from the PE in the system.

A `DSB` instruction guarantees that all memory transactions that are made by the PE are observable by writes made by a profiling operation relating to a sampled operation in program order after the `DSB` instruction.

A `Context synchronization event` guarantees that a direct write to a System register made by the PE in program order before the context synchronization event are observable by indirect reads and indirect writes of the same System register made by a profiling operation relating to a sampled operation in program order after the context synchronization event.

To synchronize previous profiling operations, software must execute a `PSB CSYNC` Buffer Synchronization instruction.

———— Note ————

The `PSB CSYNC` instruction is not defined in the AArch32 instruction set architecture.

Following a context synchronization event, a `PSB CSYNC` instruction is guaranteed to synchronize the profiling operations for all instructions that are executed in program order before the context synchronization event.

Synchronized by the `PSB CSYNC` instruction means:

- A direct read of a System register in program order following a `PSB CSYNC` instruction requires explicit synchronization to observe an indirect write to the same System register made by a profiling operation synchronized by the `PSB CSYNC` instruction.
- An indirect write to a System register made by a profiling operation synchronized by a `PSB CSYNC` instruction does not affect a direct write to the same System register made in program order following the `PSB CSYNC` instruction.
- A direct write to a System register in program order following a `PSB CSYNC` instruction is not allowed to affect an indirect read of the same System register made by a profiling operation synchronized by the `PSB CSYNC` instruction.
- A `DSB` instruction in program order following a `PSB CSYNC` instruction does not complete before the writes to the Profiling Buffer of sample records for profiling operations synchronized by the `PSB CSYNC` instruction have completed. The `DSB` instruction must apply to both loads and stores.

For the indirect write to `PMBSTR_EL1` that is made as a result of an external abort on a write of a sample record to memory, the synchronization rules apply only after the write has completed.

Although the Statistical Profiling Extension acts as another observer in the system, for determining the Shareability domain of the `DSB` instructions, the writes of sample records are treated as coming from the PE that is being profiled.

———— Note ————

If the Statistical Profiling Extension is not disabled when the context synchronization event occurs, further profiling operations might be generated that are not guaranteed to be synchronized by the `PSB CSYNC` instruction.

If the PE takes an exception to an Exception level where the Statistical Profiling Extension is disabled, no new operations are selected for sampling. The Statistical Profiling Extension is always disabled if the owning Exception level is a lower Exception level than the current Exception level.

In the absence of a context synchronization event, a **PSB CSYNC** instruction is not required to execute in program order with respect to sampled operations.

D8.9.1 UNPREDICTABLE behavior

In the absence of correct context synchronization events, it is UNPREDICTABLE whether an indirect read of a System register made by a profiling operation will return the old or the new values.

If the indirect reads mean that **ProfilingBufferEnabled()** returns FALSE when a sample record or records are about to be written to the physical address, then it is further unpredictable whether the sample record or records:

- Are written to memory.
- Are silently discarded and not written to memory.
- Are discarded and not written to memory, and a Profiling Buffer management event is generated:
 - **PMBSR_EL1.DL** is set to 1.
 - **PMBSR_EL1.EC** is set to 0x00.
 - **PMBSR_EL1.BSC** is set to 0x00 to indicate that the buffer is not full.

This means that software must execute a **PSB CSYNC** instruction to force any sample records to be written to the Profiling Buffer before changing context.

Chapter D9

Statistical Profiling Extension Sample Record Specification

This chapter describes the sample records generated by the Statistical Profiling Extension. It contains the following sections:

- [About the Statistical Profiling Extension Sample Records](#) on page D9-2620.
- [Alphabetical list of Statistical Profiling Extension packets](#) on page D9-2623.

D9.1 About the Statistical Profiling Extension Sample Records

The sample record format is self-describing and extensible. This format allows software to parse profile data even when that profile data contains extended information.

The Statistical Profiling Extension writes a series of sample records to memory, each record consisting of a sequence of packets, and each packet consisting of:

- One or two header bytes.
- Zero, 1, 2, 4 or 8 payload bytes.

D9.1.1 Headers

The first header byte encodes the number of payload bytes:

0x00–0x1F	Single byte header, no payload.
0x20–0x3F	First byte of extended header. Second byte encodes the payload length.
0x40–0x4F, 0x80–0x8F, 0xC0–0xCF	8-bit payload.
0x50–0x5F, 0x90–0x9F, 0xD0–0xDF	16-bit payload.
0x60–0x6F, 0xA0–0xAF, 0xE0–0xEF	32-bit payload.
0x70–0x7F, 0xB0–0xBF, 0xF0–0xFF	64-bit payload.

D9.1.2 Records

A record consists of multiple packets. A record comprises, in ascending address order:

- A sequence of headers, each followed by their payload byte or bytes.
- Either:
 - An end packet header.
 - A timestamp packet.

Figures in this chapter show each packet as a sequence of bytes, with the LSB of each byte to the right and the *most significant bit* (MSB) to the left. [Figure D9-1](#) shows this convention, and how it relates to data transmission for a packet with a header byte and two payload bytes.

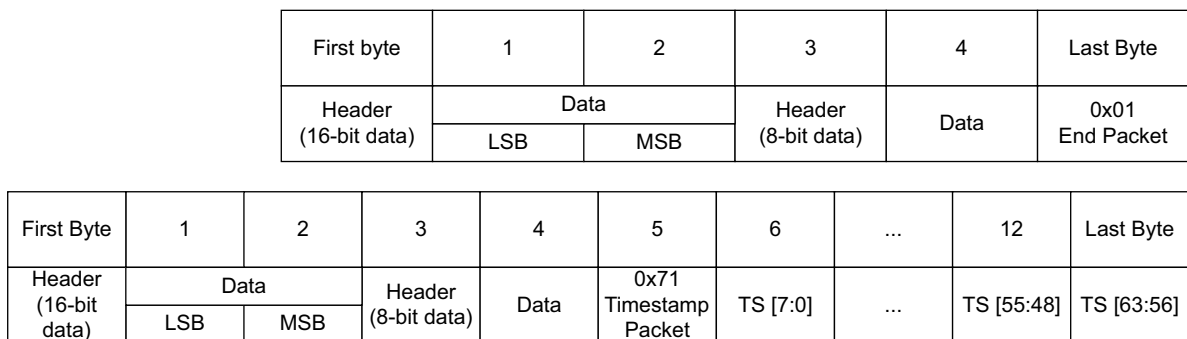

Figure D9-1 Convention for packet descriptions

In some sections, the figures are split into separate figures for the header byte and payload bytes. For instance, where the number of payload bytes varies according to a field in the header.

D9.1.3 Byte order

Header bytes and payload bytes are written in ascending address order. Within a payload value, values are written in little-endian byte order.

D9.1.4 Protocol framing packets and forwards compatibility

The padding header, alignment command, timestamp packet, and end packet are protocol framing packets that frame the records created by the Statistical Profiling Extension. Only padding headers and alignment commands are permitted between records.

———— **Note** —————

[PMBIDR_EL1](#).Align defines a minimum alignment for records. However, implementations must nevertheless create a valid protocol stream that can be parsed without knowledge of the minimum alignment.

The packet types are described in the following sections. Software must ignore unknown packets, using the size field encoded in the header. This includes packets containing reserved values in fields.

The following sections give an overview of the Statistical Profiling Extension packets and how the TPIU transmits them:

- [Statistical Profiling Extension protocol packet headers](#)

———— **Note** —————

This chapter describes packet transmission by a trace sink such as a TPIU. The Statistical Profiling Extension can send packets to any suitable trace sink. Regardless of the actual trace sink used, the Statistical Profiling Extension formats the packets as described in this chapter.

D9.1.5 Statistical Profiling Extension protocol packet headers

8-bit headers

For Address packets and Counter packets, the 8-bit header format is described as the *short format*.

Table D9-1 8-bit header encodings

[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]	Description
0	0	0	0	0	0	0	0	Padding on page D9-2641
0	0	0	0	0	0	0	1	End packet on page D9-2632
0	1	1	1	0	0	0	1	Timestamp packet on page D9-2642
0	1	x	x	0	0	1	0	Events packet on page D9-2633
0	1	x	x	0	0	1	1	Data Source packet on page D9-2631
0	1	1	0	0	1	x	x	Context packet on page D9-2628
0	1	0	0	1	0	x	x	Operation Type packet on page D9-2638
1	0	1	1	0	x	x	x	Address packet on page D9-2623 (Short format)
1	0	0	1	1	x	x	x	Counter packet on page D9-2629 (Short format)

16-bit headers

For Address packets and Counter packets, the 16-bit header format is described as the *extended format*.

Table D9-2 16-bit header encodings

Byte 0								Byte 1								Description
[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]	
0	0	1	0	x	x	x	x	0	0	0	0	0	0	0	0	<i>Alignment command on page D9-2627</i>
0	0	1	0	0	0	x	x	1	0	1	1	0	x	x	x	<i>Address packet on page D9-2623</i>
0	0	1	0	0	0	x	x	1	0	0	1	1	x	x	x	<i>Counter packet on page D9-2629</i>

D9.2 Alphabetical list of Statistical Profiling Extension packets

D9.2.1 Address packet

The Address packet characteristics are:

Purpose Provides an address value for the record. Addresses are always 64 bits.

Attributes Multi-part packet comprising:

- 8 or 16-bit header.
- 64-bit payload.

Address packet header

When Extended format is used, the Address packet header bit assignments are:

When Short format is used, the Address packet header bit assignments are:

Byte 1 bits [7:6], when Extended format, Byte 0 bits [7:6], when Short format

This field reads as 0b10.

SZ, byte 1 bits [5:4], when Extended format, SZ, byte 0 bits [5:4], when Short format

Payload size. The defined values of this field are:

0b11 Doubleword.

This field reads as 0b11.

Byte 1 bit [3], when Extended format, Byte 0 bit [3], when Short format

This bit reads as 0b0.

Byte 0 bits [7:5], when Extended format

This field reads as 0b001.

Byte 0 bits [4:2], when Extended format

This field reads-as-zero.

INDEX, byte 0 bits [1:0], byte 1 bits [2:0], when Extended format, INDEX, byte 0 bits [2:0], when Short format

The defined values of this field are:

0b00000 Issued instruction virtual address (PC). Included for all operations.

0b00001 Branch target address:

- It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether this address is included for an Exception Return to an Exception level where profiling is disabled.
- Included for all other branch and exception return instructions.

- 0b00010 Data access virtual address. Included for all load, store and atomic operations.
 - 0b00011 Data access physical address:
 - It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether this address included for accesses that generate Permission or Access Flag faults.
 - Not included for all other accesses that generate an abort, or if disabled by CollectPhysicalAddress.
 - Included for all other load, store and atomic operations.
 - 0b0011x IMPLEMENTATION DEFINED address.
 - 0b1xxxx IMPLEMENTATION DEFINED address.
- All other values are reserved.
In the Short format header, bits [4:3] are zero.

Address packet payload

When Data access physical address, the Address packet payload bit assignments are:

When Data access virtual address, the Address packet payload bit assignments are:

When Instruction virtual address, the Address packet payload bit assignments are:

TAG byte <7>, when Data access virtual address

Top-byte tag.

If the value of the applicable TBI bit is one, a data access virtual address includes the top-byte tag. If the applicable TBI bit is zero, it is IMPLEMENTATION DEFINED whether this field reads as zero or holds the address tag of the applicable address.

NS, byte 7 bit [7], when Instruction virtual address

Non-secure state. The Security state associated with the address. For an issued instruction virtual address (PC) this is the Security state the instruction was executed in. For a branch target address, this is the Security state at the target of the branch. The defined values of this bit are:

- 0 Secure state.
- 1 Non-secure state.

———— **Note** ————

For an Exception Return, the Security state at the target of the branch might be different to the Security state the instruction was executed in.

NS, byte 7 bit [7], when Data access physical address

Physical address space identifier. The Security attribute for the physical address. The defined values of this bit are:

- 0 Secure physical address space.
- 1 Non-secure physical address space.

EL, byte 7 bits [6:5], when Instruction virtual address

Exception level. The Exception level associated with the address. For an issued instruction virtual address (PC) this is the Exception level the instruction was executed in. For a branch target address, this is the Exception level at the target of the branch. The defined values of this field are:

- 0b00 EL0.
- 0b01 EL1.
- 0b10 EL2.
- 0b11 EL3.

———— **Note** ————

For an Exception Return, the Exception level at the target of the branch might be different to the Exception level the instruction was executed in.

Byte 7 bits [6:0], when Data access physical address

This field reads as 0b0000000.

Byte 7 bits [4:0], when Instruction virtual address

This field reads as 0b00000.

ADDR, bytes <6:0>

Address. Bits [55:0] of the address.

D9.2.2 Alignment command

The Alignment command characteristics are:

Purpose Allows the PE to create alignment to a naturally aligned address boundary in the buffer for the next protocol byte. Alignment bytes must be ignored.

Attributes 16-bit packet.

Field descriptions

The Alignment command bit assignments are:

Byte <1>

This field reads as `0b00000000`.

Byte 0 bits [7:5]

This field reads as `0b001`.

Byte 0 bit [4]

This bit reads-as-zero.

SIZE, byte 0 bits [3:0]

Defines the alignment of the next protocol byte. The data between the Alignment command and the next header byte is UNKNOWN. The defined values of this field are:

`0b0001` 4 byte alignment.
`0b0010` 8 byte alignment.
`0b0011` 16 byte alignment.
... ..
`0b1111` 64 Kbyte alignment.

All other values are reserved.

———— Note —————

The address of the next protocol byte is aligned to a multiple of the specified size. There will always be fewer than this number of bytes between the Alignment command and the next protocol byte.

D9.2.3 Context packet

The Context packet characteristics are:

- Purpose** Provides context information for the record.
- Attributes** Multi-part packet comprising:
- 8-bit header.
 - 32-bit payload.

Context packet header

The Context packet header bit assignments are:

Byte 0 bits [7:6]

This field reads as 0b01.

SZ, byte 0 bits [5:4]

Payload size. The defined values of this field are:

0b10 Word.

This field reads as 0b10.

Byte 0 bits [3:2]

This field reads as 0b01.

INDEX, byte 0 bits [1:0]

Identifies the context value. The defined values of this field are:

0b00 CONTEXTIDR_EL1. Included for all operations if enabled by CollectContextIDR1.

0b01 CONTEXTIDR_EL2. Included for all operations if enabled by CollectContextIDR2.

All other values are reserved.

Context packet payload

The Context packet payload bit assignments are:

CONTEXT, bytes <3:0>

The context value.

D9.2.4 Counter packet

The Counter packet characteristics are:

- Purpose** Count of cycles the operation spent performing all or part of its behavior. The counter value occupies the least significant bits of the payload. The remaining bits are set to zero.
- Attributes** Multi-part packet comprising:
- 8 or 16-bit header.
 - 16-bit payload.

Counter packet header

When Extended format, the Counter packet header bit assignments are:

When Short format, the Counter packet header bit assignments are:

Byte 1 bits [7:6], when Extended format, Byte 0 bits [7:6], when Short format

This field reads as 0b10.

SZ, byte 1 bits [5:4], when Extended format, SZ, byte 0 bits [5:4], when Short format

Payload size. The defined values of this field are:

0b01 Halfword.

This field reads as 0b01.

Byte 1 bit [3], when Extended format, Byte 0 bit [3], when Short format

This bit reads as 0b1.

Byte 0 bits [7:5], when Extended format

This field reads as 0b001.

Byte 0 bits [4:2], when Extended format

This field reads-as-zero.

INDEX, byte 0 bits [1:0], byte 1 bits [2:0], when Extended format, INDEX, byte 0 bits [2:0], when Short format

The defined values of this field are:

- 0b00000 Total latency. Cycle count from the operation being dispatched for issue to the operation being complete. Included for all operations.
- 0b00001 Issue latency. Cycle count from the operation being dispatched for issue to the operation being issued for execution. This counts any delay in waiting the operation being ready to issue. Included for all operations.
- 0b00010 Translation latency. Cycle count from a virtual address being passed to the MMU for translation to the result of the translation being available. Included for all load, store and atomic operations.
- 0b0011x IMPLEMENTATION DEFINED counter value.

0b1xxxx IMPLEMENTATION DEFINED counter value.

All other values are reserved.

In the Short format header, bits [4:3] are zero.

Dispatched for issue means:

- The operation has been decoded.
- The operation might not be ready to start execution because it is waiting for input values. The operation might be put into a queue.

Issued for execution means the operation is ready to start executing:

- For example, for a memory operation, this should be indicative of the cycle count from memory operation being dispatched for issue to access being initiated (virtual address).

Complete means:

- The operation has completed execution and is no longer capable of stalling any instruction that consumes its output.
- It is IMPLEMENTATION DEFINED whether the operation has committed its results to the architectural state of the PE.
- For example:
 - For an arithmetic, floating-point, or SIMD operation with variable timing, such as divide, the results of the operation are available.
 - For load and atomic operations that return data, all data have been returned from memory.
 - For store and atomic operations that do not return data, it is not required that the store has reached its end point for it to be complete.
 - For branch operations, the branch has been resolved as taken or not taken.
 - For barrier operations, the barrier has completed.

For WFE and WFI operations, it is IMPLEMENTATION DEFINED whether:

- The instruction is complete before the PE enters a low-power state or when the PE wakes from the low-power state.
- Counters count in the low power state.
- Sampling an operation is itself a wake-up event.

Counter packet payload

The Counter packet payload bit assignments are:

Byte 1 bits [7:4]

This field reads-as-zero.

COUNT, byte 1 bits [3:0], byte <0>, when a 12-bit counter is implemented

The counter value occupies the least significant bits of the payload. The remaining bits are set to zero. The counters are:

- Unsigned numbers.
- 12 bits.
- Saturating.

The value 0xFFF indicates the count has saturated.

D9.2.5 Data Source packet

The Data Source packet characteristics are:

Purpose If the implementation includes support for indicating the loaded data source, the Data Source packet indicates where the data returned for a load operation was sourced. It might also include other information, such as the state of the data at the source. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether this is included for load and atomic operations that generate an external abort. It is IMPLEMENTATION DEFINED whether this is included for atomic operations that do not return data to a PE register. Included for all other load and atomic operations.

Attributes Multi-part packet comprising:

- 8-bit header.
- 8 or 16-bit payload.

Data Source packet header

The Data Source packet header bit assignments are:

Byte 0 bits [7:6]

This field reads as 0b01.

SZ, byte 0 bits [5:4]

Payload size. The defined values of this field are:

0b00 Byte.

0b01 Halfword.

Byte 0 bits [3:0]

This field reads as 0b0011.

Data Source packet payload

When SZ == 0b00, the Data Source packet payload bit assignments are:

When SZ == 0b01, the Data Source packet payload bit assignments are:

SOURCE, byte <0>, when SZ == 0b00, SOURCE, bytes <1:0>, when SZ == 0b01

Because the list of data sources varies from system to system, the definition of this field is IMPLEMENTATION DEFINED. If a sampled operation generated multiple data accesses, it is IMPLEMENTATION DEFINED how the data source information is combined.

D9.2.6 End packet

The End packet characteristics are:

- Purpose** Defines the end of a record if a [Timestamp packet](#) is not present.
- Attributes** 8-bit packet.

Field descriptions

The End packet bit assignments are:

Byte <0>

This field reads as 0b00000001.

D9.2.7 Events packet

The Events packet characteristics are:

- Purpose** Indicates up to 64 events generated by the sampled operation.
- Attributes** Multi-part packet comprising:
- 8-bit header.
 - 8, 16, 32, or 64-bit payload.

Events packet header

The Events packet header bit assignments are:

7	6	5	4	3	2	1	0	
0	1	SZ		0	0	1	0	Byte 0

Byte 0 bits [7:6]

This field reads as 0b01.

SZ, byte 0 bits [5:4]

Payload size. The defined values of this field are:

- 0b00 Byte.
- 0b01 Halfword.
- 0b10 Word.
- 0b11 Doubleword.

Software must treat bits that are not output as zero.

Byte 0 bits [3:0]

This field reads as 0b0010.

Events packet payload

When SZ == 0b00, the Events packet payload bit assignments are:

7	6	5	4	3	2	1	0	
E[7]	E[6]	E[5]	E[4]	E[3]	E[2]	E[1]	E[0]	Byte 0

When SZ == 0b01, the Events packet payload bit assignments are:

7	6	5	4	3	2	1	0	
E[7]	E[6]	E[5]	E[4]	E[3]	E[2]	E[1]	E[0]	Byte 0
E[15:12]				0	E[10]	E[9]	E[8]	Byte 1

When $SZ == 0b10$, the Events packet payload bit assignments are:

7	6	5	4	3	2	1	0	
E[7]	E[6]	E[5]	E[4]	E[3]	E[2]	E[1]	E[0]	Byte 0
E[15:12]				0	E[10]	E[9]	E[8]	Byte 1
0	0	0	0	0	0	0	0	Byte 2
E[31:24]								Byte 3

When $SZ == 0b11$, the Events packet payload bit assignments are:

7	6	5	4	3	2	1	0	
E[7]	E[6]	E[5]	E[4]	E[3]	E[2]	E[1]	E[0]	Byte 0
E[15:12]				0	E[10]	E[9]	E[8]	Byte 1
0	0	0	0	0	0	0	0	Byte 2
E[31:24]								Byte 3
0	0	0	0	0	0	0	0	Byte 4
0	0	0	0	0	0	0	0	Byte 5
E[55:48]								Byte 6
E[63:56]								Byte 7

E[63:48], bytes <7:6>, when $SZ == 0b11$

Events 63 to 48. IMPLEMENTATION DEFINED.

Bytes <5:4,2>, byte 1 bit [3], when $SZ == 0b11$

This field reads-as-zero.

E[31:24], byte <3>, when $SZ == 0b10$, or when $SZ == 0b11$

Events 31 to 24. IMPLEMENTATION DEFINED.

Byte <2>, byte 1 bit [3], when $SZ == 0b10$

This field reads-as-zero.

E[15:12], byte 1 bits [7:4], when $SZ == 0b01$, when $SZ == 0b10$, or when $SZ == 0b11$

Events 15 to 12. IMPLEMENTATION DEFINED.

Byte 1 bit [3], when $SZ == 0b01$

This bit reads-as-zero.

E[10], byte 1 bit [2], when SZ == 0b01, when SZ == 0b10, or when SZ == 0b11

Remote access. The defined values of this bit are:

- 0 Did not cause access to another socket.
- 1 Load/store operation caused an access to another socket in a multi-socket system. This includes each data memory access that accesses another socket in a multi-socket system, including those that do not return data.

———— **Note** —————

See also [REMOTE_ACCESS](#).

E[9], byte 1 bit [1], when SZ == 0b01, when SZ == 0b10, or when SZ == 0b11

Last Level cache miss. The defined values of this bit are:

- 0 Did not miss Last Level cache.
- 1 Load/store operation caused an access to at least the Last Level cache but is not completed by the Last Level cache. That is, each:
 - Load operation that does not return data from the Last Level cache.
 - Store operation that does not update the Last Level cache.The event is not set for operations that are completed by a cache above the Last Level cache.

———— **Note** —————

See also [LL_CACHE_MISS](#).

E[8], byte 1 bit [0], when SZ == 0b01, when SZ == 0b10, or when SZ == 0b11

Last Level cache access. The defined values of this bit are:

- 0 Did not access Last Level data or unified cache.
- 1 Load/store operation caused a cache access to at least the Last Level data or unified cache.

———— **Note** —————

The architecture does not define the Last Level cache. The Last Level cache is typically the largest cache on this device shared by all PEs in the inner or outer Shareable domain of this PE. In a multi-socket system, it is IMPLEMENTATION DEFINED whether this includes caches on other sockets.

———— **Note** —————

See also [LL_CACHE](#).

E[7], byte 0 bit [7]

Mispredicted. The defined values of this bit are:

- 0 Did not cause correction to the predicted program flow.
- 1 A branch that caused a correction to the predicted program flow.

E[6], byte 0 bit [6]

Not taken. The defined values of this bit are:

- 0 Did not fail condition code check.
- 1 A conditional instruction that failed its condition code check. This includes conditional branches, compare-and-branch, conditional select, and conditional compares:
 - For a conditional branch or compare-and-branch instruction, this means the branch was not taken.
 - For a conditional select, this means the second operand was written to the result.

- For a condition compare, this means the condition flags were set to the immediate value and not the result of the compare.

E[5], byte 0 bit [5]

TLB walk. The defined values of this bit are:

- 0 Did not generate TLB walk.
- 1 Load/store operation that causes a refill of a data or unified TLB, involving at least one translation table walk access. This includes each complete or partial translation table walk that causes an access to memory, including to data or translation table walk caches.

———— **Note** —————

See also [DTLB_WALK](#).

E[4], byte 0 bit [4]

TLB access. The defined values of this bit are:

- 0 Did not access TLB.
- 1 Load/store operation caused an access to at least the first level of data or unified TLB.

———— **Note** —————

See also [L1D_TLB](#).

E[3], byte 0 bit [3]

Level 1 Data cache refill. The defined values of this bit are:

- 0 Did not cause level 1 data cache refill.
- 1 Load/store operation caused a refill of at least the first level of data or unified cache. This includes each data memory access that causes a refill from outside the cache. It excludes accesses that do not cause a new cache refill but are satisfied from refilling data of a previous miss.

———— **Note** —————

See also [L1D_CACHE_REFILL](#).

E[2], byte 0 bit [2]

Level 1 Data cache access. The defined values of this bit are:

- 0 Did not access level 1 data cache.
- 1 Load/store operation caused a cache access to at least the first level of data or unified cache.

———— **Note** —————

See also [L1D_CACHE](#).

E[1], byte 0 bit [1]

Architecturally retired. The defined values of this bit are:

- 0 Did not retire.
- 1 Committed its results to the architectural state of the PE, or completed with a synchronous architectural exception.

———— **Note** —————

A conditional instruction can retire even if it fails its condition code check.

E[0], byte 0 bit [0]

Generated exception. The defined values of this bit are:

- 0 Did not generate an exception.
- 1 Completed with a synchronous exception.

If E[1] in the same Events packet is set to 0, then the meaning of this bit is IMPLEMENTATION DEFINED.

D9.2.8 Operation Type packet

The Operation Type packet characteristics are:

- Purpose** Defines the type of operation sampled. Included for all operations.
- Attributes** Multi-part packet comprising:
- 8-bit header.
 - 8-bit payload.

Operation Type packet header

The Operation Type packet header bit assignments are:

Byte 0 bits [7:6]

This field reads as 0b01.

SZ, byte 0 bits [5:4]

Payload size. The defined values of this field are:

0b00 Byte.

This field reads as 0b00.

Byte 0 bits [3:2]

This field reads as 0b10.

CLASS, byte 0 bits [1:0]

Top-level instruction class. The defined values of this field are:

0b00 Other.

0b01 Load, store, or atomic.

0b10 Branch or exception return.

All other values are reserved.

Operation Type packet payload (Other)

The Operation Type packet payload (Other) bit assignments are:

SUBCLASS, byte <0>

Second-level instruction class. Defines the type of instruction. The defined values of this field are:

0x00 Other (unconditional) instruction.

0x01 Conditional instruction or select.

All other values are reserved.

Operation Type packet payload (Branch)

The Operation Type packet payload (Branch) bit assignments are:

SUBCLASS, byte <0>

Second-level instruction class. Describes the branch type. The defined values of this field are:

0b0000000x Direct branch.

0b0000001x Indirect branch.

All other values are reserved.

COND, byte 0 bit [0]

Conditional. The defined values of this bit are:

0 Unconditional branch.

1 Conditional branch.

Operation Type packet payload (Load/store)

When Extended load/store, the Operation Type packet payload (Load/store) bit assignments are:

When General-purpose load/store, the Operation Type packet payload (Load/store) bit assignments are:

When SIMD&FP load/store, the Operation Type packet payload (Load/store) bit assignments are:

SUBCLASS, byte <0>

Second-level instruction class. Indicates the load/store type. The defined values of this field are:

0b0000000x A load/store targeting the general-purpose registers, other than an atomic operation, load-acquire, store-release or exclusive.

0b000xxx1x An atomic operation, load-acquire, store-release or exclusive. Bits [4:2] are further subdivided as described by the AR, EXCL and AT fields.

0b0000010x A load/store targeting the SIMD&FP registers.

All other values are reserved.

AR, byte 0 bit [4], when Extended load/store

Acquire/Release. The defined values of this bit are:

- 0 Load/store/atomic without Acquire or Release semantics.
- 1 Load/store/atomic with Acquire or Release semantics.

EXCL, byte 0 bit [3], when Extended load/store

Exclusive. The defined values of this bit are:

- 0 Load/store/atomic without Exclusive.
- 1 Load/store with Exclusive.

This bit is RES0 if AT == 1.

AT, byte 0 bit [2], when Extended load/store

Atomic load/store. The defined values of this bit are:

- 0 Not atomic.
- 1 Atomic.

LDST, byte 0 bit [0]

Store not load. The defined values of this bit are:

- 0 Load or swap.
- 1 Store.

D9.2.9 Padding

The Padding characteristics are:

Purpose Allows the PE to create alignment in the protocol buffer.

Attributes 8-bit packet.

Field descriptions

The Padding bit assignments are:

Byte <0>

This field reads as 0b00000000.

D9.2.10 Timestamp packet

The Timestamp packet characteristics are:

Purpose The 64-bit timestamp value when the operation was sampled. The Timestamp packet must come at the end of the record. If the Timestamp packet is not present, an [End packet](#) must come at the end of the record.

Attributes Multi-part packet comprising:

- 8-bit header.
- 64-bit payload.

Timestamp packet header

The Timestamp packet header bit assignments are:

7	6	5	4	3	2	1	0	
0	1	SZ		0	0	0	1	Byte 0
		1	1					

Byte 0 bits [7:6]

This field reads as 0b01.

SZ, byte 0 bits [5:4]

Payload size. The defined values of this field are:

0b11 Doubleword.

This field reads as 0b11.

Byte 0 bits [3:0]

This field reads as 0b0001.

Timestamp packet payload

The Timestamp packet payload bit assignments are:

TS, bytes <7:0>

Timestamp value when the operation was sampled. The value depends on the result of [aarch64/debug/statisticalprofiling/CollectRecord\(\)](#):

- If `TimeStamp_Virtual`, this is the virtual timestamp, `CNTVCT_ELO`.
- If `TimeStamp_Physical`, this is the physical timestamp, `CNTPCT_ELO`.
- If `TimeStamp_None`, the timestamp packet is not included and an **End packet** must come at the end of the record.

However, if the Generic Timer System counter is disabled and [aarch64/debug/statisticalprofiling/CollectTimeStamp\(\)](#) returns a value other than `TimeStamp_None`, then it is IMPLEMENTATION DEFINED whether:

- The Statistical Profiling Extension behaves as if [aarch64/debug/statisticalprofiling/CollectTimeStamp\(\)](#) returns the value `TimeStamp_None`.
- The value of this field in the record is UNKNOWN.

———— Note —————

This relaxation refers to when the actual System counter is disabled, that is, `CNTEN.EN == 0`. It does not apply when the System counter is enabled but not accessible at the current Exception level.

Chapter D10

The Generic Timer in AArch64 state

This chapter describes the implementation of the ARM Generic Timer. It includes an overview of the AArch64 System register interface to an ARM Generic Timer.

It contains the following sections:

- [About the Generic Timer on page D10-2646.](#)
- [The AArch64 view of the Generic Timer on page D10-2650.](#)

[Chapter G6 The Generic Timer in AArch32 state](#) describes the AArch32 view of the Generic Timer, and [Chapter I2 System Level Implementation of the Generic Timer](#) describes the system level implementation of the Generic Timer.

D10.1 About the Generic Timer

Figure D10-1 shows an example system-on-chip that uses the Generic Timer as a system timer. In this figure:

- This manual defines the architecture of the individual PEs in the multiprocessor blocks.
- The *ARM Generic Interrupt Controller Architecture Specification* defines a possible architecture for the interrupt controllers.
- Generic Timer functionality is distributed across multiple components.

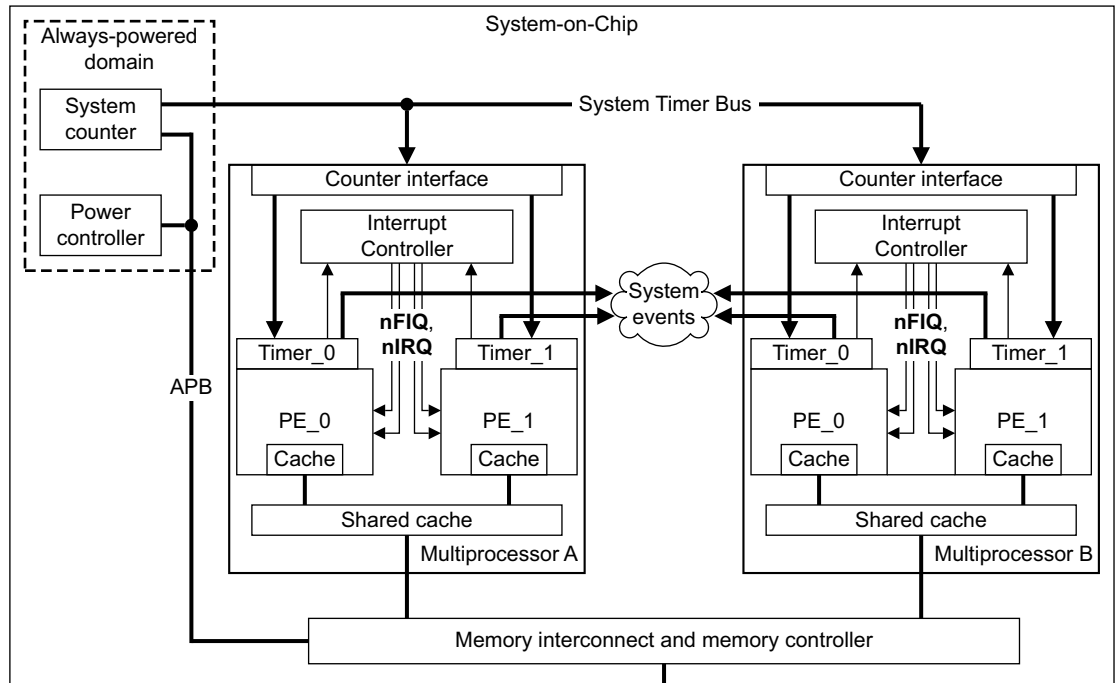

Figure D10-1 Generic Timer example

The Generic Timer:

- Provides a system counter, that measures the passing of time in real-time.

———— **Note** ————

The Generic Timer can also provide other components at a system level, but Figure D10-1 does not show any such components.

- Supports *virtual counters* that measure the passing of virtual-time. That is, a virtual counter can measure the passing of time on a particular virtual machine.
- Timers, that can trigger events after a period of time has passed. The timers:
 - Can be used as count-up or as count-down timers.
 - Can operate in real-time or in virtual-time.

This chapter describes an instance of the Generic Timer component that Figure D10-1 shows as Timer_0 or Timer_1 within the Multiprocessor A or Multiprocessor B block. This component can be accessed from AArch64 state or AArch32 state, and this chapter describes access from AArch64 state. Chapter G6 *The Generic Timer in AArch32 state* describes access to this component from AArch32 state.

A Generic Timer implementation must also include a memory-mapped system component. This component:

- Must provide the System counter shown in Figure D10-1
- Optionally, can provide timer components for use at a system level.

Chapter I2 *System Level Implementation of the Generic Timer* describes this memory-mapped component.

D10.1.1 The full set of Generic Timer components

Within a system that might include multiple PEs, a full set of Generic Timer components is as follows:

The system counter

This provides a uniform view of system time, see [The system counter on page D10-2648](#). Because this must be implemented at the system level, it is accessed through [The system level memory-mapped implementation of the Generic Timer](#). However, during initialization, a status register in each implemented timer in the system must be programmed with the frequency of the system counter, so that software can read this frequency.

PE implementations of the Generic Timer

Each PE implementation of the Generic Timer provides the following components:

- A physical counter, that gives access to the count value of the system counter.
- A virtual counter, that gives access to virtual time. In AArch64 state, the `CNTVOFF_EL2` register defines the offset between physical time, as defined by the value of the system counter, and virtual time.
- A number of timers. In an implementation where all Exception levels are implemented and can use AArch64 state, the timers that are accessible from AArch64 state are:
 - An EL1 physical timer.
 - A Non-secure EL2 physical timer.
 - An EL3 physical timer.
 - An EL1 virtual timer.
 - A Non-secure EL2 virtual timer.
 - A Secure EL2 virtual timer.
 - A Secure EL2 physical timer.

The Non-secure EL2 virtual timer is available only when [ARMv8.1-VHE](#) is implemented.

The Secure EL2 timers are available only when [ARMv8.4-SecEL2](#) is implemented.

[The AArch64 view of the Generic Timer on page D10-2650](#) describes these components.

The system level memory-mapped implementation of the Generic Timer

The memory-mapped registers that control the components of the system level implementation of the Generic Timer are grouped into *frames*. The Generic Timer architecture defines the offset of each register within its frame, but the base address of each frame is IMPLEMENTATION DEFINED, and defined by the system.

Each system level component has one or two register frames. The possible system level components are:

The memory-mapped counter module, required

This module controls the system counter. It has two frames:

- A control frame, `CNTControlBase`.
- A status frame, `CNTReadBase`.

The memory-mapped timer control module, required

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:

- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, `CNTCTLBase`.

Memory-mapped timers, optional

An implemented memory-mapped timer:

- Must provide a privileged view of the timer, in the `CNTBaseN` frame.
- Optionally, provides an unprivileged view of the timer in the `CNTEL0BaseN` frame.

N is the timer number, and the corresponding frame number, in the range 0-7.

Chapter 12 *System Level Implementation of the Generic Timer* describes these components.

D10.1.2 The system counter

The Generic Timer provides a system counter with the following specification:

Width	At least 56 bits wide. The value returned by any 64-bit read of the counter is zero-extended to 64 bits.
Frequency	Increments at a fixed frequency, typically in the range 1-50MHz. Can support one or more alternative operating modes in which it increments by larger amounts at a lower frequency, typically for power-saving.
Roll-over	Roll-over time of not less than 40 years.
Accuracy	ARM does not specify a required accuracy, but recommends that the counter does not gain or lose more than ten seconds in a 24-hour period. Use of lower-frequency modes must not affect the implemented accuracy.
Start-up	Starts operating from zero.

The system counter, once configured and running, must provide a uniform view of system time. More precisely, it must be impossible for the following sequence of events to show system time going backwards:

1. Device A reads the time from the system counter.
2. Device A communicates with another agent in the system, Device B.
3. After recognizing the communication from Device A, Device B reads the time from the system counter.

The system counter must be implemented in an always-on power domain.

To support lower-power operating modes, the counter can increment by larger amounts at a lower frequency. For example, a 10MHz system counter might either increment:

- By 1 at 10MHz.
- By 500 at 20kHz, when the system lowers the clock frequency, to reduce power consumption.

In this case, the counter must support transitions between high-frequency, high-precision operation, and lower-frequency, lower-precision operation, without any impact on the required accuracy of the counter.

The `CNTFRQ_ELO` register is intended to hold a copy of the current clock frequency to allow fast reference to this frequency by software running on the PE. For more information, see [Initializing and reading the system counter frequency](#).

The mechanism by which the count from the system counter is distributed to system components is IMPLEMENTATION DEFINED, but each PE with a System register interface to the system counter must have a counter input that can capture each increment of the counter.

———— Note —————

So that the system counter can be clocked independently from the PE hardware, the count value might be distributed using a Gray code sequence. [Gray-count scheme for timer distribution scheme on page K5-7274](#) gives more information about this possibility.

Initializing and reading the system counter frequency

The `CNTFRQ_ELO` register must be programmed to the clock frequency of the system counter. Typically, this is done only during the system boot process, by using the System register interface to write the system counter frequency to the `CNTFRQ_ELO` register. Only software executing at the highest implemented Exception level can write to `CNTFRQ_ELO`.

———— Note —————

The `CNTFRQ_ELO` register is UNKNOWN at reset, and therefore the counter frequency must be set as part of the system boot process.

Software can read the [CNTFRQ_EL0](#) register, to determine the current system counter frequency, in the following states:

- Secure and Non-secure EL2.
- Secure and Non-secure EL1.
- When [CNTKCTL_EL1.EL0PCTEN](#) is set to 1, Secure and Non-secure EL0.

Memory-mapped controls of the system counter

Some system counter controls are accessible only through the memory-mapped interface to the system counter. These controls are:

- Enabling and disabling the counter.
- Setting the counter value.
- Changing the operating mode, to change the update frequency and increment value.
- Enabling Halt-on-debug, that a debugger can then use to suspend counting.

For descriptions of these controls, see [Chapter I2 System Level Implementation of the Generic Timer](#).

D10.2 The AArch64 view of the Generic Timer

The following sections describe the components and features of a PE implementation of the Generic Timer, as seen from AArch64 state:

- [The physical counter](#).
- [The virtual counter](#).
- [Event streams](#) on page D10-2651.
- [Timers](#) on page D10-2652.

D10.2.1 The physical counter

The PE includes a physical counter that contains the count value of the system counter. The `CNTPCT_EL0` register holds the current physical counter value.

Reads of `CNTPCT_EL0` can occur speculatively and out of order relative to other instructions executed on the same PE.

For example, if a read from memory is used to obtain a signal from another agent that indicates that `CNTPCT_EL0` must be read, an ISB is used to ensure that the read of `CNTPCT_EL0` occurs after the signal has been read from memory, as shown in the following code sequence:

```
loop                ; polling for some communication to indicate a requirement to read the timer
  LDR R1, [R2]
  CMP R1, #1
  BNE loop
  ISB                ; without this, the CNTPCT could be read before the memory location in [R2]
                    ; has had the value 1 written to it
  MRS R1, CNTPCT
```

D10.2.2 The virtual counter

An implementation of the Generic Timer always includes a virtual counter, that indicates virtual time.

The virtual counter contains the value of the physical counter minus a 64-bit virtual offset. When executing at EL1 or EL0, the virtual offset value relates to the current virtual machine.

The `CNTVOFF_EL2` register contains the virtual offset. `CNTVOFF_EL2` is only accessible from EL2 and EL3.

For more information, see [Status of the CNTVOFF register](#).

The `CNTVCT_EL0` register holds the current virtual counter value.

Reads of `CNTVCT_EL0` can occur speculatively and out of order relative to other instructions executed on the same PE.

For example, if a read from memory is used to obtain a signal from another agent that indicates that `CNTVCT_EL0` must be read, an ISB is used to ensure that the read of `CNTVCT_EL0` occurs after the signal has been read from memory, as shown in the following code sequence:

```
loop                ; polling for some communication to indicate a requirement to read the timer
  LDR R1, [R2]
  CMP R1, #1
  BNE loop
  ISB                ; without this, the CNTVCT could be read before the memory location in [R2]
                    ; has had the value 1 written to it
  MRS R1, CNTVCT
```

Status of the CNTVOFF register

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the `CNTVOFF_EL2` register that defines the *virtual offset* between the physical count and the virtual count. `CNTVOFF_EL2` is only accessible at EL2 or above. If EL2 is not implemented, the virtual counter uses a fixed virtual offset of zero.

D10.2.3 Event streams

An implementation that includes the Generic Timer can use the system counter to generate one or more *event streams*, to generate periodic wake-up events as part of the mechanism described in [Wait for Event mechanism and Send event](#) on page D1-2255.

———— **Note** —————

An event stream might be used:

- To impose a time-out on a Wait For Event polling loop.
- To safeguard against any programming error that means an expected event is not generated.

An event stream is configured by:

- Selecting which bit, from the bottom 16 bits of a counter, triggers the event. This determines the frequency of the events in the stream.
- Selecting whether the event is generated on each 0 to 1 transition, or each 1 to 0 transition, of the selected counter bit.

The [CNTKCTL_EL1](#).{EVNTEN, EVNTPDIR, EVNTPDI} fields define an event stream that is generated from the virtual counter.

In all implementations, the [CNTHTCTL_EL2](#).{EVNTEN, EVNTPDIR, EVNTPDI} fields define an event stream that is generated from the physical counter.

The operation of an event stream is as follows:

- The pseudocode variables PreviousCNTVCT and PreviousCNTPCT are initialized as:
- The pseudocode functions TestEventCNTV() and TestEventCNTP() are called on each cycle of the PE clock.
- The TestEventCNTx() pseudocode template defines the functions TestEventCNTV() and TestEventCNTP():

```
// Variables used for generation of the timer event stream.
bits(64) PreviousCNTVCT = bits(64) UNKNOWN;
bits(64) PreviousCNTPCT = bits(64) UNKNOWN;

// TestEventCNTx()
// =====

// Template for the TestEventCNTV() and TestEventCNTP() functions
// Describes operation when all Exception Levels are using AArch64:
// CNTxCT_EL0 is CNTVCT_EL0 or CNTPCT_EL0 64-bit count value
// CNTx_CTL_EL0 is CNTV_CTL_EL0 or CNTP_CTL_EL0 Control register
// PreviousCNTxCT_EL0 is PreviousCNTVCT_EL0 or PreviousCNTPCT_EL0

TestEventCNTx()
    if CNTx_CTL_EL0.EVNTEN == '1' then
        n = UInt(CNTx_CTL_EL0.EVNTPDI);
        SampleBit = CNTxCT_EL0<n>;
        PreviousBit = PreviousCNTxCT_EL0<n>;

        if CNTx_CTL_EL0.EVNTPDIR == '0' then
            if PreviousBit == '0' && SampleBit == '1' then EventRegisterSet();
        else
            if PreviousBit == '1' && SampleBit == '0' then EventRegisterSet();

    PreviousCNTxCT_EL0 = CNTxCT_EL0;

    return;
```

D10.2.4 Timers

In an implementation of the Generic Timer that includes EL3, if EL3 can use AArch64, the following timers are implemented:

- An EL1 physical timer, that:
 - In Secure state, can be accessed from EL1.
 - In Non-secure state, can be accessed from EL1 unless those accesses are trapped to EL2.
When this timer can be accessed from EL1, an EL1 control determines whether it can be accessed from EL0.
- A Non-secure EL2 physical timer.
- A Secure EL3 physical timer. An EL3 control determines whether this register is accessible from Secure EL1.
- An EL1 virtual timer.
- A Non-secure EL2 virtual timer, when [ARMv8.1-VHE](#) is implemented.
- A Secure EL2 physical timer, when [ARMv8.4-SecEL2](#) is implemented, that can only be accessed in Secure EL2 and EL3.
- A Secure EL2 Virtual timer, when [ARMv8.4-SecEL2](#) is implemented, that can only be accessed in Secure EL2 and EL3.

The output of each implemented timer:

- Provides an output signal to the system.
- If the PE interfaces to a *Generic Interrupt Controller* (GIC), signals a *Private Peripheral Interrupt* (PPI) to that GIC. In a multiprocessor implementation, each PE must use the same interrupt number for each timer.

Each timer:

- Is based around a 64-bit CompareValue that provides a 64-bit unsigned upcounter.
- Provides an alternative view of the CompareValue, called the TimerValue, that appears to operate as a 32-bit downcounter.
- Has, in addition, a 32-bit Control register.

Table D10-1 Physical Timer registers summary for the Generic Timer

Timer ^a Register	EL1 Physical Timer	EL2 Physical Timer	Secure EL2 Physical Timer ^b	EL3 Physical Timer
CV	CNTP_CVAL_EL0	CNTHP_CVAL_EL2	CNTHPS_CVAL_EL2	CNTPS_CVAL_EL1
TV	CNTP_TVAL_EL0	CNTHP_TVAL_EL2	CNTHPS_TVAL_EL2	CNTPS_TVAL_EL1
Control	CNTP_CTL_EL0	CNTHP_CTL_EL2	CNTHPS_CTL_EL2	CNTPS_CTL_EL1

a. In this column, CV indicates the CompareValue register, and TV indicates the TimerValue register.

b. Only present when the implementation includes [ARMv8.4-SecEL2](#).

Table D10-2 Virtual Timer register summary for the Generic Timer

Timer ^a Register	EL1 Virtual Timer	EL2 Virtual Timer ^b	Secure EL2 Virtual Timer ^c
CV	CNTV_CVAL_EL0	CNTHV_CVAL_EL2	CNTHVS_CVAL_EL2
TV	CNTV_TVAL_EL0	CNTHV_TVAL_EL2	CNTHVS_TVAL_EL2
Control	CNTV_CTL_EL0	CNTHV_CTL_EL2	CNTHVS_CTL_EL2

a. In this column, CV indicates the CompareValue register, and TV indicates the TimerValue register.

b. Only when the implementation includes [ARMv8.1-VHE](#).

c. Only present when the implementation includes [ARMv8.4-SecEL2](#).

Operation of the CompareValue views of the timers

The CompareValue view of a timer operates as a 64-bit upcounter. The timer condition is met when the appropriate counter reaches the value programmed into its CompareValue register. When the timer condition is met, an interrupt is generated if the interrupt is not masked in the corresponding timer control register, [CNTP_CTL_EL0](#), [CNTHP_CTL_EL2](#), [CNTHPS_CTL_EL2](#), [CNTPS_CTL_EL1](#), [CNTV_CTL_EL0](#), or [CNTHVS_CTL_EL2](#). For [CNTP_CTL_EL0](#), the asserted interrupt is the same as the interrupt asserted by the Non-secure instance of the AArch32 register [CNTP_CTL](#).

The operation of this view of a timer is:

$$\text{TimerConditionMet} = (((\text{Counter}[63:0] - \text{Offset}[63:0])[63:0] - \text{CompareValue}[63:0]) \geq 0)$$

Where:

TimerConditionMet	Is TRUE if the timer condition for this counter is met, and FALSE otherwise.
Counter	The physical counter value, that can be read from the CNTPCT_EL0 register.
Offset	For a physical timer, this value is zero. For the EL1 virtual timer, this value is held in the CNTVOFF_EL2 register. For the Non-secure EL2 and Secure EL2 virtual timer, this value is zero.
CompareValue	The value of the appropriate CompareValue register, CNTP_CVAL_EL0 , CNTHP_CVAL_EL2 , CNTPS_CVAL_EL1 , CNTV_CVAL_EL0 , or CNTHV_CVAL_EL2 .

In this view of a timer, Counter, Offset, and CompareValue are all 64-bit unsigned values.

———— Note ————

This means that a timer with a CompareValue of, or close to, 0xFFFF_FFFF_FFFF_FFFF might never meet its timer condition. However, there is no practical requirement to use values close to the counter wrap value.

Software can observe the counter value by the offset in some situations by reading [CNTVCT_EL0](#). For more information see [CNTVCT_EL0](#).

Operation of the TimerValue views of the timers

The TimerValue view of a timer appears to operate as a signed 32-bit downcounter. A TimerValue register is programmed with a count value. This value decrements on each increment of the appropriate counter, and the timer condition is met when the value reaches zero. When the timer condition is met, an interrupt is generated if the interrupt is not masked in the corresponding timer control register, [CNTP_CTL_EL0](#), [CNTHP_CTL_EL2](#), [CNTHPS_CTL_EL2](#), [CNTPS_CTL_EL1](#), or [CNTV_CTL_EL0](#), [CNTHVS_CTL_EL2](#).

This view of a timer depends on the following behavior of accesses to TimerValue registers:

Reads	$\text{TimerValue} = (\text{CompareValue} - (\text{Counter} - \text{Offset}))[31:0]$
Writes	$\text{CompareValue} = ((\text{Counter} - \text{Offset})[63:0] + \text{SignExtend}(\text{TimerValue}))[63:0]$

Where the arguments other than TimerValue have the definitions used in *Operation of the CompareValue views of the timers*, and in addition:

TimerValue	The value of a TimerValue register, CNTP_TVAL_EL0 , CNTHP_TVAL_EL2 , CNTHPS_TVAL_EL2 , CNTPS_TVAL_EL1 , CNTV_TVAL_EL0 , or CNTHV_TVAL_EL2 , CNTHVS_TVAL_EL2 .
------------	---

In this view of a timer, values are signed in standard two's complement form.

A read of a TimerValue register after the timer condition has been met indicates the time since the timer condition was met.

Note

- *Operation of the CompareValue views of the timers on page D10-2653* gives a strict definition of TimerConditionMet. However, provided that the TimerValue is not expected to wrap as a 32-bit signed value when decremented from 0x80000000, the TimerValue view can be used as giving an effect equivalent to:
TimerConditionMet = (TimerValue ≤ 0)
 - Programming TimerValue to a negative number with magnitude greater than (Counter–Offset) can lead to an arithmetic overflow that causes the CompareValue to be an extremely large positive value. This potentially delays meeting the timer condition for an extremely long period of time.
-

Chapter D11

AArch64 System Register Encoding

This chapter describes the AArch64 System register encoding space. It contains the following sections:

- *The System register encoding space on page D11-2656.*
- *op0==0b10, Moves to and from debug and trace System registers on page D11-2657.*
- *op0==0b11, Moves to and from non-debug System registers, Special-purpose registers on page D11-2659.*

D11.1 The System register encoding space

The A64 instruction set includes instructions that access the System register encoding space. These instructions provide:

- Access to *System registers*, including the debug registers, that provide system control, and system status information.
- Access to Special-purpose registers such as [SPSR_ELx](#), [ELR_ELx](#), and the equivalent fields of the Process State.
- The cache and TLB maintenance instructions and address translation instructions.
- Barriers and the CLREX instruction.
- Architectural hint instructions.

This section describes the parts of the System register encoding space that provides access to the System registers described in [Chapter D12 AArch64 System Register Descriptions](#).

Note

- See [Fixed values in AArch64 instruction and System register descriptions on page C2-165](#) for information about abbreviations used in the System instruction descriptions.
- In AArch32 state much of this functionality is provided through the System register interface described in [The AArch32 System register interface on page G1-5305](#). In AArch64 state, the parameters used to characterize the System register encoding space are {op0, op1, CRn, CRm, op2}. These are based on the parameters that characterize the AArch32 System register encoding space, which reflect the original implementation of these registers, as described in [Background to the System register interface on page G1-5306](#). In ARMv8, there is no particular significance to the naming of these parameters, and no functional distinction between the *opn* parameters and the CRx parameters.

[Principles of the System instruction class encoding on page C5-338](#) describes some general properties of these encodings. [System instruction class encoding overview on page C5-339](#) then describes the top-level encoding of these instructions, identifying that:

- Entries in the encoding space are characterized by the parameter set {op0, op1, CRn, CRm, op2}.
- op0 is the most significant parameter for determining allocations in this space.

Much of this encoding space is used for System instructions, as described in [Chapter C5 The A64 System Instruction Class](#). This chapter describes only the part of the encoding space that is used for System registers, in the following sections:

- [op0==0b10, Moves to and from debug and trace System registers on page D11-2657](#).
- [op0==0b11, Moves to and from non-debug System registers, Special-purpose registers on page D11-2659](#).

D11.2 op0==0b10, Moves to and from debug and trace System registers

The instructions that move data to and from the debug, Execution environment, and trace System registers are encoded with op0==0b10. This means the encoding of these instructions is:

———— **Note** ————

- The section describes the use of all of the op0==0b10 region of the System register encoding space.
- These encodings access the registers that are equivalent to the AArch32 System registers in the (coproc==0b1110) encoding space.

The value of op1 provides the next level of decode of these instructions, as follows:

op1 == {0, 3, 4}

Debug. See *Instructions for accessing debug System registers*

———— **Note** ————

The standard encoding of debug registers is op0==0b10, op1== {0, 3, 4}. The registers in the op0==0b11 encoding space that are classified as debug registers are [DLR_EL0](#), [DSPSR_EL0](#), [MDCR_EL2](#), [MDCR_EL3](#), and [SDER32_EL3](#). See *Instructions for accessing non-debug System registers on page D11-2659* for the encodings of these registers.

op1 == 1 Trace. See the appropriate trace architecture specification.

D11.2.1 Instructions for accessing debug System registers

The instructions for accessing debug System registers are:

```
MSR <System register>, Xt    ; Write to System register
MRS Xt, <System register>   ; Read from System register
```

Where <System_register> is the register name, for example [MDCCSR_EL0](#).

This section includes only the System register access encodings for which both:

- op0 is 0b10.
- The value of op1 is one of {0, 3, 4}.

———— **Note** ————

These encodings access the registers that are equivalent to the AArch32 System registers in the (coproc==0b1110) encoding space.

Table D11-1 shows the mapping of the System register encodings for debug System register access.

Table D11-1 System instruction encodings for debug System register access

Register	Access instruction encoding					Permitted accesses
	op0	op1	CRn	CRm	op2	
OSDTRRX_EL1	2	0	0	0	2	RW
MDCCINT_EL1				2	0	RW
MDSCR_EL1					2	RW
OSDTRTX_EL1				3	2	RW
OSECCR_EL1				6	2	RW
DBGBVR<n>_EL1				0-15 ^a	4	RW
DBGBCR<n>_EL1				0-15 ^a	5	RW
DBGWVR<n>_EL1				0-15 ^a	6	RW
DBGWCR<n>_EL1				0-15 ^a	7	RW
MDRAR_EL1	2	0	1	0	0	RO
OSLAR_EL1					4	WO
OSLSR_EL1				1	4	RO
OSDLR_EL1				3	4	RW
DBGPRCR_EL1				4	4	RW
DBGCLAIMSET_EL1			7	8	6	RW
DBGCLAIMCLR_EL1				9	6	RW
DBGAUTHSTATUS_EL1				14	6	RO
MDCCSR_EL0		3	0	1	0	RO
DBGDTR_EL0				4	0	RW
DBGDTRRX_EL0				5	0	RO
DBGDTRTX_EL0						WO
DBGVCR32_EL2		4	0	7	0	RW

a. Unimplemented breakpoint and watchpoint register access instructions are unallocated. CRm encodes <n>, the breakpoint or watchpoint number.

For more information see [Mapping of the System registers between the Execution states](#) on page D1-2266.

D11.3 op0==0b11, Moves to and from non-debug System registers, Special-purpose registers

The instructions that move data to and from non-debug System registers are encoded with op0==0b11, except that some of this encoding space is reserved for IMPLEMENTATION DEFINED functionality. The encoding of these instructions is:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	16	15	12	11	8	7	5	4	0
1	1	0	1	0	1	0	1	0	0	L	1	1	op1	CRn	CRm	op2	Rt					

op0

The value of CRn provides the next level of decode of these instructions, as follows:

CRn=={0, 1, 2, 3, 5, 6, 7, 9, 10, 12, 13, 14}

See [Instructions for accessing non-debug System registers](#).

CRn==4 See [Instructions for accessing Special-purpose registers on page C5-348](#).

CRn=={11, 15} See [Reserved encodings for IMPLEMENTATION DEFINED registers on page D11-2671](#).

D11.3.1 Instructions for accessing non-debug System registers

The A64 instructions for accessing System registers are:

```
MSR <System register>, Xt    ; Write to System register
MRS Xt, <System register>    ; Read from System register
```

Where <System_register> is the register name, for example [MIDR_EL1](#).

This section includes only the System register access encodings for which both:

- op0 is 0b11.
- The value of CRn is one of {0, 1, 2, 3, 5, 6, 7, 9, 10, 12, 13, 14}.

Note

- These encodings access the registers that are equivalent to the AArch32 System registers in the (coproc==0b1111) encoding space.
- While this group is described as accessing the non-debug System registers, its correct characterization is by the {op0, CRn} values given in this subsection, and the group includes the debug registers [DLR_ELO](#), [DSPSR_ELO](#), [MDCR_EL2](#), [MDCR_EL3](#), and [SDER32_EL3](#), that are described in [Debug registers on page D12-3210](#). These registers are exceptions to the standard encoding of debug registers, that has op0==0b10, see [Instructions for accessing debug System registers on page D11-2657](#).

The instruction encoding for these accesses is:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	16	15	12	11	8	7	5	4	0
1	1	0	1	0	1	0	1	0	0	L	1	1	op1	CRn	CRm	op2	Rt					

op0

See text for permitted values of CRn

[Table D11-2 on page D11-2660](#) shows the encodings of the register access instructions. In the [Notes on page D11-2660](#) column of the table:

Config-RO Means it is configurable whether read accesses are permitted. Write accesses are UNDEFINED.

Config-WO Means it is configurable whether write accesses are permitted. Read accesses are UNDEFINED.

Config-RW Means it is configurable whether accesses are permitted. Either read and write accesses are permitted, or read and write accesses are UNDEFINED.

See the register descriptions for information about the control that determines whether these accesses are permitted.

- m. Defined to allow access from AArch64 state to registers that are only used in AArch32 state.

About the GIC System registers

From version 3.0 of the GIC architecture specification, the specification defines three groups of System registers, identified by the prefix of the register name:

- ICC_** GIC physical CPU interface System registers.
- ICH_** GIC virtual interface control System registers.
- ICV_** GIC Virtual CPU interface System registers.

———— **Note** —————

These registers are in addition to the GIC memory-mapped register groups GICC_, GICD_, GICH_, GICR_, GICV_, and GITS_.

When implemented, the GIC System registers form part of an ARM processor implementation, and therefore these registers are included in the register summaries. However, the registers are defined only in the GIC Architecture Specification.

As [Table D11-2 on page D11-2660](#) shows, the ICV_* registers have the same {op0, op1, CRn, CRm, op2} encodings as the corresponding ICC_* registers. For these encodings, GIC register configuration fields determine which register is accessed.

For more information see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0* (ARM IHI 0069).

D11.3.2 Reserved encodings for IMPLEMENTATION DEFINED registers

The System register encoding space with op0==0b11 reserves the following encodings for IMPLEMENTATION DEFINED registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	16	15	12	11	8	7	5	4	0
1	1	0	1	0	1	0	1	0	0	L	1	1	op1	1	x	1	1	CRm	op2			Rt
											op0		CRn									

The value of L defines the access type and the use of Rt as follows:

- 0** Write the value in Rt to the IMPLEMENTATION DEFINED register.
- 1** Read the value of the IMPLEMENTATION DEFINED register to Rt.

For more information about these encodings see [S3_<op1>_<Cn>_<Cm>_<op2>](#), *IMPLEMENTATION DEFINED registers on page D12-3071*. As that section describes, any IMPLEMENTATION DEFINED registers are accessed in a similar way to architecturally-defined System registers, using MRS and MSR instructions, see:

- [MRS on page C6-1024](#).
- [MSR \(immediate\) on page C6-1025](#).
- [MSR \(register\) on page C6-1027](#).

See also [Reserved encodings for IMPLEMENTATION DEFINED registers](#).

The ARM architecture guarantees not to define any register name prefixed with *IMP_* as part of the standard ARM architecture.

———— **Note** —————

ARM strongly recommends that any register names created in the IMPLEMENTATION DEFINED register spaces be prefixed with *IMP_* and postfixed with *_ELx*, where appropriate.

Chapter D12

AArch64 System Register Descriptions

This chapter defines the AArch64 System registers. It contains the following sections:

- *About the AArch64 System registers* on page D12-2674.
- *General system control registers* on page D12-2683.
- *Debug registers* on page D12-3210.
- *Performance Monitors registers* on page D12-3299.
- *Activity Monitors registers* on page D12-3343.
- *Statistical Profiling Extension registers* on page D12-3368.
- *RAS registers* on page D12-3404.
- *Generic Timer registers* on page D12-3441.

D12.1 About the AArch64 System registers

The following sections describe common features of the AArch64 registers:

- [General information about the AArch64 System registers.](#)
- [Fixed values in the System register descriptions.](#)
- [General behavior of accesses to the AArch64 System registers.](#)
- [Principles of the ID scheme for fields in ID registers on page D12-2680.](#)

D12.1.1 General information about the AArch64 System registers

The structure of the System register descriptions has changed from that used in *ARM® Architecture Reference Manual, ARMv8, for ARMv8-A architecture profile*, Issue A.j and earlier:

- Information about the accessibility of the register from different Exception levels is given in the Accessibility section, that is the last but one section of a register description.
- Information about the traps and enables that apply to the register is given in the Traps and Enables section, that is the last section of a register description.

The information in these sections can depend on:

- The mnemonic that is used to access the register.
- The value of one or more of the controls {E2H, TGE, NS}.

These controls are:

- [HCR_EL2](#). {E2H, TGE} fields.
- [SCR_EL3](#). NS field.

———— **Note** —————

- These changes mean that the register descriptions can address:
 - Cases where a single register is accessible using more than one mnemonic, in different contexts, and that the accessibility can depend on the mnemonic that is used and the context in which it is used.
 - Cases where a single mnemonic can address different registers, depending on the context, and that the accessibility can also depend on the context.

These changes are needed to describe System register behaviors associated with the Virtualization Host Extension described in [Virtualization Host Extensions on page D5-2486](#). However, they also improve the representation of many ARMv8.0 register descriptions.

- This change to the structure of System register descriptions does not apply to the description of memory-mapped registers such as those described in [Chapter H9 External Debug Register Descriptions](#).

D12.1.2 Fixed values in the System register descriptions

See [Fixed values in AArch64 instruction and System register descriptions on page C2-165](#). This section defines how the glossary terms [RAZ](#), [RES0](#), [RAO](#), and [RES1](#) can be represented in the System register descriptions.

D12.1.3 General behavior of accesses to the AArch64 System registers

The following subsections give general information about the behavior of accesses to the System registers:

- [Reset behavior of AArch64 System registers on page D12-2675.](#)
- [Synchronization requirements for AArch64 System registers on page D12-2675.](#)

Reset behavior of AArch64 System registers

Reset values apply only to RW registers and fields, however:

- Some RO registers or fields, including feature ID registers and some status registers or register fields, always return a known value.
- Some RW and RO registers or register fields return status information about the PE. Unless the register description indicates that the value is UNKNOWN on reset, a read of the register immediately after a reset returns valid information.
- Some RW and RO registers and fields are aliases of other registers or fields. In these cases, the reset behavior of the aliased register or field determines the value returned by a read of the register immediately after a reset.
- WO registers that only have an effect on writes do not have meaningful reset values. However, an access to a WO register might affect underlying state, and that state might have a defined reset value.
- IMPLEMENTATION DEFINED registers have IMPLEMENTATION DEFINED reset behavior.

After a reset, only a limited subset of the PE state is guaranteed to be set to defined values. Also, for debug and trace System registers, reset requirements must take account of different levels of reset. For more information about the reset behavior of System registers when the PE resets into an Exception level that is using AArch64, see:

- [PE state on reset to AArch64 state on page D1-2167](#).
- The appropriate Trace architecture specification, for the Trace System registers.

For a PE reset into an Exception level that is using AArch64, the architecture defines which AArch64 System registers have a defined reset value, and when that defined reset value applies. The register descriptions include this information, and [PE state on reset to AArch64 state on page D1-2167](#) summarizes these architectural requirements. Otherwise, RW registers that have a meaningful reset value reset to an architecturally UNKNOWN value.

———— Note —————

When the PE resets into an Exception level that is using AArch32, no PE state that relates to execution in AArch64 state is accessible until another reset causes the Execution state to change to AArch64. Therefore, on a reset into AArch32 state, PE state that relates only to execution in AArch64 state cannot have a meaningful reset value.

Pseudocode description of resetting System registers

The `AArch64.ResetSystemRegisters()` pseudocode function resets all System registers, and register fields, that have defined reset values, as described in this section and [PE state on reset to AArch64 state on page D1-2167](#).

———— Note —————

For debug and trace System registers, this function resets registers as defined for the appropriate level of reset.

Synchronization requirements for AArch64 System registers

Reads of the System registers can occur out of order with respect to earlier instructions executed on the same PE, provided that both:

- Any data dependencies between the instructions, including read-after-read dependencies, are respected.
- The reads to the register do not occur earlier than the most recent [Context synchronization event](#) to its architectural position in the instruction stream.

———— Note —————

In particular, the values read from System registers that hold self-incrementing counts, such as the Performance Monitors counters or the Generic Timer counter or timers, could be accessed from any time after the previous [Context synchronization event](#). For example, where a memory access is used to communicate a read of such a

counter, an ISB must be inserted between the read of the memory location that is known to have returned its data, either as a result of a condition on that data or of the read having completed, and the read of the counter, if it is necessary that the counter returns a count value after the memory communication.

Direct writes using the instructions in [Table D11-2 on page D11-2660](#) require synchronization before software can rely on the effects of changes to the System registers to affect instructions appearing in program order after the direct write to the System register. Direct writes to these registers are not allowed to affect any instructions appearing in program order before the direct write. The only exceptions are:

- All direct writes to the same register, that use the same encoding for that register, are guaranteed to occur in program order relative to each other
- All direct writes to a register occur in program order with respect to all direct reads to the same register using the same encoding.
- Any System register access that an ARM *Architecture Specification* or equivalent specification defines as not requiring synchronization.

Explicit synchronization occurs as a result of a *Context synchronization event*, which is one of the following events:

- Execution of an ISB instruction.
- Exception entry.
- Exception return.
- Execution of a DCPS instruction in Debug state.
- Execution of a DRPS instruction in Debug state.
- Exit from Debug state.

Note

The ISB and exception entry events are applicable both in Debug state and in Non-debug state.

Conceptually, explicit synchronization occurs as the first step of each of these events, so that if the event uses state that has previously been changed but was not synchronized by the time of the event, the event is guaranteed to use the state as if it had been synchronized.

Note

This explicit synchronization applies as the first step of the execution of the events, and does not apply to any effect of System registers that apply to the fetch and decode of the instructions that cause these events, such as breakpoints or changes to the translation table.

In addition, any system instructions that cause a write to a System register must be synchronized before the result is guaranteed to be visible to subsequent direct reads of that System register.

Direct reads to any one of the following registers, using the same encoding, occur in program order relative to each other:

- [ISR_EL1](#).
- The Generic Timer registers, that is, [CNTPCT_EL0](#) and [CNTVCT_EL0](#), and the Counter registers [CNTP_TVAL_EL0](#), [CNTV_TVAL_EL0](#), [CNTHP_TVAL_EL2](#), and [CNTPS_TVAL_EL1](#).
- [DBGCLAIMCLR_EL1](#).
- The PMU Counters, that is, [PMCCNTR_EL0](#), [PMEVCNTR<n>_EL0](#), [PMXVCNTR_EL0](#), [PMOVSLR_EL0](#), and [PMOVSSET_EL0](#).
- The Debug Communications Channel registers, that is, [DBGDTRRX_EL0](#), [DBGDTR_EL0](#), and [MDCCSR_EL0](#).

All other direct reads of System registers can occur in any order if synchronization has not been performed.

Table D12-1 describes the synchronization requirements between two successive read or write accesses to the same register, where the ordering of the read or write accesses is:

1. Program order, in the event that both the reads or writes are caused by an instruction executed on this PE, other than one caused by a memory access by this PE.
2. The order of arrival of asynchronous reads and writes at the PE relative to the execution of instructions that cause reads or writes.
3. The order of arrival of asynchronous reads and writes at the PE relative to each other.

Table D12-1 Synchronization requirements

First read-write	Second read-write	Synchronization requirement
Direct read	Direct read	None
	Direct write	None
	Indirect read	None
	Indirect write	None, see <i>Notes</i>
Direct write	Direct read	None
	Direct write	None
	Indirect read	Required
	Indirect write	None, see <i>Notes</i>
Indirect read	Direct read	None
	Direct write	None
	Indirect read	None
	Indirect write	None
Indirect write	Direct read	Required, see <i>Notes</i>
	Direct write	None, see <i>Notes</i>
	Indirect read	Required, see <i>Notes</i>
	Indirect write	None, see <i>Notes</i>

Notes

The terms Direct read, Direct write, Indirect read, and Indirect write, as used in Table D12-1, are defined as follows:

Direct read Where software uses a System register access instruction to read the register, see both:

- [Instructions for accessing debug System registers on page D11-2657.](#)
- [Instructions for accessing non-debug System registers on page D11-2659.](#)

Where a direct read of a register has a side-effect that changes the contents of a register, the effect of a direct read on that register is defined to be an indirect write. In this case, the indirect write is only guaranteed to have occurred, and be visible to subsequent direct or indirect reads or writes, if synchronization is performed after the direct read.

Direct write Where software uses a System register access instruction to write to the register, see both:

- [Instructions for accessing debug System registers on page D11-2657.](#)
- [Instructions for accessing non-debug System registers on page D11-2659.](#)

Where a direct write to a register has an effect on the register that means that the value in the register is not always the last value that is written (as is the case with set and clear registers), the effect of a direct write on that register is defined to be an indirect write. In this case, the indirect write is only guaranteed to be visible to subsequent direct or indirect reads or writes if synchronization is performed after the direct write and before the subsequent direct or indirect reads or writes.

Indirect read Where an instruction uses a System register to establish operating conditions for the instruction, for example, the `TTBR_ELx` address or whether memory accesses are forced to be Non-cacheable. This includes situations where the contents of one System register selects what value is read or written using a different register. Indirect reads also include reads of the System register by external agents such as debuggers. Where an indirect read of a register has a side-effect that changes the contents of that register, that is defined to be an indirect write.

Indirect write Where a System register is written as the consequence of some other instruction, exception, operation, or by the asynchronous operation of an external agent, including the passage of time as seen in counters, timers, or performance counters, the assertion of interrupts, or writes from an external debugger.

———— **Note** —————

Since an exception is context synchronizing, registers such as the Exception Syndrome registers that are indirectly written as part of exception entry do not require additional synchronization.

Where a direct read or write to a register is followed by an indirect write caused by an external agent, autonomous asynchronous event, or as a result of memory mapped write, synchronization is required to guarantee the order of those two accesses.

Where an indirect write caused by a direct write is followed by an indirect write caused by an external agent, autonomous asynchronous event, or as a result of memory mapped write, synchronization is required to guarantee the order of those two indirect accesses.

Where a direct read to one register causes a bit or field in a different register (or the same register using a different encoding) to be updated, the change to the different register (or same register using a different encoding) is defined to be an indirect write. In this case, the indirect write is only guaranteed to be visible to subsequent direct or indirect reads or writes if synchronization is performed after the direct read and before the subsequent direct or indirect reads or writes.

Where a direct write to one register causes a bit or field in a different register (or the same register using a different encoding) to be updated as a side-effect of that direct write (as opposed to simply being a direct write to the different encoding), the change to the different register (or same register using a different encoding) is defined to be an indirect write. In this case, the indirect write is only guaranteed to be visible to subsequent direct or indirect reads or writes if synchronization is performed after the direct write and before the subsequent direct or indirect reads or writes.

Where indirect writes are caused by the actions of external agents such as debuggers, or by memory-mapped reads or writes by the PE, then an indirect write by that agent and mechanism to a register, followed by an indirect read by that agent and mechanism to the same register using the same address, does not require synchronization.

Where an indirect write occurs as a side-effect of an access, this happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

Indirect writes caused by external agents, autonomous asynchronous events, or as a result of memory-mapped writes, to the registers shown in [Table D12-2 on page D12-2679](#), are required to be observable to:

- Direct reads in finite time without explicit synchronization.
- Subsequent indirect reads without explicit synchronization.

Without explicit synchronization to guarantee the order of the accesses, where the same register is accessed by two or more of a System register access instruction, and external agent, and autonomous asynchronous event, or as a result of a memory-mapped access, the behavior must be as if the accesses occurred atomically and in any order. This applies even if the accesses occur simultaneously.

Table D12-2 Registers with a guarantee of observability, VMSAv8-64

Registers	Notes
ISR_EL1	Interrupt Status Register
DBGCLAIMCLR_EL1, DBGCLAIMSET_EL1	Debug CLAIM registers
CNTPCT_EL0, CNTVCT_EL0, CNTP_TVAL_EL0, CNTV_TVAL_EL0, CNTHP_TVAL_EL2, CNTPS_TVAL_EL1	Generic Timer registers
PMCCNTR_EL0, PMEVCNTR<n>_EL0, PMXEVCNTR_EL0, PMOVSLR_EL0, PMOVSET_EL0	PMU Counters
DBGDTRTX_EL0, DBGDTRRX_EL0, DBGDTR_EL0, and the DCC flags in MDCCSR_EL0 and EDSCR	Debug Communication Channel registers
EDSCR.PipeAdv	External Debug Status and Control Register PipeAdv field

In addition to the requirements shown in [Table D12-2](#):

- Indirect writes to the following registers as a result of memory-mapped writes, including accesses by external agents, are required to be observable to the indirect read made in determining the response to a subsequent memory-mapped access without explicit synchronization:
 - OSLAR_EL1. OSLAR_EL1 is indirectly read to determine whether the subsequent access is permitted.
 - EDLAR, if implemented. EDLAR is indirectly read to determine whether a subsequent write or side-effect of an access is ignored.

Note

This requirement is stricter than the general requirement for the observability of indirect writes.

- The requirement that an indirect write to the registers in [Table D12-2](#) is observable to direct reads in finite time does not imply that all observers will observe the indirect write at the same time. For example, an increment of the system counter is an autonomous asynchronous event that performs an indirect write to the counter. This asynchronous event might generate a timer interrupt request, resulting in a [Context synchronization event](#). When a GIC is used, the timer interrupt might arrive at the GIC after the PE has taken an interrupt request from another source, but before software reads the current interrupt ID from the GIC. This means that the GIC might identify the timer interrupt as the current interrupt. Software must not assume that a subsequent direct read of the counter register is guaranteed to observe the updated value of that register. Although this example uses the counter-timer registers, it applies equally to other registers that might be linked to interrupt requests, including the PMU and Statistical Profiling status registers.
- When the PE is in Debug state, there are synchronization requirements for the Debug Communication Channel and Instruction Transfer registers. See [DCC and ITR access in Debug state on page H4-6496](#).

Note

- The provision of explicit synchronization requirements to System registers is provided to allow the direct access to these registers to be implemented in a small number of cycles, and that updates to multiple registers can be performed quickly with the synchronization penalty being paid only when the updates have occurred.
- Since toolkits might use registers such as the thread-local storage registers within compiled code, it is recommended that access to these registers is implemented to take a small number of cycles.

- While no synchronization is required between a direct write and a direct read, or between a direct read and an indirect write, this does not imply that a direct read causes synchronization of a previous direct write. That is, the sequence direct write → direct read → indirect read, with no intervening context synchronization, does not guarantee that the indirect read observes the result of the direct write.
-

D12.1.4 Principles of the ID scheme for fields in ID registers

The ARM architecture specifies a number of *ID registers* that are characterized as comprising a set of 4-bit *ID fields*. Each ID field identifies the presence, and possibly the level of support for, a particular feature in an implementation of the architecture. These fields follow an architectural model that aids their use by software and provides future compatibility. This section describes that model. *ID registers to which this scheme applies* on page D12-2681 identifies the set of ID registers.

A small number of ID fields do not follow the scheme described in this section. In these cases, the field description states that it does not follow this scheme.

Note

- The ID fields described here are distinct from register fields that enumerate the number of resources, such as the number of breakpoints, watchpoints, or performance monitors, or the amount of memory.
 - ID fields that do not follow this scheme include the `ID_AA64DFR0_EL1.PMUVer`, `ID_DFR0_EL1.PerfMon`, `ID_DFR0.PerfMon` and `EDDFR.PMUVer` fields, see *Alternative ID scheme used for the Performance Monitors Extension version* on page D12-2682.
 - The presence of an ID field for a feature does not imply that the feature is optional.
-

To provide forward compatibility, software can rely on the features of these fields that are described in this section.

The ID fields, which are either signed or unsigned, use increasing numerical values to indicate increases in functionality. Therefore, if a value of 0x1 indicates the presence of some instructions, then the value 0x2 will indicate the presence of those instructions plus some additional instructions or functionality. This means software can be written in the form:

```
if (value >= number) { // do something that relies on the value of the feature}
```

For ID fields where the value 0x0 defines that a feature is not present, the field holds an unsigned value. This covers the vast majority of such fields.

In a few cases, the architecture has been changed to permit implementations to exclude a feature that has previously been required and for which no ID field has been defined. In these cases, a new ID field is defined and:

- The field holds a signed value.
- The field value 0xF indicates that the feature is not implemented.
- The field value 0x0 indicates that the feature is implemented.
- Software that depends on the feature can use the test:

```
if value >= 0 { // Software features that depend on the presence of the hardware
feature }
```

In some cases, it has been decided retrospectively that the increase in functionality between two consecutive numerical values is too great, and it is desirable to permit an intermediate degree of functionality, and the means to discover this. This is done by the introduction of a *fractional* field that both:

- Is referred to in the definition of the original field.
- Applies only when the original field is at the lower value of the step.

In principle, a fractional field can be used for two different fractional steps, with different meanings associated with each of these steps. For this reason, a fractional field must be interpreted in the context of the field to which it relates and the value of that field. [Example D12-1 on page D12-2681](#) shows the use of such a field.

Example D12-1 Example of the use of a fractional field

For a field describing some class of functionality:

- The value 0x1 was defined as indicating that item A is present.
- The value 0x2 was defined as indicating that items B and C are present, in addition to item A.

Subsequently, it might be necessary to introduce a second ID field to indicate that A and B only are present. This new field is a fractional field, and might be defined as having the value 0x1 when A and B only are present. This fractional field is valid only when the original ID field has the value 0x1.

This approach means that:

- Software that depends on the test if (value >= 0x2) can rely on features A, B, and C being present,
- Software that depends on the test if (value >= 0x1) can rely on feature A being present.
- If new software needs to check only that features A and B are present, then it can test:

```
if (value >= 0x2 || (value == 0x1 && fractional_value >= 0x1)) {           // Software features
that depend on A and B only      }
```

A fractional field uses the same approach of increasing numerical values indicating increasing functionality, and the fractional approach can also be applied recursively to fractional fields.

Unused ID fields, and fractional fields that are not applicable, are RES0 to allow their future use when features, or fractional implementation options, are added.

ID registers to which this scheme applies

This scheme applies to the following registers:

AArch64 System registers

- The AArch64 views of the AArch32 feature ID registers given by:
 - The AArch32 Auxiliary Feature register [ID_AFR0_EL1](#).
 - The AArch32 Processor Feature registers [ID_PFR0_EL1](#) and [ID_PFR1_EL1](#).
 - The AArch32 Debug Feature register [ID_DFR0_EL1](#).
 - The AArch32 Memory Model Feature registers [ID_MMFR0_EL1](#), [ID_MMFR1_EL1](#), [ID_MMFR2_EL1](#), [ID_MMFR3_EL1](#), and [ID_MMFR4_EL1](#).
 - The AArch32 Instruction Set Attribute registers [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), and [ID_ISAR5_EL1](#).
 - The AArch32 Media and VFP Feature registers [MVFR0_EL1](#), [MVFR1_EL1](#), and [MVFR2_EL1](#).
- The AArch64 Auxiliary Feature registers [ID_AA64AFR0_EL1](#) and [ID_AA64AFR1_EL1](#).
- The AArch64 Processor Feature registers [ID_AA64PFR0_EL1](#) and [ID_AA64PFR1_EL1](#).
- The AArch64 Debug Feature registers [ID_AA64DFR0_EL1](#) and [ID_AA64DFR1_EL1](#).
- The AArch64 Memory Model Feature registers [ID_AA64MMFR0_EL1](#), [ID_AA64MMFR1_EL1](#), and [ID_AA64MMFR2_EL1](#).
- The AArch64 Instruction Set Attribute registers [ID_AA64ISAR0_EL1](#) and [ID_AA64ISAR1_EL1](#).

AArch32 System registers

- The AArch32 Auxiliary Feature register [ID_AFR0](#).
- The AArch32 Processor Feature registers [ID_PFR0](#) and [ID_PFR1](#).
- The AArch32 Debug Feature register [ID_DFR0](#).
- The AArch32 Memory Model Feature registers [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), [ID_MMFR3](#), and [ID_MMFR4](#).

- The AArch32 Instruction Set Attribute registers [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), and [ID_ISAR5](#).
- The AArch32 Media and FP Feature registers [MVFR0](#), [MVFR1](#), and [MVFR2](#).

Memory-mapped registers

- The External Debug Processor Feature register [EDPFR](#).
- The External Debug Feature register [EDDFR](#).

Alternative ID scheme used for the Performance Monitors Extension version

The [ID_AA64DFR0_EL1.PMUVer](#), [ID_DFR0_EL1.PerfMon](#), [ID_DFR0.PerfMon](#) and [EDDFR.PMUVer](#) fields, that identify the version of the Performance Monitors Extension, do not follow the standard ID scheme. Software must treat these fields as follows:

- The value 0xF indicates that the ARM-architected Performance Monitors Extension is not implemented.
- If the field value is not 0xF the field is treated as an unsigned value, as described for the standard ID scheme.

This means that software that depends on the implementation of a particular version of the ARM Performance Monitors Extension must be written in the form:

```
if (value != 0xF and value >= number) {           // do something that relies on version 'number' of the
feature }
```

For these fields, ARM deprecates use of the value 0xF in new implementations.

D12.2 General system control registers

This section lists the System registers in AArch64 that are not part of one of the other listed groups.

D12.2.1 ACTLR_EL1, Auxiliary Control Register (EL1)

The ACTLR_EL1 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

Note

ARM recommends the contents of this register have no effect on the PE when HCR_EL2.{E2H, TGE} is {1, 1}, and instead the configuration and control fields are provided by the ACTLR_EL2 register. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

Configurations

AArch64 System register ACTLR_EL1[31:0] is architecturally mapped to AArch32 System register ACTLR[31:0].

AArch64 System register ACTLR_EL1[63:32] is architecturally mapped to AArch32 System register ACTLR2[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ACTLR_EL1 is a 64-bit register.

Field descriptions

The ACTLR_EL1 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the ACTLR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ACTLR_EL1	11	0001	000	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x118]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TACR == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TACR == 1, then accesses at EL1 are trapped to EL2.

D12.2.2 ACTLR_EL2, Auxiliary Control Register (EL2)

The ACTLR_EL2 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for EL2.

Note

ARM recommends the contents of this register are updated to apply to EL0 when [HCR_EL2](#).{E2H, TGE} is {1, 1}, gaining configuration and control fields from the [ACTLR_EL1](#). This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

Configurations

AArch64 System register ACTLR_EL2[31:0] is architecturally mapped to AArch32 System register [HACTLR](#)[31:0].

AArch64 System register ACTLR_EL2[63:32] is architecturally mapped to AArch32 System register [HACTLR2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ACTLR_EL2 is a 64-bit register.

Field descriptions

The ACTLR_EL2 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the ACTLR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ACTLR_EL2	11	0001	100	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.

D12.2.3 ACTLR_EL3, Auxiliary Control Register (EL3)

The ACTLR_EL3 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for EL3.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ACTLR_EL3 is a 64-bit register.

Field descriptions

The ACTLR_EL3 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the ACTLR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ACTLR_EL3	11	0001	110	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.4 AFSR0_EL1, Auxiliary Fault Status Register 0 (EL1)

The AFSR0_EL1 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL1.

Configurations

AArch64 System register AFSR0_EL1[31:0] is architecturally mapped to AArch32 System register [ADFSR](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AFSR0_EL1 is a 64-bit register.

Field descriptions

The AFSR0_EL1 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AFSR0_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AFSR0_EL1	11	0101	000	000	0001
AFSR0_EL12	11	0101	101	000	0001

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
AFSR0_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
AFSR0_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
AFSR0_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x128]	RW	RW
AFSR0_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
AFSR0_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	AFS R0_ EL2	RW
AFSR0_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x128]	AFS R0_ EL2	RW
AFSR0_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	AFS R0_ EL2	RW
AFSR0_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
AFSR0_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
AFSR0_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x128]	-	-
AFSR0_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
AFSR0_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
AFSR0_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x128]	RW	RW
AFSR0_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [AFSR0_EL1](#) or [AFSR0_EL12](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAccessor(AFSR0_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(AFSR0_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(AFSR0_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(AFSR0_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(AFSR0_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(AFSR0_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(AFSR0_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(AFSR0_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(AFSR0_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(AFSR0_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.5 AFSR0_EL2, Auxiliary Fault Status Register 0 (EL2)

The AFSR0_EL2 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL2.

Configurations

AArch64 System register AFSR0_EL2[31:0] is architecturally mapped to AArch32 System register [HADFSR](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AFSR0_EL2 is a 64-bit register.

Field descriptions

The AFSR0_EL2 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AFSR0_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AFSR0_EL2	11	0101	100	000	0001
AFSR0_EL1	11	0101	000	000	0001

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
AFSR0_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
AFSR0_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
AFSR0_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
AFSR0_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	AFSR0_EL1	n/a	AFSR0_EL1
AFSR0_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	AFSR0_EL1	AFSR0_EL1	AFSR0_EL1
AFSR0_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	AFSR0_EL1	AFSR0_EL1
AFSR0_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	AFSR0_EL1	RW	AFSR0_EL1
AFSR0_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	AFSR0_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [AFSR0_EL2](#) or [AFSR0_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [AFSR0_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\) && IsUsingAArch64\(EL2\) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1](#), then accesses at EL1 are trapped to EL2.
- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\) && IsUsingAArch64\(EL2\) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1](#), then accesses at EL1 are trapped to EL2.

D12.2.6 AFSR0_EL3, Auxiliary Fault Status Register 0 (EL3)

The AFSR0_EL3 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL3.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AFSR0_EL3 is a 64-bit register.

Field descriptions

The AFSR0_EL3 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AFSR0_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AFSR0_EL3	11	0101	110	000	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.7 AFSR1_EL1, Auxiliary Fault Status Register 1 (EL1)

The AFSR1_EL1 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL1.

Configurations

AArch64 System register AFSR1_EL1[31:0] is architecturally mapped to AArch32 System register AIFSR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AFSR1_EL1 is a 64-bit register.

Field descriptions

The AFSR1_EL1 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AFSR1_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AFSR1_EL1	11	0101	000	001	0001
AFSR1_EL12	11	0101	101	001	0001

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
AFSR1_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW

AFSR1_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x130]	-	-
AFSR1_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
AFSR1_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
AFSR1_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x130]	RW	RW
AFSR1_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [AFSR1_EL1](#) or [AFSR1_EL12](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $\text{IsUsingAccessor}(\text{AFSR1_EL1}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1 \ || \ \text{HCR_EL2.NV} == 0) \ \&\& \ \text{IsUsingAccessor}(\text{AFSR1_EL12}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $\text{IsUsingAccessor}(\text{AFSR1_EL1}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1 \ || \ \text{HCR_EL2.NV} == 0) \ \&\& \ \text{IsUsingAccessor}(\text{AFSR1_EL12}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{IsUsingAccessor}(\text{AFSR1_EL12}) \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $\text{IsUsingAccessor}(\text{AFSR1_EL1}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1 \ || \ \text{HCR_EL2.NV} == 0) \ \&\& \ \text{IsUsingAccessor}(\text{AFSR1_EL12}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $\text{IsUsingAccessor}(\text{AFSR1_EL1}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1 \ || \ \text{HCR_EL2.NV} == 0) \ \&\& \ \text{IsUsingAccessor}(\text{AFSR1_EL12}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{IsUsingAccessor}(\text{AFSR1_EL12}) \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

D12.2.8 AFSR1_EL2, Auxiliary Fault Status Register 1 (EL2)

The AFSR1_EL2 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL2.

Configurations

AArch64 System register AFSR1_EL2[31:0] is architecturally mapped to AArch32 System register [HAIFSR](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AFSR1_EL2 is a 64-bit register.

Field descriptions

The AFSR1_EL2 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AFSR1_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AFSR1_EL2	11	0101	100	001	0001
AFSR1_EL1	11	0101	000	001	0001

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
AFSR1_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
AFSR1_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
AFSR1_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
AFSR1_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	AFSR1_EL1	n/a	AFSR1_EL1
AFSR1_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	AFSR1_EL1	AFSR1_EL1	AFSR1_EL1
AFSR1_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	AFSR1_EL1	AFSR1_EL1
AFSR1_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	AFSR1_EL1	RW	AFSR1_EL1
AFSR1_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	AFSR1_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [AFSR1_EL2](#) or [AFSR1_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [AFSR1_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\) && IsUsingAArch64\(EL2\) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1](#), then accesses at EL1 are trapped to EL2.
- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\) && IsUsingAArch64\(EL2\) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1](#), then accesses at EL1 are trapped to EL2.

D12.2.9 AFSR1_EL3, Auxiliary Fault Status Register 1 (EL3)

The AFSR1_EL3 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL3.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AFSR1_EL3 is a 64-bit register.

Field descriptions

The AFSR1_EL3 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AFSR1_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AFSR1_EL3	11	0101	110	001	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.10 AIDR_EL1, Auxiliary ID Register

The AIDR_EL1 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED identification information.

The value of this register must be interpreted in conjunction with the value of [MIDR_EL1](#).

Configurations

AArch64 System register AIDR_EL1[31:0] is architecturally mapped to AArch32 System register [AIDR](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AIDR_EL1 is a 64-bit register.

Field descriptions

The AIDR_EL1 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the AIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AIDR_EL1	11	0000	001	111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TID1} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TID1} == 1$, then read accesses at EL1 are trapped to EL2.

D12.2.11 AMAIR_EL1, Auxiliary Memory Attribute Indirection Register (EL1)

The AMAIR_EL1 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by [MAIR_EL1](#).

Configurations

AArch64 System register AMAIR_EL1[31:0] is architecturally mapped to AArch32 System register [AMAIR0](#)[31:0].

AArch64 System register AMAIR_EL1[63:32] is architecturally mapped to AArch32 System register [AMAIR1](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMAIR_EL1 is a 64-bit register.

Field descriptions

The AMAIR_EL1 bit assignments are:

AMAIR_EL1 is permitted to be cached in a TLB.

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AMAIR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMAIR_EL1	11	1010	000	000	0011
AMAIR_EL12	11	1010	101	000	0011

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
AMAIR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW

AMAIR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
AMAIR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x148]	RW	RW
AMAIR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [AMAIR_EL1](#) or [AMAIR_EL12](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAccessor(AMAIR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(AMAIR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(AMAIR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(AMAIR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(AMAIR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(AMAIR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(AMAIR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(AMAIR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(AMAIR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(AMAIR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.12 AMAIR_EL2, Auxiliary Memory Attribute Indirection Register (EL2)

The AMAIR_EL2 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by [MAIR_EL2](#).

Configurations

AArch64 System register AMAIR_EL2[31:0] is architecturally mapped to AArch32 System register [HAMAIR0](#)[31:0].

AArch64 System register AMAIR_EL2[63:32] is architecturally mapped to AArch32 System register [HAMAIR1](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMAIR_EL2 is a 64-bit register.

Field descriptions

The AMAIR_EL2 bit assignments are:

AMAIR_EL2 is permitted to be cached in a TLB.

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AMAIR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMAIR_EL2	11	1010	100	000	0011
AMAIR_EL1	11	1010	000	000	0011

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
AMAIR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
AMAIR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
AMAIR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
AMAIR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	AMAIR_EL1	n/a	AMAIR_EL1
AMAIR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	AMAIR_EL1	AMAIR_EL1	AMAIR_EL1
AMAIR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	AMAIR_EL1	AMAIR_EL1
AMAIR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	AMAIR_EL1	RW	AMAIR_EL1
AMAIR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	AMAIR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [AMAIR_EL2](#) or [AMAIR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [AMAIR_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

D12.2.13 AMAIR_EL3, Auxiliary Memory Attribute Indirection Register (EL3)

The AMAIR_EL3 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by [MAIR_EL3](#).

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMAIR_EL3 is a 64-bit register.

Field descriptions

The AMAIR_EL3 bit assignments are:

AMAIR_EL3 is permitted to be cached in a TLB.

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AMAIR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMAIR_EL3	11	1010	110	000	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.14 APDAKeyHi_EL1, Pointer Authentication Key A for Data (bits[127:64])

The APDAKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key A used for authentication of data pointer values.

Note

The term APDAKey_EL1 is used to describe the concatenation of [APDAKeyHi_EL1](#):
[APDAKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APDAKeyHi_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APDAKeyHi_EL1 is a 64-bit register.

Field descriptions

The APDAKeyHi_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APDAKeyHi_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APDAKeyHi_EL1	0010	11	000	001	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.15 APDAKeyLo_EL1, Pointer Authentication Key A for Data (bits[63:0])

The APDAKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key A used for authentication of data pointer values.

Note

The term APDAKey_EL1 is used to describe the concatenation of [APDAKeyHi_EL1](#):
[APDAKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APDAKeyLo_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APDAKeyLo_EL1 is a 64-bit register.

Field descriptions

The APDAKeyLo_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APDAKeyLo_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APDAKeyLo_EL1	0010	11	000	000	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.16 APDBKeyHi_EL1, Pointer Authentication Key B for Data (bits[127:64])

The APDBKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key B used for authentication of data pointer values.

Note

The term APDBKey_EL1 is used to describe the concatenation of [APDBKeyHi_EL1](#):
[APDBKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APDBKeyHi_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APDBKeyHi_EL1 is a 64-bit register.

Field descriptions

The APDBKeyHi_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APDBKeyHi_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APDBKeyHi_EL1	0010	11	000	011	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.17 APDBKeyLo_EL1, Pointer Authentication Key B for Data (bits[63:0])

The APDBKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key B used for authentication of data pointer values.

Note

The term APDBKey_EL1 is used to describe the concatenation of [APDBKeyHi_EL1](#):
[APDBKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APDBKeyLo_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APDBKeyLo_EL1 is a 64-bit register.

Field descriptions

The APDBKeyLo_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APDBKeyLo_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APDBKeyLo_EL1	0010	11	000	010	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.18 APGAKeyHi_EL1, Pointer Authentication Key A for Code (bits[127:64])

The APGAKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key used for generic pointer authentication code.

Note

The term APGAKey_EL1 is used to describe the concatenation of [APGAKeyHi_EL1](#):
[APGAKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APGAKeyHi_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APGAKeyHi_EL1 is a 64-bit register.

Field descriptions

The APGAKeyHi_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APGAKeyHi_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APGAKeyHi_EL1	0010	11	000	001	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.19 APGAKeyLo_EL1, Pointer Authentication Key A for Code (bits[63:0])

The APGAKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key used for generic pointer authentication code.

Note

The term APGAKey_EL1 is used to describe the concatenation of [APGAKeyHi_EL1](#):
[APGAKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAAuth is implemented. Otherwise, direct accesses to APGAKeyLo_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APGAKeyLo_EL1 is a 64-bit register.

Field descriptions

The APGAKeyLo_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APGAKeyLo_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APGAKeyLo_EL1	0010	11	000	000	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.20 APIAKeyHi_EL1, Pointer Authentication Key A for Instruction (bits[127:64])

The APIAKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key A used for authentication of instruction pointer values.

Note

The term APIAKey_EL1 is used to describe the concatenation of [APIAKeyHi_EL1](#):
[APIAKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APIAKeyHi_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APIAKeyHi_EL1 is a 64-bit register.

Field descriptions

The APIAKeyHi_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APIAKeyHi_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APIAKeyHi_EL1	0010	11	000	001	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.21 APIAKeyLo_EL1, Pointer Authentication Key A for Instruction (bits[63:0])

The APIAKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key A used for authentication of instruction pointer values.

Note

The term APIAKey_EL1 is used to describe the concatenation of [APIAKeyHi_EL1](#):
[APIAKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAAuth is implemented. Otherwise, direct accesses to APIAKeyLo_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APIAKeyLo_EL1 is a 64-bit register.

Field descriptions

The APIAKeyLo_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APIAKeyLo_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APIAKeyLo_EL1	0010	11	000	000	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.22 APIBKeyHi_EL1, Pointer Authentication Key B for Instruction (bits[127:64])

The APIBKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key B used for authentication of instruction pointer values.

Note

The term APIBKey_EL1 is used to describe the concatenation of [APIBKeyHi_EL1](#):
[APIBKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APIBKeyHi_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APIBKeyHi_EL1 is a 64-bit register.

Field descriptions

The APIBKeyHi_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APIBKeyHi_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APIBKeyHi_EL1	0010	11	000	011	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.23 APIBKeyLo_EL1, Pointer Authentication Key B for Instruction (bits[63:0])

The APIBKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key B used for authentication of instruction pointer values.

Note

The term APIBKey_EL1 is used to describe the concatenation of [APIBKeyHi_EL1](#):
[APIBKeyLo_EL1](#).

Configurations

This register is present only when ARMv8.3-PAuth is implemented. Otherwise, direct accesses to APIBKeyLo_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

APIBKeyLo_EL1 is a 64-bit register.

Field descriptions

The APIBKeyLo_EL1 bit assignments are:

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

This field resets to an architecturally UNKNOWN value.

Accessing the APIBKeyLo_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
APIBKeyLo_EL1	0010	11	000	010	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.APK == 0, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.APK == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.24 CCSIDR2_EL1, Current Cache Size ID Register 2

The CCSIDR2_EL1 characteristics are:

Purpose

When [ARMv8.3-CCIDX](#) is implemented, provides the information about the architecture of the currently selected cache from bits[63:32] of [CCSIDR_EL1](#).

When [ARMv8.3-CCIDX](#) is not implemented, this register is not implemented.

Configurations

AArch64 System register CCSIDR2_EL1[31:0] is architecturally mapped to AArch32 System register [CCSIDR2](#)[31:0].

This register is present only when ARMv8.3-CCIDX is implemented. Otherwise, direct accesses to CCSIDR2_EL1 are UNDEFINED.

If AArch32 is not implemented, it is IMPLEMENTATION DEFINED whether reading this register gives an UNKNOWN value or is UNDEFINED.

The implementation includes one CCSIDR2_EL1 for each cache that it can access. [CSSELR_EL1](#) selects which Cache Size ID Register is accessible.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CCSIDR2_EL1 is a 64-bit register.

Field descriptions

The CCSIDR2_EL1 bit assignments are:

Bits [63:24]

Reserved, RES0.

NumSets, bits [23:0]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Accessing the CCSIDR2_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
CCSIDR2_EL1	0000	11	001	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

If [CSSELR_EL1.Level](#) is programmed to a cache level that is not implemented, then on a read of the `CCSIDR2_EL1` the behavior is CONstrained UNPREDICTABLE, and can be one of the following:

- The `CCSIDR2_EL1` read is treated as NOP.
- The `CCSIDR2_EL1` read is UNDEFINED.
- The `CCSIDR2_EL1` read returns an UNKNOWN value.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TID2} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TID2} == 1$, then read accesses at EL1 are trapped to EL2.

D12.2.25 CCSIDR_EL1, Current Cache Size ID Register

The CCSIDR_EL1 characteristics are:

Purpose

Provides information about the architecture of the currently selected cache.

Configurations

AArch64 System register CCSIDR_EL1[31:0] is architecturally mapped to AArch32 System register [CCSIDR](#)[31:0].

AArch64 System register CCSIDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [CCSIDR2](#).

The implementation includes one CCSIDR_EL1 for each cache that it can access. [CSSELR_EL1](#) selects which Cache Size ID Register is accessible.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CCSIDR_EL1 is a 64-bit register.

Field descriptions

The CCSIDR_EL1 bit assignments are:

When ARMv8.3-CCIDX is implemented:

———— Note ————

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:56]

Reserved, RES0.

NumSets, bits [55:32]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Bits [31:24]

Reserved, RES0.

Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

($\text{Log}_2(\text{Number of bytes in cache line})$) - 4. For example:

- For a line length of 16 bytes: $\text{Log}_2(16) = 4$, LineSize entry = 0. This is the minimum line length.

- For a line length of 32 bytes: $\text{Log}_2(32) = 5$, LineSize entry = 1.

Otherwise:

Bits [63:32]

Reserved, RES0.

UNKNOWN, Bits [31:28]

Reserved, UNKNOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

($\text{Log}_2(\text{Number of bytes in cache line})$) - 4. For example:

- For a line length of 16 bytes: $\text{Log}_2(16) = 4$, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: $\text{Log}_2(32) = 5$, LineSize entry = 1.

Accessing the CCSIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CCSIDR_EL1	11	0000	001	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

If `CSSELR_EL1.Level` is programmed to a cache level that is not implemented, then on a read of the `CCSIDR_EL1` the behavior is `CONSTRAINED UNPREDICTABLE`, and can be one of the following:

- The `CCSIDR_EL1` read is treated as `NOP`.
- The `CCSIDR_EL1` read is `UNDEFINED`.
- The `CCSIDR_EL1` read returns an `UNKNOWN` value.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191. Subject to the prioritization rules:

- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TID2 == 1`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TID2 == 1`, then read accesses at EL1 are trapped to EL2.

D12.2.26 CLIDR_EL1, Cache Level ID Register

The CLIDR_EL1 characteristics are:

Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configurations

AArch64 System register CLIDR_EL1[31:0] is architecturally mapped to AArch32 System register CLIDR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CLIDR_EL1 is a 64-bit register.

Field descriptions

The CLIDR_EL1 bit assignments are:

Bits [63:33]

Reserved, RES0.

ICB, bits [32:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The possible values are:

0b000	Not disclosed by this mechanism.
0b001	L1 cache is the highest Inner Cacheable level.
0b010	L2 cache is the highest Inner Cacheable level.
0b011	L3 cache is the highest Inner Cacheable level.
0b100	L4 cache is the highest Inner Cacheable level.
0b101	L5 cache is the highest Inner Cacheable level.
0b110	L6 cache is the highest Inner Cacheable level.
0b111	L7 cache is the highest Inner Cacheable level.

LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 1 to 7

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

- 0b000 No cache.
- 0b001 Instruction cache only.
- 0b010 Data cache only.
- 0b011 Separate instruction and data caches.
- 0b100 Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

Accessing the CLIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CLIDR_EL1	11	0000	001	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TID2 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TID2 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.27 CONTEXTIDR_EL1, Context ID Register (EL1)

The CONTEXTIDR_EL1 characteristics are:

Purpose

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

This register is used:

- In ARMv8.0.
- When [ARMv8.1-VHE](#) is implemented and [HCR_EL2.E2H](#) is 0.

———— Note ————

When [ARMv8.1-VHE](#) is implemented and [HCR_EL2.E2H](#) is set to 1, [CONTEXTIDR_EL2](#) is used.

Configurations

AArch64 System register CONTEXTIDR_EL1[31:0] is architecturally mapped to AArch32 System register [CONTEXTIDR](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CONTEXTIDR_EL1 is a 64-bit register.

Field descriptions

The CONTEXTIDR_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

———— Note ————

In AArch32 state, when [TTBCR.EAE](#) is set to 0, [CONTEXTIDR.ASID](#) holds the ASID.

In AArch64 state, [CONTEXTIDR_EL1](#) is independent of the ASID, and for the EL1&0 translation regime either [TTBR0_EL1](#) or [TTBR1_EL1](#) holds the ASID.

This field resets to an architecturally UNKNOWN value.

Accessing the CONTEXTIDR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CONTEXTIDR_EL1	11	1101	000	001	0000
CONTEXTIDR_EL12	11	1101	101	001	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CONTEXTIDR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
CONTEXTIDR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
CONTEXTIDR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x108]	RW	RW
CONTEXTIDR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CONTEXTIDR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	CONTEXTIDR_EL2	RW
CONTEXTIDR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x108]	CONTEXTIDR_EL2	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CONTEXTIDR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	CONTEXTIDR_EL2	RW
CONTEXTIDR_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
CONTEXTIDR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
CONTEXTIDR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x108]	-	-
CONTEXTIDR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
CONTEXTIDR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CONTEXTIDR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x108]	RW	RW
CONTEXTIDR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [CONTEXTIDR_EL1](#) or [CONTEXTIDR_EL12](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAccessor(CONTEXTIDR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(CONTEXTIDR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(CONTEXTIDR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(CONTEXTIDR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(CONTEXTIDR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(CONTEXTIDR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(CONTEXTIDR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(CONTEXTIDR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(CONTEXTIDR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(CONTEXTIDR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.28 CONTEXTIDR_EL2, Context ID Register (EL2)

The CONTEXTIDR_EL2 characteristics are:

Purpose

When [ARMv8.1-VHE](#) is implemented and [HCR_EL2.E2H](#) is set to 1, identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Note

In ARMv8.0, or when [ARMv8.1-VHE](#) is implemented and [HCR_EL2.E2H](#) is 0, [CONTEXTIDR_EL2](#) replaces [CONTEXTIDR_EL1](#) where [CONTEXTIDR_EL1](#) would usually be used.

Configurations

This register is present only from ARMv8.1. Otherwise, direct accesses to [CONTEXTIDR_EL2](#) are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

[CONTEXTIDR_EL2](#) is a 64-bit register.

Field descriptions

The [CONTEXTIDR_EL2](#) bit assignments are:

Bits [63:32]

Reserved, RES0.

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

Note

In AArch32 state, when [TTBCR.EAE](#) is set to 0, [CONTEXTIDR.ASID](#) holds the ASID.

In AArch64 state, [CONTEXTIDR_EL2](#) is independent of the ASID, and for the EL2&0 translation regime either [TTBR0_EL2](#) or [TTBR1_EL2](#) holds the ASID.

This field resets to an architecturally UNKNOWN value.

Accessing the CONTEXTIDR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
CONTEXTIDR_EL2	1101	11	100	001	0000
CONTEXTIDR_EL1	1101	11	000	001	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CONTEXTIDR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
CONTEXTIDR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CONTEXTIDR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CONTEXTIDR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	CONTEXTIDR_EL1	n/a	CONTEXTIDR_EL1
CONTEXTIDR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	CONTEXTIDR_EL1	CONTEXTIDR_EL1	CONTEXTIDR_EL1

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CONTEXTIDR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	CONTEXTIDR_EL1	CONTEXTIDR_EL1
CONTEXTIDR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	CONTEXTIDR_EL1	RW	CONTEXTIDR_EL1
CONTEXTIDR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	CONTEXTIDR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CONTEXTIDR_EL2](#) or [CONTEXTIDR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [CONTEXTIDR_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \text{IsUsingAArch64(EL2)} \ \&\& \text{HCR_EL2.E2H} == 0 \ \&\& \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \text{IsUsingAArch64(EL2)} \ \&\& \text{HCR_EL2.E2H} == 1 \ \&\& \text{HCR_EL2.TGE} == 0 \ \&\& \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

D12.2.29 CPACR_EL1, Architectural Feature Access Control Register

The CPACR_EL1 characteristics are:

Purpose

Controls access to trace, SVE, Advanced SIMD and floating-point functionality.

Configurations

AArch64 System register CPACR_EL1[31:0] is architecturally mapped to AArch32 System register CPACR[31:0].

When HCR_EL2.{E2H, TGE} == {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by CPTR_EL2 are used.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CPACR_EL1 is a 64-bit register.

Field descriptions

The CPACR_EL1 bit assignments are:

Bits [63:29]

Reserved, RES0.

TTA, bit [28]

Traps EL0 and EL1 System register accesses to all implemented trace registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the ARMv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.TTA is 1.
- The ARMv8-A architecture does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bits [27:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps EL0 and EL1 accesses to the SVE, Advanced SIMD, and floating-point registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states.

- 0b00 This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by [CPACR_EL1.ZEN](#).
- 0b01 This control causes any instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by [CPACR_EL1.ZEN](#), but does not cause any instruction at EL1 to be trapped.
- 0b10 This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by [CPACR_EL1.ZEN](#).
- 0b11 This control does not cause any instructions to be trapped.

Writes to [MVFR0](#), [MVFR1](#) and [MVFR2](#) from EL1 or higher are CONstrained UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONstrained UNPREDICTABLE behavior.

———— Note ————

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [FPEXC](#) are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of [CPACR_EL1.FPEN](#) is not 0b11.

This field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

When SVE is implemented:

Traps SVE instructions and instructions that access SVE System registers at EL0 and EL1 to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

- 0b00 This control causes these instructions executed at EL0 or EL1 to be trapped.
- 0b01 This control causes these instructions executed at EL0 to be trapped, but does not cause any instruction at EL1 to be trapped.
- 0b10 This control causes these instructions executed at EL0 or EL1 to be trapped.
- 0b11 This control does not cause any instruction to be trapped.

If [SVE](#) is not implemented, this field is RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Accessing the CPACR_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CPACR_EL1	11	0001	000	010	0000
CPACR_EL12	11	0001	101	010	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CPACR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
CPACR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
CPACR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x100]	RW	RW
CPACR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CPACR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	CPTR_EL2	RW
CPACR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x100]	CPTR_EL2	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CPACR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	CPTR_EL2	RW
CPACR_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
CPACR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
CPACR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x100]	-	-
CPACR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
CPACR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CPACR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x100]	RW	RW
CPACR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CPACR_EL1 or CPACR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAccessor(CPACR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && CPTR_EL2.TCPAC == 1`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(CPACR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && CPTR_EL2.TCPAC == 1`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(CPACR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(CPACR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CPTR_EL2.TCPAC == 1`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(CPACR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CPTR_EL2.TCPAC == 1`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(CPACR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && CPTR_EL3.TCPAC == 1`, then accesses at EL2 are trapped to EL3.
- If `IsUsingAccessor(CPACR_EL1) && IsUsingAArch64(EL3) && CPTR_EL3.TCPAC == 1`, then accesses at EL1 are trapped to EL3.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(CPACR_EL12) && IsUsingAArch64(EL3) && CPTR_EL3.TCPAC == 1`, then accesses at EL1 are trapped to EL3.

D12.2.30 CPTR_EL2, Architectural Feature Trap Register (EL2)

The CPTR_EL2 characteristics are:

Purpose

Controls:

- Trapping to EL2 of access to [CPACR](#), [CPACR_EL1](#), trace functionality, and to SVE, Advanced SIMD and floating-point functionality.
- EL2 access to trace functionality, and to SVE, Advanced SIMD and floating-point functionality.

Configurations

AArch64 System register CPTR_EL2[31:0] is architecturally mapped to AArch32 System register [HCPTR](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CPTR_EL2 is a 64-bit register.

Field descriptions

The CPTR_EL2 bit assignments are:

When *HCR_EL2.E2H* == 0:

This format applies in all ARMv8.0 implementations.

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

Traps EL1 accesses to [CPACR_EL1](#) or [CPACR](#) to EL2 when it is enabled in the current Security state, from both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 accesses to [CPACR_EL1](#) and [CPACR](#) are trapped to EL2 when it is enabled in the current Security state.

Note

[CPACR_EL1](#) and [CPACR](#) are not accessible at EL0.

This field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, when EL2 is enabled in the current Security state.

0b0 Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.

0b1 Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

From ARMv8.1:

Traps System register accesses to all implemented trace registers to EL2 when it is enabled in the current Security state, from both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt at EL0, EL1, or EL2, to execute a System register access to an implemented trace register is trapped to EL2 when it is enabled in the current Security state, unless it is trapped by CPACR.TRCDIS or CPACR_EL1.TTA.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the ARMv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:14]

Reserved, RES0.

Bits [13:12]

Reserved, RES1.

Bit [11]

Reserved, RES0.

TFP, bit [10]

Traps accesses to SVE, Advanced SIMD and floating-point functionality to EL2 when it is enabled in the current Security state, from both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt at EL0, EL1 or EL2, to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point execution is trapped to EL2 when it is enabled in the current Security state, subject to the exception prioritization rules, unless it is trapped by [CPTR_EL2.TZ](#).

This field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES1.

TZ, bit [8]

When SVE is implemented:

Traps execution at EL2, EL1, or EL0 of SVE instructions and instructions that access SVE System registers to EL2 when it is enabled in the current Security state.

0b0 This control does not cause any instruction to be trapped.

0b1 This control causes these instructions to be trapped, subject to the exception prioritization rules.

This field resets to an architecturally UNKNOWN value.

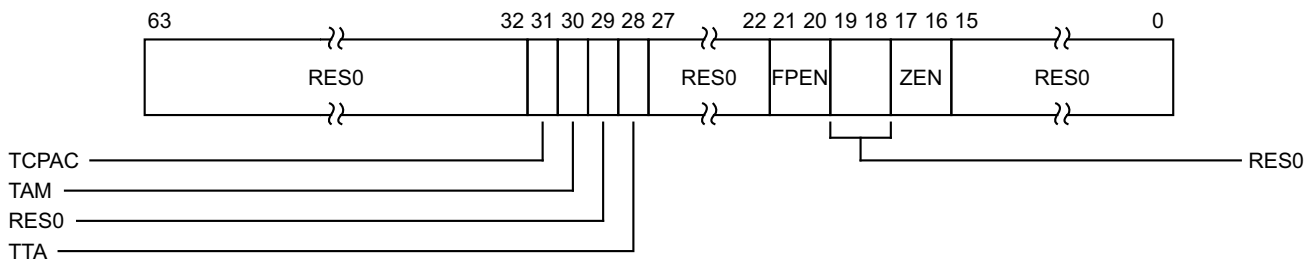

Otherwise:

Reserved, RES1.

Bits [7:0]

Reserved, RES1.

When HCR_EL2.E2H == 1:

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

From ARMv8.1:

When [HCR_EL2.TGE](#) is 0, traps EL1 accesses to [CPACR_EL1](#) and [CPACR](#) to EL2 when it is enabled in the current Security state, from both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 accesses to [CPACR_EL1](#) and [CPACR](#) are trapped to EL2 when it is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

Note

[CPACR_EL1](#) and [CPACR](#) are not accessible at EL0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TAM, bit [30]

When AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2.

0b0 Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.

0b1 Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [29]

Reserved, RES0.

TTA, bit [28]

From ARMv8.1:

Traps System register accesses to all implemented trace registers to EL2 when it is enabled in the current Security state, from both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt at EL0, EL1 or EL2, to execute a System register access to an implemented trace register is trapped to EL2 when it is enabled in the current Security state, unless [HCR_EL2.TGE](#) is 0 and it is trapped by [CPACR.NSTRCDIS](#) or [CPACR_EL1.TTA](#). When [HCR_EL2.TGE](#) is 1, any attempt at EL0 or EL2 to execute a System register access to an implemented trace register is trapped to EL2 when it is enabled in the current Security state.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the ARMv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of [CPTR_EL2.TTA](#) is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [27:22]

Reserved, RES0.

FPEN, bits [21:20]

From ARMv8.1:

Traps EL0, EL2 and, when [HCR_EL2.TGE](#) is 0, EL1 accesses to the SVE, Advanced SIMD and floating-point registers to EL2 when it is enabled in the current Security state, from both Execution states.

0b00 This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules, unless they are trapped by [CPTR_EL2.ZEN](#).

0b01 When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped. When [HCR_EL2.TGE](#) is 1, this control causes instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by [CPTR_EL2.ZEN](#), but does not cause any instruction at EL2 to be trapped.

0b10 This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules, unless they are trapped by [CPTR_EL2.ZEN](#).

0b11 This control does not cause any instructions to be trapped.

Writes to [MVFR0](#), [MVFR1](#), and [MVFR2](#) from EL1 or higher are CONstrained UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONstrained UNPREDICTABLE behavior.

Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [FPEXC](#) are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of [CPTR_EL2.FPEN](#) is not 0b11.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

When SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions or instructions that access SVE System registers to EL2 when it is enabled in the current Security state.

0b00 This control causes execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.

0b01 When [HCR_EL2.TGE](#) is 0, this control does not cause any instruction to be trapped. When [HCR_EL2.TGE](#) is 1, this control causes these instructions executed at EL0 to be trapped, but does not cause any instruction at EL2 to be trapped.

0b10 This control causes execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.

0b11 This control does not cause any instruction to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Accessing the CPTR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CPTR_EL2	11	0001	100	010	0001
CPACR_EL1	11	0001	000	010	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CPTR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
CPTR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CPTR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CPACR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	CPACR_EL1	n/a	CPACR_EL1
CPACR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	CPACR_EL1	CPACR_EL1	CPACR_EL1
CPACR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	CPACR_EL1	CPACR_EL1
CPACR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	CPACR_EL1	RW	CPACR_EL1
CPACR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	CPACR_EL1

If an _EL1 accessor is used, refer to [CPACR_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAArch64(EL3) && CPTR_EL3.TCPAC == 1`, then accesses at EL2 are trapped to EL3.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.31 CPTR_EL3, Architectural Feature Trap Register (EL3)

The CPTR_EL3 characteristics are:

Purpose

Controls trapping to EL3 of access to [CPACR_EL1](#), [CPTR_EL2](#), trace functionality and registers associated with SVE, Advanced SIMD and floating-point execution. Also controls EL3 access to trace functionality and registers associated with SVE, Advanced SIMD and floating-point execution.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CPTR_EL3 is a 64-bit register.

Field descriptions

The CPTR_EL3 bit assignments are:

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

Traps all of the following to EL3, from both Security states and both Execution states.

- EL2 accesses to the [CPTR_EL2](#) or [HCPTR](#).
- EL2 and EL1 accesses to the [CPACR_EL1](#) or [CPACR](#).

When CPTR_EL3.TCPAC is:

- 0b0 This control does not cause any instructions to be trapped.
- 0b1 EL2 accesses to the [CPTR_EL2](#) or [HCPTR](#), and EL2 and EL1 accesses to the [CPACR_EL1](#) or [CPACR](#), are trapped to EL3, unless they are trapped by [CPTR_EL2](#).TCPAC.

This field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL3.

- 0b0 Accesses from EL2, EL1, and EL0 to Activity Monitor registers are not trapped.
- 0b1 Accesses from EL2, EL1, and EL0 to Activity Monitor registers are trapped to EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps System register accesses to the trace registers, from all Exception levels, both Security states, and both Execution states, to EL3.

0b0 This control does not cause any instructions to be trapped.

0b1 Any System register access to the trace registers is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by CPACR.TRCDIS, CPACR_EL1.TTA or CPTR_EL2.TTA.

If System register access to trace functionality is not supported, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bits [19:11]

Reserved, RES0.

TFP, bit [10]

Traps all accesses to SVE, Advanced SIMD and floating-point functionality, from all Exception levels, both Security states, and both Execution states, to EL3. Defined values are:

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt at any Exception level to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by CPTR_EL3.EZ.

This field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

EZ, bit [8]

When SVE is implemented:

Traps all accesses to SVE functionality and registers from all Exception levels, and both Security states, to EL3.

0b0 This control causes these instructions executed at any Exception level to be trapped, subject to the exception prioritization rules.

0b1 This control does not cause any instruction to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

Accessing the CPTR_EL3

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CPTR_EL3	11	0001	110	010	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.32 CSSELR_EL1, Cache Size Selection Register

The CSSELR_EL1 characteristics are:

Purpose

Selects the current Cache Size ID Register, [CCSIDR_EL1](#), by specifying the required cache level and the cache type (either instruction or data cache).

Configurations

AArch64 System register CSSELR_EL1[31:0] is architecturally mapped to AArch32 System register [CSSELR](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CSSELR_EL1 is a 64-bit register.

Field descriptions

The CSSELR_EL1 bit assignments are:

Bits [63:4]

Reserved, RES0.

Level, bits [3:1]

Cache level of required cache.

0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

InD, bit [0]

Instruction not Data bit.

0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Accessing the CSSELR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CSSELR_EL1	11	0000	010	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TID2 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TID2 == 1, then accesses at EL1 are trapped to EL2.

D12.2.33 CTR_EL0, Cache Type Register

The CTR_EL0 characteristics are:

Purpose

Provides information about the architecture of the caches.

Configurations

AArch64 System register CTR_EL0[31:0] is architecturally mapped to AArch32 System register CTR[31:0].

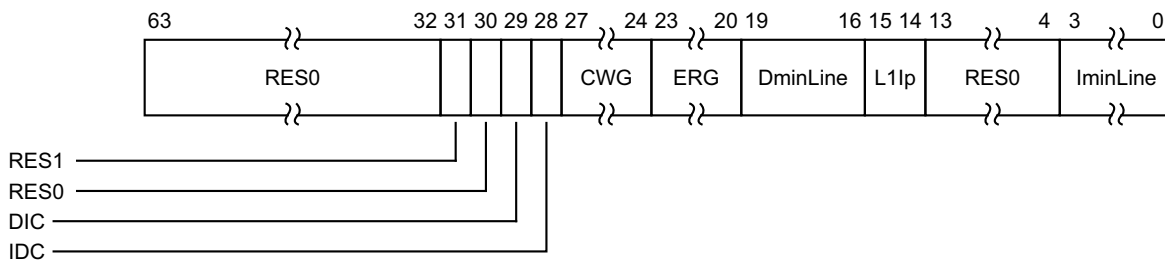

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CTR_EL0 is a 64-bit register.

Field descriptions

The CTR_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

DIC, bit [29]

Instruction cache invalidation requirements for instruction to data coherence. The meaning of this bit is:

- 0b0 Instruction cache invalidation to the Point of Unification is required for instruction to data coherence.
- 0b1 Instruction cache cleaning to the Point of Unification is not required for instruction to data coherence.

IDC, bit [28]

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

- 0b0 Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 && CLIDR_EL1.LoUU == 0b000).
- 0b1 Data cache clean to the Point of Unification is not required for instruction to data coherence.

CWG, bits [27:24]

Cache writeback granule. \log_2 of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of `0b0000` indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than `0b1001` are reserved.

ARM recommends that an implementation that does not support cache write-back implements this field as `0b0001`. This applies, for example, to an implementation that supports only write-through caches.

ERG, bits [23:20]

Exclusives reservation granule. \log_2 of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

A value of `0b0000` indicates that this register does not provide Exclusives reservation granule information and the architectural maximum of 512 words (2KB) must be assumed.

Values greater than `0b1001` are reserved.

DminLine, bits [19:16]

\log_2 of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

<code>0b00</code>	VMID aware Physical Index, Physical tag (VPIPT)
<code>0b01</code>	ASID-tagged Virtual Index, Virtual Tag (AIVIVT)
<code>0b10</code>	Virtual Index, Physical Tag (VIPT)
<code>0b11</code>	Physical Index, Physical Tag (PIPT)

The value `0b01` is reserved in ARMv8.

The value `0b00` is permitted only in an implementation that includes [ARMv8.2-VPIPT](#), otherwise the value is reserved.

Bits [13:4]

Reserved, RES0.

IminLine, bits [3:0]

\log_2 of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

Accessing the CTR_ELO

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CTR_ELO	11	0000	011	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `SCTLR_EL1.UCT == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `SCTLR_EL1.UCT == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TID2 == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TID2 == 1`, then read accesses at EL0 or EL1 are trapped to EL2.

D12.2.34 DACR32_EL2, Domain Access Control Register

The DACR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 [DACR](#) register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register DACR32_EL2[31:0] is architecturally mapped to AArch32 System register [DACR](#)[31:0].

If EL1 does not support AArch32, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DACR32_EL2 is a 64-bit register.

Field descriptions

The DACR32_EL2 bit assignments are:

Bits [63:32]

Reserved, RES0.

D<n>, bits [2n+1:2n], for n = 0 to 15

Domain n access permission, where n = 0 to 15. Permitted values are:

0b00 No access. Any access to the domain generates a Domain fault.

0b01 Client. Accesses are checked against the permission bits in the translation tables.

0b11 Manager. Accesses are not checked against the permission bits in the translation tables.

The value 0b10 is reserved.

This field resets to an architecturally UNKNOWN value.

Accessing the DACR32_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DACR32_EL2	11	0011	100	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.

D12.2.35 DCZID_EL0, Data Cache Zero ID register

The DCZID_EL0 characteristics are:

Purpose

Indicates the block size that is written with byte values of 0 by the [DC ZVA](#) (Data Cache Zero by Address) System instruction.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DCZID_EL0 is a 64-bit register.

Field descriptions

The DCZID_EL0 bit assignments are:

Bits [63:5]

Reserved, RES0.

DZP, bit [4]

Data Zero Prohibited. This field indicates whether use of [DC ZVA](#) instructions is permitted or prohibited.

0b0 Instructions are permitted.

0b1 Instructions are prohibited.

The value read from this field is governed by the access state and the values of the [HCR_EL2.TDZ](#) and [SCTLR_EL1.DZE](#) bits.

BS, bits [3:0]

Log₂ of the block size in words. The maximum size supported is 2KB (value == 9).

Accessing the DCZID_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DCZID_EL0	11	0000	011	111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

D12.2.36 ESR_EL1, Exception Syndrome Register (EL1)

The ESR_EL1 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL1.

Configurations

AArch64 System register ESR_EL1[31:0] is architecturally mapped to AArch32 System register DFSR[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ESR_EL1 is a 64-bit register.

Field descriptions

The ESR_EL1 bit assignments are:

ESR_EL1 is made UNKNOWN as a result of an exception return from EL1.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR_EL1 is UNKNOWN. The value written to ESR_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC == 0b000000

Unknown reason.

See [ISS encoding for exceptions with an unknown reason on page D12-2774](#).

EC == 0b000001

Trapped WFI or WFE instruction execution.

Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

See [ISS encoding for an exception from a WFI or WFE instruction on page D12-2776](#).

EC == 0b000011

Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.

See [ISS encoding for an exception from an MCR or MRC access on page D12-2777](#).

EC == 0b000100

Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.

See *ISS encoding for an exception from an MCRR or MRRC access* on page D12-2779.

EC == 0b000101

Trapped MCR or MRC access with (coproc==0b1110).

See *ISS encoding for an exception from an MCR or MRC access* on page D12-2777.

EC == 0b000110

Trapped LDC or STC access.

The only architected uses of these instruction are:

- An STC to write data to memory from [DBGDTRRXint](#).
- An LDC to read data from memory to [DBGDTRTXint](#).

See *ISS encoding for an exception from an LDC or STC instruction* on page D12-2781.

EC == 0b000111

Access to SVE, Advanced SIMD, or floating-point functionality trapped by [CPACR_EL1.FPEN](#), [CPTR_EL2.FPEN](#), [CPTR_EL2.TFP](#), or [CPTR_EL3.TFP](#) control. Excludes exceptions resulting from [CPACR_EL1](#) when the value of [HCR_EL2.TGE](#) is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in *The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1* on page D1-2177.

See *ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP* on page D12-2783.

EC == 0b001100

Trapped MRRC access with (coproc==0b1110).

See *ISS encoding for an exception from an MCRR or MRRC access* on page D12-2779.

EC == 0b001110

Illegal Execution state.

See *ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault* on page D12-2785.

EC == 0b010001

SVC instruction execution in AArch32 state.

This is reported in [ESR_EL2](#) only when the exception is generated because the value of [HCR_EL2.TGE](#) is 1.

See *ISS encoding for an exception from HVC or SVC instruction execution* on page D12-2785.

EC == 0b010101

SVC instruction execution in AArch64 state.

See *ISS encoding for an exception from HVC or SVC instruction execution* on page D12-2785.

EC == 0b011000

Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111, or an exception generated on a read of an ID register.

This includes all instructions that cause exceptions that are part of the encoding space defined in *System instruction class encoding overview* on page C5-339, except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.

See *ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state or, when ARMv8.4-IDST is implemented, on a read of an ID register* on page D12-2788.

EC == 0b011001

Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.

This EC is defined only if SVE is implemented.

See *ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ* on page D12-2785.

EC == 0b100000

Instruction Abort from a lower Exception level, that might be using AArch32 or AArch64.

Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from an Instruction Abort* on page D12-2790.

EC == 0b100001

Instruction Abort taken without a change in Exception level.

Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from an Instruction Abort* on page D12-2790.

EC == 0b100010

PC alignment fault exception.

See *ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault* on page D12-2785.

EC == 0b100100

Data Abort from a lower Exception level, that might be using AArch32 or AArch64.

Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from a Data Abort* on page D12-2792.

EC == 0b100101

Data Abort taken without a change in Exception level.

Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from a Data Abort* on page D12-2792.

EC == 0b100110

SP alignment fault exception.

See *ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault* on page D12-2785.

EC == 0b101000

Trapped floating-point exception taken from AArch32 state.

This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

See *ISS encoding for an exception from a trapped floating-point exception* on page D12-2796.

EC == 0b101100

Trapped floating-point exception taken from AArch64 state.

This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

See [ISS encoding for an exception from a trapped floating-point exception on page D12-2796](#).

EC == 0b101111

SError interrupt.

See [ISS encoding for an SError interrupt on page D12-2798](#).

EC == 0b110000

Breakpoint exception from a lower Exception level, that might be using AArch32 or AArch64.

See [ISS encoding for an exception from a Breakpoint or Vector Catch debug exception on page D12-2800](#).

EC == 0b110001

Breakpoint exception taken without a change in Exception level.

See [ISS encoding for an exception from a Breakpoint or Vector Catch debug exception on page D12-2800](#).

EC == 0b110010

Software Step exception from a lower Exception level, that might be using AArch32 or AArch64.

See [ISS encoding for an exception from a Software Step exception on page D12-2800](#).

EC == 0b110011

Software Step exception taken without a change in Exception level.

See [ISS encoding for an exception from a Software Step exception on page D12-2800](#).

EC == 0b110100

Watchpoint exception from a lower Exception level, that might be using AArch32 or AArch64.

See [ISS encoding for an exception from a Watchpoint exception on page D12-2801](#).

EC == 0b110101

Watchpoint exception taken without a change in Exception level.

See [ISS encoding for an exception from a Watchpoint exception on page D12-2801](#).

EC == 0b111000

BKPT instruction execution in AArch32 state.

See [ISS encoding for an exception from execution of a Breakpoint instruction on page D12-2802](#).

EC == 0b111100

BRK instruction execution in AArch64 state.

This is reported in `ESR_EL3` only if a BRK instruction is executed.

See [ISS encoding for an exception from execution of a Breakpoint instruction on page D12-2802](#).

All other EC values are reserved by ARM, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7216](#).

This field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

- 0b0 16-bit instruction trapped.
- 0b1
 - An SError interrupt.
 - An Instruction Abort exception.
 - A PC alignment fault exception.
 - An SP alignment fault exception.
 - A Data Abort exception for which the value of the ISV bit is 0.
 - An Illegal Execution state exception.
 - Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning:
 - 0b0: 16-bit T32 BKPT instruction.
 - 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.
 - An exception reported using EC value 0b000000.

This field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, [Mapping of the general-purpose registers between the Execution states on page D1-2264](#) defines this view of the specified AArch32 register. If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
 - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
 - The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

The following subsections describe each ISS format.

ISS encoding for exceptions with an unknown reason

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction at the current Exception level and Security state, including:
 - A read access using a System register pattern that is not allocated for reads at the current Exception level and Security state.
 - A write access using a System register pattern that is not allocated for writes at the current Exception level and Security state.
 - Instruction encodings for instructions not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is unallocated in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is unallocated in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the `SCTLR_EL1`.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by `HCR_EL2.HCD` or `SCR_EL3.HCE`.
 - An SMC instruction when disabled by `SCR_EL3.SMD`.
 - An HLT instruction when disabled by `EDSCR.HDE`.
- Attempted execution of an MSR or MRS instruction to access `SP_EL0` when the value of `SPSel.SP` is 0.
- Attempted execution, in Debug state, of:
 - A DCPS1 instruction when the value of `HCR_EL2.TGE` is 1 and EL2 is disabled or not implemented in the current Security state.
 - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
 - A DCPS3 instruction when the value of `EDSCR.SDD` is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using `R13_mon`. See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-2243*.
- In Debug state when the value of `EDSCR.SDD` is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to `SPSR_mon`, `SP_mon`, or `LR_mon`.
- An exception that is taken to EL2 because the value of `HCR_EL2.TGE` is 1 that, if the value of `HCR_EL2.TGE` was 0 would have been reported with an `ESR_ELx.EC` value of `0b000111`.
- When SVE is not implemented, attempted execution of:
 - An SVE instruction.
 - An MSR or MRS instruction to access `ZCR_EL1`, `ZCR_EL2`, or `ZCR_EL3`.

ISS encoding for an exception from a WFI or WFE instruction

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

- 0b0 WFI trapped.

0b1 WFE trapped.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for generating this exception:

- [Traps to EL1 of EL0 execution of WFE and WFI instructions on page D1-2211.](#)
- [Traps to EL2 of EL0 and EL1 execution of WFE and WFI instructions on page D1-2229.](#)
- [Traps to EL3 of EL2, EL1, and EL0 execution of WFE and WFI instructions on page D1-2244.](#)

ISS encoding for an exception from an MCR or MRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0 Write to System register space. MCR instruction.

0b1 Read from System register space. MRC or VMRS instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-2215](#).
- [Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-2216](#).
- [Traps to EL1 of EL0 accesses to Activity Monitors registers on page D1-2217](#).
- [Traps to EL2 of EL1 accesses to virtual memory control registers on page D1-2221](#).
- [Traps to EL2 of EL1 execution of TLB maintenance instructions on page D1-2222](#).
- [Traps to EL2 of EL0 and EL1 execution of cache maintenance instructions on page D1-2223](#).
- [Traps to EL2 of EL1 accesses to the Auxiliary Control Register on page D1-2224](#).
- [Traps to EL2 of EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page D1-2225](#).

- [Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226.](#)
- [Trapping to EL2 of EL1 accesses to the CPACR_EL1 or CPACR on page D1-2231.](#)
- [General trapping to EL2 of EL0 and EL1 accesses to System registers, from AArch32 state only on page D1-2232](#)
- [Traps to EL2 of EL0 and EL1 accesses to the Generic Timer registers on page D1-2236](#)
- [Traps to EL2 of EL0 and EL1 accesses to Performance Monitors registers on page D1-2237.](#)
- [Traps to EL2 of EL1 and EL0 accesses to Activity Monitors registers on page D1-2230.](#)
- [Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-2243.](#)
- [Trapping to EL3 of EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR on page D1-2246.](#)
- [Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers on page D1-2250.](#)
- [Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers on page D1-2246.](#)

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [Traps to EL1 of EL0 and EL1 System register accesses to the trace registers on page D1-2213.](#)
- [Traps to EL1 of EL0 accesses to the Debug Communications Channel \(DCC\) registers on page D1-2214.](#)
- [Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226, for trapped accesses to the JIDR.](#)
- [Traps to EL2 of System register accesses to the trace registers on page D1-2231.](#)
- [Trapping System register accesses to Debug ROM registers to EL2 on page D1-2234.](#)
- [Trapping System register accesses to powerdown debug registers to EL2 on page D1-2234.](#)
- [Trapping general System register accesses to debug registers to EL2 on page D1-2235.](#)

- [Trapping general System register accesses to debug registers to EL3 on page D1-2249.](#)

[Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226](#) describes configuration settings for generating exceptions that are reported using EC value 0b001000.

ISS encoding for an exception from an MCRR or MRRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

- 0b0 Write to System register space. MCRR instruction.
- 0b1 Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- *Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-2215.*
- *Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-2216.*
- *Traps to EL1 of EL0 accesses to Activity Monitors registers on page D1-2217.*
- *Traps to EL2 of EL1 accesses to virtual memory control registers on page D1-2221.*
- *General trapping to EL2 of EL0 and EL1 accesses to System registers, from AArch32 state only on page D1-2232.*
- *Traps to EL2 of EL0 and EL1 accesses to the Generic Timer registers on page D1-2236.*
- *Traps to EL2 of EL0 and EL1 accesses to Performance Monitors registers on page D1-2237.*
- *Traps to EL2 of EL1 and EL0 accesses to Activity Monitors registers on page D1-2230.*
- *Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers on page D1-2250.*
- *Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers on page D1-2246.*

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- *Traps to EL1 of EL0 and EL1 System register accesses to the trace registers on page D1-2213.*
- *Traps to EL1 of EL0 accesses to the Debug Communications Channel (DCC) registers on page D1-2214.*
- *Traps to EL2 of System register accesses to the trace registers on page D1-2231.*
- *Trapping System register accesses to Debug ROM registers to EL2 on page D1-2234.*
- *Traps to EL3 of System register accesses to the trace registers on page D1-2247.*
- *Trapping System register accesses to powerdown debug registers to EL3 on page D1-2249.*
- *Trapping general System register accesses to debug registers to EL3 on page D1-2249.*

ISS encoding for an exception from an LDC or STC instruction

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.

0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

0b0 Subtract offset.

0b1 Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

0b000 Immediate unindexed.

0b001 Immediate post-indexed.

0b010 Immediate offset.

0b011 Immediate pre-indexed.

0b100 For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.

0b110 For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONstrained UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7231](#).

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0 Write to memory. STC instruction.

0b1 Read from memory. LDC instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000110:

- [Traps to EL1 of EL0 accesses to the Debug Communications Channel \(DCC\) registers on page D1-2214](#).
- [Trapping general System register accesses to debug registers to EL2 on page D1-2235](#).
- [Trapping general System register accesses to debug registers to EL3 on page D1-2249](#).

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value `0b000000`.

CV, bit [24]

Condition code valid. Possible values of this bit are:

- `0b0` The COND field is not valid.
- `0b1` The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to `0b1110`.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to `0b1110`, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value `0b000111`:

- [Traps to EL1 of EL0 and EL1 accesses to SIMD and floating-point functionality on page D1-2214.](#)
- [General trapping to EL2 of accesses to the SIMD and floating-point registers on page D1-2231.](#)
- [Traps to EL3 of all accesses to the SIMD and floating-point registers on page D1-2248](#)

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

Bits [24:0]

When SVE is implemented:

Reserved, RES0.

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers, ZCR_ELx and ID_AA64ZFR0_EL1.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see [The Illegal Execution state exception on page D1-2182](#) and [PC alignment checking on page D1-2164](#).

[SP alignment checking on page D1-2164](#) describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from HVC or SVC instruction execution

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.

- For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see [SVC](#) and [HVC](#).

For A64 instructions, see [SVC](#) and [HVC](#).

ISS encoding for an exception from SMC instruction execution in AArch32 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR_EL2.TSC](#) is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.

- With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

0b0 The instruction was unconditional, or was conditional and passed its condition code check.

0b1 The instruction was conditional, and might have failed its condition code check.

———— Note —————

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

[Traps to EL2 of EL1 execution of SMC instructions on page D1-2226](#) describes the configuration settings for trapping SMC instructions from EL1 modes, and [System calls on page D1-2254](#) describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

[Traps to EL2 of EL1 execution of SMC instructions on page D1-2226](#) describes the configuration settings for trapping SMC instructions from Non-secure EL1 modes, and [System calls on page D1-2254](#) describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state or, when ARMv8.4-IDST is implemented, on a read of an ID register

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0 Write access, including MSR instructions.

0b1 Read access, including MRS instructions.

This field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see [System instructions on page C4-241](#) for the encoding values returned by an instruction.

The following sections describe configuration settings for generating the exception that is reported using EC value 0b011000:

- In [EL1 configurable controls on page D1-2209](#).
 - [Traps to EL1 of EL0 execution of cache maintenance instructions on page D1-2210](#).
 - [Traps to EL1 of EL0 accesses to the CTR_EL0 on page D1-2211](#).
 - [Traps to EL1 of EL0 execution of DC ZVA instructions on page D1-2212](#).
 - [Traps to EL1 of EL0 accesses to the PSTATE.{D, A, I, F} interrupt masks on page D1-2212](#).

- *Traps to EL1 of EL0 and EL1 System register accesses to the trace registers on page D1-2213.*
- *Traps to EL1 of EL0 accesses to the Debug Communications Channel (DCC) registers on page D1-2214.*
- *Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-2215.*
- *Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-2216.*
- *Traps to EL1 of EL0 accesses to Activity Monitors registers on page D1-2217.*
- *In EL2 configurable controls on page D1-2218.*
 - *Traps to EL2 of EL1 accesses to virtual memory control registers on page D1-2221.*
 - *Traps to EL2 of EL0 and EL1 execution of DC ZVA instructions on page D1-2222.*
 - *Traps to EL2 of EL1 execution of TLB maintenance instructions on page D1-2222.*
 - *Traps to EL2 of EL0 and EL1 execution of cache maintenance instructions on page D1-2223.*
 - *Traps to EL2 of EL1 accesses to the Auxiliary Control Register on page D1-2224.*
 - *Traps to EL2 of EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page D1-2225.*
 - *Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226.*
 - *Trapping to EL2 of EL1 accesses to the CPACR_EL1 or CPACR on page D1-2231.*
 - *Traps to EL2 of System register accesses to the trace registers on page D1-2231.*

 - *Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers on page D1-2246.*

ISS encoding for a IMPLEMENTATION DEFINED exception to EL3

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and IFSC is 0b010000, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:

- 0b00 Recoverable error (UER).
- 0b10 Uncontainable error (UC).
- 0b11 Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the IFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

- 0b0 FAR is valid.
- 0b1 FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.

0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

0b000000 Address size fault, level 0 of translation or translation table base register

0b000001 Address size fault, level 1

0b000010 Address size fault, level 2

0b000011 Address size fault, level 3

0b000100 Translation fault, level 0

0b000101 Translation fault, level 1

0b000110 Translation fault, level 2

0b000111 Translation fault, level 3

0b001001 Access flag fault, level 1

0b001010 Access flag fault, level 2

0b001011 Access flag fault, level 3

0b001101 Permission fault, level 1

0b001110 Permission fault, level 2

0b001111 Permission fault, level 3

0b010000 Synchronous External abort, not on translation table walk

0b010100 Synchronous External abort, on translation table walk, level 0

0b010101 Synchronous External abort, on translation table walk, level 1

0b010110 Synchronous External abort, on translation table walk, level 2

0b010111 Synchronous External abort, on translation table walk, level 3

0b011000 Synchronous parity or ECC error on memory access, not on translation table walk

0b011100 Synchronous parity or ECC error on memory access on translation table walk, level 0

0b011101 Synchronous parity or ECC error on memory access on translation table walk, level 1

0b011110 Synchronous parity or ECC error on memory access on translation table walk, level 2

0b011111 Synchronous parity or ECC error on memory access on translation table walk, level 3

0b110000 TLB conflict abort

0b110001 Unsupported atomic hardware update fault, if the implementation includes [ARMv8.1-TTHM](#). Otherwise reserved.

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

———— Note —————

ARMv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see *The level associated with MMU faults* on page D5-2505.

Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:0] is valid.

- 0b0 No valid instruction syndrome. ISS[23:14] are RES0.
- 0b1 ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults reported in ESR_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

- 0b00 Byte

0b01 Halfword
0b10 Word
0b11 Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

0b0 Sign-extension not required.
0b1 Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SRT, bits [20:16]

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SF, bit [15]

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

0b0 Instruction loads/stores a 32-bit wide register.
0b1 Instruction loads/stores a 64-bit wide register.

————— **Note** —————

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

0b0 Instruction did not have acquire/release semantics.
0b1 Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

Indicates that the fault came from use of `VNCR_EL2` register by EL1 code.

- | | |
|-----|---|
| 0b0 | The fault was not generated by the use of <code>VNCR_EL2</code> , by an MRS or MSR instruction executed at EL1. |
| 0b1 | The fault was generated by the use of <code>VNCR_EL2</code> , by an MRS or MSR instruction executed at EL1. |

This field is 0 in `ESR_EL1`.

This field resets to an architecturally UNKNOWN value.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and DFSC is `0b010000`, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

- | | |
|------|--|
| 0b00 | Recoverable error (UER). |
| 0b10 | Uncontainable error (UC). |
| 0b11 | Restartable error (UEO) or Corrected error (CE). |

All other values are reserved.

———— Note ————

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not `0b010000`.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

- | | |
|-----|---|
| 0b0 | FAR is valid. |
| 0b1 | FAR is not valid, and holds an UNKNOWN value. |

This field is valid only if the DFSC code is `0b010000`. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

- | | |
|-----|---|
| 0b0 | The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1. |
| 0b1 | The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <code>DC ZVA</code> instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1. |

This field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.

0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

0b0 Abort caused by an instruction reading from a memory location.

0b1 Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

0b000000 Address size fault, level 0 of translation or translation table base register.

0b000001 Address size fault, level 1.

0b000010 Address size fault, level 2.

0b000011 Address size fault, level 3.

0b000100 Translation fault, level 0.

0b000101 Translation fault, level 1.

0b000110 Translation fault, level 2.

0b000111 Translation fault, level 3.

0b001001 Access flag fault, level 1.

0b001010 Access flag fault, level 2.

0b001011 Access flag fault, level 3.

0b001101 Permission fault, level 1.

0b001110 Permission fault, level 2.

0b001111 Permission fault, level 3.

0b010000 Synchronous External abort, not on translation table walk.

0b010001 Synchronous Tag Check fail

0b010100 Synchronous External abort, on translation table walk, level 0.

0b010101 Synchronous External abort, on translation table walk, level 1.

0b010110 Synchronous External abort, on translation table walk, level 2.

- 0b010111 Synchronous External abort, on translation table walk, level 3.
- 0b011000 Synchronous parity or ECC error on memory access, not on translation table walk.
- 0b011100 Synchronous parity or ECC error on memory access on translation table walk, level 0.
- 0b011101 Synchronous parity or ECC error on memory access on translation table walk, level 1.
- 0b011110 Synchronous parity or ECC error on memory access on translation table walk, level 2.
- 0b011111 Synchronous parity or ECC error on memory access on translation table walk, level 3.
- 0b100001 Alignment fault.
- 0b110000 TLB conflict abort.
- 0b110001 Unsupported atomic hardware update fault, if the implementation includes [ARMv8.1-TTHM](#). Otherwise reserved.
- 0b110100 IMPLEMENTATION DEFINED fault (Lockdown).
- 0b110101 IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).
- 0b111101 Section Domain Fault, used only for faults reported in the [PAR_EL1](#).
- 0b111110 Page Domain Fault, used only for faults reported in the [PAR_EL1](#).

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on page D5-2505](#).

Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions. The possible values of this bit are:

- 0b0 The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.

0b1 One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see [Floating-point exceptions and exception traps on page D1-2196](#).

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

———— **Note** ————

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

—————
This field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Input denormal floating-point exception has not occurred.

0b1 Input denormal floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Inexact floating-point exception has not occurred.

0b1 Inexact floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Underflow floating-point exception has not occurred.

0b1 Underflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Overflow floating-point exception has not occurred.

0b1 Overflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Divide by Zero floating-point exception has not occurred.

0b1 Divide by Zero floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Invalid Operation floating-point exception has not occurred.

0b1 Invalid Operation floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the **FPCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the **FPSCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

0b0 Bits[23:0] of the ISS field holds the fields described in this encoding.

Note

If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are RES0.

0b1 Bits[23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

Implicit error synchronization event.

- | | |
|-----|--|
| 0b0 | The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately. |
| 0b1 | The SError interrupt was synchronized by the implicit error synchronization event and taken immediately. |

This field is RES0 if the value returned in the DFSC field is not 0b010001.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension and [ARMv8.2-IESB](#).

This field resets to an architecturally UNKNOWN value.

AET, bits [12:10]

Asynchronous Error Type.

When the RAS Extension is implemented and DFSC is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

- | | |
|-------|----------------------------|
| 0b000 | Uncontainable error (UC). |
| 0b001 | Unrecoverable error (UEU). |
| 0b010 | Restartable error (UEO). |
| 0b011 | Recoverable error (UER). |
| 0b110 | Corrected error (CE). |

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

———— **Note** —————

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. When the RAS Extension is implemented, this bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Data Fault Status Code. When the RAS Extension is implemented, possible values of this field are:

0b000000 Uncategorized.

0b010001 Asynchronous SError interrupt.

All other values are reserved.

If the RAS Extension is not implemented, this field is RES0.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see [Breakpoint exceptions on page D2-2296](#).
- For exceptions from AArch32, see [Breakpoint exceptions on page G2-5366](#) and [Vector Catch exceptions on page G2-5405](#).

ISS encoding for an exception from a Software Step exception

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

0b0 EX bit is RES0.

0b1 EX bit is valid.

See the EX bit description for more information.
This field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

0b0 An instruction other than a Load-Exclusive instruction was stepped.

0b1 A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Software Step exceptions on page D2-2329](#).

ISS encoding for an exception from a Watchpoint exception

Bits [24:14]

Reserved, RES0.

VNCR, bit [13]

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

0b0 The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.

0b1 The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

0b0 The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.

0b1 The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

0b0 Watchpoint exception caused by an instruction reading from a memory location.

0b1 Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Watchpoint exceptions on page D2-2314](#).

ISS encoding for an exception from execution of a Breakpoint instruction

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary. For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Breakpoint Instruction exceptions on page D2-2294](#).

ISS encoding for an exception from ERET, ERETA or ERETAB instruction

This EC value only applies when `HCR_EL2.NV` is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2. Possible values are:

- 0b0 ERET instruction trapped to EL2.
- 0b1 ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2. Possible values are:

- 0b0 ERETAA instruction trapped to EL2.
- 0b1 ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Traps to EL2 for Nested virtualization on page D1-2240](#).

ISS encoding for an exception from Branch Target Identification instruction

Bits [24:2]

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the `PSTATE.BTYPE` value that generated the Branch Target Exception.

For more information about generating these exceptions, see [Chapter B1 The AArch64 Application Level Programmers' Model](#).

ISS encoding for an exception from a Pointer Authentication instruction when `HCR_EL2.API == 0` || `SCR_EL3.API == 0`

Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- [Trap to EL2 of EL0 accesses to Pointer authentication instructions on page D1-2239](#).

- [Trap to EL3 accesses to Pointer authentication instructions on page D1-2252.](#)

Accessing the ESR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ESR_EL1	11	0101	000	000	0010
ESR_EL12	11	0101	101	000	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
ESR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
ESR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
ESR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x138]	RW	RW
ESR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
ESR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	ESR_EL2	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
ESR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x138]	ESR_EL2	RW
ESR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	ESR_EL2	RW
ESR_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
ESR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
ESR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x138]	-	-
ESR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
ESR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
ESR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x138]	RW	RW
ESR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic `ESR_EL1` or `ESR_EL12` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `IsUsingAccessor(ESR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(ESR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(ESR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(ESR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(ESR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(ESR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(ESR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(ESR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(ESR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(ESR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.37 ESR_EL2, Exception Syndrome Register (EL2)

The ESR_EL2 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL2.

Configurations

AArch64 System register ESR_EL2[31:0] is architecturally mapped to AArch32 System register HSR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ESR_EL2 is a 64-bit register.

Field descriptions

The ESR_EL2 bit assignments are:

ESR_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR_EL2 is UNKNOWN. The value written to ESR_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC == 0b000000

Unknown reason.

See [ISS encoding for exceptions with an unknown reason on page D12-2812](#).

EC == 0b000001

Trapped WFI or WFE instruction execution.

Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

See [ISS encoding for an exception from a WFI or WFE instruction on page D12-2813](#).

EC == 0b000011

Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.

See *ISS encoding for an exception from an MCR or MRC access* on page D12-2815.

EC == 0b000100

Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.

See *ISS encoding for an exception from an MCRR or MRRC access* on page D12-2817.

EC == 0b000101

Trapped MCR or MRC access with (coproc==0b1110).

See *ISS encoding for an exception from an MCR or MRC access* on page D12-2815.

EC == 0b000110

Trapped LDC or STC access.

The only architected uses of these instruction are:

- An STC to write data to memory from `DBGDTRRXint`.
- An LDC to read data from memory to `DBGDTRTXint`.

See *ISS encoding for an exception from an LDC or STC instruction* on page D12-2819.

EC == 0b000111

Access to SVE, Advanced SIMD, or floating-point functionality trapped by `CPACR_EL1.FPEN`, `CPTR_EL2.FPEN`, `CPTR_EL2.TFP`, or `CPTR_EL3.TFP` control. Excludes exceptions resulting from `CPACR_EL1` when the value of `HCR_EL2.TGE` is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in *The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1* on page D1-2177.

See *ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP* on page D12-2821.

EC == 0b001000

Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.

See *ISS encoding for an exception from an MCR or MRC access* on page D12-2815.

EC == 0b001001 From ARMv8.3

Trapped use of a Pointer authentication instruction because `HCR_EL2.API == 0` || `SCR_EL3.API == 0`.

See *ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0* on page D12-2841.

EC == 0b001100

Trapped MRRC access with (coproc==0b1110).

See *ISS encoding for an exception from an MCRR or MRRC access* on page D12-2817.

EC == 0b001110

Illegal Execution state.

See *ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault* on page D12-2823.

EC == 0b010001

SVC instruction execution in AArch32 state.

This is reported in `ESR_EL2` only when the exception is generated because the value of `HCR_EL2.TGE` is 1.

See *ISS encoding for an exception from HVC or SVC instruction execution* on page D12-2823.

EC == 0b010010

HVC instruction execution in AArch32 state, when HVC is not disabled.

See *ISS encoding for an exception from HVC or SVC instruction execution* on page D12-2823.

EC == 0b010011

SMC instruction execution in AArch32 state, when SMC is not disabled.

This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.

See *ISS encoding for an exception from SMC instruction execution in AArch32 state on page D12-2824*.

EC == 0b010101

SVC instruction execution in AArch64 state.

See *ISS encoding for an exception from HVC or SVC instruction execution on page D12-2823*.

EC == 0b010110

HVC instruction execution in AArch64 state, when HVC is not disabled.

See *ISS encoding for an exception from HVC or SVC instruction execution on page D12-2823*.

EC == 0b010111

SMC instruction execution in AArch64 state, when SMC is not disabled.

This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.

See *ISS encoding for an exception from SMC instruction execution in AArch64 state on page D12-2825*.

EC == 0b011000

Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111, or an exception generated on a read of an ID register.

This includes all instructions that cause exceptions that are part of the encoding space defined in *System instruction class encoding overview on page C5-339*, except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.

See *ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state or, when ARMv8.4-IDST is implemented, on a read of an ID register on page D12-2826*.

EC == 0b011001

Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.

This EC is defined only if SVE is implemented.

See *ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ on page D12-2822*.

EC == 0b011010 From ARMv8.3

Trapped ERET, ERETAA, or ERETAB instruction execution.

See *ISS encoding for an exception from ERET, ERETAA or ERETAB instruction on page D12-2840*.

EC == 0b100000

Instruction Abort from a lower Exception level, that might be using AArch32 or AArch64.

Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from an Instruction Abort on page D12-2828*.

EC == 0b100001

Instruction Abort taken without a change in Exception level.

Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from an Instruction Abort* on page D12-2828.

EC == 0b100010

PC alignment fault exception.

See *ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault* on page D12-2823.

EC == 0b100100

Data Abort from a lower Exception level, that might be using AArch32 or AArch64. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from a Data Abort* on page D12-2830.

EC == 0b100101

Data Abort taken without a change in Exception level.

Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from a Data Abort* on page D12-2830.

EC == 0b100110

SP alignment fault exception.

See *ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault* on page D12-2823.

EC == 0b101000

Trapped floating-point exception taken from AArch32 state.

This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

See *ISS encoding for an exception from a trapped floating-point exception* on page D12-2834.

EC == 0b101100

Trapped floating-point exception taken from AArch64 state.

This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

See *ISS encoding for an exception from a trapped floating-point exception* on page D12-2834.

EC == 0b101111

SError interrupt.

See *ISS encoding for an SError interrupt* on page D12-2836.

EC == 0b110000

Breakpoint exception from a lower Exception level, that might be using AArch32 or AArch64.

See *ISS encoding for an exception from a Breakpoint or Vector Catch debug exception* on page D12-2838.

EC == 0b110001

Breakpoint exception taken without a change in Exception level.

See *ISS encoding for an exception from a Breakpoint or Vector Catch debug exception* on page D12-2838.

EC == 0b110010

Software Step exception from a lower Exception level, that might be using AArch32 or AArch64.

See *ISS encoding for an exception from a Software Step exception* on page D12-2838.

EC == 0b110011

Software Step exception taken without a change in Exception level.

See *ISS encoding for an exception from a Software Step exception* on page D12-2838.

EC == 0b110100

Watchpoint exception from a lower Exception level, that might be using AArch32 or AArch64.

See *ISS encoding for an exception from a Watchpoint exception* on page D12-2839.

EC == 0b110101

Watchpoint exception taken without a change in Exception level.

See *ISS encoding for an exception from a Watchpoint exception* on page D12-2839.

EC == 0b111000

BKPT instruction execution in AArch32 state.

See *ISS encoding for an exception from execution of a Breakpoint instruction* on page D12-2840.

EC == 0b111010

Vector Catch exception from AArch32 state.

The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.

See *ISS encoding for an exception from a Breakpoint or Vector Catch debug exception* on page D12-2838.

EC == 0b111100

BRK instruction execution in AArch64 state.

This is reported in `ESR_EL3` only if a BRK instruction is executed.

See *ISS encoding for an exception from execution of a Breakpoint instruction* on page D12-2840.

All other EC values are reserved by ARM, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

This field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

- | | |
|-----|---|
| 0b0 | 16-bit instruction trapped. |
| 0b1 | <ul style="list-style-type: none">• An SError interrupt.• An Instruction Abort exception.• A PC alignment fault exception.• An SP alignment fault exception.• A Data Abort exception for which the value of the ISV bit is 0.• An Illegal Execution state exception. |

- Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning:
 - 0b0: 16-bit T32 BKPT instruction.
 - 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.
- An exception reported using EC value 0b000000.

This field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, [Mapping of the general-purpose registers between the Execution states on page D1-2264](#) defines this view of the specified AArch32 register. If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
 - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
 - The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

The following subsections describe each ISS format.

ISS encoding for exceptions with an unknown reason

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction at the current Exception level and Security state, including:
 - A read access using a System register pattern that is not allocated for reads at the current Exception level and Security state.
 - A write access using a System register pattern that is not allocated for writes at the current Exception level and Security state.
 - Instruction encodings for instructions not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is unallocated in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is unallocated in Non-debug state.

- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the `SCTLR_EL1`. {ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by `HCR_EL2.HCD` or `SCR_EL3.HCE`.
 - An SMC instruction when disabled by `SCR_EL3.SMD`.
 - An HLT instruction when disabled by `EDSCR.HDE`.
- Attempted execution of an MSR or MRS instruction to access `SP_EL0` when the value of `SPSel.SP` is 0.
- Attempted execution, in Debug state, of:
 - A DCPS1 instruction when the value of `HCR_EL2.TGE` is 1 and EL2 is disabled or not implemented in the current Security state.
 - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
 - A DCPS3 instruction when the value of `EDSCR.SDD` is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using `R13_mon`. See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32* on page D1-2243.
- In Debug state when the value of `EDSCR.SDD` is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to `SPSR_mon`, `SP_mon`, or `LR_mon`.
- An exception that is taken to EL2 because the value of `HCR_EL2.TGE` is 1 that, if the value of `HCR_EL2.TGE` was 0 would have been reported with an `ESR_ELx.EC` value of `0b000111`.
- When SVE is not implemented, attempted execution of:
 - An SVE instruction.
 - An MSR or MRS instruction to access `ZCR_EL1`, `ZCR_EL2`, or `ZCR_EL3`.

ISS encoding for an exception from a WFI or WFE instruction

CV, bit [24]

Condition code valid. Possible values of this bit are:

- `0b0` The COND field is not valid.
- `0b1` The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.

- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

- | | |
|-----|--------------|
| 0b0 | WFI trapped. |
| 0b1 | WFE trapped. |

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for generating this exception:

- [Traps to EL1 of EL0 execution of WFE and WFI instructions on page D1-2211.](#)
- [Traps to EL2 of EL0 and EL1 execution of WFE and WFI instructions on page D1-2229.](#)
- [Traps to EL3 of EL2, EL1, and EL0 execution of WFE and WFI instructions on page D1-2244.](#)

ISS encoding for an exception from an MCR or MRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.
For a trapped VMRS access, holds the value 0b111.
This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.
For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.
This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).
This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.
For a trapped VMRS access, holds the value 0b0000.
This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-2215.](#)
- [Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-2216.](#)
- [Traps to EL1 of EL0 accesses to Activity Monitors registers on page D1-2217.](#)
- [Traps to EL2 of EL1 accesses to virtual memory control registers on page D1-2221.](#)
- [Traps to EL2 of EL1 execution of TLB maintenance instructions on page D1-2222.](#)
- [Traps to EL2 of EL0 and EL1 execution of cache maintenance instructions on page D1-2223.](#)
- [Traps to EL2 of EL1 accesses to the Auxiliary Control Register on page D1-2224.](#)
- [Traps to EL2 of EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page D1-2225.](#)
- [Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226.](#)
- [Trapping to EL2 of EL1 accesses to the CPACR_EL1 or CPACR on page D1-2231.](#)

- [Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers on page D1-2250.](#)
- [Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers on page D1-2246.](#)

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [Traps to EL1 of EL0 and EL1 System register accesses to the trace registers on page D1-2213.](#)
- [Traps to EL1 of EL0 accesses to the Debug Communications Channel \(DCC\) registers on page D1-2214.](#)
- [Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226, for trapped accesses to the JIDR.](#)
- [Traps to EL2 of System register accesses to the trace registers on page D1-2231.](#)
- [Trapping System register accesses to Debug ROM registers to EL2 on page D1-2234.](#)
- [Trapping System register accesses to powerdown debug registers to EL2 on page D1-2234.](#)
- [Trapping general System register accesses to debug registers to EL2 on page D1-2235.](#)
- [Traps to EL3 of System register accesses to the trace registers on page D1-2247.](#)
- [Trapping System register accesses to powerdown debug registers to EL3 on page D1-2249.](#)
- [Trapping general System register accesses to debug registers to EL3 on page D1-2249.](#)

[Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226](#) describes configuration settings for generating exceptions that are reported using EC value 0b001000.

ISS encoding for an exception from an MCRR or MRRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

- 0b0 Write to System register space. MCRR instruction.
- 0b1 Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-2215](#).

- [Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-2216.](#)
- [Traps to EL1 of EL0 accesses to Activity Monitors registers on page D1-2217.](#)

- [Trapping general System register accesses to debug registers to EL3 on page D1-2249.](#)

ISS encoding for an exception from an LDC or STC instruction

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See *Mapping of the general-purpose registers between the Execution states* on page D1-2264.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

0b0 Subtract offset.

0b1 Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

0b000 Immediate unindexed.

0b001 Immediate post-indexed.

0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONstrained UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7231](#).

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000110:

- [Traps to EL1 of EL0 accesses to the Debug Communications Channel \(DCC\) registers on page D1-2214](#).
- [Trapping general System register accesses to debug registers to EL2 on page D1-2235](#).
- [Trapping general System register accesses to debug registers to EL3 on page D1-2249](#).

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid. Possible values of this bit are:

0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- [Traps to EL1 of EL0 and EL1 accesses to SIMD and floating-point functionality on page D1-2214.](#)
- [General trapping to EL2 of accesses to the SIMD and floating-point registers on page D1-2231.](#)
- [Traps to EL3 of all accesses to the SIMD and floating-point registers on page D1-2248](#)

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

Bits [24:0]

When SVE is implemented:

Reserved, RES0.

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers, ZCR_ELx and ID_AA64ZFR0_EL1.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see [The Illegal Execution state exception on page D1-2182](#) and [PC alignment checking on page D1-2164](#).

[SP alignment checking on page D1-2164](#) describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from HVC or SVC instruction execution

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see [SVC](#) and [HVC](#).

For A64 instructions, see [SVC](#) and [HVC](#).

ISS encoding for an exception from SMC instruction execution in AArch32 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR_EL2.TSC](#) is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

- 0b0 The instruction was unconditional, or was conditional and passed its condition code check.
- 0b1 The instruction was conditional, and might have failed its condition code check.

———— **Note** —————

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

Traps to EL2 of EL1 execution of SMC instructions on page D1-2226 describes the configuration settings for trapping SMC instructions from EL1 modes, and *System calls on page D1-2254* describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

Traps to EL2 of EL1 execution of SMC instructions on page D1-2226 describes the configuration settings for trapping SMC instructions from Non-secure EL1 modes, and *System calls on page D1-2254* describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state or, when ARMv8.4-IDST is implemented, on a read of an ID register

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0 Write access, including MSR instructions.

0b1 Read access, including MRS instructions.

This field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see [System instructions on page C4-241](#) for the encoding values returned by an instruction.

The following sections describe configuration settings for generating the exception that is reported using EC value 0b011000:

- In [EL1 configurable controls on page D1-2209](#).
 - [Traps to EL1 of EL0 execution of cache maintenance instructions on page D1-2210](#).
 - [Traps to EL1 of EL0 accesses to the CTR_EL0 on page D1-2211](#).
 - [Traps to EL1 of EL0 execution of DC ZVA instructions on page D1-2212](#).
 - [Traps to EL1 of EL0 accesses to the PSTATE.{D, A, I, F} interrupt masks on page D1-2212](#).

- *Traps to EL1 of EL0 and EL1 System register accesses to the trace registers on page D1-2213.*
- *Traps to EL1 of EL0 accesses to the Debug Communications Channel (DCC) registers on page D1-2214.*
- *Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-2215.*
- *Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-2216.*
- *Traps to EL1 of EL0 accesses to Activity Monitors registers on page D1-2217.*
- **In EL2 configurable controls on page D1-2218.**
 - *Traps to EL2 of EL1 accesses to virtual memory control registers on page D1-2221.*
 - *Traps to EL2 of EL0 and EL1 execution of DC ZVA instructions on page D1-2222.*
 - *Traps to EL2 of EL1 execution of TLB maintenance instructions on page D1-2222.*
 - *Traps to EL2 of EL0 and EL1 execution of cache maintenance instructions on page D1-2223.*
 - *Traps to EL2 of EL1 accesses to the Auxiliary Control Register on page D1-2224.*
 - *Traps to EL2 of EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page D1-2225.*
 - *Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226.*

 - *Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers on page D1-2246.*

ISS encoding for a IMPLEMENTATION DEFINED exception to EL3

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and IFSC is 0b010000, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:

- 0b00 Recoverable error (UER).
- 0b10 Uncontainable error (UC).
- 0b11 Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the IFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

- 0b0 FAR is valid.
- 0b1 FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.

0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

0b000000 Address size fault, level 0 of translation or translation table base register

0b000001 Address size fault, level 1

0b000010 Address size fault, level 2

0b000011 Address size fault, level 3

0b000100 Translation fault, level 0

0b000101 Translation fault, level 1

0b000110 Translation fault, level 2

0b000111 Translation fault, level 3

0b001001 Access flag fault, level 1

0b001010 Access flag fault, level 2

0b001011 Access flag fault, level 3

0b001101 Permission fault, level 1

0b001110 Permission fault, level 2

0b001111 Permission fault, level 3

0b010000 Synchronous External abort, not on translation table walk

0b010100 Synchronous External abort, on translation table walk, level 0

0b010101 Synchronous External abort, on translation table walk, level 1

0b010110 Synchronous External abort, on translation table walk, level 2

0b010111 Synchronous External abort, on translation table walk, level 3

0b011000 Synchronous parity or ECC error on memory access, not on translation table walk

0b011100 Synchronous parity or ECC error on memory access on translation table walk, level 0

0b011101 Synchronous parity or ECC error on memory access on translation table walk, level 1

0b011110 Synchronous parity or ECC error on memory access on translation table walk, level 2

0b011111 Synchronous parity or ECC error on memory access on translation table walk, level 3

0b110000 TLB conflict abort

0b110001 Unsupported atomic hardware update fault, if the implementation includes [ARMv8.1-TTHM](#). Otherwise reserved.

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

————— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see *The level associated with MMU faults* on page D5-2505.

Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:0] is valid.

- 0b0 No valid instruction syndrome. ISS[23:14] are RES0.
- 0b1 ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults reported in ESR_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

- 0b00 Byte

0b01 Halfword
0b10 Word
0b11 Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

0b0 Sign-extension not required.
0b1 Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SRT, bits [20:16]

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SF, bit [15]

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

0b0 Instruction loads/stores a 32-bit wide register.
0b1 Instruction loads/stores a 64-bit wide register.

————— **Note** —————

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

0b0 Instruction did not have acquire/release semantics.
0b1 Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

Indicates that the fault came from use of `VNCR_EL2` register by EL1 code.

- | | |
|-----|---|
| 0b0 | The fault was not generated by the use of <code>VNCR_EL2</code> , by an MRS or MSR instruction executed at EL1. |
| 0b1 | The fault was generated by the use of <code>VNCR_EL2</code> , by an MRS or MSR instruction executed at EL1. |

This field is 0 in `ESR_EL1`.

This field resets to an architecturally UNKNOWN value.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and DFSC is `0b010000`, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

- | | |
|------|--|
| 0b00 | Recoverable error (UER). |
| 0b10 | Uncontainable error (UC). |
| 0b11 | Restartable error (UEO) or Corrected error (CE). |

All other values are reserved.

———— Note ————

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not `0b010000`.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

- | | |
|-----|---|
| 0b0 | FAR is valid. |
| 0b1 | FAR is not valid, and holds an UNKNOWN value. |

This field is valid only if the DFSC code is `0b010000`. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

- | | |
|-----|---|
| 0b0 | The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1. |
| 0b1 | The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <code>DC ZVA</code> instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1. |

This field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.

0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

0b0 Abort caused by an instruction reading from a memory location.

0b1 Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

0b000000 Address size fault, level 0 of translation or translation table base register.

0b000001 Address size fault, level 1.

0b000010 Address size fault, level 2.

0b000011 Address size fault, level 3.

0b000100 Translation fault, level 0.

0b000101 Translation fault, level 1.

0b000110 Translation fault, level 2.

0b000111 Translation fault, level 3.

0b001001 Access flag fault, level 1.

0b001010 Access flag fault, level 2.

0b001011 Access flag fault, level 3.

0b001101 Permission fault, level 1.

0b001110 Permission fault, level 2.

0b001111 Permission fault, level 3.

0b010000 Synchronous External abort, not on translation table walk.

0b010001 Synchronous Tag Check fail

0b010100 Synchronous External abort, on translation table walk, level 0.

0b010101 Synchronous External abort, on translation table walk, level 1.

0b010110 Synchronous External abort, on translation table walk, level 2.

- 0b010111 Synchronous External abort, on translation table walk, level 3.
- 0b011000 Synchronous parity or ECC error on memory access, not on translation table walk.
- 0b011100 Synchronous parity or ECC error on memory access on translation table walk, level 0.
- 0b011101 Synchronous parity or ECC error on memory access on translation table walk, level 1.
- 0b011110 Synchronous parity or ECC error on memory access on translation table walk, level 2.
- 0b011111 Synchronous parity or ECC error on memory access on translation table walk, level 3.
- 0b100001 Alignment fault.
- 0b110000 TLB conflict abort.
- 0b110001 Unsupported atomic hardware update fault, if the implementation includes [ARMv8.1-TTHM](#). Otherwise reserved.
- 0b110100 IMPLEMENTATION DEFINED fault (Lockdown).
- 0b110101 IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).
- 0b111101 Section Domain Fault, used only for faults reported in the [PAR_EL1](#).
- 0b111110 Page Domain Fault, used only for faults reported in the [PAR_EL1](#).

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on page D5-2505](#).

———— Note ————

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions. The possible values of this bit are:

- 0b0 The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.

0b1 One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see [Floating-point exceptions and exception traps on page D1-2196](#).

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

———— **Note** ————

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

—————
This field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Input denormal floating-point exception has not occurred.

0b1 Input denormal floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Inexact floating-point exception has not occurred.

0b1 Inexact floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Underflow floating-point exception has not occurred.

0b1 Underflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Overflow floating-point exception has not occurred.

0b1 Overflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Divide by Zero floating-point exception has not occurred.

0b1 Divide by Zero floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Invalid Operation floating-point exception has not occurred.

0b1 Invalid Operation floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the **FPCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the **FPSCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

0b0 Bits[23:0] of the ISS field holds the fields described in this encoding.

Note

If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are RES0.

0b1 Bits[23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

Implicit error synchronization event.

- | | |
|-----|--|
| 0b0 | The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately. |
| 0b1 | The SError interrupt was synchronized by the implicit error synchronization event and taken immediately. |

This field is RES0 if the value returned in the DFSC field is not 0b010001.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension and [ARMv8.2-IESB](#).

This field resets to an architecturally UNKNOWN value.

AET, bits [12:10]

Asynchronous Error Type.

When the RAS Extension is implemented and DFSC is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

- | | |
|-------|----------------------------|
| 0b000 | Uncontainable error (UC). |
| 0b001 | Unrecoverable error (UEU). |
| 0b010 | Restartable error (UEO). |
| 0b011 | Recoverable error (UER). |
| 0b110 | Corrected error (CE). |

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

———— **Note** —————

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. When the RAS Extension is implemented, this bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Data Fault Status Code. When the RAS Extension is implemented, possible values of this field are:

0b000000 Uncategorized.

0b010001 Asynchronous SError interrupt.

All other values are reserved.

If the RAS Extension is not implemented, this field is RES0.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see [Breakpoint exceptions on page D2-2296](#).
- For exceptions from AArch32, see [Breakpoint exceptions on page G2-5366](#) and [Vector Catch exceptions on page G2-5405](#).

ISS encoding for an exception from a Software Step exception

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

0b0 EX bit is RES0.

0b1 EX bit is valid.

See the EX bit description for more information.
This field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

0b0 An instruction other than a Load-Exclusive instruction was stepped.

0b1 A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Software Step exceptions on page D2-2329](#).

ISS encoding for an exception from a Watchpoint exception

Bits [24:14]

Reserved, RES0.

VNCR, bit [13]

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

0b0 The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.

0b1 The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

0b0 The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.

0b1 The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

0b0 Watchpoint exception caused by an instruction reading from a memory location.

0b1 Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Watchpoint exceptions on page D2-2314](#).

ISS encoding for an exception from execution of a Breakpoint instruction

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary. For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Breakpoint Instruction exceptions on page D2-2294](#).

ISS encoding for an exception from ERET, ERETAA or ERETAB instruction

This EC value only applies when `HCR_EL2.NV` is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2. Possible values are:

- 0b0 ERET instruction trapped to EL2.
- 0b1 ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2. Possible values are:

- 0b0 ERETAA instruction trapped to EL2.
- 0b1 ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Traps to EL2 for Nested virtualization on page D1-2240](#).

ISS encoding for an exception from Branch Target Identification instruction

Bits [24:2]

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the `PSTATE.BTYPE` value that generated the Branch Target Exception.

For more information about generating these exceptions, see [Chapter B1 The AArch64 Application Level Programmers' Model](#).

ISS encoding for an exception from a Pointer Authentication instruction when `HCR_EL2.API == 0` || `SCR_EL3.API == 0`

Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- [Trap to EL2 of EL0 accesses to Pointer authentication instructions on page D1-2239](#).

- [Trap to EL3 accesses to Pointer authentication instructions on page D1-2252.](#)

Accessing the ESR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ESR_EL2	11	0101	100	000	0010
ESR_EL1	11	0101	000	000	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
ESR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
ESR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
ESR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
ESR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	ESR_EL1	n/a	ESR_EL1
ESR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	ESR_EL1	ESR_EL1	ESR_EL1
ESR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	ESR_EL1	ESR_EL1
ESR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	ESR_EL1	RW	ESR_EL1
ESR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	ESR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [ESR_EL2](#) or [ESR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If [HCR_EL2.NV2](#), [NV](#) == {1, 1}, access to [ESR_EL2](#) is redefined to access [ESR_EL1](#) when in EL1. The behavior when in EL3, EL2, or EL0 is unchanged.

If an [_EL1](#) accessor is used, refer to [ESR_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{IsUsingAccessor}(\text{ESR_EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{IsUsingAccessor}(\text{ESR_EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

D12.2.38 ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL3.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ESR_EL3 is a 64-bit register.

Field descriptions

The ESR_EL3 bit assignments are:

ESR_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR_EL3 is UNKNOWN. The value written to ESR_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC == 0b000000

Unknown reason.

See [ISS encoding for exceptions with an unknown reason on page D12-2848](#).

EC == 0b000001

Trapped WFI or WFE instruction execution.

Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

See [ISS encoding for an exception from a WFI or WFE instruction on page D12-2849](#).

EC == 0b000011

Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.

See [ISS encoding for an exception from an MCR or MRC access on page D12-2850](#).

EC == 0b000100

Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.

See [ISS encoding for an exception from an MCRR or MRRC access on page D12-2853](#).

EC == 0b000101

Trapped MCR or MRC access with (coproc==0b1110).

See *ISS encoding for an exception from an MCR or MRC access* on page D12-2850.

EC == 0b000110

Trapped LDC or STC access.

The only architected uses of these instruction are:

- An STC to write data to memory from [DBGDTRRXint](#).
- An LDC to read data from memory to [DBGDTRTXint](#).

See *ISS encoding for an exception from an LDC or STC instruction* on page D12-2855.

EC == 0b000111

Access to SVE, Advanced SIMD, or floating-point functionality trapped by [CPACR_EL1.FPEN](#), [CPTR_EL2.FPEN](#), [CPTR_EL2.TFP](#), or [CPTR_EL3.TFP](#) control.

Excludes exceptions resulting from [CPACR_EL1](#) when the value of [HCR_EL2.TGE](#) is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in *The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1* on page D1-2177.

See *ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP* on page D12-2857.

EC == 0b001001 From ARMv8.3

Trapped use of a Pointer authentication instruction because [HCR_EL2.API](#) == 0 || [SCR_EL3.API](#) == 0.

See *ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0* on page D12-2877.

EC == 0b001100

Trapped MRRC access with (coproc==0b1110).

See *ISS encoding for an exception from an MCRR or MRRC access* on page D12-2853.

EC == 0b001110

Illegal Execution state.

See *ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault* on page D12-2858.

EC == 0b010011

SMC instruction execution in AArch32 state, when SMC is not disabled.

This is reported in [ESR_EL2](#) only when the exception is generated because the value of [HCR_EL2.TSC](#) is 1.

See *ISS encoding for an exception from SMC instruction execution in AArch32 state* on page D12-2859.

EC == 0b010101

SVC instruction execution in AArch64 state.

See *ISS encoding for an exception from HVC or SVC instruction execution* on page D12-2859.

EC == 0b010110

HVC instruction execution in AArch64 state, when HVC is not disabled.

See *ISS encoding for an exception from HVC or SVC instruction execution* on page D12-2859.

EC == 0b010111

SMC instruction execution in AArch64 state, when SMC is not disabled.

This is reported in [ESR_EL2](#) only when the exception is generated because the value of [HCR_EL2.TSC](#) is 1.

See *ISS encoding for an exception from SMC instruction execution in AArch64 state* on page D12-2861.

EC == 0b011000

Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111, or an exception generated on a read of an ID register.

This includes all instructions that cause exceptions that are part of the encoding space defined in *System instruction class encoding overview* on page C5-339, except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.

See *ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state or, when ARMv8.4-IDST is implemented, on a read of an ID register* on page D12-2861.

EC == 0b011001

Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.

This EC is defined only if SVE is implemented.

See *ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ* on page D12-2858.

EC == 0b011111

IMPLEMENTATION DEFINED exception to EL3.

See *ISS encoding for a IMPLEMENTATION DEFINED exception to EL3* on page D12-2863.

EC == 0b100000

Instruction Abort from a lower Exception level, that might be using AArch32 or AArch64.

Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from an Instruction Abort* on page D12-2863.

EC == 0b100001

Instruction Abort taken without a change in Exception level.

Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from an Instruction Abort* on page D12-2863.

EC == 0b100010

PC alignment fault exception.

See *ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault* on page D12-2858.

EC == 0b100100

Data Abort from a lower Exception level, that might be using AArch32 or AArch64.

Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from a Data Abort* on page D12-2866.

EC == 0b100101

Data Abort taken without a change in Exception level.

Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.

See *ISS encoding for an exception from a Data Abort* on page D12-2866.

EC == 0b100110

SP alignment fault exception.

See *ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault* on page D12-2858.

EC == 0b101100

Trapped floating-point exception taken from AArch64 state.

This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.

See *ISS encoding for an exception from a trapped floating-point exception* on page D12-2870.

EC == 0b101111

SError interrupt.

See *ISS encoding for an SError interrupt* on page D12-2872.

EC == 0b111100

BRK instruction execution in AArch64 state.

This is reported in `ESR_EL3` only if a BRK instruction is executed.

See *ISS encoding for an exception from execution of a Breakpoint instruction* on page D12-2876.

All other EC values are reserved by ARM, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

This field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

- | | |
|-----|--|
| 0b0 | 16-bit instruction trapped. |
| 0b1 | <ul style="list-style-type: none">• An SError interrupt.• An Instruction Abort exception.• A PC alignment fault exception.• An SP alignment fault exception.• A Data Abort exception for which the value of the ISV bit is 0.• An Illegal Execution state exception.• Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning:<ul style="list-style-type: none">— 0b0: 16-bit T32 BKPT instruction.— 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.• An exception reported using EC value 0b000000. |

This field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, [Mapping of the general-purpose registers between the Execution states on page D1-2264](#) defines this view of the specified AArch32 register. If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
 - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
 - The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

The following subsections describe each ISS format.

ISS encoding for exceptions with an unknown reason

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction at the current Exception level and Security state, including:
 - A read access using a System register pattern that is not allocated for reads at the current Exception level and Security state.
 - A write access using a System register pattern that is not allocated for writes at the current Exception level and Security state.
 - Instruction encodings for instructions not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is unallocated in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is unallocated in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR_EL1](#). {ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by [HCR_EL2](#).HCD or [SCR_EL3](#).HCE.
 - An SMC instruction when disabled by [SCR_EL3](#).SMD.

- An HLT instruction when disabled by [EDSCR.HDE](#).
- Attempted execution of an MSR or MRS instruction to access [SP_EL0](#) when the value of [SPSel.SP](#) is 0.
- Attempted execution, in Debug state, of:
 - A DCPS1 instruction when the value of [HCR_EL2.TGE](#) is 1 and EL2 is disabled or not implemented in the current Security state.
 - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
 - A DCPS3 instruction when the value of [EDSCR.SDD](#) is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using [R13_mon](#). See [Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-2243](#).
- In Debug state when the value of [EDSCR.SDD](#) is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR_mon](#), [SP_mon](#), or [LR_mon](#).
- An exception that is taken to EL2 because the value of [HCR_EL2.TGE](#) is 1 that, if the value of [HCR_EL2.TGE](#) was 0 would have been reported with an [ESR_ELx.EC](#) value of `0b000111`.
- When SVE is not implemented, attempted execution of:
 - An SVE instruction.
 - An MSR or MRS instruction to access [ZCR_EL1](#), [ZCR_EL2](#), or [ZCR_EL3](#).

ISS encoding for an exception from a WFI or WFE instruction

CV, bit [24]

Condition code valid. Possible values of this bit are:

- `0b0` The COND field is not valid.
- `0b1` The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to `0b1110`.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

- 0b0 WFI trapped.
- 0b1 WFE trapped.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for generating this exception:

- [Traps to EL1 of EL0 execution of WFE and WFI instructions on page D1-2211.](#)
- [Traps to EL2 of EL0 and EL1 execution of WFE and WFI instructions on page D1-2229.](#)
- [Traps to EL3 of EL2, EL1, and EL0 execution of WFE and WFI instructions on page D1-2244.](#)

ISS encoding for an exception from an MCR or MRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0 Write to System register space. MCR instruction.

0b1 Read from System register space. MRC or VMRS instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-2215.](#)
- [Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-2216.](#)
- [Traps to EL1 of EL0 accesses to Activity Monitors registers on page D1-2217.](#)

- [Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers on page D1-2250.](#)
- [Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers on page D1-2246.](#)

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [Traps to EL1 of EL0 and EL1 System register accesses to the trace registers on page D1-2213.](#)
- [Traps to EL1 of EL0 accesses to the Debug Communications Channel \(DCC\) registers on page D1-2214.](#)
- [Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226, for trapped accesses to the JIDR.](#)
- [Traps to EL2 of System register accesses to the trace registers on page D1-2231.](#)
- [Trapping System register accesses to Debug ROM registers to EL2 on page D1-2234.](#)

- [Trapping System register accesses to powerdown debug registers to EL2 on page D1-2234.](#)
- [Trapping general System register accesses to debug registers to EL2 on page D1-2235.](#)
- [Traps to EL3 of System register accesses to the trace registers on page D1-2247.](#)
- [Trapping System register accesses to powerdown debug registers to EL3 on page D1-2249.](#)
- [Trapping general System register accesses to debug registers to EL3 on page D1-2249.](#)

[Traps to EL2 of EL0 and EL1 accesses to the ID registers on page D1-2226](#) describes configuration settings for generating exceptions that are reported using EC value `0b001000`.

ISS encoding for an exception from an MCRR or MRRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

- `0b0` The COND field is not valid.
- `0b1` The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to `0b1110`.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to `0b1110`, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

- 0b0 Write to System register space. MCRR instruction.
- 0b1 Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [Traps to EL1 of EL0 accesses to the Generic Timer registers on page D1-2215](#).
- [Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-2216](#).
- [Traps to EL1 of EL0 accesses to Activity Monitors registers on page D1-2217](#).
- [Traps to EL2 of EL1 accesses to virtual memory control registers on page D1-2221](#).
- [General trapping to EL2 of EL0 and EL1 accesses to System registers, from AArch32 state only on page D1-2232](#).
- [Traps to EL2 of EL0 and EL1 accesses to the Generic Timer registers on page D1-2236](#).
- [Traps to EL2 of EL0 and EL1 accesses to Performance Monitors registers on page D1-2237](#).
- [Traps to EL2 of EL1 and EL0 accesses to Activity Monitors registers on page D1-2230](#).
- [Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers on page D1-2250](#).
- [Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers on page D1-2246](#).

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [Traps to EL1 of EL0 and EL1 System register accesses to the trace registers on page D1-2213.](#)
- [Traps to EL1 of EL0 accesses to the Debug Communications Channel \(DCC\) registers on page D1-2214.](#)
- [Traps to EL2 of System register accesses to the trace registers on page D1-2231.](#)
- [Trapping System register accesses to Debug ROM registers to EL2 on page D1-2234.](#)
- [Traps to EL3 of System register accesses to the trace registers on page D1-2247.](#)
- [Trapping System register accesses to powerdown debug registers to EL3 on page D1-2249.](#)
- [Trapping general System register accesses to debug registers to EL3 on page D1-2249.](#)

ISS encoding for an exception from an LDC or STC instruction

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.

- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

- 0b0 Subtract offset.
- 0b1 Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

- 0b000 Immediate unindexed.
- 0b001 Immediate post-indexed.
- 0b010 Immediate offset.
- 0b011 Immediate pre-indexed.
- 0b100 For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
- 0b110 For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7231](#).

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

- 0b0 Write to memory. STC instruction.
- 0b1 Read from memory. LDC instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000110:

- [Traps to EL1 of EL0 accesses to the Debug Communications Channel \(DCC\) registers on page D1-2214.](#)
- [Trapping general System register accesses to debug registers to EL2 on page D1-2235.](#)
- [Trapping general System register accesses to debug registers to EL3 on page D1-2249.](#)

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.

- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- [Traps to EL1 of EL0 and EL1 accesses to SIMD and floating-point functionality on page D1-2214.](#)
- [General trapping to EL2 of accesses to the SIMD and floating-point registers on page D1-2231.](#)
- [Traps to EL3 of all accesses to the SIMD and floating-point registers on page D1-2248](#)

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

Bits [24:0]

When SVE is implemented:

Reserved, RES0.

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers, ZCR_ELx and ID_AA64ZFR0_EL1.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see [The Illegal Execution state exception on page D1-2182](#) and [PC alignment checking on page D1-2164](#).

[SP alignment checking on page D1-2164](#) describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from HVC or SVC instruction execution

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see [SVC](#) and [HVC](#).

For A64 instructions, see [SVC](#) and [HVC](#).

ISS encoding for an exception from SMC instruction execution in AArch32 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because `HCR_EL2.TSC` is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

- 0b0 The instruction was unconditional, or was conditional and passed its condition code check.
- 0b1 The instruction was conditional, and might have failed its condition code check.

————— Note —————

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

[Traps to EL2 of EL1 execution of SMC instructions on page D1-2226](#) describes the configuration settings for trapping SMC instructions from EL1 modes, and [System calls on page D1-2254](#) describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

[Traps to EL2 of EL1 execution of SMC instructions on page D1-2226](#) describes the configuration settings for trapping SMC instructions from Non-secure EL1 modes, and [System calls on page D1-2254](#) describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state or, when ARMv8.4-IDST is implemented, on a read of an ID register

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0 Write access, including MSR instructions.

0b1 Read access, including MRS instructions.

This field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see [System instructions](#) on page C4-241 for the encoding values returned by an instruction.

The following sections describe configuration settings for generating the exception that is reported using EC value 0b011000:

- In [EL1 configurable controls](#) on page D1-2209.
 - [Traps to EL1 of EL0 execution of cache maintenance instructions](#) on page D1-2210.
 - [Traps to EL1 of EL0 accesses to the CTR_EL0](#) on page D1-2211.
 - [Traps to EL1 of EL0 execution of DC ZVA instructions](#) on page D1-2212.
 - [Traps to EL1 of EL0 accesses to the PSTATE.{D, A, I, F} interrupt masks](#) on page D1-2212.
 - [Traps to EL1 of EL0 and EL1 System register accesses to the trace registers](#) on page D1-2213.
 - [Traps to EL1 of EL0 accesses to the Debug Communications Channel \(DCC\) registers](#) on page D1-2214.
 - [Traps to EL1 of EL0 accesses to the Generic Timer registers](#) on page D1-2215.
 - [Traps to EL1 of EL0 accesses to Performance Monitors registers](#) on page D1-2216.
 - [Traps to EL1 of EL0 accesses to Activity Monitors registers](#) on page D1-2217.
- In [EL2 configurable controls](#) on page D1-2218.
 - [Traps to EL2 of EL1 accesses to virtual memory control registers](#) on page D1-2221.
 - [Traps to EL2 of EL0 and EL1 execution of DC ZVA instructions](#) on page D1-2222.
 - [Traps to EL2 of EL1 execution of TLB maintenance instructions](#) on page D1-2222.
 - [Traps to EL2 of EL0 and EL1 execution of cache maintenance instructions](#) on page D1-2223.
 - [Traps to EL2 of EL1 accesses to the Auxiliary Control Register](#) on page D1-2224.
 - [Traps to EL2 of EL0 and EL1 accesses to lockdown, DMA, and TCM operations](#) on page D1-2225.
 - [Traps to EL2 of EL0 and EL1 accesses to the ID registers](#) on page D1-2226.
 - [Trapping to EL2 of EL1 accesses to the CPACR_EL1 or CPACR](#) on page D1-2231.
 - [Traps to EL2 of System register accesses to the trace registers](#) on page D1-2231.
 - [Trapping System register accesses to Debug ROM registers to EL2](#) on page D1-2234.
 - [Trapping System register accesses to powerdown debug registers to EL2](#) on page D1-2234.
 - [Traps to EL2 of EL0 and EL1 accesses to the Generic Timer registers](#) on page D1-2236.

- *Trapping general System register accesses to debug registers to EL2* on page D1-2235.
- *Traps to EL2 of EL0 and EL1 accesses to Performance Monitors registers* on page D1-2237.
- *Traps to EL2 of EL1 and EL0 accesses to Activity Monitors registers* on page D1-2230.
- *Trap to EL2 of EL1 accesses to Pointer authentication key registers* on page D1-2238.
- *Traps to EL2 for Nested virtualization* on page D1-2240.
- *Trap to EL2 of EL1 accesses to AT SIE* instructions* on page D1-2241.
- *Table G1-64* on page G1-5341.
- In *EL3 configurable controls* on page D1-2241.
 - *Traps to EL3 of Secure EL1 accesses to the Counter-timer Physical Secure timer registers* on page D1-2244.
 - *Trapping to EL3 of EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR* on page D1-2246.
 - *Traps to EL3 of System register accesses to the trace registers* on page D1-2247.
 - *Trapping System register accesses to powerdown debug registers to EL3* on page D1-2249.
 - *Trapping general System register accesses to debug registers to EL3* on page D1-2249.
 - *Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers* on page D1-2250.
 - *Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers* on page D1-2246.

ISS encoding for a IMPLEMENTATION DEFINED exception to EL3

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and IFSC is 0b010000, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:

- 0b00 Recoverable error (UER).
- 0b10 Uncontainable error (UC).

0b11 Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

———— **Note** —————

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the IFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0b0 FAR is valid.

0b1 FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.

0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

0b000000 Address size fault, level 0 of translation or translation table base register

0b000001 Address size fault, level 1

0b000010 Address size fault, level 2

0b000011 Address size fault, level 3

0b000100 Translation fault, level 0

0b000101 Translation fault, level 1

0b000110 Translation fault, level 2

0b000111 Translation fault, level 3

0b001001	Access flag fault, level 1
0b001010	Access flag fault, level 2
0b001011	Access flag fault, level 3
0b001101	Permission fault, level 1
0b001110	Permission fault, level 2
0b001111	Permission fault, level 3
0b010000	Synchronous External abort, not on translation table walk
0b010100	Synchronous External abort, on translation table walk, level 0
0b010101	Synchronous External abort, on translation table walk, level 1
0b010110	Synchronous External abort, on translation table walk, level 2
0b010111	Synchronous External abort, on translation table walk, level 3
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk
0b011100	Synchronous parity or ECC error on memory access on translation table walk, level 0
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3
0b110000	TLB conflict abort
0b110001	Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM . Otherwise reserved.

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on page D5-2505](#).

———— **Note** —————

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:0] is valid.

0b0 No valid instruction syndrome. ISS[23:14] are RES0.

0b1 ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults reported in ESR_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

0b00 Byte

0b01 Halfword

0b10 Word

0b11 Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

- 0b0 Sign-extension not required.
- 0b1 Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SRT, bits [20:16]

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See [Mapping of the general-purpose registers between the Execution states on page D1-2264](#).

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SF, bit [15]

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

- 0b0 Instruction loads/stores a 32-bit wide register.
- 0b1 Instruction loads/stores a 64-bit wide register.

———— **Note** —————

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

- 0b0 Instruction did not have acquire/release semantics.
- 0b1 Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

- 0b0 The fault was not generated by the use of [VNCR_EL2](#), by an MRS or MSR instruction executed at EL1.
- 0b1 The fault was generated by the use of [VNCR_EL2](#), by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and DFSC is 0b010000, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

- 0b00 Recoverable error (UER).
- 0b10 Uncontainable error (UC).
- 0b11 Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

————— **Note** —————

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

- 0b0 FAR is valid.
- 0b1 FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

- 0b0 The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
- 0b1 The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

- 0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.
- 0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

- 0b0 Abort caused by an instruction reading from a memory location.
- 0b1 Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

- 0b000000 Address size fault, level 0 of translation or translation table base register.
- 0b000001 Address size fault, level 1.
- 0b000010 Address size fault, level 2.
- 0b000011 Address size fault, level 3.
- 0b000100 Translation fault, level 0.
- 0b000101 Translation fault, level 1.
- 0b000110 Translation fault, level 2.
- 0b000111 Translation fault, level 3.
- 0b001001 Access flag fault, level 1.
- 0b001010 Access flag fault, level 2.
- 0b001011 Access flag fault, level 3.
- 0b001101 Permission fault, level 1.
- 0b001110 Permission fault, level 2.
- 0b001111 Permission fault, level 3.
- 0b010000 Synchronous External abort, not on translation table walk.
- 0b010001 Synchronous Tag Check fail
- 0b010100 Synchronous External abort, on translation table walk, level 0.
- 0b010101 Synchronous External abort, on translation table walk, level 1.
- 0b010110 Synchronous External abort, on translation table walk, level 2.
- 0b010111 Synchronous External abort, on translation table walk, level 3.
- 0b011000 Synchronous parity or ECC error on memory access, not on translation table walk.
- 0b011100 Synchronous parity or ECC error on memory access on translation table walk, level 0.
- 0b011101 Synchronous parity or ECC error on memory access on translation table walk, level 1.
- 0b011110 Synchronous parity or ECC error on memory access on translation table walk, level 2.
- 0b011111 Synchronous parity or ECC error on memory access on translation table walk, level 3.
- 0b100001 Alignment fault.

- 0b110000 TLB conflict abort.
- 0b110001 Unsupported atomic hardware update fault, if the implementation includes [ARMv8.1-TTHM](#). Otherwise reserved.
- 0b110100 IMPLEMENTATION DEFINED fault (Lockdown).
- 0b110101 IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).
- 0b111101 Section Domain Fault, used only for faults reported in the [PAR_EL1](#).
- 0b111110 Page Domain Fault, used only for faults reported in the [PAR_EL1](#).

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on page D5-2505](#).

———— Note ————

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions. The possible values of this bit are:

- 0b0 The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
- 0b1 One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see [Floating-point exceptions and exception traps on page D1-2196](#).

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

———— **Note** ————

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

This field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Input denormal floating-point exception has not occurred.

0b1 Input denormal floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Inexact floating-point exception has not occurred.

0b1 Inexact floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Underflow floating-point exception has not occurred.

0b1 Underflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b0 Overflow floating-point exception has not occurred.

0b1 Overflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

- 0b0 Divide by Zero floating-point exception has not occurred.
- 0b1 Divide by Zero floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

- 0b0 Invalid Operation floating-point exception has not occurred.
- 0b1 Invalid Operation floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the **FPCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the **FPSCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

- 0b0 Bits[23:0] of the ISS field holds the fields described in this encoding.

Note

If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are RES0.

- 0b1 Bits[23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

Implicit error synchronization event.

- 0b0 The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
- 0b1 The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is RES0 if the value returned in the DFSC field is not 0b010001.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension and [ARMv8.2-IESB](#).

This field resets to an architecturally UNKNOWN value.

AET, bits [12:10]

Asynchronous Error Type.

When the RAS Extension is implemented and DFSC is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

- 0b000 Uncontainable error (UC).
- 0b001 Unrecoverable error (UEU).
- 0b010 Restartable error (UEO).
- 0b011 Recoverable error (UER).
- 0b110 Corrected error (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

———— **Note** —————

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. When the RAS Extension is implemented, this bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Data Fault Status Code. When the RAS Extension is implemented, possible values of this field are:

0b000000 Uncategorized.

0b010001 Asynchronous SError interrupt.

All other values are reserved.

If the RAS Extension is not implemented, this field is RES0.

———— **Note** ————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see [Breakpoint exceptions on page D2-2296](#).
- For exceptions from AArch32, see [Breakpoint exceptions on page G2-5366](#) and [Vector Catch exceptions on page G2-5405](#).

ISS encoding for an exception from a Software Step exception

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

0b0 EX bit is RES0.

0b1 EX bit is valid.

See the EX bit description for more information.

This field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

0b0 An instruction other than a Load-Exclusive instruction was stepped.

0b1 A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Software Step exceptions on page D2-2329](#).

ISS encoding for an exception from a Watchpoint exception

Bits [24:14]

Reserved, RES0.

VNCR, bit [13]

Indicates that the watchpoint came from use of [VNCR_EL2](#) register by EL1 code.

0b0 The watchpoint was not generated by the use of [VNCR_EL2](#) by EL1 code.

0b1 The watchpoint was generated by the use of [VNCR_EL2](#) by EL1 code.

This field is 0 in [ESR_EL1](#).

This field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

0b0 The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.

0b1 The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The [DC ZVA](#) instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

0b0 Watchpoint exception caused by an instruction reading from a memory location.

0b1 Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Watchpoint exceptions on page D2-2314](#).

ISS encoding for an exception from execution of a Breakpoint instruction

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary. For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Breakpoint Instruction exceptions on page D2-2294](#).

ISS encoding for an exception from ERET, ERETA or ERETAB instruction

This EC value only applies when [HCR_EL2.NV](#) is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2. Possible values are:

- 0b0 ERET instruction trapped to EL2.
- 0b1 ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2. Possible values are:

- 0b0 ERETAA instruction trapped to EL2.
- 0b1 ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [Traps to EL2 for Nested virtualization on page D1-2240](#).

ISS encoding for an exception from Branch Target Identification instruction

Bits [24:2]

Reserved, RES0.

BTYP, bits [1:0]

This field is set to the PSTATE.BTYP value that generated the Branch Target Exception.

For more information about generating these exceptions, see [Chapter B1 The AArch64 Application Level Programmers' Model](#).

ISS encoding for an exception from a Pointer Authentication instruction when $HCR_EL2.API == 0$ || $SCR_EL3.API == 0$

Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- [Trap to EL2 of EL0 accesses to Pointer authentication instructions on page D1-2239](#).
- [Trap to EL3 accesses to Pointer authentication instructions on page D1-2252](#).

Accessing the ESR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ESR_EL3	11	0101	110	000	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.39 FAR_EL1, Fault Address Register (EL1)

The FAR_EL1 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL1.

Configurations

AArch64 System register FAR_EL1[31:0] is architecturally mapped to AArch32 System register [DFAR](#)[31:0] (NS).

AArch64 System register FAR_EL1[63:32] is architecturally mapped to AArch32 System register [IFAR](#)[31:0] (NS).

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

FAR_EL1 is a 64-bit register.

Field descriptions

The FAR_EL1 bit assignments are:

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR_EL1 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). [ESR_EL1](#).EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which [TCR_ELx](#).TBI{<0>1} = 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR_EL1](#).FnV is 0, and the FAR_EL1 is UNKNOWN if [ESR_EL1](#).FnV is 1.

For all other exceptions taken to EL1, the FAR_EL1 is UNKNOWN.

If a memory fault that sets FAR_EL1 is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL1 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store is CONstrained UNPREDICTABLE. See [Out of range VA](#) on page K1-7203.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see [Address tagging in AArch64 state](#) on page D5-2386.

Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL1 is made UNKNOWN on an exception return from EL1.

This field resets to an architecturally UNKNOWN value.

Accessing the FAR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
FAR_EL1	11	0110	000	000	0000
FAR_EL12	11	0110	101	000	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
FAR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
FAR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
FAR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x220]	RW	RW
FAR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
FAR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	FAR_EL2	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
FAR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x220]	FAR_EL2	RW
FAR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	FAR_EL2	RW
FAR_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
FAR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
FAR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x220]	-	-
FAR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
FAR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
FAR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x220]	RW	RW
FAR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic FAR_EL1 or FAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAccessor(FAR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(FAR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(FAR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(FAR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(FAR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(FAR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(FAR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(FAR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(FAR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(FAR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.40 FAR_EL2, Fault Address Register (EL2)

The FAR_EL2 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL2.

Configurations

AArch64 System register FAR_EL2[31:0] is architecturally mapped to AArch32 System register HDFAR[31:0].

AArch64 System register FAR_EL2[63:32] is architecturally mapped to AArch32 System register HIFAR[31:0].

AArch64 System register FAR_EL2[31:0] is architecturally mapped to AArch32 System register DFAR[31:0] (S) when when IsExceptionLevelImplemented(EL2).

AArch64 System register FAR_EL2[63:32] is architecturally mapped to AArch32 System register IFAR[31:0] (S) when IsExceptionLevelImplemented(EL2).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

FAR_EL2 is a 64-bit register.

Field descriptions

The FAR_EL2 bit assignments are:

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR_EL2 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). [ESR_EL2.EC](#) holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which $\text{TCR_ELx.TBI}\{\langle 0|1 \rangle\} = 1$ for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR_EL2.FnV](#) is 0, and the FAR_EL2 is UNKNOWN if [ESR_EL2.FnV](#) is 1.

For all other exceptions taken to EL2, the FAR_EL2 is UNKNOWN.

If a memory fault that sets FAR_EL2 is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL2 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONstrained UNPREDICTABLE. See *Out of range VA* on page K1-7203.

- The implementation treats such incrementing as setting bit[32] of the virtual address to 1. For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see [Address tagging in AArch64 state on page D5-2386](#).

———— **Note** ————

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL2 is made UNKNOWN on an exception return from EL2.

This field resets to an architecturally UNKNOWN value.

Accessing the FAR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
FAR_EL2	11	0110	100	000	0000
FAR_EL1	11	0110	000	000	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
FAR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
FAR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
FAR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
FAR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	FAR_EL1	n/a	FAR_EL1
FAR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	FAR_EL1	FAR_EL1	FAR_EL1

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
FAR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	FAR_EL1	FAR_EL1
FAR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	FAR_EL1	RW	FAR_EL1
FAR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	FAR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [FAR_EL2](#) or [FAR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If [HCR_EL2.NV2](#) == {1, 1}, access to [FAR_EL2](#) is redefined to access [FAR_EL1](#) when in EL1. The behavior when in EL3, EL2, or EL0 is unchanged.

If an [_EL1](#) accessor is used, refer to [FAR_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191. Subject to the prioritization rules:

- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [IsUsingAccessor\(FAR_EL2\)](#) && [HCR_EL2.E2H](#) == 0 && [HCR_EL2.NV](#) == 1, then accesses at EL1 are trapped to EL2.
- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [IsUsingAccessor\(FAR_EL2\)](#) && [HCR_EL2.E2H](#) == 1 && [HCR_EL2.TGE](#) == 0 && [HCR_EL2.NV](#) == 1, then accesses at EL1 are trapped to EL2.

D12.2.41 FAR_EL3, Fault Address Register (EL3)

The FAR_EL3 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort and PC alignment fault exceptions that are taken to EL3.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

FAR_EL3 is a 64-bit register.

Field descriptions

The FAR_EL3 bit assignments are:

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR_EL3 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), and PC alignment faults (EC 0x22). [ESR_EL3.EC](#) holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which [TCR_ELx.TBI](#){<0|1>} = 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR_EL3.FnV](#) is 0, and the FAR_EL3 is UNKNOWN if [ESR_EL3.FnV](#) is 1.

For all other exceptions taken to EL3, the FAR_EL3 is UNKNOWN.

If a memory fault that sets FAR_EL3 is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL3 is taken from an Exception Level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_EL3 are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is *CONSTRAINED UNPREDICTABLE*. See *Out of range VA* on page K1-7203.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see *Address tagging in AArch64 state* on page D5-2386.

————— Note —————

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL3 is made UNKNOWN on an exception return from EL3.

This field resets to an architecturally UNKNOWN value.

Accessing the FAR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
FAR_EL3	11	0110	110	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.42 FPEXC32_EL2, Floating-Point Exception Control register

The FPEXC32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register [FPEXC](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register FPEXC32_EL2[31:0] is architecturally mapped to AArch32 System register [FPEXC](#)[31:0].

If EL1 cannot use AArch32, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

FPEXC32_EL2 is a 64-bit register.

Field descriptions

The FPEXC32_EL2 bit assignments are:

Bits [63:32]

Reserved, RES0.

EX, bit [31]

Exception bit. In ARMv8, this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the [FPEXC](#) or [FPSID](#).
- VMRS accesses from the [FPEXC](#), [FPSID](#), [MVFR0](#), [MVFR1](#), or [MVFR2](#).

0b0 Accesses to the [FPSCR](#), and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.

0b1 This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- [CPACR](#).cp10, or, if executing at EL0, [CPACR_EL1](#).FPEN.
- [FPEXC](#).EN.
- If executing in Non-secure state:
 - [HCPTR](#).TCP10, or if EL2 is using AArch64, [CPTR_EL2](#).TFP.
 - [NSACR](#).cp10, or if EL3 is using AArch64, [CPTR_EL3](#).TFP.
- For Advanced SIMD instructions only:
 - [CPACR](#).ASEDIS.
 - If executing in Non-secure state, [HCPTR](#).TASE and [NSACR](#).NSTRCDIS.

See the descriptions of the controls for more information.

———— **Note** —————

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of [FPEXC](#).EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of [HCR_EL2](#).{RW, TGE} is {1, 1} then behavior is as if the value of [FPEXC](#).EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of [HCR_EL2](#).{RW, TGE} is {0, 1} then it is IMPLEMENTATION DEFINED whether the behavior is:
 - As if the value of [FPEXC](#).EN is 1.
 - Determined by the value of [FPEXC32_EL2](#).EN, as described in this field description. However, ARM deprecates using the value of [FPEXC32_EL2](#).EN to determine behavior.

This field resets to an architecturally UNKNOWN value.

DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function `ExecutingCP10or11Instr()` returning TRUE. This field also indicates whether the [FPEXC32_EL2](#).TFV field is valid.

The meaning of this bit is:

- 0b0 The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function `ExecutingCP10or11Instr()`. If [FPEXC32_EL2](#).TFV is RW then it is invalid and UNKNOWN. If [FPEXC32_EL2](#).{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
- 0b1 The exception was generated during the execution of an unallocated encoding. [FPEXC32_EL2](#).TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 [FPSCR](#).{Stride, Len} fields as RAZ, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

FP2V, bit [28]

FPINST2 instruction valid bit. In ARMv8, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

VV, bit [27]

VECITR valid bit. In ARMv8, this bit is RES0.
This field resets to an architecturally UNKNOWN value.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

- 0b0 The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of [FPSCR](#).{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.
- 0b1 FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements [FPSCR](#).{Stride, Len} as RAZ, this bit is RAO/WI.

This field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. In ARMv8, this field is RES1.
This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while [FPSCR](#).IDE was 1:

- 0b0 Input Denormal exception has not occurred.
- 0b1 Input Denormal exception has occurred.

Input Denormal exceptions can occur only when [FPSCR](#).FZ is 1.

———— Note —————

A half-precision floating-point value that is flushed to zero because the value of [FPSCR](#).FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

0b0 Inexact exception has not occurred.

0b1 Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

0b0 Underflow exception has not occurred.

0b1 Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
- Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

0b0 Overflow exception has not occurred.

0b1 Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

0b0 Divide by Zero exception has not occurred.

0b1 Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

0b0 Invalid Operation exception has not occurred.

0b1 Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

Accessing the FPEXC32_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
FPEXC32_EL2	11	0101	100	000	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} = 1 \parallel \text{SCR_EL3.EEL2} = 1) \ \&\& \text{IsUsingAArch64}(\text{EL2}) \ \&\& \text{HCR_EL2.E2H} = 0 \ \&\& \text{CPTR_EL2.TFP} = 1$, then accesses at EL2 are trapped to EL2.
- If $(\text{SCR_EL3.NS} = 1 \parallel \text{SCR_EL3.EEL2} = 1) \ \&\& \text{IsUsingAArch64}(\text{EL2}) \ \&\& \text{HCR_EL2.E2H} = 0 \ \&\& \text{HCR_EL2.NV} = 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} = 1 \parallel \text{SCR_EL3.EEL2} = 1) \ \&\& \text{IsUsingAArch64}(\text{EL2}) \ \&\& \text{HCR_EL2.E2H} = 1 \ \&\& \text{HCR_EL2.TGE} = 0 \ \&\& \text{CPTR_EL2.FPEN} = 0$, then accesses at EL2 are trapped to EL2.
- If $(\text{SCR_EL3.NS} = 1 \parallel \text{SCR_EL3.EEL2} = 1) \ \&\& \text{IsUsingAArch64}(\text{EL2}) \ \&\& \text{HCR_EL2.E2H} = 1 \ \&\& \text{HCR_EL2.TGE} = 0 \ \&\& \text{CPTR_EL2.FPEN} = 10$, then accesses at EL2 are trapped to EL2.
- If $(\text{SCR_EL3.NS} = 1 \parallel \text{SCR_EL3.EEL2} = 1) \ \&\& \text{IsUsingAArch64}(\text{EL2}) \ \&\& \text{HCR_EL2.E2H} = 1 \ \&\& \text{HCR_EL2.TGE} = 0 \ \&\& \text{HCR_EL2.NV} = 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} = 1 \parallel \text{SCR_EL3.EEL2} = 1) \ \&\& \text{IsUsingAArch64}(\text{EL2}) \ \&\& \text{HCR_EL2.E2H} = 1 \ \&\& \text{HCR_EL2.TGE} = 1 \ \&\& \text{CPTR_EL2.FPEN} = 0$, then accesses at EL2 are trapped to EL2.
- If $(\text{SCR_EL3.NS} = 1 \parallel \text{SCR_EL3.EEL2} = 1) \ \&\& \text{IsUsingAArch64}(\text{EL2}) \ \&\& \text{HCR_EL2.E2H} = 1 \ \&\& \text{HCR_EL2.TGE} = 1 \ \&\& \text{CPTR_EL2.FPEN} = 10$, then accesses at EL2 are trapped to EL2.
- If $\text{IsUsingAArch64}(\text{EL3}) \ \&\& \text{CPTR_EL3.TFP} = 1$, then accesses at EL2 or EL3 are trapped to EL3.

D12.2.43 HACR_EL2, Hypervisor Auxiliary Control Register

The HACR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of IMPLEMENTATION DEFINED aspects of EL1 or EL0 operation.

————— Note —————

ARM recommends that the values in this register do not cause unnecessary traps to EL2 when $HCR_EL2.\{E2H, TGE\} = \{1, 1\}$.

Configurations

AArch64 System register HACR_EL2[31:0] is architecturally mapped to AArch32 System register HACR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HACR_EL2 is a 64-bit register.

Field descriptions

The HACR_EL2 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the HACR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
HACR_EL2	11	0001	100	111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.

D12.2.44 HCR_EL2, Hypervisor Configuration Register

The HCR_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configurations

AArch64 System register HCR_EL2[31:0] is architecturally mapped to AArch32 System register HCR[31:0].

AArch64 System register HCR_EL2[63:32] is architecturally mapped to AArch32 System register HCR2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HCR_EL2 is a 64-bit register.

Field descriptions

The HCR_EL2 bit assignments are:

Bits [63:48]

Reserved, RES0.

FIEN, bit [47]

From ARMv8.4:

Fault Injection Enable. Unless this bit is set to 1, accesses to the [ERXPFGCND_EL1](#), [ERXPFGCTL_EL1](#), and [ERXPFGE_EL1](#) registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state.

0b0 Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.

0b1 This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the *Effective value* of HCR_EL2.FIEN is 0b1.

If the RAS Common Fault Injection Model Extension is not implemented, this field is RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FWB, bit [46]

When ARMv8.4-S2FWB is implemented:

Defines the combined cacheability attributes in a 2 stage translation regime.

0b0 When this bit is 0, then:

- The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the ARMv8.0 architecture. For more information see [Combining the stage 1 and stage 2 attributes, EL1&0 translation regime on page D5-2482](#)
- The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the ARMv8.0 architecture.

0b1 When this bit is 1, then:

- Bit[5] of stage 2 page or block descriptor is RES0.
- When bit[4] of stage 2 page or block descriptor is 1 and when:
 - Bits[3:2] of stage 2 page or block descriptor are 0b11, the resultant memory type and inner or outer cacheability attribute is the same as the stage 1 memory type and inner or outer cacheability attribute.
 - Bits[3:2] of stage 2 page or block descriptor are 0b10, the resultant memory type and attribute is Normal Write-Back.
 - Bits[3:2] of stage 2 page or block descriptor are 0b0x, the resultant memory type will be Normal Non-cacheable except where the stage 1 memory type was Device->attr< the resultant memory type will be Device->attr<
- When bit[4] of stage 2 page or block descriptor is 0 the memory type is Device, and when:
 - Bits[3:2] of stage 2 page or block descriptor are 0b00, the resultant memory type is Device-nGnRnE.
 - Bits[3:2] of stage 2 page or block descriptor are 0b01, the resultant memory type is Device-nGnRE.
 - Bits[3:2] of stage 2 page or block descriptor are 0b10, the resultant memory type is Device-nGRE.
 - Bits[3:2] of stage 2 page or block descriptor are 0b11, the resultant memory type is Device-GRE.
- If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable.

- If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate.

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]

When ARMv8.4-NV is implemented:

Nested Virtualization. Changes the behaviors of HCR_EL2.{NV, NV1} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

0b0 This bit has no effect on the behavior of HCR_EL2.{NV, NV1}.

0b1 Redefines behavior of HCR_EL2.{NV, NV1} to enable:

- Transformation of read/writes to registers into read/writes to memory.
- Redirection of EL2 registers to EL1 registers.

When this bit is 0, the behavior of HCR_EL2.{NV, NV1} is as defined for [ARMv8.3-NV](#).

When this bit is 1, then any exception taken from EL1 and taken to EL1 causes [SPSR_EL1.M\[3:2\]](#) to be set to 0b10 and not 0b01.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AT, bit [44]

When ARMv8.3-NV is implemented:

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state:

[AT S1E0R](#), [AT S1E0W](#), [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#)

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 execution of the specified instructions is trapped to EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV1, bit [43]

When ARMv8.4-NV is implemented:

Nested Virtualization.

0b0 If HCR_EL2.{NV, NV2} are both 1, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores.

If HCR_EL2.NV2 is 0 or HCR_EL2.{NV, NV2} == {0, 1}, this control does not cause any instructions to be trapped.

0b1 If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores.

If HCR_EL2.NV2 is 0, EL1 accesses to [VBAR_EL1](#), [ELR_EL1](#), and [SPSR_EL1](#), are trapped to EL2, when EL2 is enabled in the current Security state.

If HCR_EL2.NV2 is 1, the value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register is treated as unallocated.

For the list of registers affected, see [Enhanced support for nested virtualization on page D5-2494](#).

If HCR_EL2.{NV, NV1, NV2} are {1, 0, 0}, any exception taken from EL1, and taken to EL1, causes the [SPSR_EL1.M\[3:2\]](#) to be set to 0b10, and not 0b01.

If HCR_EL2.{NV, NV1, NV2} are {1, 1, 0}, then:

- The EL1 translation table Block and Page descriptors:
 - Bit[54] holds the PXN instead of the UXN.
 - Bit[53] is RES0.
 - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
 - Bit[61] is treated as 0 regardless of the actual value.
 - Bit[60] holds the PXNTable instead of the UXNTable.
 - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.{NV, NV1, NV2} are {0, 1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

When ARMv8.3-NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 accesses to [VBAR_EL1](#), [ELR_EL1](#), [SPSR_EL1](#) are trapped to EL2, when EL2 is enabled in the current Security state.

If HCR_EL2.NV is 1 and HCR_EL2.NV1 is 0 then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the [SPSR_EL1.M\[3:2\]](#) to be set to 0b10, and not 0b01.

If the bits HCR_EL2.NV and HCR_EL2.NV1 are both set to 1 then following effects also apply:

- The EL1 translation table Block and Page descriptors:
 - Bit[54] holds the PXN instead of the UXN.
 - Bit[53] is RES0.
 - Bit[6] is treated as 0 regardless of the actual value.

- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
 - Bit[61] is treated as 0 regardless of the actual value.
 - Bit[60] holds the PXNTable instead of the UXNTable.
 - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.NV is 0 and HCR_EL2.NV1 is 1 then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV, bit [42]

When ARMv8.4-NV is implemented:

Nested Virtualization.

When HCR_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers [SPSR_EL2](#) and [ELR_EL2](#) instead access [SPSR_EL1](#) and [ELR_EL1](#) respectively.
- Instructions accessing the System registers [ESR_EL2](#) and [FAR_EL2](#) instead access [ESR_EL1](#) and [FAR_EL1](#).

When HCR_EL2.NV2 is 0, or if [ARMv8.4-NV](#) is not implemented, traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

0b0 When this bit is set to 0, HCR_EL2.NV2 == 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped.

When HCR_EL2.NV2 is 1, no [ARMv8.4-NV](#) functionality is implemented.

0b1 When HCR_EL2.NV2 is 0, or if [ARMv8.4-NV](#) is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the [CurrentEL](#) register return a value of 0x2.

When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing [SPSR_EL2](#), [ELR_EL2](#), [ESR_EL2](#), and [FAR_EL2](#) instead access [SPSR_EL1](#), [ELR_EL1](#), [ESR_EL1](#), and [FAR_EL1](#) respectively.

When HCR_EL2.NV2 is 0, or if [ARMv8.4-NV](#) is not implemented, then:

- The System or Special-purpose registers for which accesses are trapped are as follows:
 - Registers accessed using MRS or MSR with a name ending in [_EL2](#).

- Registers accessed using MRS or MSR with a name ending in `_EL12`.
- Registers accessed using MRS or MSR with a name ending in `_EL02`.
- Special-purpose registers `SPSR_irq`, `SPSR_abt`, `SPSR_und` and `SPSR_fiq`, accessed using MRS or MSR.
- Special-purpose register `SP_EL1` accessed using the dedicated MRS or MSR instruction.
- The instructions for which the execution is trapped are as follows:
 - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
 - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are only accessible from EL2 and EL3.
 - SMC in an implementation that does not include EL3 and when `HCR_EL2.TSC` is 1. `HCR_EL2.TSC` bit is not RES0 in this case.
 - The `ERET`, `ERETAA`, and `ERETAB` instructions.

Note

The priority of this trap is higher than the priority of the `HCR_EL2.API` trap. If both of these bits are set so that EL1 execution of an `ERETAA` or `ERETAB` instruction is trapped to EL2, then the syndrome reported is `0x1A`.

This field resets to an architecturally UNKNOWN value.

When ARMv8.3-NV is implemented:

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

The possible values are:

- `0b0` This control does not cause any instructions to be trapped.
- `0b1` EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the `CurrentEL` register return a value of `0x2`.

The System or Special-purpose registers for which accesses are trapped are as follows:

- Registers accessed using MRS or MSR with a name ending in `_EL2`.
- Registers accessed using MRS or MSR with a name ending in `_EL12`.
- Registers accessed using MRS or MSR with a name ending in `_EL02`.
- Special-purpose registers `SPSR_irq`, `SPSR_abt`, `SPSR_und` and `SPSR_fiq`, accessed using MRS or MSR.
- Special-purpose register `SP_EL1` accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are only accessible from EL2 and EL3.
- The `ERET`, `ERETAA`, and `ERETAB` instructions.

———— **Note** —————

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

- SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [41]

When ARMv8.3-PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA, XPACD, XPACI, and XPACLRI.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
 - In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated [SCTLR_EL1.En<N><M>==1](#).
 - In EL1, the associated [SCTLR_EL1.En<N><M>==1](#).

0b0 The instructions related to Pointer Authentication are trapped to EL2, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&0 translation regime, from:

- EL0 when HCR_EL2.TGE==0 or HCR_EL2.E2H==0.
- EL1.

If HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETAA and ERETAB instructions.

0b1 This control does not cause any instructions to be trapped.

———— **Note** —————

If [ARMv8.3-PAuth](#) is implemented but EL2 is not implemented or disabled in the current Security state, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [40]

When ARMv8.3-PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state:

- [APIAKeyLo_EL1](#), [APIAKeyHi_EL1](#), [APIBKeyLo_EL1](#), [APIBKeyHi_EL1](#), [APDAKeyLo_EL1](#), [APDAKeyHi_EL1](#), [APDBKeyLo_EL1](#), [APDBKeyHi_EL1](#), [APGAKeyLo_EL1](#), and [APGAKeyHi_EL1](#).

0b0 Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.

0b1 This control does not cause any instructions to be trapped.

———— **Note** ————

If [ARMv8.3-PAuth](#) is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

MIOCNCEN, bit [38]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the EL1&0 translation regimes.

0b0 For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

0b1 For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information see [Mismatched memory attributes on page B2-132](#).

This field can be implemented as RAZ/WI.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TEA, bit [37]

Route synchronous External abort exceptions to EL2. If the RAS Extension is implemented, the possible values of this bit are:

0b0 This control does not cause exceptions to be routed from EL0 and EL1 to EL2.

0b1 Route synchronous External abort exceptions from EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, if not routed to EL3.

When the RAS Extension is not implemented, this field is RES0.

This field resets to an architecturally UNKNOWN value.

TERR, bit [36]

When RAS is implemented:

Trap Error record accesses. Trap accesses to the following registers from EL1 to EL2:

EL1 using AArch64: [ERRIDR_EL1](#), [ERRSELR_EL1](#), [ERXADDR_EL1](#), [ERXCTLR_EL1](#), [ERXFR_EL1](#), [ERXMISC0_EL1](#), [ERXMISC1_EL1](#), and [ERXSTATUS_EL1](#). When ARMv8.4-RAS is implemented, [ERXMISC2_EL1](#), and [ERXMISC3_EL1](#).

EL1 using AArch32: [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#). When ARMv8.4-RAS is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

0b0 This control does not cause any instructions to be trapped.

0b1 Accesses to the specified registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [35]

From ARMv8.1:

Trap LOR registers. Traps accesses to the [LORSA_EL1](#), [LOREA_EL1](#), [LORN_EL1](#), [LORC_EL1](#), and [LORID_EL1](#) registers from EL1 to EL2, when EL2 is enabled in the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 accesses to the LOR registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2H, bit [34]

From ARMv8.1:

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

0b0 The facilities to support a Host Operating System at EL2 are disabled.

0b1 The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see [Behavior of HCR_EL2.E2H](#) on page D5-2486.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ID, bit [33]

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and [HCR_EL2.VM](#)==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

0b0 This control has no effect on stage 2 of the EL1&0 translation regime.

0b1 Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

CD, bit [32]

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and [HCR_EL2.VM](#)==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

0b0 This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.

0b1 Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

RW, bit [31]

Execution state control for lower Exception levels:

0b0 Lower levels are all AArch32.

0b1 The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of `PSTATE.nRW` when executing at EL0.

If all lower Exception levels cannot use AArch32 then this bit is RAO/WI.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the `SCR_EL3.RW` bit for all purposes other than a direct read or write access of `HCR_EL2`.

The RW bit is permitted to be cached in a TLB.

When `ARMv8.1-VHE` is implemented, and the value of `HCR_EL2.{E2H, TGE}` is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, from both Execution states. The registers for which read accesses are trapped are as follows:

EL1 using AArch64: `SCTLR_EL1`, `TTBR0_EL1`, `TTBR1_EL1`, `TCR_EL1`, `ESR_EL1`, `FAR_EL1`, `AFSR0_EL1`, `AFSR1_EL1`, `MAIR_EL1`, `AMAIR_EL1`, `CONTEXTIDR_EL1`.

EL1 using AArch32: `SCTLR`, `TTBR0`, `TTBR1`, `TTBCR`, `TTBCR2`, `DACR`, `DFSR`, `IFSR`, `DFAR`, `IFAR`, `ADFSR`, `AIFSR`, `PRRR`, `NMRR`, `MAIR0`, `MAIR1`, `AMAIR0`, `AMAIR1`, `CONTEXTIDR`.

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 read accesses to the specified Virtual Memory controls are trapped to EL2, when EL2 is enabled in the current Security state.

When `HCR_EL2.TGE` is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

HCD, bit [29]

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state.

0b0 HVC instruction execution is enabled at EL2 and EL1.

0b1 HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

———— Note ————

HVC instructions are always UNDEFINED at EL0.

This bit is only implemented if EL3 is not implemented. Otherwise, it is RES0.

When `HCR_EL2.TGE` is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TDZ, bit [28]

Trap `DC ZVA` instructions. Traps EL0 and EL1 execution of `DC ZVA` instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only.

0b0 This control does not cause any instructions to be trapped.

0b1 In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state.

Reading the [DCZID_EL0](#) returns a value that indicates that the instructions this trap applies to are not supported.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TGE, bit [27]

Trap General Exceptions, from EL0.

0b0 This control has no effect on execution at EL0.

0b1 When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0.

When EL2 is enabled in the current Security state, in all cases:

- All exceptions that would be routed to EL1 are routed to EL2.
- The [SCTLR_EL1](#).M field, or the [SCTLR](#).M field if EL1 is using AArch32, is treated as being 0 for all purposes other than returning the result of a direct read of [SCTLR_EL1](#) or [SCTLR](#).
- All virtual interrupts are disabled.
- Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.
- An exception return to EL1 is treated as an illegal exception return.

When EL2 is enabled in the current Security state and the value of [HCR_EL2](#).E2H is 0, additionally:

- The [HCR_EL2](#).{FMO, IMO, AMO} fields are treated as being 1 for all purposes other than a direct read or write access of [HCR_EL2](#).
- The [MDCR_EL2](#).{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of [MDCR_EL2](#).

For information on the behavior of this bit when E2H is 1, see *Behavior of [HCR_EL2.E2H](#)* on page D5-2486.

[HCR_EL2](#).TGE must not be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Trap Virtual Memory controls. Traps EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, from both Execution states. The registers for which write accesses are trapped are as follows:

EL1 using AArch64: [SCTLR_EL1](#), [TTBR0_EL1](#), [TTBR1_EL1](#), [TCR_EL1](#), [ESR_EL1](#), [FAR_EL1](#), [AFSR0_EL1](#), [AFSR1_EL1](#), [MAIR_EL1](#), [AMAIR_EL1](#), [CONTEXTIDR_EL1](#).

EL1 using AArch32: [SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#).

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2](#).TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

When ARMv8.4-TLBI is implemented:

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states. This applies to the following instructions:

- When EL1 is using AArch64, [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#), [TLBI VMALLE1](#), [TLBI VAE1](#), [TLBI ASIDE1](#), [TLBI VAAE1](#), [TLBI VALE1](#), [TLBI VAALE1](#), [TLBI VMALLE1OS](#), [TLBI VAE1OS](#), [TLBI ASIDE1OS](#), [TLBI VAAE1OS](#), [TLBI VALE1OS](#), [TLBI VAALE1OS](#), [TLBI RVAE1](#), [TLBI RVAE1IS](#), [TLBI RVAE1OS](#), [TLBI RVAAE1](#), [TLBI RVAE1IS](#), [TLBI RVAE1OS](#), [TLBI RVAAE1IS](#), [TLBI RVAE1OS](#), [TLBI RVALE1](#), [TLBI RVALE1IS](#), [TLBI RVALE1OS](#), [TLBI RVAALE1](#), [TLBI RVAALE1IS](#), [TLBI RVAALE1OS](#).
- When EL1 is using AArch32, [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [TLBIMVAA](#), [TLBIMVAL](#), [TLBIMVAAL](#).

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

From ARMv8.0:

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states. This applies to the following instructions:

- When EL1 is using AArch64, [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#), [TLBI VMALLE1](#), [TLBI VAE1](#), [TLBI ASIDE1](#), [TLBI VAAE1](#), [TLBI VALE1](#), [TLBI VAALE1](#).
- When EL1 is using AArch32, [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [TLBIMVAA](#), [TLBIMVAL](#), [TLBIMVAAL](#).

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL0 is using AArch64, [IC IVAU](#), [DC CVAU](#). However, if the value of [SCTLR_EL1.UCI](#) is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- When EL1 is using AArch64, [IC IVAU](#), [IC IALLU](#), [IC IALLUIS](#), [DC CVAU](#).
- When EL1 is using AArch32, [ICIMVAU](#), [IC IALLU](#), [IC IALLUIS](#), [DCCMVAU](#).

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- **IC IALLUIS** and **IC IALLU** are always UNDEFINED at EL0 using AArch64.
- **ICIMVAU**, **ICIALLU**, **ICIALLUIS**, and **DCCMVAU** are always UNDEFINED at EL0 using AArch32.

0b0 This control does not cause any instructions to be trapped.

0b1 Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When **ARMv8.1-VHE** is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TPCP, bit [23]

When ARMv8.2-DCPoP is implemented:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL0 is using AArch64, **DC CIVAC**, **DC CVAC**, **DC CVAP**. However, if the value of **SCTLR_EL1**.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- When EL1 is using AArch64, **DC IVAC**, **DC CIVAC**, **DC CVAC**, **DC CVAP**.
- When EL1 is using AArch32, **DCIMVAC**, **DCCIMVAC**, **DCCMVAC**.

Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

— AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.

— **DCIMVAC**, **DCCIMVAC**, and **DCCMVAC** are always UNDEFINED at EL0 using AArch32.

- In ARMv8.0 this field is named TPC. From ARMv8.2 it is named TPCP.

0b0 This control does not cause any instructions to be trapped.

0b1 Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If **HCR_EL2**.{E2H, TGE} is set to {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL0 is using AArch64, [DC CIVAC](#), [DC CVAC](#). However, if the value of [SCTLR_EL1.UCI](#) is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- When EL1 is using AArch64, [DC IVAC](#), [DC CIVAC](#), [DC CVAC](#).
- When EL1 is using AArch32, [DCIMVAC](#), [DCCIMVAC](#), [DCCMVAC](#).

———— **Note** ————

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
 - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
 - [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.
- In ARMv8.0 this field is named TPC. From ARMv8.2 it is named TPCP.

0b0 This control does not cause any instructions to be trapped.

0b1 Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 using AArch64, and at EL1 using AArch32, to EL2 when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, [DC ISW](#), [DC CSW](#), [DC CISW](#).
- When EL1 is using AArch32, [DCISW](#), [DCCSW](#), [DCCISW](#).

———— **Note** ————

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

0b0 This control does not cause any instructions to be trapped.

0b1 Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2](#).TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TACR, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states. This applies to the following register accesses:

- EL1 using AArch64: [ACTLR_EL1](#).

- EL1 using AArch32: [ACTLR](#) and, if implemented, [ACTLR2](#).
- 0b0 This control does not cause any instructions to be trapped.
- 0b1 EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state. This applies to the following register accesses:

AArch64: The following reserved encoding spaces:

- IMPLEMENTATION DEFINED System instructions, which are accessed using *SYS* and *SYSL*, with $CRn == \{11, 15\}$.
- IMPLEMENTATION DEFINED System registers, which are accessed using *MRS* and *MSR* with the *S3_<op1>_<Cn>_<Cm>_<op2>* register name.

AArch32: MCR and MRC instructions accessing the following encodings:

- All coproc= $p15$, $CRn=c9$, $opc1 == \{0-7\}$, $CRm == \{c0-c2, c5-c8\}$, $opc2 == \{0-7\}$.
- All coproc= $p15$, $CRn=c10$, $opc1 == \{0-7\}$, $CRm == \{c0, c1, c4, c8\}$, $opc2 == \{0-7\}$.
- All coproc= $p15$, $CRn=c11$, $opc1==\{0-7\}$, $CRm == \{c0-c8, c15\}$, $opc2 == \{0-7\}$.

When the value of [HCR_EL2.TIDCP](#) is 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from EL0 is trapped to EL2. If it is not, then it is UNDEFINED, and any attempt to access it from EL0 generates an exception that is taken to EL1.

- 0b0 This control does not cause any instructions to be trapped.
- 0b1 EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

This field resets to an architecturally UNKNOWN value.

TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states.

- 0b0 This control does not cause any instructions to be trapped.
- 0b1 If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 using AArch64 or EL1 using AArch32 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of [SCR_EL3.SMD](#).
If EL3 is not implemented, [ARMv8.3-NV](#) is implemented, and [HCR_EL2.NV](#) is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state.

In AArch32 state, the ARMv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

If EL3 is not implemented, and [HCR_EL2.NV](#) is 0, this bit is RES0.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TID3, bit [18]

Trap ID group 3. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

AArch64: [ID_PFR0_EL1](#), [ID_PFR1_EL1](#), [ID_DFR0_EL1](#), [ID_AFR0_EL1](#), [ID_MMFR0_EL1](#), [ID_MMFR1_EL1](#), [ID_MMFR2_EL1](#), [ID_MMFR3_EL1](#), [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), [ID_ISAR5_EL1](#), [ID_ISAR6_EL1](#), [MVFR0_EL1](#), [MVFR1_EL1](#), [MVFR2_EL1](#), [ID_AA64PFR0_EL1](#), [ID_AA64PFR1_EL1](#), [ID_AA64DFR0_EL1](#), [ID_AA64DFR1_EL1](#), [ID_AA64ISAR0_EL1](#), [ID_AA64ISAR1_EL1](#), [ID_AA64MMFR0_EL1](#), [ID_AA64MMFR1_EL1](#), [ID_AA64MMFR2_EL1](#), [ID_AA64AFR0_EL1](#), [ID_AA64AFR1_EL1](#), [ID_AA64ZFR0_EL1](#) (where SVE is implemented), and [ID_MMFR4_EL1](#), except that if [ID_MMFR4_EL1](#) is implemented as RAZ/WI then it is IMPLEMENTATION DEFINED whether accesses to [ID_MMFR4_EL1](#) are trapped.

It is IMPLEMENTATION DEFINED whether this field traps MRS accesses to encodings in the following range that are not already mentioned in this field description:

- $Op0 == 3, op1 == 0, CRn == c0, CRm == \{c2-c7\}, op2 == \{0-7\}$.

AArch32: [ID_PFR0](#), [ID_PFR1](#), [ID_DFR0](#), [ID_AFR0](#), [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), [ID_MMFR3](#), [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), [ID_ISAR5](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [ID_MMFR4](#), except that if [ID_MMFR4](#) is implemented as RAZ/WI then it is IMPLEMENTATION DEFINED whether accesses to [ID_MMFR4](#) are trapped.

MRC access to any of the following encodings are also trapped:

- $coproc == p15, opc1 == 0, CRn == c0, CRm == \{c3-c7\}, opc2 == \{0,1\}$.
- $coproc == p15, opc1 == 0, CRn == c0, CRm == c3, opc2 == 2$.
- $coproc == p15, opc1 == 0, CRn == c0, CRm == c5, opc2 == \{4,5\}$.

It is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to the following encodings:

- $coproc == p15, opc1 == 0, CRn == c0, CRm == c2, opc2 == 7$.
- $coproc == p15, opc1 == 0, CRn == c0, CRm == c3, opc2 == \{3-7\}$.
- $coproc == p15, opc1 == 0, CRn == c0, CRm == \{c4, c6, c7\}, opc2 == \{2-7\}$.
- $coproc == p15, opc1 == 0, CRn == c0, CRm == c5, opc2 == \{2, 3, 6, 7\}$.

0b0 This control does not cause any instructions to be trapped.

0b1 The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- EL1 reads of [CTR_EL0](#), [CCSIDR_EL1](#), [CCSIDR2_EL1](#), [CLIDR_EL1](#), and [CSSELR_EL1](#).
- EL0 reads of [CTR_EL0](#), except that if the value of [SCTLR_EL1.UCT](#) is 0 then EL0 reads of [CTR_EL0](#) are UNDEFINED and any resulting exception takes precedence over this trap.
- EL1 writes to [CSSELR_EL1](#).

AArch32:

- EL1 reads of the [CTR](#), [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- EL1 writes to the [CSSELR](#).

0b0 This control does not cause any instructions to be trapped.

0b1 The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

AArch64: [REVIDR_EL1](#), [AIDR_EL1](#).

AArch32: [TCMTR](#), [TLBTR](#), [REVIDR](#), [AIDR](#).

0b0 This control does not cause any instructions to be trapped.

0b1 The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2:

AArch64: None.

AArch32:

- EL1 reads of the [JIDR](#).
- If the [JIDR](#) is RAZ from EL0, EL0 reads of the [JIDR](#).
- EL1 reads of the [FPSID](#).

Note

- It is IMPLEMENTATION DEFINED whether the [JIDR](#) is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then any resulting exception takes precedence over this trap.
- The [FPSID](#) is not accessible at EL0 using AArch32.
- Writes to the [FPSID](#) are ignored, and not trapped by this control.

0b0 This control does not cause any instructions to be trapped.

0b1 The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

In an AArch64 only implementation, this bit is RES0.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TWE, bit [14]

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWE](#) or [SCTLR_EL1.nTWE](#).

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TWI, bit [13]

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWI](#) or [SCTLR_EL1.nTWI](#).

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

DC, bit [12]

Default Cacheability.

0b0 This control has no effect on the EL1&0 translation regime.

0b1 In both Security states:

- When EL1 is using AArch64, the PE behaves as if the value of the [SCTLR_EL1.M](#) field is 0 for all purposes other than returning the value of a direct read of [SCTLR_EL1](#).
- When EL1 is using AArch32, the PE behaves as if the value of the [SCTLR.M](#) field is 0 for all purposes other than returning the value of a direct read of [SCTLR](#).
- The PE behaves as if the value of the [HCR_EL2.VM](#) field is 1 for all purposes other than returning the value of a direct read of [HCR_EL2](#).
- The memory type produced by stage 1 of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This field is permitted to be cached in a TLB.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

This field resets to an architecturally UNKNOWN value.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

0b00 No effect.

0b01 Inner Shareable.

0b10 Outer Shareable.

0b11 Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When **ARMv8.1-VHE** is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this field behaves as 0b00 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

AArch32: **BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, TLBIMVAAL.**

AArch64: **TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1, IC IALLU, TLBI RVAE1, TLBI RVAAE1, TLBI RVALE1, TLBI RVAALE1.**

0b0 This field has no effect on the operation of the specified instructions.

0b1 When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.

When **HCR_EL2**.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

VSE, bit [8]

Virtual SError interrupt.

0b0 This mechanism is not making a virtual SError interrupt pending.

0b1 A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is only enabled when the value of **HCR_EL2**.{TGE, AMO} is {0, 1}.

This field resets to an architecturally UNKNOWN value.

VI, bit [7]

Virtual IRQ Interrupt.

0b0 This mechanism is not making a virtual IRQ pending.

0b1 A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of **HCR_EL2**.{TGE, IMO} is {0, 1}.

This field resets to an architecturally UNKNOWN value.

VF, bit [6]

Virtual FIQ Interrupt.

0b0 This mechanism is not making a virtual FIQ pending.

0b1 A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of **HCR_EL2**.{TGE, FMO} is {0, 1}.

This field resets to an architecturally UNKNOWN value.

AMO, bit [5]

Physical SError interrupt routing.

0b0 When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:

- Physical SError interrupts are not taken to EL2.
- When the value of **HCR_EL2**.TGE is 0, if the PE is executing at EL2 using AArch64, physical SError interrupts are not taken unless they are routed to EL3 by the **SCR_EL3**.EA bit.
- Virtual SError interrupts are disabled.

- 0b1 When executing at any Exception level, and EL2 is enabled in the current Security state:
- Physical SError interrupts are taken to EL2, unless they are routed to EL3.
 - When the value of HCR_EL2.TGE is 0, then virtual SError interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
- When [ARMv8.1-VHE](#) is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When [ARMv8.1-VHE](#) is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see [Asynchronous exception routing on page D1-2199](#).

This field resets to an architecturally UNKNOWN value.

IMO, bit [4]

Physical IRQ Routing.

- 0b0 When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:
- Physical IRQ interrupts are not taken to EL2.
 - When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical IRQ interrupts are not taken unless they are routed to EL3 by the SCR_EL3.IRQ bit.
 - Virtual IRQ interrupts are disabled.

- 0b1 When executing at any Exception level, and EL2 is enabled in the current Security state:
- Physical IRQ interrupts are taken to EL2, unless they are routed to EL3.
 - When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled.

If EL2 is enabled in the current Security state, and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
- When [ARMv8.1-VHE](#) is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When [ARMv8.1-VHE](#) is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see [Asynchronous exception routing on page D1-2199](#).

This field resets to an architecturally UNKNOWN value.

FMO, bit [3]

Physical FIQ Routing.

- 0b0 When executing at Exception levels below EL2, and EL2 is enabled in the current Security state:
- Physical FIQ interrupts are not taken to EL2.
 - When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical FIQ interrupts are not taken unless they are routed to EL3 by the SCR_EL3.FIQ bit.
 - Virtual FIQ interrupts are disabled.

- 0b1 When executing at any Exception level, and EL2 is enabled in the current Security state:
- Physical FIQ interrupts are taken to EL2, unless they are routed to EL3.
 - When HCR_EL2.TGE is 0, then Virtual FIQ interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
- When [ARMv8.1-VHE](#) is not implemented, or if [HCR_EL2.E2H](#) is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When [ARMv8.1-VHE](#) is implemented and [HCR_EL2.E2H](#) is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see [Asynchronous exception routing on page D1-2199](#).

This field resets to an architecturally UNKNOWN value.

PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

0b0 The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.

0b1 The memory access generates a stage 2 Permission fault.

This field is permitted to be cached in a TLB.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

0b0 This control has no effect on the operation of data cache invalidate by set/way instructions.

0b1 Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: [DCISW](#) performs the same invalidation as a [DCCISW](#) instruction.

AArch64: [DC ISW](#) performs the same invalidation as a [DC CISW](#) instruction.

This bit can be implemented as RES1.

When [HCR_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

0b0 EL1&0 stage 2 address translation disabled.

0b1 EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the [HCR_EL2.SWIO](#) bit.

This bit is permitted to be cached in a TLB.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Accessing the HCR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
HCR_EL2	11	0001	100	000	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x78]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.45 HPFAR_EL2, Hypervisor IPA Fault Address Register

The HPFAR_EL2 characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2.

Configurations

AArch64 System register HPFAR_EL2[31:0] is architecturally mapped to AArch32 System register HPFAR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HPFAR_EL2 is a 64-bit register.

Field descriptions

The HPFAR_EL2 bit assignments are:

Execution at EL1 or EL0 makes HPFAR_EL2 become UNKNOWN.

NS, bit [63]

From ARMv8.4:

Faulting IPA address space.

0b0 Faulting IPA is from the Secure IPA space.

0b1 Faulting IPA is from the Non-secure IPA space.

For data or instruction aborts taken to Non-secure EL2, this field is RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [62:44]

Reserved, RES0.

FIPA[51:48], bits [43:40]

From ARMv8.2, or if ARMv8.2-LPA is implemented:

Extension to FIPA[47:12]. See FIPA[47:12] for more details.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIPA[47:12], bits [39:4]

Bits [47:12] of the faulting intermediate physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

When [ARMv8.2-LPA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use for the stage 1 translation, the FIPA[51:48] bits form the upper part of the address value. For implementations or stage 1 translation granules with fewer than 52 physical address bits the FIPA[51:48] bits are RES0.

The HPFAR_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.

———— **Note** ————

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

For all other exceptions taken to EL2, this register is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing the HPFAR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
HPFAR_EL2	11	0110	100	100	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} = 1 \parallel \text{SCR_EL3.EEL2} = 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} = 0 \ \&\& \ \text{HCR_EL2.NV} = 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} = 1 \parallel \text{SCR_EL3.EEL2} = 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} = 1 \ \&\& \ \text{HCR_EL2.TGE} = 0 \ \&\& \ \text{HCR_EL2.NV} = 1$, then accesses at EL1 are trapped to EL2.

D12.2.46 HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == 0b1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

Configurations

AArch64 System register HSTR_EL2[31:0] is architecturally mapped to AArch32 System register HSTR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

If no Exception level can use AArch32, then this register is RES0.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HSTR_EL2 is a 64-bit register.

Field descriptions

The HSTR_EL2 bit assignments are:

Bits [63:16]

Reserved, RES0.

T<n>, bit [n], for n = 0 to 15

Fields T14 and T4 are RES0.

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space are trapped to EL2:

- 0b0 This control has no effect on EL0 or EL1 accesses to System registers.
- 0b1 Any EL1 MCR or MRC access with coproc == 0b1111 and CRn == <n> is trapped to EL2. An EL0 MCR or MRC access with these values is trapped to EL2 only if the access is not UNDEFINED when the value of this field is 0.
Any EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == <n> is trapped to EL2. An EL0 MCRR or MRRC access with these values is trapped to EL2 only if the access is not UNDEFINED when the value of this field is 0.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.

- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When [ARMv8.1-VHE](#) is implemented, and the value of `HCR_EL2.{E2H, TGE}` is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Accessing the HSTR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
HSTR_EL2	11	0001	100	011	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x80]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191. Subject to the prioritization rules:

- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.47 ID_AA64AFR0_EL1, AArch64 Auxiliary Feature Register 0

The ID_AA64AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch64 state.
For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

There are no configuration notes.
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64AFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64AFR0_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:28]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [27:24]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [23:20]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [19:16]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [15:12]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [11:8]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [7:4]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [3:0]

IMPLEMENTATION DEFINED.

Accessing the ID_AA64AFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64AFR0_EL1	11	0000	000	100	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.48 ID_AA64AFR1_EL1, AArch64 Auxiliary Feature Register 1

The ID_AA64AFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of information about the IMPLEMENTATION DEFINED features of the PE in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D12-2680](#).

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64AFR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64AFR1_EL1 bit assignments are:

Bits [63:0]

Reserved, RES0.

Accessing the ID_AA64AFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64AFR1_EL1	11	0000	000	101	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.TID3} == 1$, then read accesses at EL1 are trapped to EL2.

D12.2.49 ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

The external register [EDDFR](#) gives information from this register.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64DFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64DFR0_EL1 bit assignments are:

Bits [63:44]

Reserved, RES0.

TraceFilt, bits [43:40]

ARMv8.4 Self-hosted Trace Extension version. Defined values are:

0b0000 ARMv8.4 Self-hosted Trace Extension not implemented.

0b0001 ARMv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

DoubleLock, bits [39:36]

OS Double Lock implemented. Defined values are:

0b0000 OS Double Lock not implemented. [OSDLR_EL1](#) is RAZ/WI.

0b0001 OS Double Lock implemented. [OSDLR_EL1](#) is read/write.

All other values are reserved.

PMSVer, bits [35:32]

From ARMv8.2:

Statistical Profiling Extension version. The defined values of this field are:

0b0000 Statistical Profiling Extension not implemented.

0b0001 Statistical Profiling Extension implemented.

[SVE](#) on page A1-75 implements the functionality added by the value 0b0001.

All other values are reserved.

Otherwise:

Reserved, RES0.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in [Alternative ID scheme used for the Performance Monitors Extension version on page D12-2682](#).

Defined values are:

- | | |
|--------|---|
| 0b0000 | Performance Monitors Extension not implemented. |
| 0b0001 | Performance Monitors Extension implemented, PMUv3. |
| 0b0100 | PMUv3 for ARMv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none">Extended 16-bit PMEVTYPER<n>_EL0.evtCount field.If EL2 is implemented, the MDCR_EL2.HPMD control bit. |
| 0b0101 | PMUv3 for ARMv8.4. As 0b0100 and also includes support for the PMMIR_EL1 register. |
| 0b1111 | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations. |

[ARMv8.1-PMU](#) implements the functionality added by the value 0b0100.

[ARMv8.4-PMU](#) implements the functionality added by the value 0b0101.

All other values are reserved.

From ARMv8.1, the value 0b0001 is not permitted.

From ARMv8.4, the value 0b0100 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented.

Defined values are:

- | | |
|--------|---|
| 0b0000 | PE trace unit System registers not implemented. |
| 0b0001 | PE trace unit System registers implemented. |

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

See the ETM Architecture Specification for more information.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of ARMv8 debug architecture. Defined values are:

- | | |
|--------|---|
| 0b0110 | ARMv8 debug architecture. |
| 0b0111 | ARMv8 debug architecture with Virtualization Host Extensions. |

0b1000 ARMv8.2 debug architecture

0b1001 ARMv8.4 debug architecture

All other values are reserved.

[ARMv8.2-Debug](#) adds the functionality indicated by the value 0b1000.

- If [ARMv8.1-VHE](#) is not implemented the only permitted value is 0b0110.
- In an ARMv8.0 implementation the value 0b1000 is not permitted.

Accessing the ID_AA64DFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64DFR0_EL1	11	0000	000	000	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.50 ID_AA64DFR1_EL1, AArch64 Debug Feature Register 1

The ID_AA64DFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of top level information about the debug system in AArch64 state.
For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

There are no configuration notes.
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64DFR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64DFR1_EL1 bit assignments are:

Bits [63:0]

Reserved, RES0.

Accessing the ID_AA64DFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64DFR1_EL1	11	0000	000	001	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.TID3} == 1$, then read accesses at EL1 are trapped to EL2.

D12.2.51 ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0

The ID_AA64ISAR0_EL1 characteristics are:

Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D12-2680](#).

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64ISAR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64ISAR0_EL1 bit assignments are:

Bits [63:60]

Reserved, RES0.

TLB, bits [59:56]

From ARMv8.4:

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

- 0b0000 Outer shareable and TLB range maintenance instructions are not implemented.
- 0b0001 Outer shareable TLB maintenance instructions are implemented.
- 0b0010 Outer shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

[ARMv8.4-TLBI](#) implements the functionality identified by the values 0b0001 and 0b0010.

From ARMv8.4, the only permitted value is 0b0010.

Otherwise:

Reserved, RES0.

TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

- 0b0000 No flag manipulation instructions are implemented.
- 0b0001 CFINV, RMIF, SETF16, and SETF8 instructions are implemented.

All other values are reserved.

[ARMv8.4-CondM](#) implements the functionality identified by the value 0b0001.

From ARMv8.4, the only permitted value is 0b0001.

FHM, bits [51:48]

From ARMv8.2:

Indicates whether FMLAL and FMLSL instructions are implemented.

0b0000 FMLAL and FMLSL instructions are not implemented.

0b0001 FMLAL and FMLSL instructions are implemented.

All other values are reserved.

[ARMv8.2-FHM](#) implements the functionality identified by the value 0b0001.

From ARMv8.2, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

DP, bits [47:44]

From ARMv8.2:

Dot Product instructions implemented in AArch64 state. Defined values are:

0b0000 No Dot Product instructions implemented.

0b0001 UDOT and SDOT instructions implemented.

All other values are reserved.

[ARMv8.2-DotProd](#) implements the functionality identified by the value 0b0001.

From ARMv8.2, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

SM4, bits [43:40]

From ARMv8.2:

SM4 instructions implemented in AArch64 state. Defined values are:

0b0000 No SM4 instructions implemented.

0b0001 SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If [ARMv8.2-SM](#) is not implemented the value 0b0001 is reserved.

From ARMv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

Otherwise:

Reserved, RES0.

SM3, bits [39:36]

From ARMv8.2:

SM3 instructions implemented in AArch64 state. Defined values are:

0b0000 No SM3 instructions implemented.

0b0001 SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.

If [ARMv8.2-SM](#) is not implemented the value 0b0001 is reserved.

[ARMv8.2-SM](#) implements the functionality identified by the value 0b0001.

From ARMv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

Otherwise:

Reserved, RES0.

SHA3, bits [35:32]

From ARMv8.2:

SHA3 instructions implemented in AArch64 state. Defined values are:

0b0000 No SHA3 instructions implemented.

0b0001 EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.

If [ARMv8.2-SHA](#) is not implemented the value 0b0001 is reserved.

[ARMv8.2-SHA](#) implements the functionality identified by the value 0b0001.

From ARMv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, then this field must have the value 0b0000.

If the value of this field is 0b0001, then ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

Otherwise:

Reserved, RES0.

RDM, bits [31:28]

From ARMv8.1:

SQRDMLAH and SQRDMLSH instructions implemented in AArch64 state. Defined values are:

0b0000 No SQRDMLAH and SQRDMLSH instructions implemented.

0b0001 SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

[ARMv8.1-RDMA](#) implements the functionality identified by the value 0b0001.

From ARMv8.1, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Bits [27:24]

Reserved, RES0.

Atomic, bits [23:20]

From ARMv8.1:

Atomic instructions implemented in AArch64 state. Defined values are:

0b0000 No Atomic instructions implemented.

0b0010 LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.

All other values are reserved.

implements the functionality identified by the value 0b0010.

From ARMv8.1, the only permitted value is 0b0010.

Otherwise:

Reserved, RES0.

CRC32, bits [19:16]

CRC32 instructions implemented in AArch64 state. Defined values are:

0b0000 No CRC32 instructions implemented.

0b0001 CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.

All other values are reserved.

In ARMv8.0, the permitted values are 0b0000 and 0b0001.

From ARMv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

SHA2 instructions implemented in AArch64 state. Defined values are:

0b0000 No SHA2 instructions implemented.

0b0001 SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 instructions implemented.

0b0010 As 0b0001, plus SHA512H, SHA512H2, SHA512SU0, and SHA512SU1 instructions implemented.

All other values are reserved.

If [ARMv8.2-SHA](#) is not implemented the value 0b0010 is reserved.

From ARMv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, then this field must have the value 0b0000.

If the value of this field is 0b0010, then ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

SHA1, bits [11:8]

SHA1 instructions implemented in AArch64 state. Defined values are:

0b0000 No SHA1 instructions implemented.

0b0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

In ARMv8, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, then this field must have the value 0b0000.

AES, bits [7:4]

AES instructions implemented in AArch64 state. Defined values are:

0b0000 No AES instructions implemented.

0b0001 AESE, AESD, AESMC, and AESIMC instructions implemented.

0b0010 As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

All other values are reserved.

In ARMv8, the permitted values are 0b0000, 0b0001, and 0b0010.

Bits [3:0]

Reserved, RES0.

Accessing the ID_AA64ISAR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64ISAR0_EL1	11	0000	000	000	0110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.52 ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64ISAR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64ISAR1_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

GPI, bits [31:28]

From ARMv8.3:

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication, in AArch64 state. Defined values are:

0b0000 Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.

0b0001 Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This involves the PACGA instruction.

All other values are reserved.

From ARMv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, this field must have the value 0b0000.

Otherwise:

Reserved, RES0.

GPA, bits [27:24]

From ARMv8.3:

Indicates whether QARMA or Architected algorithm is implemented in the PE for generic code authentication, in AArch64 state. Defined values are:

0b0000 Generic Authentication using an Architected algorithm is not implemented.

0b0001 Generic Authentication using the QARMA algorithm is implemented. This involves the PACGA instruction.

All other values are reserved.

From ARMv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is non-zero, this field must have the value 0b0000.

Otherwise:

Reserved, RES0.

LRCPC, bits [23:20]

From ARMv8.4:

Indicates support for weaker release consistency, RCpc based model. Defined values are:

0b0000 The LDAPUR*, STLUR*, and LDAPR* instructions are not implemented.

0b0001 The LDAPR* instructions are implemented.

0b0010 The LDAPUR*, STLUR*, and LDAPR* instructions are implemented.

In ARMv8.0, ARMv8.1, and ARMv8.2, the only permitted value is 0b0000.

In ARMv8.3, the only permitted value is 0b0001. [ARMv8.3-RCpc](#) implements the functionality identified by the value 0b0001.

From ARMv8.4, the only permitted value is 0b0010. [ARMv8.4-RCpc](#) implements the functionality identified by the value 0b0010.

All other values are reserved.

From ARMv8.3:

Indicates support for weaker release consistency, RCpc based model. Defined values are:

0b0000 The LDAPRB, LDAPRH and LDAPR instructions are not implemented.

0b0001 The LDAPRB, LDAPRH and LDAPR instructions are implemented.

All other values are reserved.

[ARMv8.3-RCpc](#) implements the functionality identified by the value 0b0001.

In ARMv8.0, ARMv8.1, and ARMv8.2, the only permitted value is 0b0000.

In ARMv8.3, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

FCMA, bits [19:16]

From ARMv8.3:

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

0b0000 The FCMLA and FCADD instructions are not implemented.

0b0001 The FCMLA and FCADD instructions are implemented.

All other values are reserved.

[ARMv8.3-CompNum](#) implements the functionality identified by the value 0b0001.

In ARMv8.0, ARMv8.1, and ARMv8.2, the only permitted value is 0b0000.

From ARMv8.3, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

JSCVT, bits [15:12]

From ARMv8.3:

Indicates support for javascript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

0b0000 The FJCVTZS instruction is not implemented.

0b0001 The FJCVTZS instruction is implemented.

All other values are reserved.

[ARMv8.3-JSConv](#) implements the functionality identified by 0b0001.

In ARMv8.0, ARMv8.1, and ARMv8.2, the only permitted value is 0b0000.

From ARMv8.3, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

API, bits [11:8]

From ARMv8.3:

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. Defined values are:

0b0000 Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.

0b0001 Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This involves all Pointer Authentication instructions other than the PACGA instruction.

All other values are reserved.

From ARMv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, this field must have the value 0b0000.

Otherwise:

Reserved, RES0.

APA, bits [7:4]

From ARMv8.3:

Indicates whether QARMA or Architected algorithm is implemented in the PE for address authentication, in AArch64 state. Defined values are:

0b0000 Address Authentication using an Architected algorithm is not implemented.

0b0001 Address Authentication using the QARMA algorithm is implemented. This involves all Pointer Authentication instructions other than the PACGA instruction.

All other values are reserved.

From ARMv8.3, the permitted values are 0b0000 and 0b0001.

If the value of the ID_AA64ISAR1_EL1.API is non-zero, this field must have the value 0b0000.

Otherwise:

Reserved, RES0.

DPB, bits [3:0]

From ARMv8.2:

Indicates support for the DC CVAP instruction in AArch64 state. Defined values are:

0b0000 DC CVAP not supported.

0b0001 DC CVAP supported.

All other values are reserved.

ARMv8.2-DCPoP implements the functionality identified by the value 0b0001.

From ARMv8.2 to ARMv8.4, the only permitted values is 0b0001.

Otherwise:

Reserved, RES0.

If API == 0000 and APA == 0000, then:

- The TCR_EL1.{TBID,TBID0}, TCR_EL2.{TBID0,TBID1}, TCR_EL2.TBID and TCR_EL3.TBID bits are RES0.
- APIAKeyHi_EL1, APIAKeyLo_EL1, APIBKeyHi_EL1, APIBKeyLo_EL1, APDAKeyHi_EL1, APDAKeyLo_EL1, APDBKeyHi_EL1, APDBKeyLo_EL1 are not allocated.

- [SCTLR_ELx.EnIA](#), [SCTLR_ELx.EnIB](#), [SCTLR_ELx.EnDA](#), [SCTLR_ELx.EnDB](#) are all RES0.

If [API](#) == 0000 and [APA](#) == 0000 and [GPI](#) == 0000 and [GPA](#) == 0000, then:

- [HCR_EL2.APK](#) and [HCR_EL2.API](#) are RES0.
- [SCR_EL3.APK](#) and [SCR_EL3.API](#) are RES0.

Accessing the ID_AA64ISAR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64ISAR1_EL1	11	0000	000	001	0110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.TID3](#) == 1, then read accesses at EL1 are trapped to EL2.

D12.2.53 ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64MMFR0_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

TGran4, bits [31:28]

Support for 4KB memory translation granule size. Defined values are:

0b0000 4KB granule supported.

0b1111 4KB granule not supported.

All other values are reserved.

TGran64, bits [27:24]

Support for 64KB memory translation granule size. Defined values are:

0b0000 64KB granule supported.

0b1111 64KB granule not supported.

All other values are reserved.

TGran16, bits [23:20]

Support for 16KB memory translation granule size. Defined values are:

0b0000 16KB granule not supported.

0b0001 16KB granule supported.

All other values are reserved.

BigEndEL0, bits [19:16]

Mixed-endian support at EL0 only. Defined values are:

0b0000 No mixed-endian support at EL0. The [SCTLR_EL1.E0E](#) bit has a fixed value.

0b0001 Mixed-endian support at EL0. The [SCTLR_EL1.E0E](#) bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if the BigEnd field, bits [11:8], is not 0b0000.

SNSMem, bits [15:12]

Secure versus Non-secure Memory distinction. Defined values are:

0b0000 Does not support a distinction between Secure and Non-secure Memory.

0b0001 Does support a distinction between Secure and Non-secure Memory.

All other values are reserved.

BigEnd, bits [11:8]

Mixed-endian configuration support. Defined values are:

0b0000 No mixed-endian support. The `SCTLR_ELx.EE` bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.

0b0001 Mixed-endian support. The `SCTLR_ELx.EE` and `SCTLR_EL1.E0E` bits can be configured.

All other values are reserved.

ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

0b0000 8 bits.

0b0010 16 bits.

All other values are reserved.

PARange, bits [3:0]

Physical Address range supported. Defined values are:

0b0000 32 bits, 4GB.

0b0001 36 bits, 64GB.

0b0010 40 bits, 1TB.

0b0011 42 bits, 4TB.

0b0100 44 bits, 16TB.

0b0101 48 bits, 256TB.

0b0110 52 bits, 4PB.

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes [ARMv8.2-LPA](#), otherwise it is reserved.

Accessing the ID_AA64MMFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64MMFR0_EL1	11	0000	000	000	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.54 ID_AA64MMFR1_EL1, AArch64 Memory Model Feature Register 1

The ID_AA64MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64MMFR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64MMFR1_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

XNX, bits [31:28]

From ARMv8.2:

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

0b0000 Distinction between EL0 and EL1 execute-never control at stage 2 not supported.

0b0001 Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

[ARMv8.2-TTS2UXN](#) implements the functionality identified by the value 0b0001.

From ARMv8.2, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

SpecSEI, bits [27:24]

When RAS is implemented:

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

0b0000 The PE never generates an SError interrupt due to an External abort on a speculative read.

0b0001 The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

Otherwise:

Reserved, RES0. This provides no information about whether the PE generates a speculative SError interrupt.

PAN, bits [23:20]

From ARMv8.1:

Privileged Access Never. Indicates support for the PAN bit in PSTATE, [SPSR_EL1](#), [SPSR_EL2](#), [SPSR_EL3](#), and [DPSR_EL0](#). Defined values are:

- 0b0000 PAN not supported.
- 0b0001 PAN supported.
- 0b0010 PAN supported and [AT SIE1RP](#) and [AT SIE1WP](#) instructions supported.

All other values are reserved.

[ARMv8.1-PAN](#) implements the functionality identified by the value 0b0001.

[ARMv8.2-ATSIE1](#) implements the functionality added by the value 0b0010.

In ARMv8.1, the only permitted value is 0b0001.

From ARMv8.2, the only permitted value is 0b0010.

Otherwise:

Reserved, RES0.

LO, bits [19:16]

From ARMv8.1:

LORegions. Indicates support for LORegions. Defined values are:

- 0b0000 LORegions not supported.
- 0b0001 LORegions supported.

All other values are reserved.

[ARMv8.1-LOR](#) implements the functionality identified by the value 0b0001.

From ARMv8.1, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

HPDS, bits [15:12]

From ARMv8.1:

Hierarchical permission disables bits in translation tables. Defined values are:

- 0b0000 Disabling of hierarchical controls not supported.
- 0b0001 Disabling of hierarchical controls supported with the [TCR_EL1](#).{HPD1, HPD0}, [TCR_EL2](#).HPD or [TCR_EL2](#).{HPD1, HPD0}, and [TCR_EL3](#).HPD bits.
- 0b0010 As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

[ARMv8.1-HPD](#) implements the functionality identified by the value 0b0001.

[ARMv8.2-TTPBHA](#) implements the functionality identified by the value 0b0010.

From ARMv8.1, the value 0b0000 is not permitted.

Otherwise:

Reserved, RES0.

VH, bits [11:8]

From ARMv8.1:

Virtualization Host Extensions. Defined values are:

- 0b0000 Virtualization Host Extensions not supported.
- 0b0001 Virtualization Host Extensions supported.

All other values are reserved.

[ARMv8.1-VHE](#) implements the functionality identified by the value 0b0001.

From ARMv8.1, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

VMIDBits, bits [7:4]

From ARMv8.1:

Number of VMID bits. Defined values are:

0b0000 8 bits

0b0010 16 bits

All other values are reserved.

[ARMv8.1-VMID16](#) implements the functionality identified by the value 0b0010.

From ARMv8.1, the permitted values are 0b0000 and 0b0010.

Otherwise:

Reserved, RES0.

HAFDBS, bits [3:0]

From ARMv8.1:

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

0b0000 Hardware update of the Access flag and dirty state are not supported.

0b0001 Hardware update of the Access flag is supported.

0b0010 Hardware update of both the Access flag and dirty state is supported.

All other values are reserved.

[ARMv8.1-TTHM](#) implements the functionality identified by the values 0b0001 and 0b0010.

From ARMv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

Otherwise:

Reserved, RES0.

Accessing the ID_AA64MMFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64MMFR1_EL1	11	0000	000	001	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.55 ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

This register is present only from ARMv8.2. Otherwise, direct accesses to ID_AA64MMFR2_EL1 are RES0.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.2.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions

The ID_AA64MMFR2_EL1 bit assignments are:

Bits [63:56]

Reserved, RES0.

BBM, bits [55:52]

From ARMv8.4:

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

0b0000 Level 0 support for changing block size is supported.

0b0001 Level 1 support for changing block size is supported.

0b0010 Level 2 support for changing block size is supported.

All other values are reserved.

[ARMv8.4-TTRem](#) implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From ARMv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

Otherwise:

Reserved, RES0.

TTL, bits [51:48]

From ARMv8.4:

Indicates support for TTL field in address operations. Defined values are:

0b0000 TLB maintenance instructions by address have bits[47:44] as RES0.

0b0001 TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

[ARMv8.4-TTL](#) implements the functionality identified by the value 0b0001.

This field affects TLBI IPAS2E1, TLBI IPAS2E1IS, TLBI IPAS2E1OS, TLBI IPAS2LE1, TLBI IPAS2LE1IS, TLBI IPAS2LE1OS, TLBI VAAE1, TLBI VAAE1IS, TLBI VAAE1OS, TLBI VAALE1, TLBI VAALE1IS, TLBI VAALE1OS, TLBI VAE1, TLBI VAE1IS, TLBI VAE1OS, TLBI VAE2, TLBI VAE2IS, TLBI VAE2OS, TLBI VAE3, TLBI VAE3IS, TLBI VAE3OS, TLBI VALE1, TLBI VALE1IS, TLBI VALE1OS, TLBI VALE2, TLBI VALE2IS, TLBI VALE2OS, TLBI VALE3, TLBI VALE3IS, TLBI VALE3OS.

From ARMv8.4, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

From ARMv8.4:

Indicates support for HCR_EL2.FWB

0b0000 HCR_EL2.FWB bit is not supported and the field is RES0

0b0001 HCR_EL2.FWB is supported.

If Armv8.4Sec-EL2 is implemented the only permitted value is 0b0001

All other values reserved.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IDS, bits [39:36]

From ARMv8.4:

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

0b0000 An exception generated by a read access to the feature ID space is reported by ESR_ELx.EC == 0x0.

0b0001 An exception generated by a read access to the feature ID space is reported by ESR_ELx.EC == 0x18.

All other values are reserved.

ARMv8.4-IDST implements the functionality identified by the value 0b0001.

From ARMv8.4, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

AT, bits [35:32]

From ARMv8.4:

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

0b0000 Unaligned single-copy atomicity and atomic functions are not supported.

0b0001 Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

ARMv8.4-LSE implements the functionality identified by the value 0b0001.

From ARMv8.4, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

ST, bits [31:28]

From ARMv8.4:

Identifies support for small translation tables. Defined values are:

- 0b0000 The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.
- 0b0001 The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

[ARMv8.4-TTST](#) implements the functionality identified by the value 0b0001.

If Armv8.4-SecEL2 is implemented the only permitted value is 0b0001.

In an implementation which does not support Secure EL2, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

NV, bits [27:24]

From ARMv8.4:

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

- 0b0000 Nested virtualization is not supported.
- 0b0001 The HCR_EL2.NV, HCR_EL2.NV1, HCR_EL2.AT bits are implemented.
- 0b0010 The [VNCR_EL2](#) register and the HCR_EL2.{AT, NV, NV1, NV2} bits are implemented.

All other values are reserved.

In ARMv8.2, the only permitted value is 0b0000.

In ARMv8.3, the permitted values are:

- When EL2 is not implemented, 0b0000.
- When EL2 is implemented, 0b0001.

The feature [ARMv8.3-NV](#) implements the functionality identified by the value 0b0001.

In ARMv8.4, the permitted values are:

- When EL2 is not implemented, 0b0000.
- When EL2 is implemented, 0b0010.

The feature [ARMv8.4-NV](#) implements the functionality identified by the value 0b0010.

From ARMv8.3:

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

- 0b0000 Nested virtualization is not supported.
- 0b0001 The HCR_EL2.NV, HCR_EL2.NV1, HCR_EL2.AT bits are implemented.

All other values are reserved.

In ARMv8.2, the only permitted value is 0b0000.

From ARMv8.3, the permitted values are:

- When EL2 is not implemented, 0b0000.
- When EL2 is implemented, 0b0001.

The feature [ARMv8.3-NV](#) implements the functionality identified by this value.

Otherwise:

Reserved, RES0.

CCIDX, bits [23:20]

From ARMv8.3:

Support for the use of revised [CCSIDR_EL1](#) register format. Defined values are:

- 0b0000 32-bit format implemented for all levels of the [CCSIDR_EL1](#).
- 0b0001 64-bit format implemented for all levels of the [CCSIDR_EL1](#).

All other values are reserved.

This feature is identified as [ARMv8.3-CCIDX](#).

From ARMv8.3, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

VARange, bits [19:16]

From ARMv8.2:

Indicates support for a larger virtual address. Defined values are:

- 0b0000 VMSAv8-64 supports 48-bit VAs.
- 0b0001 VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The other translation granules support 48-bit VAs.

All other values are reserved.

[ARMv8.2-LVA](#) implements the functionality identified by the value 0b0001.

From ARMv8.2, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

IESB, bits [15:12]

From ARMv8.2:

Indicates support for the IESB bit in the [SCTLR_ELx](#) registers. Defined values are:

- 0b0000 IESB bit in the [SCTLR_ELx](#) registers is not supported.
- 0b0001 IESB bit in the [SCTLR_ELx](#) registers is supported.

All other values are reserved.

[ARMv8.2-IESB](#) implements the functionality identified by the value 0b0001.

From ARMv8.2, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

LSM, bits [11:8]

From ARMv8.2:

Indicates support for LSMAOE and nTLSMD bits in [SCTLR_EL1](#) and [SCTLR_EL2](#). Defined values are:

- 0b0000 LSMAOE and nTLSMD bits not supported.
- 0b0001 LSMAOE and nTLSMD bits supported.

All other values are reserved.

[ARMv8.2-LSMAOC](#) implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

UAO, bits [7:4]

From ARMv8.2:

User Access Override. Defined values are:

0b0000 UAO not supported.

0b0001 UAO supported.

All other values are reserved.

[ARMv8.2-UAO](#) implements the functionality identified by the value 0b0001.

From ARMv8.2, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

CnP, bits [3:0]

From ARMv8.2:

Common not Private translations. Defined values are:

0b0000 Common not Private translations not supported.

0b0001 Common not Private translations supported.

All other values are reserved.

[ARMv8.2-TTCNP](#) implements the functionality identified by the value 0b0001.

From ARMv8.2, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Accessing the ID_AA64MMFR2_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
ID_AA64MMFR2_EL1	0000	11	000	010	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.TID3} == 1$, then read accesses at EL1 are trapped to EL2.

D12.2.56 ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

The external register [EDPFR](#) gives information from this register.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64PFR0_EL1 bit assignments are:

Bits [63:52]

Reserved, RES0.

DIT, bits [51:48]

From ARMv8.4:

Data Independent Timing. Defined values are:

0b0000 AArch64 does not guarantee constant execution time of any instructions.

0b0001 AArch64 provides the [PSTATE.DIT](#) mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

[ARMv8.4-DIT](#) implements the functionality identified by the value 0b0001.

From ARMv8.4, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

AMU, bits [47:44]

From ARMv8.4:

Activity Monitors Extension. Defined values are:

0b0000 Activity Monitors Extension is not implemented.

0b0001 Activity Monitors Extension Version 1 is implemented.

All other values are reserved.

[AMUv1](#) implements the functionality identified by the value 0b0001.

In ARMv8.0, ARMv8.1, ARMv8.2, and ARMv8.3, the only permitted value is 0b0000.

From ARMv8.4, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

MPAM, bits [43:40]

From ARMv8.2, or if ARMv8.3 or ARMv8.4:

MPAM Extension. Defined values are:

0b0000 MPAM is not implemented.

0b0001 MPAM is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

SEL2, bits [39:36]

From ARMv8.4:

Secure EL2. Defined values are:

0b0000 Secure EL2 is not implemented.

0b0001 Secure EL2 is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

SVE, bits [35:32]

From ARMv8.2:

Scalable Vector Extension. Defined values are:

0b0000 SVE is not implemented.

0b0001 SVE is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

RAS, bits [31:28]

RAS Extension version. The defined values of this field are:

0b0000 No RAS Extension.

0b0001 RAS Extension present.

0b0010 ARMv8.4-RAS present. As 0b0001, and adds support for:

- If EL3 is implemented, [ARMv8.4-DFE](#).
- Additional ERXMISC<m>_EL1 System registers.
- Additional System registers [ERXPFPCDN_EL1](#), [ERXPFPCCTL_EL1](#), and [ERXPFPGF_EL1](#), and the [SCR_EL3.FIEN](#) and [HCR_EL2.FIEN](#) trap controls, to support the optional RAS Common Fault Injection Model Extension.

Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

From ARMv8.4, the only permitted value is 0b0010.

[ARMv8.4-RAS](#) implements the functionality identified by the value 0b0010.

In ARMv8.2, the only permitted value is 0b0001.

In ARMv8.1 and ARMv8.0, the permitted values are 0b0000 and 0b0001.

GIC, bits [27:24]

System register GIC interface support. Defined values are:

- 0b0000 No System register interface to the GIC is supported.
 - 0b0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
- All other values are reserved.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

- 0b0000 Advanced SIMD is implemented, including support for the following SIMD and SIMD operations:
 - Integer byte, halfword, word and doubleword element operations.
 - Single-precision and double-precision floating-point arithmetic.
 - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
- 0b0001 As for 0b0000, and also includes support for half-precision floating-point arithmetic.
- 0b1111 Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the [ARMv8.2-FP16](#) extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the [ARMv8.2-FP16](#) extension.
- 0b1111 in an implementation without Advanced SIMD support.

FP, bits [19:16]

Floating-point. Defined values are:

- 0b0000 Floating-point is implemented, and includes support for:
 - Single-precision and double-precision floating-point types.
 - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
- 0b0001 As for 0b0000, and also includes support for half-precision floating-point arithmetic.
- 0b1111 Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the [ARMv8.2-FP16](#) extension.
- 0b0001 in an implementation with floating-point support that includes the [ARMv8.2-FP16](#) extension.
- 0b1111 in an implementation without floating-point support.

EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

- 0b0000 EL3 is not implemented.
- 0b0001 EL3 can be executed in AArch64 state only.
- 0b0010 EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

0b0000 EL2 is not implemented.

0b0001 EL2 can be executed in AArch64 state only.

0b0010 EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

0b0001 EL1 can be executed in AArch64 state only.

0b0010 EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

0b0001 EL0 can be executed in AArch64 state only.

0b0010 EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

Accessing the ID_AA64PFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64PFR0_EL1	11	0000	000	000	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.57 ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.
For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

There are no configuration notes.
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AA64PFR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64PFR1_EL1 bit assignments are:

Bits [63:16]

Reserved, RES0.

RAS_frac, bits [15:12]

When ARMv8.4-RAS is implemented:

RAS Extension fractional field.

0b0000 If ID_AA64PFR0_EL1.RAS == 0b0001, RAS Extension implemented.

0b0001 If ID_AA64PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for:

- Additional ERXMISC<m>_EL1 System registers.
- Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension.

Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

This field is valid only if ID_AA64PFR0_EL1.RAS == 0b0001.

Otherwise:

Reserved, RES0.

Bits [11:0]

Reserved, RES0.

Accessing the ID_AA64PFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AA64PFR1_EL1	11	0000	000	001	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.58 ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D12-2680](#).

Configurations

AArch64 System register ID_AFR0_EL1[31:0] is architecturally mapped to AArch32 System register [ID_AFR0](#)[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AFR0_EL1 bit assignments are:

Bits [63:16]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [15:12]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [11:8]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [7:4]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [3:0]

IMPLEMENTATION DEFINED.

Accessing the ID_AFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_AFR0_EL1	11	0000	000	011	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.59 ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D12-2680](#).

Configurations

AArch64 System register ID_DFR0_EL1[31:0] is architecturally mapped to AArch32 System register [ID_DFR0](#)[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_DFR0_EL1 is a 64-bit register.

Field descriptions

The ID_DFR0_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

TraceFilt, bits [31:28]

ARMv8.4 Self-hosted Trace Extension version. Defined values are:

0b0000 ARMv8.4 Self-hosted Trace Extension not implemented.

0b0001 ARMv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

[ARMv8.4-Trace](#) implements the functionality added by the value 0b0001.

From ARMv8.3, the permitted values are 0b0000 and 0b0001.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in [Alternative ID scheme used for the Performance Monitors Extension version on page D12-2682](#).

Defined values are:

0b0000 Performance Monitors Extension not implemented.

0b0001 Performance Monitors Extension version 1 implemented, PMUv1.

0b0010 Performance Monitors Extension version 2 implemented, PMUv2.

0b0011 Performance Monitors Extension version 3 implemented, PMUv3.

0b0100 PMUv3 for ARMv8.1. As 0b0011, and also includes support for:

- Extended 16-bit [PMEVTYPER<n>.evtCount](#) field.
- If EL2 is implemented, the [HDCR.HPMD](#) control bit.

0b0101 PMUv3 for ARMv8.4. As 0b0100 and also includes support for the [PMMIR](#) register.
0b1111 IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations.

[ARMv8.1-PMU](#) implements the functionality added by the value 0b0100.

[ARMv8.4-PMU](#) implements the functionality added by the value 0b0101.

All other values are reserved.

In any ARMv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From ARMv8.1, the value 0b0011 is not permitted.

From ARMv8.4, the value 0b0100 is not permitted.

———— **Note** —————

In ARMv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an ARMv8 implementation.

MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

0b0000 Not supported.

0b0001 Support for M profile Debug architecture, with memory-mapped access.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0000.

MMapTrc, bits [19:16]

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

0b0000 Not supported.

0b0001 Support for ARM trace architecture, with memory-mapped access.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

0b0000 Not supported.

0b0001 Support for ARM trace architecture, with System registers access.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

MMapDbg, bits [11:8]

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In ARMv8-A, this field is RES0.

The optional memory map defined by ARMv8 is not compatible with ARMv7.

CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:

- 0b0000 Not supported.
- 0b0010 Support for ARMv6, v6 Debug architecture, with System registers access.
- 0b0011 Support for ARMv6, v6.1 Debug architecture, with System registers access.
- 0b0100 Support for ARMv7, v7 Debug architecture, with System registers access.
- 0b0101 Support for ARMv7, v7.1 Debug architecture, with System registers access.
- 0b0110 Support for ARMv8 debug architecture, with System registers access.
- 0b0111 Support for ARMv8 debug architecture, with System registers access, and Virtualization Host extensions.
- 0b1000 Support for ARMv8.2 debug architecture.
- 0b1001 Support for ARMv8.4 debug architecture.

All other values are reserved.

In any ARMv8 implementation, the values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

If [ARMv8.1-VHE](#) is not implemented, the only permitted value is 0b0110.

In an ARMv8.0 implementation, the value 0b1000 is not permitted.

Accessing the ID_DFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_DFR0_EL1	11	0000	000	010	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.TID3} == 1$, then read accesses at EL1 are trapped to EL2.

D12.2.60 ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D12-2680.

Configurations

AArch64 System register ID_ISAR0_EL1[31:0] is architecturally mapped to AArch32 System register ID_ISAR0[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR0_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR0_EL1 bit assignments are:

Bits [63:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds SDIV and UDIV in the T32 instruction set.

0b0010 As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0010.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds BKPT.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

0b0000 None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.

0b0001 Adds generic CDP, LDC, MCR, MRC, and STC.

0b0010 As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.

0b0011 As for 0b0010, and adds generic MCRR and MRRC.

0b0100 As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0000.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

0b0000 None implemented.

0b0001 Adds CBNZ and CBZ.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds CLZ.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

0b0000 None implemented.

0b0001 Adds SWP and SWPB.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0000.

Accessing the ID_ISAR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_ISAR0_EL1	11	0000	000	000	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.61 ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D12-2680.

Configurations

AArch64 System register ID_ISAR1_EL1[31:0] is architecturally mapped to AArch32 System register ID_ISAR1[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR1_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR1_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

0b0000 No support for Jazelle.

0b0001 Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the BX instruction, and the T bit in the PSR.

0b0010 As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.

0b0011 As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0011.

Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

0b0000 None implemented.

0b0001 Adds:

- The MOV_T instruction.
- The MOV instruction encodings with zero-extended 16-bit immediates.
- The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

0b0000 None implemented.

0b0001 Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

0b0000 No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.

0b0001 Adds the SXTB, SXT_H, UXTB, and UXTH instructions.

0b0010 As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0010.

Except_AR, bits [11:8]

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

0b0000 Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.

0b0001 Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the SETEND instruction, and the E bit in the PSRs.
All other values are reserved.
In ARMv8-A, the permitted values are 0b0000 and 0b0001.

Accessing the ID_ISAR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_ISAR1_EL1	11	0000	000	001	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.62 ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D12-2680.

Configurations

AArch64 System register ID_ISAR2_EL1[31:0] is architecturally mapped to AArch32 System register ID_ISAR2[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR2_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR2_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the REV, REV16, and REVSH instructions.
- 0b0010 As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

PSR_AR, bits [27:24]

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.

- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the UMULL and UMLAL instructions.
- 0b0010 As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the SMULL and SMLAL instructions.
- 0b0010 As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
- 0b0011 As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLS LD, SMLS LD, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0011.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

- 0b0000 No additional instructions implemented. This means only MUL is implemented.
- 0b0001 Adds the MLA instruction.
- 0b0010 As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

- 0b0000 No support. This means the LDM and STM instructions are not interruptible.
- 0b0001 LDM and STM instructions are restartable.
- 0b0010 LDM and STM instructions are continuable.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the PLD instruction.
- 0b0010 Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
- 0b0011 As for 0b0001 (or 0b0010), and adds the PLI instruction.
- 0b0100 As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0100.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

- 0b0000 No additional load/store instructions implemented.
- 0b0001 Adds the LDRD and STRD instructions.
- 0b0010 As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

Accessing the ID_ISAR2_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_ISAR2_EL1	11	0000	000	010	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.63 ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D12-2680.

Configurations

AArch64 System register ID_ISAR3_EL1[31:0] is architecturally mapped to AArch32 System register ID_ISAR3[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR3_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR3_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0000.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

0b0000 None implemented. This means there are no NOP instructions that do not have any register dependencies.

0b0001 Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

0b0000 Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.

0b0001 Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

0b0000 None implemented.

0b0001 Adds the TBB and TBH instructions.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

0b0000 If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.

0b0001 If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions.

If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.

0b0010 If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In ARMv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

0b0000 Not implemented.

0b0001 Adds the SVC instruction.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the SSAT and USAT instructions, and the Q bit in the PSRs.

0b0011 As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

0b0000 None implemented. This means no non-Advanced SIMD saturate instructions are implemented.

0b0001 Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

Accessing the ID_ISAR3_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_ISAR3_EL1	11	0000	000	011	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.64 ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D12-2680.

Configurations

AArch64 System register ID_ISAR4_EL1[31:0] is architecturally mapped to AArch32 System register [ID_ISAR4](#)[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR4_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR4_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

0b0000 SWP or SWPB instructions not implemented.

0b0001 SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if the [ID_ISAR0](#).Swap_insts field is 0b0000.

In ARMv8-A, the only permitted value is 0b0000.

PSR_M, bits [27:24]

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

0b0000 None implemented.

0b0001 Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with [ID_ISAR3.SynchPrim](#) to indicate the implemented Synchronization Primitive instructions. Possible values are:

- 0b0000 If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
- 0b0011 If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In ARMv8-A, the only permitted value is 0b0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

- 0b0000 None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
- 0b0001 Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the SMC instruction.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32, then this field has the value 0b0000.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

- 0b0000 Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
- 0b0001 Adds support for all of the writeback addressing modes.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

- 0b0000 Nonzero shifts supported only in MOV and shift instructions.
- 0b0001 Adds support for shifts of loads and stores over the range LSL 0-3.
- 0b0011 As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
- 0b0100 As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0100.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

0b0000 None implemented. No T variant instructions are implemented.

0b0001 Adds the LDRBT, LDRT, STRBT, and STRT instructions.

0b0010 As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0010.

Accessing the ID_ISAR4_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_ISAR4_EL1	11	0000	000	100	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.65 ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D12-2680.

Configurations

AArch64 System register ID_ISAR5_EL1[31:0] is architecturally mapped to AArch32 System register ID_ISAR5[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR5_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR5_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

VCMA, bits [31:28]

From ARMv8.3:

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

0b0000 The VCMLA and VCADD instructions are not implemented in AArch32.

0b0001 The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

ARMv8.3-CompNum implements the functionality identified by 0b0001.

In ARMv8.0, ARMv8.1, and ARMv8.2, the only permitted value is 0b0000.

From ARMv8.3, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

RDM, bits [27:24]

From ARMv8.1:

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

0b0000 No VQRDMLAH and VQRDMLSH instructions implemented.

0b0001 VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

ARMv8.1-RDMA implements the functionality identified by the value 0b0001.

In ARMv8.0, the only permitted value is 0b0000.

From ARMv8.1, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

0b0000 No CRC32 instructions implemented.

0b0001 CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In ARMv8.0, the permitted values are 0b0000 and 0b0001.

From ARMv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

0b0000 No SHA2 instructions implemented.

0b0001 SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

0b0000 No SHA1 instructions implemented.

0b0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

0b0000 No AES instructions implemented.

0b0001 AESE, AESD, AESMC, and AESIMC implemented.

0b0010 As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0010.

SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

0b0000 SEVL is implemented as a NOP.

0b0001 SEVL is implemented as Send Event Local.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0001.

Accessing the ID_ISAR5_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_ISAR5_EL1	11	0000	000	101	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.66 ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D12-2680.

Configurations

AArch64 System register ID_ISAR6_EL1[31:0] is architecturally mapped to AArch32 System register ID_ISAR6[31:0].

This register is present only from ARMv8.2. Otherwise, direct accesses to ID_ISAR6_EL1 are RES0.

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.2.

Attributes

ID_ISAR6_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR6_EL1 bit assignments are:

Bits [63:12]

Reserved, RES0.

FHM, bits [11:8]

Indicates whether VFMAL and VFMSL instructions are implemented.

0b0000 VFMAL and VMFSL instructions are not implemented.

0b0001 VFMAL and VMFSL instructions are implemented.

[ARMv8.2-FHM](#) implements the functionality identified by the value 0b0001.

In ARMv8.0 and ARMv8.1, the only permitted value is 0b0000.

In ARMv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [7:4]

Indicates the support for dot product instructions in AArch32 state.

0b0000 No dot product instructions are implemented.

0b0001 VUDOT and VSDOT instructions are implemented.

All other values are reserved.

[ARMv8.2-DotProd](#) implements the functionality identified by the value 0b0001.

In ARMv8.0 and ARMv8.1, the only permitted value is 0b0000.

In ARMv8.2, the permitted values are 0b0000 and 0b0001.

JSCVT, bits [3:0]

From ARMv8.3:

Indicates whether the Javascript conversion instruction is implemented in AArch32 state. Defined values are:

0b0000 The VJCVT instruction is not implemented.

0b0001 The VJCVT instruction is implemented.

All other values are reserved.

[ARMv8.3-JSConv](#) implements the functionality identified by 0b0001.

In ARMv8.0, ARMv8.1, and ARMv8.2, the only permitted value is 0b0000.

From ARMv8.3, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Accessing the ID_ISAR6_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
ID_ISAR6_EL1	0000	11	000	111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.67 ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID_MMFR1_EL1](#), [ID_MMFR2_EL1](#), [ID_MMFR3_EL1](#), and [ID_MMFR4_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

AArch64 System register ID_MMFR0_EL1[31:0] is architecturally mapped to AArch32 System register [ID_MMFR0](#)[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_MMFR0_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR0_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

- 0b0000 Implemented as Non-cacheable.
- 0b0001 Implemented with hardware coherency support.
- 0b1111 Shareability ignored.

All other values are reserved.

In ARMv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNK.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support for FCSE.

All other values are reserved.

In ARMv8 the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

- 0b0000 None supported.
- 0b0001 Support for Auxiliary Control Register only.
- 0b0010 Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

In ARMv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support is IMPLEMENTATION DEFINED. ARMv7 requires this setting.
- 0b0010 Support for TCM only, ARMv6 implementation.
- 0b0011 Support for TCM and DMA, ARMv6 implementation.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

- 0b0000 One level of shareability implemented.
- 0b0001 Two levels of shareability implemented.

All other values are reserved.

In ARMv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

- 0b0000 Implemented as Non-cacheable.
- 0b0001 Implemented with hardware coherency support.
- 0b1111 Shareability ignored.

All other values are reserved.

In ARMv8 the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support for IMPLEMENTATION DEFINED PMSA.
- 0b0010 Support for PMSAv6, with a Cache Type Register implemented.
- 0b0011 Support for PMSAv7, with support for memory subsections. ARMv7-R profile.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

VMVA, bits [3:0]

Indicates support for a VMVA. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support for IMPLEMENTATION DEFINED VMVA.
- 0b0010 Support for VMVAv6, with Cache and TLB Type Registers implemented.
- 0b0011 Support for VMVAv7, with support for remapping and the Access flag. ARMv7-A profile.
- 0b0100 As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
- 0b0101 As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0101.

Accessing the ID_MMFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_MMFR0_EL1	11	0000	000	100	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.68 ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1

The ID_MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID_MMFR0_EL1](#), [ID_MMFR2_EL1](#), [ID_MMFR3_EL1](#), and [ID_MMFR4_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

AArch64 System register ID_MMFR1_EL1[31:0] is architecturally mapped to AArch32 System register [ID_MMFR1](#)[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_MMFR1_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR1_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

- | | |
|--------|--|
| 0b0000 | No branch predictor, or no MMU present. Implies a fixed MPU configuration. |
| 0b0001 | Branch predictor requires flushing on: <ul style="list-style-type: none"> • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Changes to the TTBR0, TTBR1, or TTBCR registers. • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported. |
| 0b0010 | Branch predictor requires flushing on: <ul style="list-style-type: none"> • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported. |
| 0b0011 | Branch predictor requires flushing only on writing new data to instruction locations. |
| 0b0100 | For execution correctness, branch predictor requires no flushing at any time. |
- All other values are reserved.

In ARMv8-A the permitted values are 0b0010, 0b0011, or 0b0100. For values other than 0b0000 and 0b0100 the ARM Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 data cache test and clean operations are:
- Test and clean data cache.
- 0b0010 As for 0001, and adds:
- Test, clean, and invalidate data cache.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported entire Level 1 cache operations are:
- Invalidate cache, including branch predictor if appropriate.
 - Invalidate branch predictor, if appropriate.
- 0b0010 As for 0001, and adds:
- Clean cache, using a recursive model that uses the cache dirty status bit.
 - Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported entire Level 1 cache operations are:
- Invalidate instruction cache, including branch predictor if appropriate.
 - Invalidate branch predictor, if appropriate.
- 0b0010 As for 0001, and adds:
- Invalidate data cache.
 - Invalidate data cache and instruction cache, including branch predictor if appropriate.
- 0b0011 As for 0010, and adds:
- Clean data cache, using a recursive model that uses the cache dirty status bit.
 - Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 unified cache line maintenance operations by set/way are:
 - Clean cache line by set/way.
- 0b0010 As for 0001, and adds:
 - Clean and invalidate cache line by set/way.
- 0b0011 As for 0010, and adds:
 - Invalidate cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 Harvard cache line maintenance operations by set/way are:
 - Clean data cache line by set/way.
 - Clean and invalidate data cache line by set/way.
- 0b0010 As for 0001, and adds:
 - Invalidate data cache line by set/way.
- 0b0011 As for 0010, and adds:
 - Invalidate instruction cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 unified cache line maintenance operations by VA are:
 - Clean cache line by VA.
 - Invalidate cache line by VA.
 - Clean and invalidate cache line by VA.
- 0b0010 As for 0001, and adds:
 - Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 Harvard cache line maintenance operations by VA are:
 - Clean data cache line by VA.
 - Invalidate data cache line by VA.

- Clean and invalidate data cache line by VA.
 - Clean instruction cache line by VA.
- 0b0010 As for 0001, and adds:
- Invalidate branch predictor by VA, if branch predictor is implemented.
- All other values are reserved.
In ARMv8-A the only permitted value is 0b0000.

Accessing the ID_MMFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_MMFR1_EL1	11	0000	000	101	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

0b0001 Supported memory barrier System instructions are:

- Data Synchronization Barrier (DSB).

0b0010 As for 0001, and adds:

- Instruction Synchronization Barrier (ISB).
- Data Memory Barrier (DMB).

All other values are reserved.

In ARMv8 the only permitted value is 0b0010.

ARM deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

0b0000 Not supported.

0b0001 Supported unified TLB maintenance operations are:

- Invalidate all entries in the TLB.
- Invalidate TLB entry by VA.

0b0010 As for 0001, and adds:

- Invalidate TLB entries by ASID match.

0b0011 As for 0010, and adds:

- Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.

0b0100 As for 0011, and adds:

- Invalidate Hyp mode unified TLB entry by VA.
- Invalidate entire Non-secure PL1&0 unified TLB.
- Invalidate entire Hyp mode unified TLB.

0b0101 As for 0b0100, and adds the following operations: [TLBIMVALIS](#), [TLBIMVAALIS](#), [TLBIMVALHIS](#), [TLBIMVAL](#), [TLBIMVAAL](#), [TLBIMVALH](#).

0b0110 As for 0b0101, and adds the following operations: [TLBIIPAS2IS](#), [TLBIIPAS2LIS](#), [TLBIIPAS2](#), [TLBIIPAS2L](#).

All other values are reserved.

In ARMv8-A the only permitted value is 0b0110.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. ARM deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

0b0000 Not supported.

0b0001 Supported Level 1 Harvard cache maintenance range operations are:

- Invalidate data cache range by VA.
- Invalidate instruction cache range by VA.
- Clean data cache range by VA.
- Clean and invalidate data cache range by VA.

All other values are reserved.

In ARMv8 the only permitted value is 0b0000.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

0b0000 Not supported.

0b0001 Supported Level 1 Harvard cache background fetch operations are:

- Fetch instruction cache range by VA.
- Fetch data cache range by VA.

All other values are reserved.

In ARMv8 the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

0b0000 Not supported.

0b0001 Supported Level 1 Harvard cache foreground fetch operations are:

- Fetch instruction cache range by VA.
- Fetch data cache range by VA.

All other values are reserved.

In ARMv8 the only permitted value is 0b0000.

Accessing the ID_MMFR2_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_MMFR2_EL1	11	0000	000	110	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.TID3} == 1$, then read accesses at EL1 are trapped to EL2.

D12.2.70 ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID_MMFR0_EL1](#), [ID_MMFR1_EL1](#), [ID_MMFR2_EL1](#), and [ID_MMFR4_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

AArch64 System register ID_MMFR3_EL1[31:0] is architecturally mapped to AArch32 System register [ID_MMFR3](#)[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_MMFR3_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR3_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

0b0000 Supersections supported.

0b1111 Supersections not supported.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b1111.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

0b0000 4GB, corresponding to a 32-bit physical address range.

0b0001 64GB, corresponding to a 36-bit physical address range.

0b0010 1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000, 0b0001, and 0b0010.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

- 0b0000 Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
- 0b0001 Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

PAN, bits [19:16]

From ARMv8.1:

Privileged Access Never. Indicates support for the PAN bit in [CPSR](#), [SPSR](#), and [DSPSR](#) in AArch32 state. Defined values are:

- 0b0000 PAN not supported.
- 0b0001 PAN supported.
- 0b0010 PAN supported and [ATS1CPRP](#) and [ATS1CPWP](#) instructions supported.

All other values are reserved.

[ARMv8.1-PAN](#) implements the functionality identified by the value 0b0001.

[ARMv8.2-ATS1E1](#) implements the functionality added by the value 0b0010.

In ARMv8.1 the value 0b0000 is not permitted.

From ARMv8.2, the only permitted value is 0b0010.

Otherwise:

Reserved, RES0.

MaintBest, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

- 0b0000 Cache, TLB, and branch predictor operations only affect local structures.
- 0b0001 Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
- 0b0010 Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported branch predictor maintenance operations are:
 - Invalidate all branch predictors.
- 0b0010 As for 0001, and adds:
 - Invalidate branch predictors by VA.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported hierarchical cache maintenance instructions by set/way are:
- Invalidate data cache by set/way.
 - Clean data cache by set/way.
 - Clean and invalidate data cache by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported hierarchical cache maintenance operations by VA are:
- Invalidate data cache by VA.
 - Clean data cache by VA.
 - Clean and invalidate data cache by VA.
 - Invalidate instruction cache by VA.
 - Invalidate all instruction cache entries.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Accessing the ID_MMFR3_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_MMFR3_EL1	11	0000	000	111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.71 ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID_MMFR0_EL1](#), [ID_MMFR1_EL1](#), [ID_MMFR2_EL1](#), and [ID_MMFR3_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

AArch64 System register ID_MMFR4_EL1[31:0] is architecturally mapped to AArch32 System register [ID_MMFR4](#)[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_MMFR4_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR4_EL1 bit assignments are:

Bits [63:28]

Reserved, RES0.

CCIDX, bits [27:24]

From ARMv8.3:

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated.

Defined values are:

0b0000 32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.

0b0001 64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

From ARMv8.3, the permitted values are 0b0000 and 0b0001. This feature is identified as [ARMv8.3-CCIDX](#).

From ARMv8.2, or if ARMv8.1 or ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

LSM, bits [23:20]

From ARMv8.2:

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

0b0000 LSMAOE and nTLSMD bits not supported.

0b0001 LSMAOE and nTLSMD bits supported.

All other values are reserved.

[ARMv8.2-LSMAOC](#) implements the functionality identified by the value 0b0001.

From ARMv8.1, or if ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

HPDS, bits [19:16]

From ARMv8.2:

Hierarchical permission disables bits in translation tables. Defined values are:

0b0000 Disabling of hierarchical controls not supported.

0b0001 Supports disabling of hierarchical controls using the [TTBCR2.HPD0](#), [TTBCR2.HPD1](#), and [HTCR.HPD](#) bits.

0b0010 As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

[ARMv8.2-AA32HPD](#) implements the functionality identified by the value 0b0001.

[ARMv8.2-TTPBHA](#) implements the functionality added by the value 0b0010.

———— **Note** —————

The value 0b0000 implies that the encoding for [TTBCR2](#) is unallocated.

From ARMv8.1, or if ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

CnP, bits [15:12]

From ARMv8.2:

Common not Private translations. Defined values are:

0b0000 Common not Private translations not supported.

0b0001 Common not Private translations supported.

All other values are reserved.

[ARMv8.2-TTCNP](#) implements the functionality identified by the value 0b0001.

From ARMv8.2 the only permitted value is 0b0001.

From ARMv8.1, or if ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

XNX, bits [11:8]

From ARMv8.2:

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

- 0b0000 Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
- 0b0001 Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

[ARMv8.2-TTS2UXN](#) implements the functionality identified by the value 0b0001.

When [ARMv8.2-TTS2UXN](#) is implemented:

- If all of the following conditions are true it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0b0000 or 0b0001:
 - ID_AA64MMFR1_EL1.XNX ==1.
 - EL2 cannot use AArch32.
 - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

From ARMv8.1, or if ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

AC2, bits [7:4]

Indicates the extension of the [ACTLR](#) and [HACTLR](#) registers using [ACTLR2](#) and [HACTLR2](#). Defined values are:

- 0b0000 [ACTLR2](#) and [HACTLR2](#) are not implemented.
- 0b0001 [ACTLR2](#) and [HACTLR2](#) are implemented.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the permitted values are 0b0000 and 0b0001.

From ARMv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]

When RAS is implemented:

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

- 0b0000 The PE never generates an SError interrupt due to an External abort on a speculative read.
- 0b0001 The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

Otherwise:

Reserved, RES0. This provides no information about whether the PE generates a speculative SError interrupt.

Accessing the ID_MMFR4_EL1

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_MMFR4_EL1	11	0000	000	110	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0) && (HCR_EL2.TID3==1):
 - If the register is not RAZ/WI, Non-secure read accesses to this register from EL1 are trapped to EL2. Otherwise it is IMPLEMENTATION DEFINED whether Non-secure EL1 read accesses to this register are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0) && (HCR_EL2.TID3==1):
 - If the register is not RAZ/WI, Non-secure read accesses to this register from EL1 are trapped to EL2. Otherwise it is implementation defined whether Non-secure EL1 read accesses to this register are trapped to EL2.

D12.2.72 ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D12-2680.

Configurations

AArch64 System register ID_PFR0_EL1[31:0] is architecturally mapped to AArch32 System register ID_PFR0[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_PFR0_EL1 is a 64-bit register.

Field descriptions

The ID_PFR0_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

RAS, bits [31:28]

RAS Extension version.

0b0000 No RAS Extension.

0b0001 RAS Extension present.

0b0010 ARMv8.4-RAS present. As 0b0001, and adds support for additional ERXMISC<m>_EL1 System registers.

Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS, and support for the optional RAS Timestamp Extension.

All other values are reserved.

From ARMv8.4, the only permitted value is 0b0010.

[ARMv8.4-RAS](#) implements the functionality identified by the value 0b0010.

In ARMv8.2, the only permitted value is 0b0001.

In ARMv8.1 and ARMv8.0, the permitted values are 0b0000 and 0b0001.

DIT, bits [27:24]

From ARMv8.4:

Data Independent Timing. Defined values are:

0b0000 AArch32 does not guarantee constant execution time of any instructions.

0b0001 AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

[ARMv8.4-DIT](#) implements the functionality identified by the value `0b0001`.

From ARMv8.4, the only permitted value is `0b0001`.

Otherwise:

Reserved, RES0.

AMU, bits [23:20]

From ARMv8.4:

Activity Monitors Extension. Defined values are:

`0b0000` Activity Monitors Extension is not implemented.

`0b0001` Activity Monitors Extension Version 1 is implemented.

All other values are reserved.

[AMUv1](#) implements the functionality identified by the value `0b0001`.

In ARMv8.0, ARMv8.1, ARMv8.2, and ARMv8.3, the only permitted value is `0b0000`.

From ARMv8.4, the permitted values are `0b0000` and `0b0001`.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

`0b0000` Not implemented.

`0b0001` T32EE instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is `0b0000`.

State2, bits [11:8]

Jazelle extension support. Defined values are:

`0b0000` Not implemented.

`0b0001` Jazelle extension implemented, without clearing of [JOSCR.CV](#) on exception entry.

`0b0010` Jazelle extension implemented, with clearing of [JOSCR.CV](#) on exception entry.

All other values are reserved.

In ARMv8-A the only permitted value is `0b0001`.

State1, bits [7:4]

T32 instruction set support. Defined values are:

`0b0000` T32 instruction set not implemented.

`0b0001` T32 encodings before the introduction of Thumb-2 technology implemented:

- All instructions are 16-bit.
- A BL or BLX is a pair of 16-bit instructions.
- 32-bit instructions other than BL and BLX cannot be encoded.

`0b0011` T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In ARMv8-A the only permitted value is `0b0011`.

State0, bits [3:0]

A32 instruction set support. Defined values are:
 0b0000 A32 instruction set not implemented.
 0b0001 A32 instruction set implemented.
 All other values are reserved.
 In ARMv8-A the only permitted value is 0b0001.

Accessing the ID_PFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_PFR0_EL1	11	0000	000	000	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.73 ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D12-2680.

Configurations

AArch64 System register ID_PFR1_EL1[31:0] is architecturally mapped to AArch32 System register ID_PFR1[31:0].

In an implementation that supports only AArch64 state, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_PFR1_EL1 is a 64-bit register.

Field descriptions

The ID_PFR1_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

- 0b0000 No System register interface to the GIC CPU interface is supported.
 - 0b0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
- All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

- 0b0000 No features from the ARMv7 Virtualization Extensions are implemented.
- 0b0001 The following features of the ARMv7 Virtualization Extensions are implemented:
 - The SCR.SIF bit, if EL3 is implemented.
 - The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.
 - The MSR (banked register) and MRS (banked register) instructions.
 - The ERET instruction.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 when EL2 is implemented.

- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

———— **Note** —————

The ID_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

—————

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

0b0000 No features from the ARMv7 Security Extensions are implemented.

0b0001 The following features from the ARMv7 Security Extensions are implemented:

- The VBAR register.
- The TTBCR.PD0 and TTBCR.PD1 bits.

0b0010 As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

0b0000 Not implemented.

0b0001 Generic Timer implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

0b0000 EL2, Hyp mode, and the HVC instruction not implemented.

0b0001 EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

———— **Note** —————

The ID_ISARs do not identify whether the HVC instruction is implemented.

—————

MProgMod, bits [11:8]

M profile programmers' model support. Defined values are:

0b0000 Not supported.

0b0010 Support for two-stack programmers' model.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

Security, bits [7:4]

Security support. Defined values are:

0b0000 EL3, Monitor mode, and the SMC instruction not implemented.

0b0001 EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.

0b0010 As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in ARMv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

0b0000 Not supported.

0b0001 Supported.

All other values are reserved.

In ARMv8-A the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Accessing the ID_PFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_PFR1_EL1	11	0000	000	001	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ID_PFR2_EL1	11	0000	000	100	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.75 IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 [IFSR](#) register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register IFSR32_EL2[31:0] is architecturally mapped to AArch32 System register [IFSR](#)[31:0].

If EL1 is AArch64 only, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

IFSR32_EL2 is a 64-bit register.

Field descriptions

The IFSR32_EL2 bit assignments are:

When *TTBCR.EAE* == 0:

Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0b0 [IFAR](#) is valid.

0b1 [IFAR](#) is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

Ext, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bit [10]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

0b00001	PC alignment fault.
0b00010	Debug exception.
0b00011	Access flag fault, level 1.
0b00101	Translation fault, level 1.
0b00110	Access flag fault, level 2.
0b00111	Translation fault, level 2.
0b01000	Synchronous External abort, not on translation table walk.
0b01001	Domain fault, level 1.
0b01011	Domain fault, level 2.
0b01100	Synchronous External abort, on translation table walk, level 1.
0b01101	Permission fault, level 1.
0b01110	Synchronous External abort, on translation table walk, level 2.
0b01111	Permission fault, level 2.
0b10000	TLB conflict abort.
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.
0b11100	Synchronous parity or ECC error on translation table walk, level 1.
0b11110	Synchronous parity or ECC error on translation table walk, level 2.

All other values are reserved.

When the RAS Extension is implemented, 0b11001, 0b11100, and 0b11110 are reserved.

This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

FS, bits [3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

0b00001	PC alignment fault.
---------	---------------------

- 0b00010 Debug exception.
- 0b00011 Access flag fault, level 1.
- 0b00101 Translation fault, level 1.
- 0b00110 Access flag fault, level 2.
- 0b00111 Translation fault, level 2.
- 0b01000 Synchronous External abort, not on translation table walk.
- 0b01001 Domain fault, level 1.
- 0b01011 Domain fault, level 2.
- 0b01100 Synchronous External abort, on translation table walk, level 1.
- 0b01101 Permission fault, level 1.
- 0b01110 Synchronous External abort, on translation table walk, level 2.
- 0b01111 Permission fault, level 2.
- 0b10000 TLB conflict abort.
- 0b10100 IMPLEMENTATION DEFINED fault (Lockdown fault).
- 0b11001 Synchronous parity or ECC error on memory access, not on translation table walk.
- 0b11100 Synchronous parity or ECC error on translation table walk, level 1.
- 0b11110 Synchronous parity or ECC error on translation table walk, level 2.

All other values are reserved.

When the RAS Extension is implemented, 0b11001, 0b11100, and 0b11110 are reserved.

This field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0b0 **IFAR** is valid.

0b1 **IFAR** is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

Ext, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

0b0 Using the Short-descriptor translation table formats.

0b1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. All encodings not shown below are reserved:

0b000000 Address size fault in [TTBR0](#) or [TTBR1](#).

0b000001 Address size fault, level 1.

0b000010 Address size fault, level 2.

0b000011 Address size fault, level 3.

0b000101 Translation fault, level 1.

0b000110 Translation fault, level 2.

0b000111 Translation fault, level 3.

0b001001 Access flag fault, level 1.

0b001010 Access flag fault, level 2.

0b001011 Access flag fault, level 3.

0b001101 Permission fault, level 1.

0b001110 Permission fault, level 2.

0b001111 Permission fault, level 3.

0b010000 Synchronous External abort, not on translation table walk.

0b010101 Synchronous External abort, on translation table walk, level 1.

0b010110 Synchronous External abort, on translation table walk, level 2.

0b010111 Synchronous External abort, on translation table walk, level 3.

0b011000 Synchronous parity or ECC error on memory access, not on translation table walk.

0b011101 Synchronous parity or ECC error on memory access on translation table walk, level 1.

0b011110 Synchronous parity or ECC error on memory access on translation table walk, level 2.

0b011111 Synchronous parity or ECC error on memory access on translation table walk, level 3.

0b100001 PC alignment fault.

0b100010 Debug exception.

0b110000 TLB conflict abort.

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011101, 0b011110, and 0b011111, are reserved.

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a fault at level 1.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

This field resets to an architecturally UNKNOWN value.

Accessing the IFSR32_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
IFSR32_EL2	11	0101	100	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.

D12.2.76 ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

Purpose

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when `SCR_EL3.EEL2 == 0b0`, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when `SCR_EL3.EEL2 == 0b1`:

- If the `HCR_EL2.{IMO,FMO,AMO}` bit has a value of 1, the corresponding `ISR_EL1.{I,F,A}` bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the `HCR_EL2.{IMO,FMO,AMO}` bit has a value of 0, the corresponding `ISR_EL1.{I,F,A}` bit shows the pending status of the physical IRQ, FIQ, or SError.

Configurations

AArch64 System register `ISR_EL1[31:0]` is architecturally mapped to AArch32 System register `ISR[31:0]`.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ISR_EL1 is a 64-bit register.

Field descriptions

The ISR_EL1 bit assignments are:

Bits [63:9]

Reserved, RES0.

A, bit [8]

SError interrupt pending bit.

0b0 No pending SError.

0b1 An SError interrupt is pending.

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

0b0 No pending IRQ.

0b1 An IRQ interrupt is pending.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

0b0 No pending FIQ.

0b1 An FIQ interrupt is pending.

Bits [5:0]

Reserved, RES0.

Accessing the ISR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ISR_EL1	11	1100	000	000	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

D12.2.77 LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

Configurations

This register is present only from ARMv8.1. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

LORC_EL1 is a 64-bit register.

Field descriptions

The LORC_EL1 bit assignments are:

Bits [63:10]

Reserved, RES0.

DS, bits [9:2]

From ARMv8.1:

Descriptor Select. Selects the current LORegion descriptor accessed by [LORSA_EL1](#), [LOREA_EL1](#), and [LORN_EL1](#).

The number of LORegion descriptors is IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is $\text{Log}_2(\text{Number of LORegion descriptors supported by the implementation})$.

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers [LORN_EL1](#), [LOREA_EL1](#), and [LORSA_EL1](#) are RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [1]

Reserved, RES0.

EN, bit [0]

From ARMv8.1:

Enable. Indicates whether LORegions are enabled.

0b0 Disabled. Memory accesses do not match any LORegions.

0b1 Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

This field resets to 0.

Otherwise:

Reserved, RES0.

Accessing the LORC_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
LORC_EL1	1010	11	000	011	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64 && HCR_EL2.E2H == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.NS == 1 && SCR_EL3.TLOR == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.78 LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by [LORC_EL1.DS](#).

Configurations

This register is present only from ARMv8.1. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1.DS](#) points to a LORegion that is not supported by the PE.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

LOREA_EL1 is a 64-bit register.

Field descriptions

The LOREA_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:52]

Reserved, RES0.

EA[51:48], bits [51:48]

When ARMv8.2-LPA is implemented:

Extension to EA[47:16]. See EA[47:16] for more details.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by [LORC_EL1.DS](#). Bits [15:0] of this address are defined to be 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When [ARMv8.2-LPA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, EA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, EA[51:48] are RES0.

This field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

Accessing the LOREA_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
LOREA_EL1	1010	11	000	001	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.NS == 1 && SCR_EL3.TLOR == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.79 LORID_EL1, LORegionID (EL1)

The LORID_EL1 characteristics are:

Purpose

Indicates the number of LORegions and LORegion descriptors supported by the PE.

Configurations

This register is present only from ARMv8.1. Otherwise, direct accesses to LORID_EL1 are UNDEFINED.

If no LORegion descriptors are implemented, then the registers [LORC_EL1](#), [LORN_EL1](#), [LOREA_EL1](#), and [LORSA_EL1](#) are RES0.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

LORID_EL1 is a 64-bit register.

Field descriptions

The LORID_EL1 bit assignments are:

Bits [63:24]

Reserved, RES0.

LD, bits [23:16]

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

Bits [15:8]

Reserved, RES0.

LR, bits [7:0]

Number of LORegions supported by the PE. This is an 8-bit binary number.

Note

If LORID_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

Accessing the LORID_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
LORID_EL1	1010	11	000	111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.TLOR == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.80 LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by [LORC_EL1.DS](#).

Configurations

This register is present only from ARMv8.1. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1.DS](#) points to a LORegion that is not supported by the PE.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

LORN_EL1 is a 64-bit register.

Field descriptions

The LORN_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:8]

Reserved, RES0.

Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by [LORC_EL1.DS](#).

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log₂(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

This field resets to an architecturally UNKNOWN value.

Accessing the LORN_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
LORN_EL1	1010	11	000	010	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.NS == 1 && SCR_EL3.TLOR == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.81 LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

Purpose

Indicates whether the current LORegion descriptor selected by `LORC_EL1.DS` is enabled, and holds the physical address of the start of the LORegion.

Configurations

This register is present only from ARMv8.1. Otherwise, direct accesses to LORSA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- `LORC_EL1.DS` points to a LORegion that is not supported by the PE.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

LORSA_EL1 is a 64-bit register.

Field descriptions

The LORSA_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:52]

Reserved, RES0.

SA[51:48], bits [51:48]

From ARMv8.2:

Extension to SA[47:16]. See SA[47:16] for more details.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SA[47:16], bits [47:16]

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by `LORC_EL1.DS`. Bits[15:0] of this address are defined to be `0x0000`. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When `ARMv8.2-LPA` is implemented, and 52-bit addresses and a 64KB translation granule are in use, SA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, SA[51:48] are RES0.

This field resets to an architecturally UNKNOWN value.

Bits [15:1]

Reserved, RES0.

Valid, bit [0]

Indicates whether the current LORegion Descriptor is enabled.

0b0 Disabled

0b1 Enabled

This field resets to 0.

Accessing the LORSA_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
LORSA_EL1	1010	11	000	000	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TLOR == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && SCR_EL3.NS == 1 && SCR_EL3.TLOR == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.2.82 MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

Configurations

AArch64 System register MAIR_EL1[31:0] is architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1[31:0] is architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1[63:32] is architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1[63:32] is architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MAIR_EL1 is a 64-bit register.

Field descriptions

The MAIR_EL1 bit assignments are:

MAIR_EL1 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 0 to 7

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the MAIR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MAIR_EL1	11	1010	000	000	0010
MAIR_EL12	11	1010	101	000	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
MAIR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
MAIR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
MAIR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x140]	RW	RW
MAIR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
MAIR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	MAIR_EL2	RW
MAIR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x140]	MAIR_EL2	RW
MAIR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	MAIR_EL2	RW
MAIR_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
MAIR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
MAIR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x140]	-	-
MAIR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
MAIR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
MAIR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x140]	RW	RW
MAIR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAccessor(MAIR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(MAIR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(MAIR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(MAIR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(MAIR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(MAIR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(MAIR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(MAIR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(MAIR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(MAIR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.83 MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

Configurations

AArch64 System register MAIR_EL2[31:0] is architecturally mapped to AArch32 System register HMAIRO[31:0].

AArch64 System register MAIR_EL2[63:32] is architecturally mapped to AArch32 System register HMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MAIR_EL2 is a 64-bit register.

Field descriptions

The MAIR_EL2 bit assignments are:

MAIR_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 0 to 7

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the MAIR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MAIR_EL2	11	1010	100	000	0010
MAIR_EL1	11	1010	000	000	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
MAIR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
MAIR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
MAIR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
MAIR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	MAIR_EL1	n/a	MAIR_EL1
MAIR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	MAIR_EL1	MAIR_EL1	MAIR_EL1
MAIR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	MAIR_EL1	MAIR_EL1
MAIR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	MAIR_EL1	RW	MAIR_EL1
MAIR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	MAIR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR_EL2 or MAIR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [MAIR_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.

D12.2.84 MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MAIR_EL3 is a 64-bit register.

Field descriptions

The MAIR_EL3 bit assignments are:

MAIR_EL3 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 0 to 7

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the MAIR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MAIR_EL3	11	1010	110	000	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.85 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configurations

AArch64 System register MIDR_EL1[31:0] is architecturally mapped to AArch32 System register MIDR[31:0].

AArch64 System register MIDR_EL1[31:0] is architecturally mapped to External register MIDR_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MIDR_EL1 is a 64-bit register.

Field descriptions

The MIDR_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

Hex representation	ISO8859-1 representation	Implementer
0x0	NUL	Reserved for software use
0xc0	À	Ampere Computing
0x41	A	ARM Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation

Hex representation	ISO8859-1 representation	Implementer
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

Architecture, bits [19:16]

The permitted values of this field are:

0b0001	ARMv4.
0b0010	ARMv4T.
0b0011	ARMv5 (obsolete).
0b0100	ARMv5T.
0b0101	ARMv5TE.
0b0110	ARMv5TEJ.
0b0111	ARMv6.
0b1111	Architectural features are individually identified in the ID_* registers, see ID registers on page K13-7414 .

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

Accessing the MIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MIDR_EL1	11	0000	000	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

D12.2.86 MPIDR_EL1, Multiprocessor Affinity Register

The MPIDR_EL1 characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

Configurations

AArch64 System register MPIDR_EL1[31:0] is architecturally mapped to AArch32 System register MPIDR[31:0].

In a uniprocessor system ARM recommends that each Aff<n> field of this register returns a value of 0.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MPIDR_EL1 is a 64-bit register.

Field descriptions

The MPIDR_EL1 bit assignments are:

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

- 0b0 Processor is part of a multiprocessor system.
- 0b1 Processor is part of a uniprocessor system.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of [affinity](#) consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

- 0b0 Performance of PEs at the lowest affinity level is largely independent.
- 0b1 Performance of PEs at the lowest affinity level is very interdependent.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the [affinity](#) level that is most significant for determining PE behavior. Higher [affinity](#) levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing the MPIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MPIDR_EL1	11	0000	000	101	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

D12.2.87 MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR1_EL1](#) and [MVFR2_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Configurations

AArch64 System register MVFR0_EL1[31:0] is architecturally mapped to AArch32 System register [MVFR0](#)[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64 only implementation, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MVFR0_EL1 is a 64-bit register.

Field descriptions

The MVFR0_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

0b0000 Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the [FPSCR](#) setting.

0b0001 All rounding modes supported.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

0b0000 Short vectors not supported.

0b0001 Short vector operation supported.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

0b0000 Not supported in hardware.

0b0001 Supported.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

0b0000 Not supported in hardware.

0b0001 Supported.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

0b0000 Not supported.

0b0001 Supported.

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

0b0000 Not supported in hardware.

0b0001 Supported, VFPv2.

0b0010 Supported, VFPv3, VFPv4, or ARMv8. VFPv3 and ARMv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

- 0b0000 Not supported in hardware.
- 0b0001 Supported, VFPv2.
- 0b0010 Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDRReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

- 0b0000 The implementation has no Advanced SIMD and floating-point support.
- 0b0001 The implementation includes floating-point support with 16 x 64-bit registers.
- 0b0010 The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0010.

Accessing the MVFR0_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MVFR0_EL1	11	0000	000	000	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.TID3} == 1$, then read accesses at EL1 are trapped to EL2.

D12.2.88 MVFR1_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0_EL1](#) and [MVFR2_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D12-2680](#).

Configurations

AArch64 System register MVFR1_EL1[31:0] is architecturally mapped to AArch32 System register [MVFR1](#)[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64 only implementation, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MVFR1_EL1 is a 64-bit register.

Field descriptions

The MVFR1_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

0b0000 Not supported.

0b0001 Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.

0b0010 As for 0b0001, and adds instructions for conversion between double-precision and half-precision.

0b0011 As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the [ARMv8.2-FP16](#) extension.
- 0b0011 in an implementation with floating-point support that includes the [ARMv8.2-FP16](#) extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support.

Defined values are:

0b0000 Not supported.

0b0001 SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.

0b0010 As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0010 in an implementation with SIMD floating-point support that does not include the [ARMv8.2-FP16](#) extension.
- 0b0011 in an implementation with SIMD floating-point support that includes the [ARMv8.2-FP16](#) extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

SIMDIInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

0b0000 Not implemented, or hardware supports only the Default NaN mode.

0b0001 Hardware supports propagation of NaN values.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

0b0000 Not implemented, or hardware supports only the Flush-to-Zero mode of operation.

0b0001 Hardware supports full denormalized number arithmetic.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

Accessing the MVFR1_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MVFR1_EL1	11	0000	000	001	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.89 MVFR2_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0_EL1](#) and [MVFR1_EL1](#).

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers on page D12-2680](#).

Configurations

AArch64 System register MVFR2_EL1[31:0] is architecturally mapped to AArch32 System register [MVFR2](#)[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64 only implementation, this register is UNKNOWN.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MVFR2_EL1 is a 64-bit register.

Field descriptions

The MVFR2_EL1 bit assignments are:

Bits [63:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

0b0000 Not implemented, or no support for miscellaneous features.

0b0001 Support for Floating-point selection.

0b0010 As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.

0b0011 As 0b0010, and Floating-point Round to Integer Floating-point.

0b0100 As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0100.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

0b0000 Not implemented, or no support for miscellaneous features.

0b0001 Floating-point Conversion to Integer with Directed Rounding modes.

0b0010 As 0b0001, and Floating-point Round to Integer Floating-point.

0b0011 As 0b0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0011.

Accessing the MVFR2_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MVFR2_EL1	11	0000	000	010	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.

D12.2.90 PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configurations

AArch64 System register PAR_EL1[63:0] is architecturally mapped to AArch32 System register PAR[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PAR_EL1 is a 64-bit register.

Field descriptions

The PAR_EL1 bit assignments are:

When PAR_EL1.F == 0b0:

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

PA[51:48], bits [51:48]

From ARMv8.2, or if ARMv8.2-LPA is implemented:

Extension to PA[47:12]. See PA[47:12] for more details.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When [ARMv8.2-LPA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, the PA[51:48] bits form the upper part of the address value. Otherwise the PA[51:48] bits are RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when [SCR_EL3.EEL2](#) is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

- 0b00 Non-shareable.
- 0b10 Outer Shareable.
- 0b11 Inner Shareable.

The value 0b01 is reserved.

———— **Note** ————

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

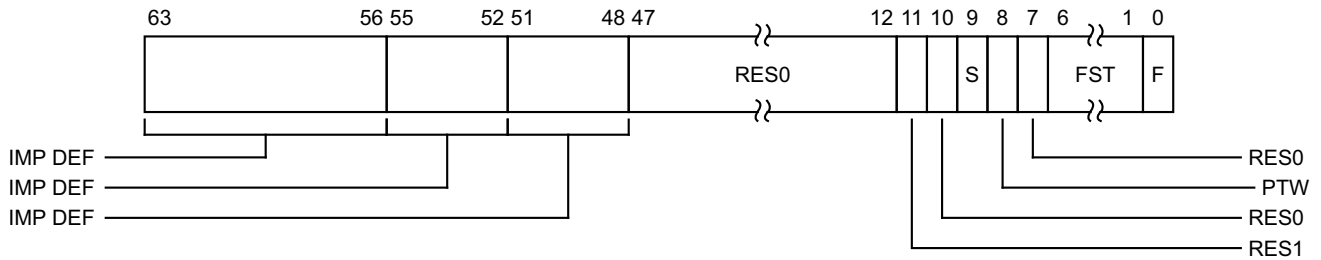

F, bit [0]

Indicates whether the instruction performed a successful address translation.

0b0 Address translation completed successfully.

This field resets to an architecturally UNKNOWN value.

When PAR_EL1.F == 0b1:

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Bits [47:12]

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

0b0 Translation aborted because of a fault in the stage 1 translation.

0b1 Translation aborted because of a fault in the stage 2 translation.

This field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort ESR encoding.

This field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

0b1 Address translation aborted.

This field resets to an architecturally UNKNOWN value.

Accessing the PAR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PAR_EL1	11	0111	000	000	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

D12.2.91 REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configurations

AArch64 System register REVIDR_EL1[31:0] is architecturally mapped to AArch32 System register REVIDR[31:0].

If REVIDR_EL1 has the same value as MIDR_EL1, then its contents have no significance.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

REVIDR_EL1 is a 64-bit register.

Field descriptions

The REVIDR_EL1 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the REVIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
REVIDR_EL1	11	0000	000	110	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TID1} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TID1} == 1$, then read accesses at EL1 are trapped to EL2.

D12.2.92 RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

Purpose

If EL1 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configurations

AArch64 System register RMR_EL1[31:0] is architecturally mapped to AArch32 System register RMR[31:0] when IsHighestEL(EL1).

Only implemented if EL1 is the highest implemented Exception level. In this case:

- If EL1 can use AArch32 and AArch64 then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

Attributes

RMR_EL1 is a 64-bit register.

Field descriptions

The RMR_EL1 bit assignments are:

Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

AA64, bit [0]

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

0b0 AArch32.

0b1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL1 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

Accessing the RMR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
RMR_EL1	11	1100	000	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	-	RW	n/a	n/a

When RMR_EL1 is not implemented, the encoding for this register is UNDEFINED.

D12.2.93 RMR_EL2, Reset Management Register (EL2)

The RMR_EL2 characteristics are:

Purpose

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configurations

AArch64 System register RMR_EL2[31:0] is architecturally mapped to AArch32 System register HRMR[31:0].

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

This register has no effect if EL2 is not enabled in the current Security state.

See the field descriptions for the reset values. These apply whenever the register is implemented.

Attributes

RMR_EL2 is a 64-bit register.

Field descriptions

The RMR_EL2 bit assignments are:

Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

AA64, bit [0]

When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

0b0 AArch32.

0b1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

Accessing the RMR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
RMR_EL2	11	1100	100	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a

When RMR_EL2 is not implemented, the encoding for this register is UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.

D12.2.94 RMR_EL3, Reset Management Register (EL3)

The RMR_EL3 characteristics are:

Purpose

If EL3 is implemented and this register is implemented:

- A write to the register at EL3 can request a Warm reset.
- If EL3 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configurations

AArch64 System register RMR_EL3[31:0] is architecturally mapped to AArch32 System register RMR[31:0] when `IsExceptionLevelImplemented(EL3)`.

When EL3 is implemented:

- If EL3 can use AArch32 and AArch64 then this register must be implemented.
- If EL3 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

Attributes

RMR_EL3 is a 64-bit register.

Field descriptions

The RMR_EL3 bit assignments are:

Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

AA64, bit [0]

When EL3 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

0b0 AArch32.

0b1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL3 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

Accessing the RMR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
RMR_EL3	11	1100	110	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	-	-	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

When RMR_EL3 is not implemented, the encoding for this register is UNDEFINED.

D12.2.95 RVBAR_EL1, Reset Vector Base Address Register (if EL2 and EL3 not implemented)

The RVBAR_EL1 characteristics are:

Purpose

If EL1 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configurations

Only implemented if the highest Exception level implemented is EL1.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

RVBAR_EL1 is a 64-bit register.

Field descriptions

The RVBAR_EL1 bit assignments are:

Bits [63:0]

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

Accessing the RVBAR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
RVBAR_EL1	11	1100	000	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	-	RO	n/a	n/a

When EL1 is not the highest implemented Exception level, the encoding for this register is UNDEFINED.

D12.2.96 RVBAR_EL2, Reset Vector Base Address Register (if EL3 not implemented)

The RVBAR_EL2 characteristics are:

Purpose

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configurations

Only implemented if the highest Exception level implemented is EL2.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

RVBAR_EL2 is a 64-bit register.

Field descriptions

The RVBAR_EL2 bit assignments are:

Bits [63:0]

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

Accessing the RVBAR_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
RVBAR_EL2	11	1100	100	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RO	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	n/a

When EL2 is not the highest implemented Exception level, the encoding for this register is UNDEFINED.

D12.2.97 RVBAR_EL3, Reset Vector Base Address Register (if EL3 implemented)

The RVBAR_EL3 characteristics are:

Purpose

If EL3 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configurations

Only implemented if the highest Exception level implemented is EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

RVBAR_EL3 is a 64-bit register.

Field descriptions

The RVBAR_EL3 bit assignments are:

Bits [63:0]

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

Accessing the RVBAR_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
RVBAR_EL3	11	1100	110	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	-	-	n/a	RO
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RO
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RO

When EL3 is not the highest implemented Exception level, the encoding for this register is UNDEFINED.

D12.2.98 S3_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED registers

The S3_<op1>_<Cn>_<Cm>_<op2> characteristics are:

Purpose

This area of the instruction set space is reserved for IMPLEMENTATION DEFINED registers.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

S3_<op1>_<Cn>_<Cm>_<op2> is a 64-bit register.

Field descriptions

The S3_<op1>_<Cn>_<Cm>_<op2> bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

D12.2.99 SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

Configurations

AArch64 System register SCR_EL3[31:0] can be mapped to AArch32 System register SCR[31:0], but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SCR_EL3 is a 64-bit register.

Field descriptions

The SCR_EL3 bit assignments are:

Bits [63:22]

Reserved, RES0.

FIEN, bit [21]

From ARMv8.4:

Fault Injection enable.

Trap accesses to the [ERXPFPCDN_EL1](#), [ERXPFPCCTL_EL1](#), and [ERXPFPCFG_EL1](#) registers from EL1 and EL2 to EL3.

0b0 Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.

0b1 This control does not cause any instructions to be trapped.
If EL3 is not implemented, the *Effective value* of SCR_EL3.FIEN is 0b1.
If the RAS Common Fault Injection Model Extension is not implemented, this field is RES0.
This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]

When ARMv8.4-DFE is implemented:

Non-maskable External Aborts.

When SCR_EL3.EA == 1, controls whether PSTATE.A masks SError interrupts at EL3.

0b0 If SCR_EL3.EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1.
0b1 If SCR_EL3.EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A.

When SCR_EL3.EA == 0, asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this bit.

This field resets to 0.

Otherwise:

Reserved, RES0.

EASE, bit [19]

When ARMv8.4-DFE is implemented:

External aborts to SError interrupt vector.

0b0 Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.
0b1 Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3.

This field resets to 0.

Otherwise:

Reserved, RES0.

EEL2, bit [18]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 Enable.

0b0 All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by ARMv8.4-SecEL2 are UNDEFINED, and those timers are disabled.
0b1 All behaviors associated with Secure EL2 are enabled.

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of ESR_EL2.EC == 0x3 :
 - A read or write of the SCR.
 - A read or write of the NSACR.
 - A read or write of the SDCR.
 - A read or write of the MVBAR.
 - Execution of an ATS12NSO** instruction.

- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of `ESR_EL2.EC == 0x0` :
 - Execution of an SRS instruction that uses `R13_mon`.
 - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access `SPSR_mon`, `R13_mon`, or `R14_mon`.

———— **Note** —————

If the *Effective value* of `SCR_EL3.EEL2` is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

In a Secure only implementation that does not implement EL3 but implements EL2, behaves as if `SCR_EL3.EEL2 == 1`.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, `RES0`.

API, bit [17]

From ARMv8.4, when ARMv8.3-PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- `PACGA`, `XPACD`, `XPACI`, and `XPACLRI`.
- `AUTDA`, `AUTDB`, `AUTDZA`, `AUTDZB`, `AUTIA`, `AUTIA1716`, `AUTIASP`, `AUTIAZ`, `AUTIB`, `AUTIB1716`, `AUTIBSP`, `AUTIBZ`, `AUTIZA`, `AUTIZB`, `PACDA`, `PACDB`, `PACDZA`, `PACDZB`, `PACIA`, `PACIA1716`, `PACIASP`, `PACIAZ`, `PACIB`, `PACIB1716`, `PACIBSP`, `PACIBZ`, `PACIZA`, `PACIZ`, `RETAA`, `RETAB`, `BRAA`, `BRAB`, `BLRAA`, `BLRAB`, `BRAAZ`, `BRABZ`, `BLRAAZ`, `BLRABZ`, `ERETAA`, `ERETAB`, `LDRAA` and `LDRAB` when:
 - In EL0, when `HCR_EL2.TGE == 0` or `HCR_EL2.E2H == 0`, and the associated `SCTLR_EL1.En<N><M> == 1`.
 - In EL0, when `HCR_EL2.TGE == 1` and `HCR_EL2.E2H == 1`, and the associated `SCTLR_EL2.En<N><M> == 1`.
 - In EL1, when the associated `SCTLR_EL1.En<N><M> == 1`.
 - In EL2, when the associated `SCTLR_EL2.En<N><M> == 1`.

`0b0` The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the `HCR_EL2.API` bit.

`0b1` This control does not cause any instructions to be trapped.

———— **Note** —————

If `ARMv8.3-PAuth` is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

From ARMv8.3, when ARMv8.3-PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- `PACGA`, `XPACD`, `XPACI`, and `XPACLRI`.
- `AUTDA`, `AUTDB`, `AUTDZA`, `AUTDZB`, `AUTIA`, `AUTIA1716`, `AUTIASP`, `AUTIAZ`, `AUTIB`, `AUTIB1716`, `AUTIBSP`, `AUTIBZ`, `AUTIZA`, `AUTIZB`, `PACDA`, `PACDB`, `PACDZA`, `PACDZB`, `PACIA`, `PACIA1716`, `PACIASP`, `PACIAZ`, `PACIB`, `PACIB1716`, `PACIBSP`, `PACIBZ`, `PACIZA`, `PACIZ`, `RETAA`, `RETAB`, `BRAA`, `BRAB`, `BLRAA`, `BLRAB`, `BRAAZ`, `BRABZ`, `BLRAAZ`, `BLRABZ`, `ERETAA`, `ERETAB`, `LDRAA` and `LDRAB` when:
 - In Non-secure EL0, when `HCR_EL2.TGE == 0` or `HCR_EL2.E2H == 0`, and the associated `SCTLR_EL1.En<N><M> == 1`.

- In Non-secure EL0, when `HCR_EL2.TGE==1` and `HCR_EL2.E2H==1`, and the associated `SCTLR_EL2.En<N><M> == 1`.
 - In Secure EL0, when the associated `SCTLR_EL2.En<N><M> == 1`.
 - In Secure or Non-secure EL1, when the associated `SCTLR_EL1.En<N><M> == 1`.
 - In EL2, when the associated `SCTLR_EL2.En<N><M> == 1`.
- 0b0 The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the `HCR_EL2.API` bit.
- 0b1 This control does not cause any instructions to be trapped.

———— **Note** —————

If [ARMv8.3-PAuth](#) is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]

When ARMv8.3-PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the `HCR_EL2.APK` bit or other traps:

- [APIAKeyLo_EL1](#), [APIAKeyHi_EL1](#), [APIBKeyLo_EL1](#), [APIBKeyHi_EL1](#), [APDAKeyLo_EL1](#), [APDAKeyHi_EL1](#), [APDBKeyLo_EL1](#), [APDBKeyHi_EL1](#), [APGAKeyLo_EL1](#), and [APGAKeyHi_EL1](#).

- 0b0 Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the `HCR_EL2.APK` bit or other traps.
- 0b1 This control does not cause any instructions to be trapped.

———— **Note** —————

If [ARMv8.3-PAuth](#) is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]

When RAS is implemented:

Trap Error record accesses. Trap accesses to the following registers from EL1 and EL2 to EL3:

EL1 using AArch64: [ERRIDR_EL1](#), [ERRSELR_EL1](#), [ERXADDR_EL1](#), [ERXCTLR_EL1](#), [ERXFR_EL1](#), [ERXMISC0_EL1](#), [ERXMISC1_EL1](#), and [ERXSTATUS_EL1](#). When ARMv8.4-RAS is implemented, [ERXMISC2_EL1](#), and [ERXMISC3_EL1](#).

EL1 using AArch32: [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#). When ARMv8.4-RAS is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

- 0b0 This control does not cause any instructions to be trapped.
- 0b1 Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3. This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]

When ARMv8.1-LOR is implemented:

Trap LOR registers. Traps accesses to the [LORSA_EL1](#), [LOREA_EL1](#), [LORN_EL1](#), [LORC_EL1](#), and [LORID_EL1](#) registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped [HCR_EL2.TLOR](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWE](#), [HCR.TWE](#), [SCTLR_EL1.nTWE](#), [SCTLR_EL2.nTWE](#), or [HCR_EL2.TWE](#).

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to an architecturally UNKNOWN value.

TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWI](#), [HCR.TWI](#), [SCTLR_EL1.nTWI](#), [SCTLR_EL2.nTWI](#), or [HCR_EL2.TWI](#).

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to an architecturally UNKNOWN value.

ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only.

0b0 Secure EL1 using AArch64 accesses to the [CNTPS_TVAL_EL1](#), [CNTPS_CTL_EL1](#), and [CNTPS_CVAL_EL1](#) are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.

0b1 This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

RW, bit [10]

Execution state control for lower Exception levels.

0b0 Lower levels are all AArch32.

0b1 The next lower level is AArch64.

If EL2 is present:

- EL2 is AArch64.
- EL2 controls EL1 and EL0 behaviors.

If EL2 is not present:

- EL1 is AArch64.
- EL0 is determined by the Execution state described in the current process state when executing at EL0.

If all lower Exception levels cannot use AArch32, then this bit is RAO/WI.

When `SCR_EL3.{EEL2, NS} == {1, 0}`, this bit is treated as 1 for all purposes other than reading or writing the register.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

SIF, bit [9]

From ARMv8.4:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure. The possible values for this bit are:

0b0 Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are permitted.

0b1 Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are not permitted.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

From ARMv8.3, or if ARMv8.2, or ARMv8.1 or ARMv8.0:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

0b0 Secure state instruction fetches from Non-secure memory are permitted.

0b1 Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states.

0b0 HVC instructions are UNDEFINED.

0b1 HVC instructions are enabled at EL3, EL2, and EL1.

———— **Note** ————

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1.

If EL2 is not implemented, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states.

0b0 SMC instructions are enabled at EL1 and above.

0b1 SMC instructions are UNDEFINED at EL1 and above.

———— **Note** ————

SMC instructions are always UNDEFINED at EL0.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError interrupt routing.

0b0 When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3.

In addition, when executing at EL3:

- SError interrupts are not taken.
- External aborts are taken to EL3.

0b1 When executing at any Exception level, External aborts and SError interrupts are taken to EL3.

For more information, see *Asynchronous exception routing* on page D1-2199.

This field resets to an architecturally UNKNOWN value.

FIQ, bit [2]

Physical FIQ Routing.

0b0 When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3.

When executing at EL3, physical FIQ interrupts are not taken.

0b1 When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see *Asynchronous exception routing* on page D1-2199.

This field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

0b0 When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3.

When executing at EL3, physical IRQ interrupts are not taken.

0b1 When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see [Asynchronous exception routing on page D1-2199](#).

This field resets to an architecturally UNKNOWN value.

NS, bit [0]

Non-secure bit.

0b0 Indicates that EL0 and EL1 are in Secure state.

0b1 Indicates that Exception levels lower than EL3 are in Non-secure state, and so memory accesses from those Exception levels cannot access Secure memory.

When $SCR_EL3.\{EEL2, NS\} = \{1, 0\}$, then EL2 is using AArch64 and in Secure state.

This field resets to an architecturally UNKNOWN value.

Accessing the SCR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
SCR_EL3	11	0001	110	000	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
$SCR_EL3.NS == 0 \ \&\& \ SCR_EL3.EEL2 == 0$	-	-	n/a	RW
$HCR_EL2.TGE == 0 \ \&\& \ (SCR_EL3.NS == 1 \ \ SCR_EL3.EEL2 == 1)$	-	-	-	RW
$HCR_EL2.TGE == 1 \ \&\& \ (SCR_EL3.NS == 1 \ \ SCR_EL3.EEL2 == 1)$	-	n/a	-	RW

D12.2.100 SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

Configurations

AArch64 System register SCTLR_EL1[31:0] is architecturally mapped to AArch32 System register SCTLR[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL1 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SCTLR_EL1 is a 64-bit register.

Field descriptions

The SCTLR_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

EnIA, bit [31]

From ARMv8.3:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

Possible values of this bit are:

- 0b0 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
- 0b1 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

From ARMv8.3:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

Possible values of this bit are:

- 0b0 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
- 0b1 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When ARMv8.2-LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

- 0b0 For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
- 0b1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

0b0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

0b1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

From ARMv8.3:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

Possible values of this bit are:

0b0 Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.

0b1 Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions to EL1, from AArch64 state only. This applies to DC CVAU, DC CIVAC, DC CVAC, DC CVAP, and IC IVAU.

0b0 Execution of the specified instructions at EL0 using AArch64 is trapped to EL1.

0b1 This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

- 0b0 Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
- 0b1 Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

The possible values of this bit are:

- 0b0 Explicit data accesses at EL0 are little-endian.
- 0b1 Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when [SCTLR_EL1.EE](#) is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when [SCTLR_EL1.EE](#) is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

From ARMv8.1:

Set Privileged Access Never, on taking an exception to EL1.

- 0b0 PSTATE.PAN is set to 1 on taking an exception to EL1.
- 0b1 The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [22]

Reserved, RES1.

IESB, bit [21]

When ARMv8.2-IESB is implemented:

Implicit error synchronization event enable. Possible values are:

- 0b0 Disabled.
- 0b1 An implicit error synchronization event is added:
 - After each exception taken to EL1.
 - Before the operational pseudocode of each ERET instruction executed at EL1.

When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its *Effective value* might be 0 or 1 regardless of the value of the field. If the *Effective value* of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

This field is part of [ARMv8.2-IESB](#).

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- 0b0 This control has no effect on memory access permissions.
- 0b1 Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.

The WXN bit is permitted to be cached in a TLB.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

When HCR_EL2.TGE == 1 and (SCR_EL3.NS == 1 or SCR_EL3.EEL2 == 1):

Traps EL0 execution of WFE instructions to EL2, from both Execution states.

- 0b0 Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
- 0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Traps EL0 execution of WFE instructions to EL1, from both Execution states.

0b0 Any attempt to execute a WFE instruction at EL0 is trapped to EL1, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

———— **Note** —————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

When [HCR_EL2.TGE](#) == 1 and ([SCR_EL3.NS](#) == 1 or [SCR_EL3.EEL2](#) == 1):

Traps EL0 execution of WFI instructions to EL2, from both Execution states.

0b0 Any attempt to execute a WFI instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— **Note** —————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Traps EL0 execution of WFI instructions to EL1, from both Execution states.

0b0 Any attempt to execute a WFI instruction at EL0 is trapped to EL1, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— **Note** —————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Traps EL0 accesses to the [CTR_EL0](#) to EL1, from AArch64 state only.

0b0 Accesses to the [CTR_EL0](#) from EL0 using AArch64 are trapped to EL1.

0b1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Traps EL0 execution of [DC ZVA](#) instructions to EL1, from AArch64 state only.

0b0 Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL1. Reading [DCZID_EL0](#).DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.

0b1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

From ARMv8.3:

Controls enabling of pointer authentication (using the [APDBKey_EL1](#) key) of instruction addresses in the EL1&0 translation regime.

0b0 Pointer authentication (using the [APDBKey_EL1](#) key) of data addresses is not enabled.

0b1 Pointer authentication (using the [APDBKey_EL1](#) key) of data addresses is enabled.

————— **Note** —————

This field controls the behavior of the [AddPACDB](#) and [AuthDB](#) pseudocode functions. Specifically, when the field is 1, [AddPACDB](#) returns a copy of a pointer to which a pointer authentication code has been added, and [AuthDB](#) returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL0 and EL1:

0b0 All instruction access to Normal memory from EL0 and EL1 are Non-cacheable for all levels of instruction and unified cache.

If the value of [SCTLR_EL1](#).M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1 This control has no effect on the Cacheability of instruction access to Normal memory from EL0 and EL1.

If the value of [SCTLR_EL1](#).M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the [HCR_EL2.DC](#) bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the [SCTLR_EL1.I](#) bit.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE. {D, A, I, F} masks to EL1, from AArch64 state only.

0b0 Any attempt at EL0 using AArch64 to execute an MRS, MSR(register), or MSR(immediate) instruction that accesses the [DAIF](#) is trapped to EL1.

0b1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

0b0 SETEND instruction execution is enabled at EL0 using AArch32.

0b1 SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

If EL0 cannot use AArch32, this bit is RES1.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

0b0 All IT instruction functionality is enabled at EL0 using AArch32.

0b1 Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with hw1[3:0]! = 1000.
- All encodings of the subsequent instruction with the following values for hw1:
 - 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
 - 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the ARMv8 ARM, section F3.2.5.
 - 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm
 - 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
 - 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
 - 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see [Changes to an ITD control by an instruction in an IT block on page E1-3540](#)

If EL0 cannot use AArch32, this bit is RES1.

ITD is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the [SCTLR_EL1](#). If it is not implemented then this bit is RAZ/WI.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

nAA, bit [6]

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

- | | |
|-----|--|
| 0b0 | LDAPR, LDAPRH, LAPUR, LAPURH, LAPURSH, LAPURSW, LAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses. |
| 0b1 | This control bit does not cause LDAPR, LDAPRH, LAPUR, LAPURH, LAPURSH, LAPURSW, LAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes. |

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

- | | |
|-----|--|
| 0b0 | EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED. |
| 0b1 | EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled. |

If EL0 cannot use AArch32, this bit is RES0.

CP15BEN is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the [SCTLR_EL1](#). If it is not implemented then this bit is RAO/WI.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2164](#).

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2164](#).

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

0b0 All data access to Normal memory from EL0 and EL1, and all Normal memory accesses to the EL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.

0b1 This control has no effect on the Cacheability of:

- Data access to Normal memory from EL0 and EL1.
- Normal memory accesses to the EL1&0 stage 1 translation tables.

When the value of the [HCR_EL2](#).DC bit is 1, the PE ignores SCLTR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

0b0 Alignment fault checking disabled when executing at EL1 or EL0.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1 Alignment fault checking enabled when executing at EL1 or EL0.

All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

0b0 EL1 and EL0 stage 1 address translation disabled.

See the [SCTLR_EL1.I](#) field for the behavior of instruction accesses to Normal memory.

0b1 EL1 and EL0 stage 1 address translation enabled.

If the value of **HCR_EL2**.{DC, TGE} is not {0, 0} then in Non-secure state the PE behaves as if the value of the **SCTLR_EL1**.M field is 0 for all purposes other than returning the value of a direct read of the field.

When **ARMv8.1-VHE** is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.

Accessing the SCTLR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
SCTLR_EL1	11	0001	000	000	0000
SCTLR_EL12	11	0001	101	000	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
SCTLR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
SCTLR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
SCTLR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x110]	RW	RW
SCTLR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
SCTLR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	SCTLR_EL2	RW
SCTLR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x110]	SCTLR_EL2	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
SCTLR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	SCTLR_EL2	RW
SCTLR_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
SCTLR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
SCTLR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x110]	-	-
SCTLR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
SCTLR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
SCTLR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x110]	RW	RW
SCTLR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [SCTLR_EL1](#) or [SCTLR_EL12](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $\text{IsUsingAccessor}(\text{SCTLR_EL1}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1 \ || \ \text{HCR_EL2.NV} == 0) \ \&\& \ \text{IsUsingAccessor}(\text{SCTLR_EL12}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $\text{IsUsingAccessor}(\text{SCTLR_EL1}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1 \ || \ \text{HCR_EL2.NV} == 0) \ \&\& \ \text{IsUsingAccessor}(\text{SCTLR_EL12}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{IsUsingAccessor}(\text{SCTLR_EL12}) \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $\text{IsUsingAccessor}(\text{SCTLR_EL1}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1 \ || \ \text{HCR_EL2.NV} == 0) \ \&\& \ \text{IsUsingAccessor}(\text{SCTLR_EL12}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $\text{IsUsingAccessor}(\text{SCTLR_EL1}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1 \ || \ \text{HCR_EL2.NV} == 0) \ \&\& \ \text{IsUsingAccessor}(\text{SCTLR_EL12}) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{HCR_EL2.NV2} == 0 \ || \ \text{HCR_EL2.NV1} == 1) \ \&\& \ (\text{SCR_EL3.NS} == 1 \ || \ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{IsUsingAccessor}(\text{SCTLR_EL12}) \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

D12.2.101 SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL2.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, these controls apply also to execution at EL0.

Configurations

AArch64 System register SCTLR_EL2[31:0] is architecturally mapped to AArch32 System register [HSCTLR](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SCTLR_EL2 is a 64-bit register.

Field descriptions

The SCTLR_EL2 bit assignments are:

When [HCR_EL2.E2H](#) != 0b1 or [HCR_EL2.TGE](#) != 0b1:

This format applies in all ARMv8.0 implementations, and from ARMv8.1 when the *Effective value* of [HCR_EL2](#).{E2H, TGE} != {1, 1}.

Bits [63:32]

Reserved, RES0.

EnIA, bit [31]

From ARMv8.3:

Controls enabling of pointer authentication (using the [APIAKey_EL1](#) key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

- 0b0 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
- 0b1 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

From ARMv8.3:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

- 0b0 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
- 0b1 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

From ARMv8.3:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

- 0b0 Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is not enabled.
- 0b1 Pointer authentication (using the APDAKey_EL1 key) of instruction addresses is enabled.

———— **Note** ————

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

- | | |
|-----|---|
| 0b0 | Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian. |
| 0b1 | Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian. |

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bits [23:22]

Reserved, RES1.

IESB, bit [21]

When ARMv8.2-IESB is implemented:

Implicit Error Synchronization event Enable.

- | | |
|-----|--|
| 0b0 | Disabled. |
| 0b1 | An implicit error synchronization event is added: <ul style="list-style-type: none">• After each exception taken to EL2.• Before the operational pseudocode of each ERET instruction executed at EL2. |

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its *Effective value* might be 0 or 1 regardless of the value of the field. If the *Effective value* of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

This field is part of [ARMv8.2-IESB](#).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN:

0b0 This control has no effect on memory access permissions.

0b1 Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]

From ARMv8.3:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

0b0 Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.

0b1 Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

0b0 All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache.

If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1 This control has no effect on the Cacheability of instruction access to Normal memory from EL2.

If the value of SCTL_R_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0 or EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

Bit [11]

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 under certain conditions.

0b0 LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.

0b1 This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2164](#).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

0b0 All data access to Normal memory from EL2, and all Normal memory accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.

0b1 This control has no effect on the Cacheability of:

- Data access to Normal memory from EL2.
- Normal memory accesses to the EL2 translation tables.

This bit has no effect on the EL1&0 or EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

0b0 Alignment fault checking disabled when executing at EL2.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1 Alignment fault checking enabled when executing at EL2.
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

0b0 EL2 stage 1 address translation disabled.
See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1 EL2 stage 1 address translation enabled.

In a system where the PE resets into EL2, this field resets to 0.

When HCR_EL2.E2H == 0b1 and HCR_EL2.TGE == 0b1:

This format applies only from ARMv8.1 when EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}.

Bits [63:32]

Reserved, RES0.

EnIA, bit [31]

From ARMv8.3:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

0b0 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.

0b1 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

———— **Note** ————

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

From ARMv8.3:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

0b0 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.

0b1 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

———— **Note** ————

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When ARMv8.2-LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

0b0 For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.

0b1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

0b0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

0b1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

From ARMv8.3:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

0b0 Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.

0b1 Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions to EL2, from AArch64 state only. This applies to **DC CVAU**, **DC CIVAC**, **DC CVAC**, **DC CVAP**, and **IC IVAU**.

0b0 Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime.

The possible values of this bit are:

- 0b0 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are little-endian.
- 0b1 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

- 0b0 Explicit data accesses at EL0 are little-endian.
- 0b1 Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

Set Privileged Access Never, on taking an exception to EL2.

- 0b0 PSTATE.PAN is set to 1 on taking an exception to EL2.
- 0b1 The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [22]

Reserved, RES1.

IESB, bit [21]

When ARMv8.2-IESB is implemented:

Implicit Error Synchronization event Enable.

- 0b0 Disabled.
- 0b1 An implicit error synchronization event is added:
- After each exception taken to EL2.
 - Before the operational pseudocode of each ERET instruction executed at EL2.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its *Effective value* might be 0 or 1 regardless of the value of the field. If the *Effective value* of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- 0b0 This control has no effect on memory access permissions.
- 0b1 Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL2, from both Execution states.

- 0b0 Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
- 0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

———— Note ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL2, from both Execution states.

- 0b0 Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
- 0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— Note ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Traps EL0 accesses to the [CTR_EL0](#) to EL2, from AArch64 state only.

- 0b0 Accesses to the [CTR_EL0](#) from EL0 using AArch64 are trapped to EL2.
- 0b1 This control does not cause any instructions to be trapped.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Traps EL0 execution of [DC ZVA](#) instructions to EL2, from AArch64 state only.

0b0 Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading [DCZID_EL0.DZP](#) from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.

0b1 This control does not cause any instructions to be trapped.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

From ARMv8.3:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

Possible values of this bit are:

0b0 Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is not enabled.

0b1 Pointer authentication (using the APDBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and EL0:

0b0 All instruction access to Normal memory from EL2 and EL0 are Non-cacheable for all levels of instruction and unified cache.

If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1 This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and EL0.

If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

0b0 SETEND instruction execution is enabled at EL0 using AArch32.

0b1 SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

If EL0 cannot use AArch32, this bit is RES1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

0b0 All IT instruction functionality is enabled at EL0 using AArch32.

0b1 Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with $hw1[3:0] \neq 1000$.
- All encodings of the subsequent instruction with the following values for $hw1$:
 - 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
 - 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the ARMv8 ARM, section F3.2.5.
 - 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm
 - 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
 - 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
 - 0b010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see [Changes to an ITD control by an instruction in an IT block on page E1-3540](#)

If EL0 cannot use AArch32, this bit is RES1.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nAA, bit [6]

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 and EL0 under certain conditions.

0b0 LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.

0b1 This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

- | | |
|-----|--|
| 0b0 | EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED. |
| 0b1 | EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled. |

If EL0 cannot use AArch32, this bit is RES0.

CP15BEN is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the [SCTLR_EL1](#). If it is not implemented then this bit is RAO/WI.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2164](#).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2164](#).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

- | | |
|-----|---|
| 0b0 | All data access to Normal memory from EL2 and EL0, and all Normal memory accesses to the EL2&0 translation tables, are Non-cacheable for all levels of data and unified cache. |
| 0b1 | This control has no effect on the Cacheability of: <ul style="list-style-type: none">• Data access to Normal memory from EL2 and EL0.• Normal memory accesses to the EL2&0 translation tables. |

This bit has no effect on the EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and EL0.

- | | |
|-----|--|
| 0b0 | Alignment fault checking disabled when executing at EL2 and EL0.
Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed. |
| 0b1 | Alignment fault checking enabled when executing at EL2 and EL0.
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception. |

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2&0 stage 1 address translation. Possible values of this bit are:

0b0 EL2&0 stage 1 address translation disabled.

See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.

0b1 EL2&0 stage 1 address translation enabled.

In a system where the PE resets into EL2, this field resets to 0.

Accessing the SCTLR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
SCTLR_EL2	11	0001	100	000	0000
SCTLR_EL1	11	0001	000	000	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
SCTLR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
SCTLR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
SCTLR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
SCTLR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	SCTLR_EL1	n/a	SCTLR_EL1
SCTLR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	SCTLR_EL1	SCTLR_EL1	SCTLR_EL1
SCTLR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	SCTLR_EL1	SCTLR_EL1
SCTLR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	SCTLR_EL1	RW	SCTLR_EL1
SCTLR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	SCTLR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [SCTLR_EL2](#) or [SCTLR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [SCTLR_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64}(\text{EL2})$ && $\text{IsUsingAccessor}(\text{SCTLR_EL2})$ && $\text{HCR_EL2.E2H} == 0$ && $\text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64}(\text{EL2})$ && $\text{IsUsingAccessor}(\text{SCTLR_EL2})$ && $\text{HCR_EL2.E2H} == 1$ && $\text{HCR_EL2.TGE} == 0$ && $\text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

D12.2.102 SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL3.

Configurations

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL3 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions

The SCTLR_EL3 bit assignments are:

Bits [63:32]

Reserved, RES0.

EnIA, bit [31]

From ARMv8.3:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

- 0b0 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
- 0b1 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

From ARMv8.3:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

- 0b0 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
- 0b1 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

From ARMv8.3:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

- 0b0 Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
- 0b1 Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

The possible values of this bit are:

- 0b0 Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.

0b1 Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bits [23:22]

Reserved, RES1.

IESB, bit [21]

From ARMv8.2:

Implicit error synchronization event enable. Possible values are:

0b0 Disabled.

0b1 An implicit error synchronization event is added:

- After each exception taken to EL3.
- Before the operational pseudocode of each ERET instruction executed at EL3.

When the PE is in Debug state, the effect of this field is CONstrained UNPREDICTABLE, and its *Effective value* might be 0 or 1 regardless of the value of the field. If the *Effective value* of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

This field is part of .

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

0b0 This control has no effect on memory access permissions.

0b1 Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]

From ARMv8.3:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

0b0 Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.

0b1 Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

0b0 All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache.

If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1 This control has no effect on the Cacheability of instruction access to Normal memory from EL3.

If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

In a system where the PE resets into EL3, this field resets to 0.

Bit [11]

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

0b0 LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.

0b1 This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAPURW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2164](#).

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

0b0 All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.

0b1 This control has no effect on the Cacheability of:

- Data access to Normal memory from EL3.
- Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

In a system where the PE resets into EL3, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

0b0 Alignment fault checking disabled when executing at EL3.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1 Alignment fault checking enabled when executing at EL3.

All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

0b0 EL3 stage 1 address translation disabled.

See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.

0b1 EL3 stage 1 address translation enabled.

In a system where the PE resets into EL3, this field resets to 0.

Accessing the SCTLR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
SCTLR_EL3	11	0001	110	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.103 TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

Configurations

AArch64 System register TCR_EL1[31:0] is architecturally mapped to AArch32 System register [TTBCR](#)[31:0].

AArch64 System register TCR_EL1[63:32] is architecturally mapped to AArch32 System register [TTBCR2](#)[31:0].

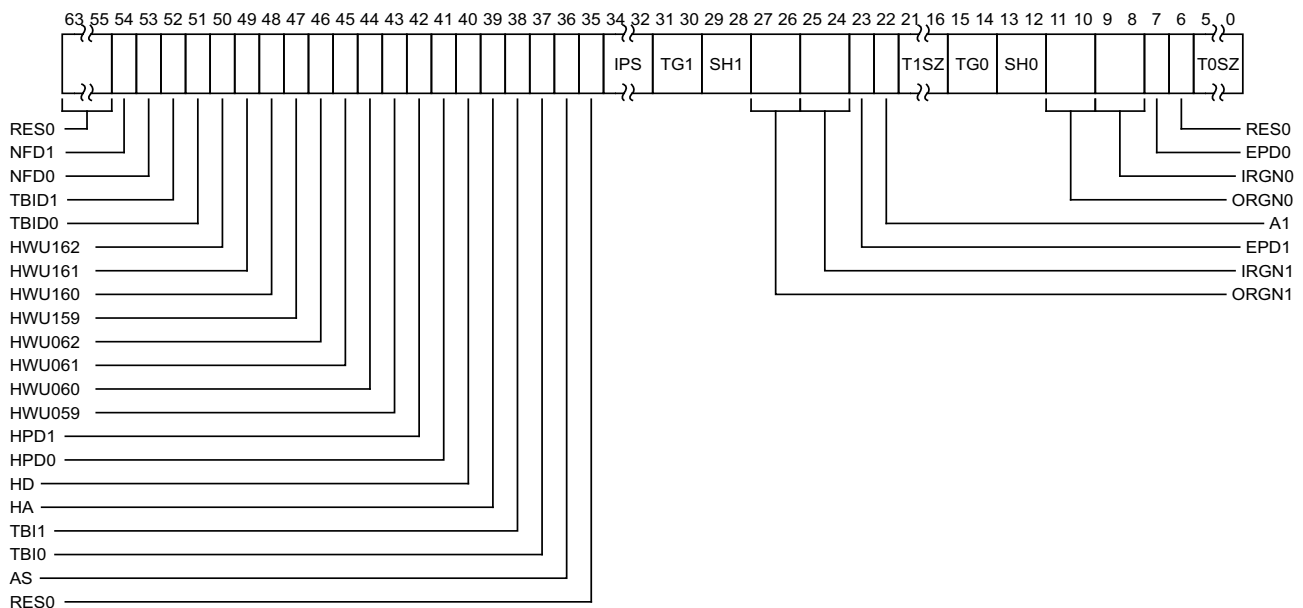

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TCR_EL1 is a 64-bit register.

Field descriptions

The TCR_EL1 bit assignments are:

Any of the bits in TCR_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:55]

Reserved, RES0.

NFD1, bit [54]

When SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using [TTBR1_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.

- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See *The Scalable Vector Extension (SVE)* on page A1-75 for more information.

Defined values are:

- 0b0 Does not disable stage 1 translation table walks using [TTBR1_EL1](#).
- 0b1 A TLB miss on a virtual address that is translated using [TTBR1_EL1](#) due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using [TTBR0_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See *The Scalable Vector Extension (SVE)* on page A1-75 for more information.

Defined values are:

- 0b0 Does not disable stage 1 translation table walks using [TTBR0_EL1](#).
- 0b1 A TLB miss on a virtual address that is translated using [TTBR0_EL1](#) due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

- 0b0 TCR_EL1.TBI1 applies to Instruction and Data accesses.
- 0b1 TCR_EL1.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL1](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

0b0 TCR_EL1.TBID0 applies to Instruction and Data accesses.

0b1 TCR_EL1.TBID0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL1](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

0b0 For translations using [TTBR1_EL1](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL1](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

0b0 For translations using [TTBR1_EL1](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL1](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

0b0 For translations using [TTBR1_EL1](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL1](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

- 0b0 For translations using [TTBR1_EL1](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR1_EL1](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1_EL1](#).

- 0b0 Hierarchical permissions are enabled.
- 0b1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL1](#).

- 0b0 Hierarchical permissions are enabled.
- 0b1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

0b0 Stage 1 hardware management of dirty state disabled.

0b1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

0b0 Stage 1 Access flag update disabled.

0b1 Stage 1 Access flag update enabled.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the [TTBR1_EL1](#) region, or ignored and used for tagged addresses. Defined values are:

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If [ARMv8.3-PAuth](#) is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the [TTBR0_EL1](#) region, or ignored and used for tagged addresses. Defined values are:

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If [ARMv8.3-PAuth](#) is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of `TBIO` is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size. Defined values are:

- `0b0` 8 bit - the upper 8 bits of `TTBR0_EL1` and `TTBR1_EL1` are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
- `0b1` 16 bit - the upper 16 bits of `TTBR0_EL1` and `TTBR1_EL1` are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

- `0b000` 32 bits, 4GB.
- `0b001` 36 bits, 64GB.
- `0b010` 40 bits, 1TB.
- `0b011` 42 bits, 4TB.
- `0b100` 44 bits, 16TB.
- `0b101` 48 bits, 256TB.
- `0b110` 52 bits, 4PB.

Other values are reserved.

The reserved values behave in the same way as the `0b101` or `0b110` encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value `0b110` is permitted only if [ARMv8.2-LPA](#) is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not `0b110` or a value treated as `0b110`, then bits[51:48] of every translation table base address for the stage of translation controlled by `TCR_EL1` are `0b0000`.

This field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the `TTBR1_EL1`.

- `0b01` 16KB.
- `0b10` 4KB.
- `0b11` 64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

- 0b00 Non-shareable.
- 0b10 Outer Shareable.
- 0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7231.

This field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

- 0b00 Normal memory, Outer Non-cacheable.
- 0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

- 0b00 Normal memory, Inner Non-cacheable.
- 0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL1](#). The encoding of this bit is:

- 0b0 Perform translation table walks using [TTBR1_EL1](#).
- 0b1 A TLB miss on an address that is translated using [TTBR1_EL1](#) generates a Translation fault. No translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether [TTBR0_EL1](#) or [TTBR1_EL1](#) defines the ASID. The encoding of this bit is:

- 0b0 [TTBR0_EL1](#).ASID defines the ASID.
- 0b1 [TTBR1_EL1](#).ASID defines the ASID.

This field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1_EL1](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL1](#).

0b00	4KB
0b01	64KB
0b10	16KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7231](#).

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL1](#). The encoding of this bit is:

- 0b0 Perform translation table walks using [TTBR0_EL1](#).
- 0b1 A TLB miss on an address that is translated using [TTBR0_EL1](#) generates a Translation fault. No translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL1](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

Accessing the TCR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TCR_EL1	11	0010	000	010	0000
TCR_EL12	11	0010	101	010	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TCR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
TCR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
TCR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x120]	RW	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
TCR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	TCR_EL2	RW
TCR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x120]	TCR_EL2	RW
TCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	TCR_EL2	RW
TCR_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
TCR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
TCR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x120]	-	-
TCR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
TCR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
TCR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x120]	RW	RW
TCR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAccessor(TCR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TCR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(TCR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TCR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(TCR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(TCR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TCR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(TCR_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TCR_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(TCR_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.104 TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the *Effective value* of HCR_EL2.E2H is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using TTBR0_EL2.
- When the value of HCR_EL2.E2H is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
 - A lower VA range, translated using TTBR0_EL2.
 - A higher VA range, translated using TTBR1_EL2.

Configurations

AArch64 System register TCR_EL2[31:0] is architecturally mapped to AArch32 System register HTCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

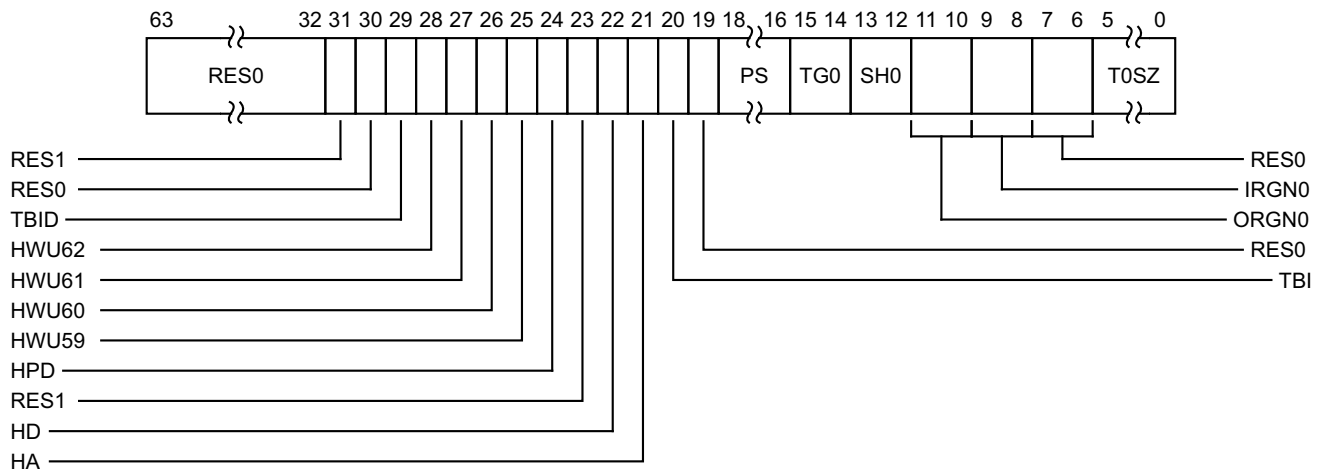

Attributes

TCR_EL2 is a 64-bit register.

Field descriptions

The TCR_EL2 bit assignments are:

When HCR_EL2.E2H == 0:

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

TBID, bit [29]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

0b0 TCR_EL2.TBI applies to Instruction and Data accesses.

0b1 TCR_EL2.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

0b0 Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

0b0 Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

0b0 Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

- 0b0 Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

- 0b0 Hierarchical permissions are enabled.
- 0b1 Hierarchical permissions are disabled.

Note

In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

- 0b0 Stage 1 hardware management of dirty state disabled.
- 0b1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in stage 1 translations from EL2.

- 0b0 Stage 1 Access flag update disabled.
- 0b1 Stage 1 Access flag update enabled.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses.

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If [ARMv8.3-PAuth](#) is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

This field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

0b000 32 bits, 4GB.

0b001 36 bits, 64GB.

0b010 40 bits, 1TB.

0b011 42 bits, 4TB.

0b100 44 bits, 16TB.

0b101 48 bits, 256TB.

0b110 52 bits, 4PB.

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if [ARMv8.2-LPA](#) is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

This field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL2](#).

0b00 4KB.

0b01 64KB.

0b10 16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

- 0b00 Non-shareable.
- 0b10 Outer Shareable.
- 0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7231](#).

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

- 0b00 Normal memory, Outer Non-cacheable.
- 0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

- 0b00 Normal memory, Inner Non-cacheable.
- 0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

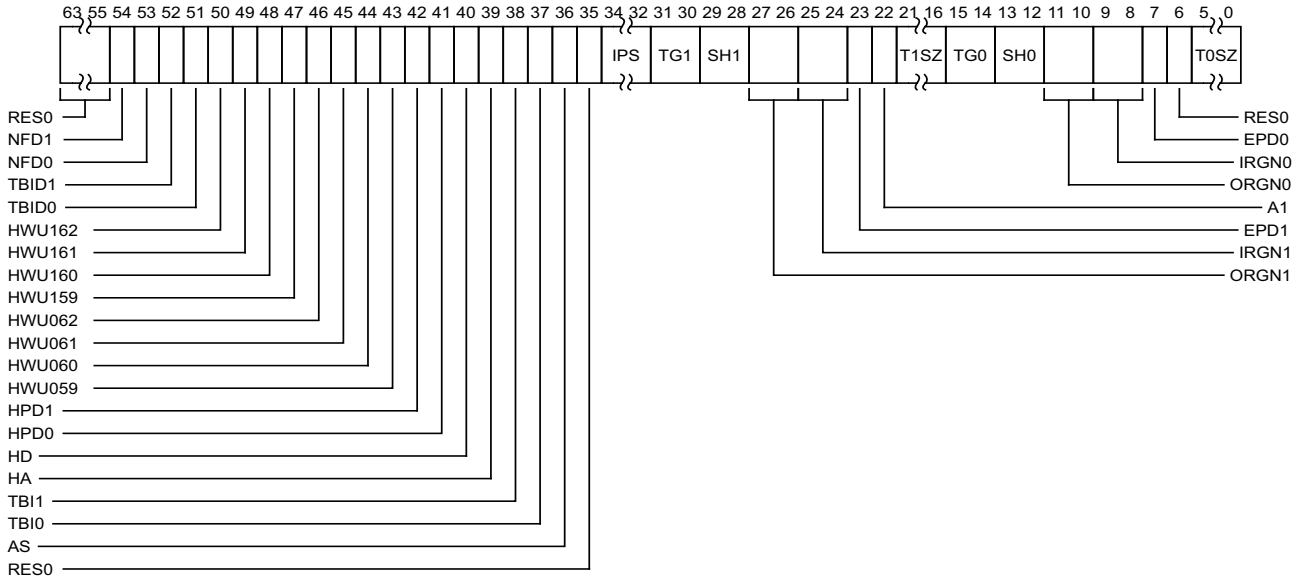

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

When HCR_EL2.E2H == 1:

This view of the register is only valid from ARMv8.1 when HCR_EL2.E2H is 1.

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

Bits [63:55]

Reserved, RES0.

NFD1, bit [54]

When SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using [TTBR1_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See [The Scalable Vector Extension \(SVE\) on page A1-75](#) for more information.

Defined values are:

- 0b0 Does not disable stage 1 translation table walks using [TTBR1_EL2](#).
- 0b1 A TLB miss on a virtual address that is translated using [TTBR1_EL2](#) due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using [TTBR0_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See [The Scalable Vector Extension \(SVE\) on page A1-75](#) for more information.

Defined values are:

- 0b0 Does not disable stage 1 translation table walks using [TTBR0_EL2](#).
- 0b1 A TLB miss on a virtual address that is translated using [TTBR0_EL2](#) due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

- 0b0 TCR_EL2.TBI1 applies to Instruction and Data accesses.
- 0b1 TCR_EL2.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL2](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

- 0b0 TCR_EL2.TBI0 applies to Instruction and Data accesses.
- 0b1 TCR_EL2.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

- 0b0 For translations using [TTBR1_EL2](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL2](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

0b0 For translations using [TTBR1_EL2](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL2](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

0b0 For translations using [TTBR1_EL2](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL2](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

0b0 For translations using [TTBR1_EL2](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL2](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TCR_EL2.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR0_EL1](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of [TCR_EL2.HPD0](#) is 1.

The *Effective value* of this field is 0 if the value of [TCR_EL2.HPD0](#) is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, [APTable](#), [PXNTable](#), and [UXNTable](#), except [NSTable](#), in the translation tables pointed to by [TTBR1_EL2](#).

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, [APTable](#), [PXNTable](#), and [UXNTable](#), except [NSTable](#), in the translation tables pointed to by [TTBR0_EL2](#).

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

0b0 Stage 1 hardware management of dirty state disabled.

0b1 Stage 1 hardware management of dirty state enabled, only if the [HA](#) bit is also set to 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in stage 1 translations from EL2.

0b0 Stage 1 Access flag update disabled.

0b1 Stage 1 Access flag update enabled.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

From ARMv8.1:

Top Byte ignored - indicates whether the top byte of an address is used for address match for the [TTBR1_EL2](#) region, or ignored and used for tagged addresses. Defined values are:

- 0b0 Top Byte used in the address calculation.
- 0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If [ARMv8.3-PAuth](#) is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI0, bit [37]

When ARMv8.1-VHE is implemented:

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses. Defined values are:

- 0b0 Top Byte used in the address calculation.
- 0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If [ARMv8.3-PAuth](#) is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AS, bit [36]

ASID Size. Defined values are:

- 0b0 8 bit - the upper 8 bits of [TTBR0_EL2](#) and [TTBR1_EL2](#) are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
- 0b1 16 bit - the upper 16 bits of [TTBR0_EL2](#) and [TTBR1_EL2](#) are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

0b000 32 bits, 4GB.

0b001 36 bits, 64GB.

0b010 40 bits, 1TB.

0b011 42 bits, 4TB.

0b100 44 bits, 16TB.

0b101 48 bits, 256TB.

0b110 **When ARMv8.2-LPA is implemented** 52 bits, 4PB.

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if [ARMv8.2-LPA](#) is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

This field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

From ARMv8.1:

Granule size for the [TTBR1_EL2](#).

0b01 16KB.

0b10 4KB.

0b11 64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH1, bits [29:28]

From ARMv8.1:

Shareability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

Defined values are:

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7231.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ORGN1, bits [27:26]

From ARMv8.1:

Outer cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IRGN1, bits [25:24]

From ARMv8.1:

Inner cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPD1, bit [23]

From ARMv8.1:

Translation table walk disable for translations using [TTBR1_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL2](#). The encoding of this bit is:

0b0 Perform translation table walks using [TTBR1_EL2](#).

0b1 A TLB miss on an address that is translated using [TTBR1_EL2](#) generates a Translation fault. No translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

A1, bit [22]

Selects whether [TTBR0_EL2](#) or [TTBR1_EL2](#) defines the ASID. The encoding of this bit is:

0b0 [TTBR0_EL2](#).ASID defines the ASID.

0b1 [TTBR1_EL2](#).ASID defines the ASID.

This field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

From ARMv8.1:

The size offset of the memory region addressed by [TTBR1_EL2](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TG0, bits [15:14]

From ARMv8.1:

Granule size for the [TTBR0_EL2](#).

0b00 4KB.

0b01 64KB.

0b10 16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH0, bits [13:12]

From ARMv8.1:

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7231](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ORGN0, bits [11:10]

From ARMv8.1:

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IRGN0, bits [9:8]

From ARMv8.1:

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPD0, bit [7]

From ARMv8.1:

Translation table walk disable for translations using [TTBR0_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL2](#). The encoding of this bit is:

0b0 Perform translation table walks using [TTBR0_EL2](#).

0b1 A TLB miss on an address that is translated using [TTBR0_EL2](#) generates a Translation fault. No translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

From ARMv8.1:

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TCR_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TCR_EL2	11	0010	100	010	0000
TCR_EL1	11	0010	000	010	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TCR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
TCR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
TCR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
TCR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	TCR_EL1	n/a	TCR_EL1
TCR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	TCR_EL1	TCR_EL1	TCR_EL1
TCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	TCR_EL1	TCR_EL1
TCR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	TCR_EL1	RW	TCR_EL1
TCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	TCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [TCR_EL2](#) or [TCR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [TCR_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If ([SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1](#)) && [IsUsingAArch64\(EL2\)](#) && [IsUsingAccessor\(TCR_EL2\)](#) && [HCR_EL2.E2H == 0](#) && [HCR_EL2.NV == 1](#), then accesses at EL1 are trapped to EL2.
- If ([SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1](#)) && [IsUsingAArch64\(EL2\)](#) && [IsUsingAccessor\(TCR_EL2\)](#) && [HCR_EL2.E2H == 1](#) && [HCR_EL2.TGE == 0](#) && [HCR_EL2.NV == 1](#), then accesses at EL1 are trapped to EL2.

D12.2.105 TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

Purpose

The control register for stage 1 of the EL3 translation regime.

Configurations

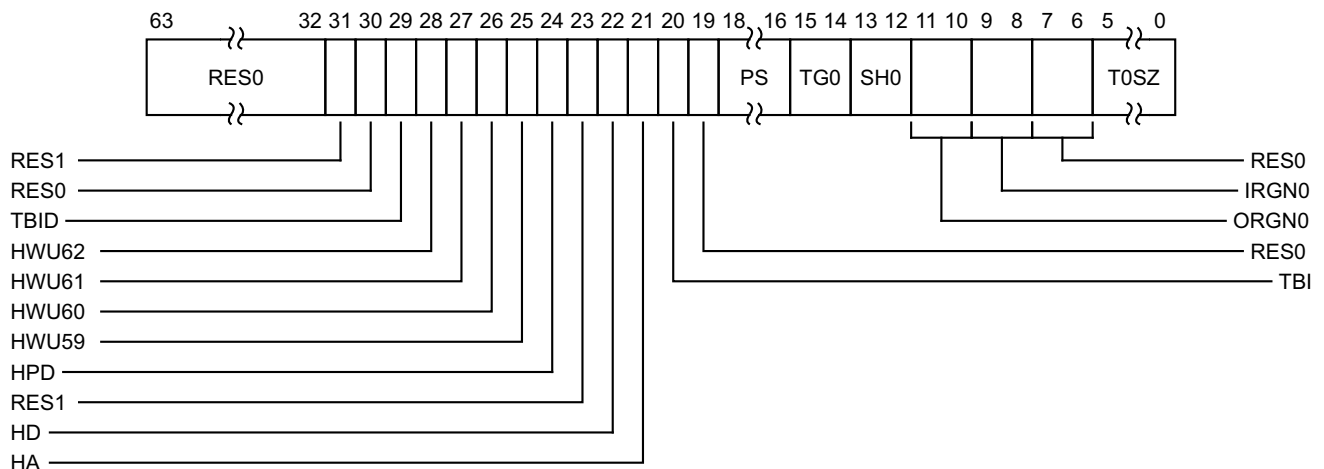

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TCR_EL3 is a 64-bit register.

Field descriptions

The TCR_EL3 bit assignments are:

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

Bits [63:32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

TBID, bit [29]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

0b0 TCR_EL3.TBI applies to Instruction and Data accesses.

0b1 TCR_EL3.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL3](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

0b0 Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The *Effective value* of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

0b0 Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The *Effective value* of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

0b0 Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The *Effective value* of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

0b0 Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The *Effective value* of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL3](#).

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled.

Note

In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 1 translations from EL3.

0b0 Stage 1 hardware management of dirty state disabled.

0b1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in stage 1 translations from EL3.

0b0 Stage 1 Access flag update disabled.

0b1 Stage 1 Access flag update enabled.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the [TTBR0_EL3](#) region, or ignored and used for tagged addresses.

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL3](#). It has an effect whether the EL3 translation regime is enabled or not.

If [ARMv8.3-PAuth](#) is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

This field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if [ARMv8.2-LPA](#) is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

This field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL3](#).

0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7231.

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL3](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

Accessing the TCR_EL3

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TCR_EL3	11	0010	110	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.106 TPIDR_EL0, EL0 Read/Write Software Thread ID Register

The TPIDR_EL0 characteristics are:

Purpose

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch64 System register TPIDR_EL0[31:0] is architecturally mapped to AArch32 System register [TPIDRURW](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDR_EL0 is a 64-bit register.

Field descriptions

The TPIDR_EL0 bit assignments are:

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

Accessing the TPIDR_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TPIDR_EL0	11	1101	011	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

D12.2.107 TPIDR_EL1, EL1 Software Thread ID Register

The TPIDR_EL1 characteristics are:

Purpose

Provides a location where software executing at EL1 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch64 System register TPIDR_EL1[31:0] is architecturally mapped to AArch32 System register [TPIDRPRW](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDR_EL1 is a 64-bit register.

Field descriptions

The TPIDR_EL1 bit assignments are:

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

Accessing the TPIDR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TPIDR_EL1	11	1101	000	100	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

D12.2.108 TPIDR_EL2, EL2 Software Thread ID Register

The TPIDR_EL2 characteristics are:

Purpose

Provides a location where software executing at EL2 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch64 System register TPIDR_EL2[31:0] is architecturally mapped to AArch32 System register [HTPIDR](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDR_EL2 is a 64-bit register.

Field descriptions

The TPIDR_EL2 bit assignments are:

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

Accessing the TPIDR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TPIDR_EL2	11	1101	100	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x90]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.109 TPIDR_EL3, EL3 Software Thread ID Register

The TPIDR_EL3 characteristics are:

Purpose

Provides a location where software executing at EL3 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDR_EL3 is a 64-bit register.

Field descriptions

The TPIDR_EL3 bit assignments are:

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

Accessing the TPIDR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TPIDR_EL3	11	1101	110	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.110 TPIDRRO_EL0, EL0 Read-Only Software Thread ID Register

The TPIDRRO_EL0 characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch64 System register TPIDRRO_EL0[31:0] is architecturally mapped to AArch32 System register [TPIDRURO](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDRRO_EL0 is a 64-bit register.

Field descriptions

The TPIDRRO_EL0 bit assignments are:

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

Accessing the TPIDRRO_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TPIDRRO_EL0	11	1101	011	011	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	RW

D12.2.111 TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

Configurations

AArch64 System register TTBR0_EL1[63:0] is architecturally mapped to AArch32 System register [TTBR0](#)[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TTBR0_EL1 is a 64-bit register.

Field descriptions

The TTBR0_EL1 bit assignments are:

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL1.A1](#) field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of [TCR_EL1.IPS](#) is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.

- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes [ARMv8.2-LPA](#) a [TCR_EL1](#).IPS value of 0b110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of [TCR_EL1](#).IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the *Effective value* of [TCR_EL1](#).IPS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

Note

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any [TTBR0_EL1](#)[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using [TTBR0_EL1](#), then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL1](#).T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by [TTBR0_EL1](#) is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of [TTBR0_EL1](#).CnP is 1.

- 0b0 The translation table entries pointed to by [TTBR0_EL1](#), for the current translation regime and ASID, are permitted to differ from corresponding entries for [TTBR0_EL1](#) for other PEs in the Inner Shareable domain. This is not affected by:
- The value of [TTBR0_EL1](#).CnP on those other PEs.
 - The value of the current ASID.
 - If EL2 is enabled in the current Security state, the value of the current VMID.
- 0b1 The translation table entries pointed to by [TTBR0_EL1](#) are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of [TTBR0_EL1](#).CnP is 1 and all of the following apply:
- The translation table entries are pointed to by [TTBR0_EL1](#).

- The translation tables relate to the same translation regime.
- The ASID is the same as the current ASID.
- If EL2 is enabled in the current Security state, the value of the current VMID.

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

———— **Note** ————

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see *CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218*.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR0_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TTBR0_EL1	11	0010	000	000	0000
TTBR0_EL12	11	0010	101	000	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TTBR0_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
TTBR0_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
TTBR0_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x200]	RW	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TTBR0_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
TTBR0_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	TTBR0_EL2	RW
TTBR0_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x200]	TTBR0_EL2	RW
TTBR0_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	TTBR0_EL2	RW
TTBR0_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
TTBR0_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
TTBR0_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x200]	-	-
TTBR0_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
TTBR0_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
TTBR0_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x200]	RW	RW
TTBR0_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAccessor(TTBR0_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TTBR0_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(TTBR0_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TTBR0_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(TTBR0_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(TTBR0_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TTBR0_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(TTBR0_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TTBR0_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(TTBR0_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.112 TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

Purpose

When [HCR_EL2.E2H](#) is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When [HCR_EL2.E2H](#) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

Configurations

AArch64 System register TTBR0_EL2[47:1] is architecturally mapped to AArch32 System register [HTTBR](#)[47:1].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TTBR0_EL2 is a 64-bit register.

Field descriptions

The TTBR0_EL2 bit assignments are:

ASID, bits [63:48]

From *ARMv8.1*:

When [HCR_EL2.E2H](#) is 0, this field is RES0.

When [HCR_EL2.E2H](#) is 1, it holds an ASID for the translation table base address. The [TCR_EL2.A1](#) field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

————— Note —————

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of `TCR_EL2.{I}PS` is `0b110`, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

Note

In an implementation that includes [ARMv8.2-LPA](#):

- A `TCR_EL2.{I}PS` value of `0b110`, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- The OA size is specified by:
 - The value of `TCR_EL2.PS` when the value of `HCR_EL2.E2H` is 0.
 - The value of `TCR_EL2.IPS` when the value of `HCR_EL2.E2H` is 1.

When the value of `ID_AA64MMFR0_EL1.PARange` indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of `TCR_EL2.{I}PS` is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the *Effective value* of `TCR_EL2.{I}PS` is not `0b110` then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

Note

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any `TTBR0_EL2[47:0]` bit that is defined as RES0 has the value 1 when a translation table walk is performed using `TTBR0_EL2`, then the translation table base address might be misaligned, with effects that are CONstrained UNpredictable, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of `TCR_EL2.T0SZ`, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

- 0b0 The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:
 - The value of TTBR0_EL2.CnP on those other PEs.
 - When the current translation regime is the EL2&0 regime, the value of the current ASID.
- 0b1 The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:
 - The translation table entries are pointed to by TTBR0_EL2.
 - The translation tables relate to the same translation regime.
 - If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This field is permitted to be cached in a TLB.

———— **Note** —————

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see *CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218*.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR0_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TTBR0_EL2	11	0010	100	000	0000
TTBR0_EL1	11	0010	000	000	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TTBR0_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
TTBR0_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
TTBR0_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
TTBR0_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	TTBR0_EL1	n/a	TTBR0_EL1
TTBR0_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	TTBR0_EL1	TTBR0_EL1	TTBR0_EL1
TTBR0_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	TTBR0_EL1	TTBR0_EL1
TTBR0_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	TTBR0_EL1	RW	TTBR0_EL1
TTBR0_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	TTBR0_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [TTBR0_EL2](#) or [TTBR0_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [TTBR0_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

D12.2.113 TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TTBR0_EL3 is a 64-bit register.

Field descriptions

The TTBR0_EL3 bit assignments are:

Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of [TCR_EL3.PS](#) is 0b110 then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes [ARMv8.2-LPA](#) a [TCR_EL3.PS](#) value of 0b110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of [TCR_EL3.PS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the *Effective value* of [TCR_EL3.PS](#) is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

Note

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any [TTBR0_EL3](#)[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using [TTBR0_EL3](#), then the translation table base address might be misaligned, with effects that are *CONSTRAINED UNPREDICTABLE*, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL3.T0SZ](#), the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by [TTBR0_EL3](#) is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of [TTBR0_EL3.CnP](#) is 1.

- 0b0 The translation table entries pointed to by [TTBR0_EL3](#), for the current translation regime, are permitted to differ from corresponding entries for [TTBR0_EL3](#) for other PEs in the Inner Shareable domain. This is not affected by the value of [TTBR0_EL3.CnP](#) on those other PEs.
- 0b1 The translation table entries pointed to by [TTBR0_EL3](#) are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of [TTBR0_EL3.CnP](#) is 1 and the translation table entries are pointed to by [TTBR0_EL3](#).

This field is permitted to be cached in a TLB.

Note

If the value of the [TTBR0_EL3.CnP](#) bit is 1 on multiple PEs in the same Inner Shareable domain and those [TTBR0_EL3](#)s do not point to the same translation table entries the results of translations using [TTBR0_EL3](#) are *CONSTRAINED UNPREDICTABLE*, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR0_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TTBR0_EL3	11	0010	110	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.114 TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

Configurations

AArch64 System register TTBR1_EL1[63:0] is architecturally mapped to AArch32 System register [TTBR1](#)[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TTBR1_EL1 is a 64-bit register.

Field descriptions

The TTBR1_EL1 bit assignments are:

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL1.A1](#) field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of [TCR_EL1.IPS](#) is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.

- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes [ARMv8.2-LPA](#) a [TCR_EL1](#).IPS value of 0b110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of [TCR_EL1](#).IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the *Effective value* of [TCR_EL1](#).IPS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

Note

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any [TTBR1_EL1](#)[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using [TTBR1_EL1](#), then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL1](#).T1SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by [TBR1_EL1](#) is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of [TTBR1_EL1](#).CnP is 1.

- 0b0 The translation table entries pointed to by [TTBR1_EL1](#), for the current translation regime and ASID, are permitted to differ from corresponding entries for [TTBR1_EL1](#) for other PEs in the Inner Shareable domain. This is not affected by:
- The value of [TTBR1_EL1](#).CnP on those other PEs.
 - The value of the current ASID.
 - If EL2 is enabled in the current Security state, the value of the current VMID.
- 0b1 The translation table entries pointed to by [TTBR1_EL1](#) are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of [TTBR1_EL1](#).CnP is 1 and all of the following apply:
- The translation table entries are pointed to by [TTBR1_EL1](#).

- The translation tables relate to the same translation regime.
- The ASID is the same as the current ASID.
- If EL2 is enabled in the current Security state, the value of the current VMID.

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

———— **Note** ————

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see *CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218*.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR1_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
TTBR1_EL1	11	0010	000	001	0000
TTBR1_EL12	11	0010	101	001	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TTBR1_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
TTBR1_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
TTBR1_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x210]	RW	RW

TTBR1_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
TTBR1_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
TTBR1_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x210]	RW	RW
TTBR1_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `IsUsingAccessor(TTBR1_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TTBR1_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(TTBR1_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TTBR1_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(TTBR1_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(TTBR1_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TTBR1_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(TTBR1_EL1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(TTBR1_EL12) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1`, then write accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(TTBR1_EL12) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.115 TTBR1_EL2, Translation Table Base Register 1 (EL2)

The TTBR1_EL2 characteristics are:

Purpose

When [HCR_EL2.E2H](#) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

Note

When [HCR_EL2.E2H](#) is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

Configurations

This register is present only from ARMv8.1. Otherwise, direct accesses to TTBR1_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

TTBR1_EL2 is a 64-bit register.

Field descriptions

The TTBR1_EL2 bit assignments are:

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL2.A1](#) field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

From ARMv8.1:

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of `TCR_EL2.{I}PS` is `0b110`, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes [ARMv8.2-LPA](#) a `TCR_EL2.IPS` value of `0b110`, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of `ID_AA64MMFR0_EL1.PARange` indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of `TCR_EL2.IPS` is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the *Effective value* of `TCR_EL2.IPS` is not `0b110` then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

Note

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any `TTBR1_EL2[47:0]` bit that is defined as RES0 has the value 1 when a translation table walk is performed using `TTBR1_EL2`, then the translation table base address might be misaligned, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of `TCR_EL2.T1SZ`, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

- 0b0 The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by:
 - The value of TTBR1_EL2.CnP on those other PEs.
 - The value of the current ASID.
- 0b1 The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply:
 - The translation table entries are pointed to by TTBR1_EL2.
 - The ASID is the same as the current ASID.

This field is permitted to be cached in a TLB.

Note

- TTBR1_EL2 is accessible only when the value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see [CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR1_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
TTBR1_EL2	0010	11	100	001	0000
TTBR1_EL1	0010	11	000	001	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TTBR1_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
TTBR1_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
TTBR1_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
TTBR1_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	TTBR1_EL1	n/a	TTBR1_EL1
TTBR1_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	TTBR1_EL1	TTBR1_EL1	TTBR1_EL1
TTBR1_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	TTBR1_EL1	TTBR1_EL1
TTBR1_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	TTBR1_EL1	RW	TTBR1_EL1
TTBR1_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	TTBR1_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [TTBR1_EL2](#) or [TTBR1_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [TTBR1_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VBAR_EL1	11	1100	000	000	0000
VBAR_EL12	11	1100	101	000	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
VBAR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
VBAR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
VBAR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x250]	RW	RW

		EL0	EL1	EL2	EL3
VBAR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
VBAR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x250]	RW	RW
VBAR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic VBAR_EL1 or VBAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If ([HCR_EL2.NV2](#) == 0 || [HCR_EL2.NV1](#) == 1) && ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H](#) == 0 && [IsUsingAccessor\(VBAR_EL12\)](#) && [HCR_EL2.NV](#) == 1, then accesses at EL1 are trapped to EL2.
- If [IsUsingAccessor\(VBAR_EL1\)](#) && ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.NV1](#) == 1, then accesses at EL1 are trapped to EL2.
- If [IsUsingAccessor\(VBAR_EL12\)](#) && ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.NV1](#) == 1, then accesses at EL1 are trapped to EL2.
- If ([HCR_EL2.NV2](#) == 0 || [HCR_EL2.NV1](#) == 1) && ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H](#) == 1 && [HCR_EL2.TGE](#) == 0 && [IsUsingAccessor\(VBAR_EL12\)](#) && [HCR_EL2.NV](#) == 1, then accesses at EL1 are trapped to EL2.

D12.2.117 VBAR_EL2, Vector Base Address Register (EL2)

The VBAR_EL2 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL2.

Configurations

AArch64 System register VBAR_EL2[31:0] is architecturally mapped to AArch32 System register HVBAR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VBAR_EL2 is a 64-bit register.

Field descriptions

The VBAR_EL2 bit assignments are:

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

If the implementation does not support [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.

This field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing the VBAR_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VBAR_EL2	11	1100	100	000	0000
VBAR_EL1	11	1100	000	000	0000

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
VBAR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
VBAR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
VBAR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
VBAR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	VBAR_EL1	n/a	VBAR_EL1
VBAR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	VBAR_EL1	VBAR_EL1	VBAR_EL1
VBAR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	VBAR_EL1	VBAR_EL1
VBAR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	VBAR_EL1	RW	VBAR_EL1
VBAR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	VBAR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [VBAR_EL2](#) or [VBAR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [VBAR_EL1](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

D12.2.118 VBAR_EL3, Vector Base Address Register (EL3)

The VBAR_EL3 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL3.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VBAR_EL3 is a 64-bit register.

Field descriptions

The VBAR_EL3 bit assignments are:

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

If the implementation does not support [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL3 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL3 must be the same or else the use of the vector address will result in a recursive exception.

This field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing the VBAR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VBAR_EL3	11	1100	110	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.2.119 VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of [MPIDR_EL1](#).

Configurations

AArch64 System register VMPIDR_EL2[31:0] is architecturally mapped to AArch32 System register [VMPIDR](#)[31:0].

If EL2 is not implemented, reads of this register return the value of the [MPIDR_EL1](#), and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VMPIDR_EL2 is a 64-bit register.

Field descriptions

The VMPIDR_EL2 bit assignments are:

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

This field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

0b0 Processor is part of a multiprocessor system.

0b1 Processor is part of a uniprocessor system.

This field resets to an architecturally UNKNOWN value.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of [affinity](#) consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

- 0b0 Performance of PEs at the lowest affinity level is largely independent.
- 0b1 Performance of PEs at the lowest affinity level is very interdependent.

This field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0. This is the [affinity](#) level that is most significant for determining PE behavior. Higher [affinity](#) levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field resets to an architecturally UNKNOWN value.

Accessing the VMPIDR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VMPIDR_EL2	11	0000	100	101	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x50]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HCR_EL2.NV2 == 0` && (`SCR_EL3.NS == 1` || `SCR_EL3.EEL2 == 1`) && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `HCR_EL2.NV2 == 0` && (`SCR_EL3.NS == 1` || `SCR_EL3.EEL2 == 1`) && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.120 VNCR_EL2, Virtual Nested Control Register

The VNCR_EL2 characteristics are:

Purpose

When [ARMv8.4-NV](#) is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

Configurations

This register is present only when ARMv8.4-NV is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VNCR_EL2 is a 64-bit register.

Field descriptions

The VNCR_EL2 bit assignments are:

RESS, bits [63:53]

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

BADDR, bits [52:12]

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR.BADDR:Offset<11:0>, 64).

This field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing the VNCR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VNCR_EL2	11	0010	100	000	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0xB0]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

D12.2.121 VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of [MIDR_EL1](#).

Configurations

AArch64 System register VPIDR_EL2[31:0] is architecturally mapped to AArch32 System register [VPIDR](#)[31:0].

If EL2 is not implemented, reads of this register return the value of the [MIDR_EL1](#), and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VPIDR_EL2 is a 64-bit register.

Field descriptions

The VPIDR_EL2 bit assignments are:

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

Hex representation	ASCII representation	Implementer
0x41	A	ARM Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation

Hex representation	ASCII representation	Implementer
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

This field resets to an architecturally UNKNOWN value.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field resets to an architecturally UNKNOWN value.

Architecture, bits [19:16]

The permitted values of this field are:

0b0001	ARMv4.
0b0010	ARMv4T.
0b0011	ARMv5 (obsolete).
0b0100	ARMv5T.
0b0101	ARMv5TE.
0b0110	ARMv5TEJ.
0b0111	ARMv6.
0b1111	Architectural features are individually identified in the ID_* registers, see ID registers on page K13-7414 .

All other values are reserved.

This field resets to an architecturally UNKNOWN value.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field resets to an architecturally UNKNOWN value.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

This field resets to an architecturally UNKNOWN value.

Accessing the VPIDR_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VPIDR_EL2	11	0000	100	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x88]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.122 VSTCR_EL2, Virtualization Secure Translation Control Register

The VSTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the Secure EL1&0 translation regime.

Configurations

This register is present only from ARMv8.4. Otherwise, direct accesses to VSTCR_EL2 are UNDEFINED.

If Secure EL2 is not implemented, this register is UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.4.

Attributes

VSTCR_EL2 is a 64-bit register.

Field descriptions

The VSTCR_EL2 bit assignments are:

Any of the bits in VSTCR_EL2 are permitted to be cached in a TLB.

Bits [63:32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

SA, bit [30]

Secure stage 2 translation output address space.

0b0 All stage 2 translations for the Secure IPA space access the Secure PA space.

0b1 All stage 2 translations for the Secure IPA space access the Non-secure PA space.

When the value of VSTCR_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

This field resets to an architecturally UNKNOWN value.

SW, bit [29]

Secure stage 2 translation address space.

0b0 All stage 2 translation table walks for the Secure IPA space are to the Secure PA space.

0b1 All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space.

This field resets to an architecturally UNKNOWN value.

Bits [28:16]

Reserved, RES0.

TG0, bits [15:14]

Secure stage 2 granule size for [VSTTBR_EL2](#).

0b00 4KB.

0b01 64KB.

0b10 16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

Bits [13:8]

Reserved, RES0.

SL0, bits [7:6]

From ARMv8.4, when ARMv8.4-TTST is implemented:

Starting level of the Secure stage 2 translation lookup, controlled by [VSTCR_EL2](#). The meaning of this field depends on the value of [VSTCR_EL2.TG0](#).

0b00 If [VSTCR_EL2.TG0](#) is 0b00 (4KB granule), start at level 2. If [VSTCR_EL2.TG0](#) is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.

0b01 If [VSTCR_EL2.TG0](#) is 0b00 (4KB granule), start at level 1. If [VSTCR_EL2.TG0](#) is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.

0b10 If [VSTCR_EL2.TG0](#) is 0b00 (4KB granule), start at level 0. If [VSTCR_EL2.TG0](#) is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

0b11 If [VSTCR_EL2.TG0](#) is 0b00 (4KB granule), start at level 3.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of [VSTCR_EL2.T0SZ](#), then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the Secure stage 2 translation lookup, controlled by [VSTCR_EL2](#). The meaning of this field depends on the value of [VSTCR_EL2.TG0](#).

0b00 If [VSTCR_EL2.TG0](#) is 0b00 (4KB granule), start at level 2. If [VSTCR_EL2.TG0](#) is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.

0b01 If [VSTCR_EL2.TG0](#) is 0b00 (4KB granule), start at level 1. If [VSTCR_EL2.TG0](#) is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.

0b10 If [VSTCR_EL2.TG0](#) is 0b00 (4KB granule), start at level 0. If [VSTCR_EL2.TG0](#) is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of [VSTCR_EL2.T0SZ](#), then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [VSTTBR_EL2](#). The region size is $2^{(64-VSTCR_EL2.T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

Accessing the VSTCR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VSTCR_EL2	11	0010	100	010	0110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	[VNCR_EL2.BADDR << 12 + 0x48]	RW	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	RW	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && SCR_EL3.NS == 1 && HCR_EL2.TGE == 0	-	-	-	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && SCR_EL3.NS == 1 && HCR_EL2.TGE == 0	-	[VNCR_EL2.BADDR << 12 + 0x48]	-	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HCR_EL2.NV2 == 0` && `SCR_EL3.NS == 0` && `SCR_EL3.EEL2 == 1` && `IsUsingAArch64(EL2) && HCR_EL2.E2H == 0` && `HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `HCR_EL2.NV2 == 0` && `SCR_EL3.NS == 0` && `SCR_EL3.EEL2 == 1` && `IsUsingAArch64(EL2) && HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.123 VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

Purpose

The base register for stage 2 of the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Secure EL1&0 translation regime, and other information for this translation stage.

Configurations

This register is present only from ARMv8.4. Otherwise, direct accesses to VSTTBR_EL2 are UNDEFINED.

If Secure EL2 is not implemented, this register is UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.4.

Attributes

VSTTBR_EL2 is a 64-bit register.

Field descriptions

The VSTTBR_EL2 bit assignments are:

Any of the bits in VSTTBR_EL2 are permitted to be cached in a TLB.

Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

If the value of [VTCR_EL2.PS](#) is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.

- When $x > 6$ register bits[($x-1$):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.

———— **Note** ————

When the value of `ID_AA64MMFR0_EL1.PARange` indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of `VTTCR_EL2.PS` is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the *Effective value* of `VTTCR_EL2.PS` is not `0b110` then:

- Register bits[47: x] hold bits[47: x] of the stage 1 translation table base address.
- Register bits[($x-1$):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

If any `VSTTBR_EL2[47:1]` bit that is defined as RES0 has the value 1 when a translation table walk is performed using `VSTTBR_EL2`, then the translation table base address might be misaligned, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Bits[$x-1$:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of `VSTTCR_EL2.TOSZ`, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes ARMv8.2-TTCNP, indicates whether each entry that is pointed to by `VSTTBR_EL2` is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of `VSTTBR_EL2.CnP` is 1.

- | | |
|-----|--|
| 0b0 | The translation table entries pointed to by <code>VSTTBR_EL2</code> are permitted to differ from the entries for <code>VSTTBR_EL2</code> for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID. |
| 0b1 | The translation table entries pointed to by <code>VSTTBR_EL2</code> are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of <code>VSTTBR_EL2.CnP</code> is 1 and the VMID is the same as the current VMID. |

———— **Note** ————

If the value of `VSTTBR_EL2.CnP` bit is 1 on multiple PEs in the same Inner Shareable domain and those `VSTTBR_EL2s` do not point to the same translation table entries when using the current VMID, then the results of translations using `VSTTBR_EL2` are CONstrained UNPREDICTABLE, see CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-6254.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Accessing the VSTTBR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VSTTBR_EL2	11	0010	100	000	0110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	[VNCR_EL2.BADDR << 12 + 0x30]	RW	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	RW	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && SCR_EL3.NS == 1 && HCR_EL2.TGE == 0	-	-	-	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && SCR_EL3.NS == 1 && HCR_EL2.TGE == 0	-	[VNCR_EL2.BADDR << 12 + 0x30]	-	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HCR_EL2.NV2 == 0 && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If HCR_EL2.NV2 == 0 && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.

D12.2.124 VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the EL1&0 translation regime.

Configurations

AArch64 System register VTCR_EL2[31:0] is architecturally mapped to AArch32 System register VTCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

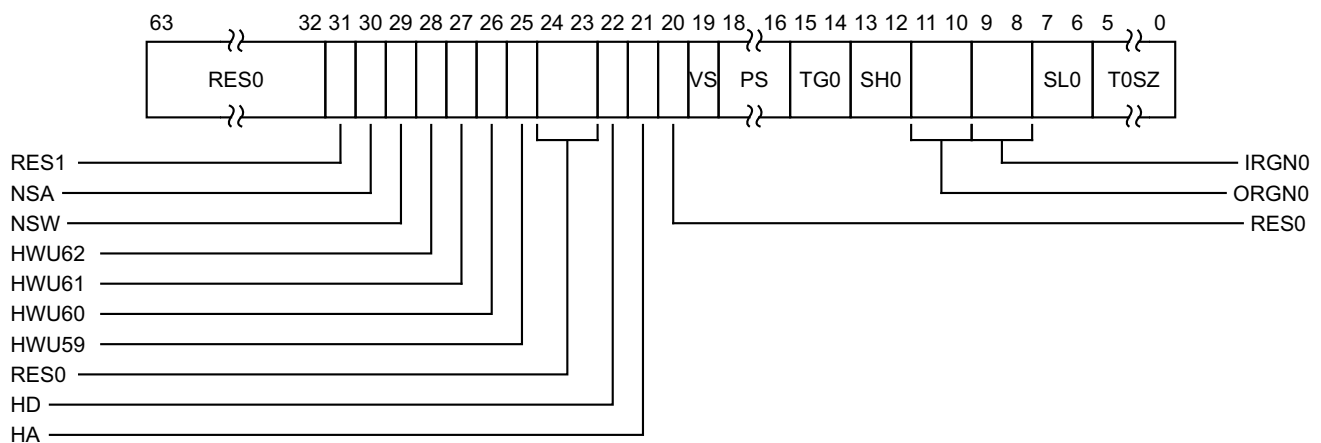

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VTCR_EL2 is a 64-bit register.

Field descriptions

The VTCR_EL2 bit assignments are:

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Bits [63:32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

NSA, bit [30]

From ARMv8.4:

Non-secure stage 2 translation output address space.

0b0 All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Secure PA space.

0b1 All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Non-secure PA space.

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The PE is executing in Non-secure state.

- The value of VTCR_EL2.NSW is 1.
- The value of VSTCR_EL2.SA is 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSW, bit [29]

From ARMv8.4:

Non-secure stage 2 translation table address space.

0b0 All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Secure PA space.

0b1 All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Non-secure PA space.

When the PE is executing in Non-secure state, this bit behaves as 1 for all purposes other than reading back the value of the bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

0b0 Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

0b0 Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

0b0 Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

0b0 Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:23]

Reserved, RES0.

HD, bit [22]

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

0b0 Stage 2 hardware management of dirty state disabled.

0b1 Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in Non-secure and Secure stage 2 translations when EL2 is enabled in the current Security state.

0b0 Stage 2 Access flag update disabled.

0b1 Stage 2 Access flag update enabled.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

VS, bit [19]

When ARMv8.1-VMID16 is implemented:

VMID Size.

0b0 8 bit - the upper 8 bits of `VTTBR_EL2` and `VSTTBR_EL2` are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.

0b1 16 bit - the upper 8 bits of [VTTBR_EL2](#) and [VSTTBR_EL2](#) are used for allocation and matching in the TLB.

If the implementation only supports an 8-bit VMID, this field is RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PS, bits [18:16]

Physical address Size for the Second Stage of translation.

0b000 32 bits, 4GB.

0b001 36 bits, 64GB.

0b010 40 bits, 1TB.

0b011 42 bits, 4TB.

0b100 44 bits, 16TB.

0b101 48 bits, 256TB.

0b110 52 bits, 4PB.

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if [ARMv8.2-LPA](#) is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by [VTCR_EL2](#) are 0b0000.

This field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [VTTBR_EL2](#).

0b00 4KB.

0b01 64KB.

0b10 16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR_EL2](#) or [VSTTBR_EL2](#).

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7231.

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using `VTTBR_EL2` or `VSTTBR_EL2`.

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using `VTTBR_EL2` or `VSTTBR_EL2`.

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

When ARMv8.4-TTST is implemented:

Starting level of the Secure stage 2 translation lookup, controlled by `VTCR_EL2`. The meaning of this field depends on the value of `VTCR_EL2.TG0`.

0b00 If `VTCR_EL2.TG0` is 0b00 (4KB granule), start at level 2. If `VTCR_EL2.TG0` is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.

0b01 If `VTCR_EL2.TG0` is 0b00 (4KB granule), start at level 1. If `VTCR_EL2.TG0` is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.

0b10 If `VTCR_EL2.TG0` is 0b00 (4KB granule), start at level 0. If `VTCR_EL2.TG0` is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

0b11 If `VTCR_EL2.TG0` is 0b00 (4KB granule), start at level 3.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of `VTCR_EL2.TOSZ`, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the Secure stage 2 translation lookup, controlled by `VTCR_EL2`. The meaning of this field depends on the value of `VTCR_EL2.TG0`.

0b00 If `VTCR_EL2.TG0` is 0b00 (4KB granule), start at level 2. If `VTCR_EL2.TG0` is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.

0b01 If `VTCR_EL2.TG0` is 0b00 (4KB granule), start at level 1. If `VTCR_EL2.TG0` is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.

0b10 If `VTCR_EL2.TG0` is 0b00 (4KB granule), start at level 0. If `VTCR_EL2.TG0` is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of `VTCR_EL2.TOSZ`, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by `VTTBR_EL2`. The region size is $2^{(64-T0SZ)}$ bytes. The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

Accessing the VTCR_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VTCR_EL2	11	0010	100	010	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x40]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.2.125 VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

Configurations

AArch64 System register VTTBR_EL2[63:0] is architecturally mapped to AArch32 System register VTTBR[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VTTBR_EL2 is a 64-bit register.

Field descriptions

The VTTBR_EL2 bit assignments are:

VMID[15:8], bits [63:56]

When ARMv8.1-VMID16 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [55:48]

The VMID for the translation table.

It is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

If the implementation has an 8-bit VMID, then VMID[15:8] are RES0.

If the implementation has a 16-bit VMID, then:

- The VTCR_EL2.VS bit selects whether VMID[15:8] are ignored by the hardware for every purpose except reading back the register, or whether these bits are used for allocation and matching in the TLB.
- The 16-bit VMID is only supported when EL2 is using AArch64. This means the hardware must ignore VMID[15:8] when EL2 is using AArch32.

This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of `VTCCR_EL2.PS` is `0b110`, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#), bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes [ARMv8.2-LPA](#) a `VTCCR_EL2.PS` value of `0b110`, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of `ID_AA64MMFR0_EL1.PARange` indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of `VTCCR_EL2.PS` is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the *Effective value* of `VTCCR_EL2.PS` is not `0b110` then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

Note

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any `VTTBR_EL2[47:0]` bit that is defined as RES0 has the value 1 when a translation table walk is performed using `VTTBR_EL2`, then the translation table base address might be misaligned, with effects that are `CONSTRAINED UNPREDICTABLE`, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of `VTCCR_EL2.TOSZ`, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

0b0 The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.

0b1 The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This field is permitted to be cached in a TLB.

———— **Note** ————

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are *CONSTRAINED UNPREDICTABLE*, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7218](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the VTTBR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VTTBR_EL2	11	0010	100	000	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x20]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

D12.3 Debug registers

This section lists the Debug System registers in AArch64 state, in alphabetic order:

- The principal encoding space for debug registers is $op0==0b10$, $op1==\{0, 3, 4\}$. [Instructions for accessing debug System registers on page D11-2657](#) summarizes the registers in this encoding space and lists them in order of their encodings.
- In addition, the following registers in the $op0==0b11$ encoding space are classified as Debug registers:
 - [DLR_EL0](#).
 - [DSPSR_EL0](#).
 - [MDCR_EL2](#).
 - [MDCR_EL3](#).
 - [SDER32_EL3](#).

D12.3.1 DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configurations

AArch64 System register DBGAUTHSTATUS_EL1[31:0] is architecturally mapped to AArch32 System register [DBGAUTHSTATUS](#)[31:0].

AArch64 System register DBGAUTHSTATUS_EL1[31:0] is architecturally mapped to External register [DBGAUTHSTATUS_EL1](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGAUTHSTATUS_EL1 is a 64-bit register.

Field descriptions

The DBGAUTHSTATUS_EL1 bit assignments are:

Bits [63:8]

Reserved, RES0.

SNID, bits [7:6]

When ARMv8.4-Debug is implemented:

Secure non-invasive debug.

This field has the same as [DBGAUTHSTATUS_EL1.SID](#).

Otherwise:

Secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1.

0b10 Implemented and disabled. `ExternalSecureNoninvasiveDebugEnabled() == FALSE`.

0b11 Implemented and enabled. `ExternalSecureNoninvasiveDebugEnabled() == TRUE`.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1.

0b10 Implemented and disabled. `ExternalSecureInvasiveDebugEnabled() == FALSE`.

0b11 Implemented and enabled. `ExternalSecureInvasiveDebugEnabled() == TRUE`.

All other values are reserved.

NSNID, bits [3:2]

When ARMv8.4-Debug is implemented:

Non-secure non-invasive debug.

- 0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0
- 0b11 Implemented and enabled. EL3 is implemented or the Effective value of [SCR_EL3.NS](#) is 1.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

- 0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0.
- 0b10 Implemented and disabled. `ExternalNoninvasiveDebugEnabled() == FALSE`.
- 0b11 Implemented and enabled. `ExternalNoninvasiveDebugEnabled() == TRUE`.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

- 0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0.
- 0b10 Implemented and disabled. `ExternalInvasiveDebugEnabled() == FALSE`.
- 0b11 Implemented and enabled. `ExternalInvasiveDebugEnabled() == TRUE`.

All other values are reserved.

Accessing the DBGAUTHSTATUS_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGAUTHSTATUS_EL1	10	0111	000	110	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{MDCR_EL2.TDA} == 1$, then read accesses at EL1 are trapped to EL2.
- If $\text{IsUsingAArch64}(\text{EL3}) \ \&\& \ \text{MDCR_EL3.TDA} == 1$, then read accesses at EL1 or EL2 are trapped to EL3.

D12.3.2 DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Configurations

AArch64 System register DBGBCR<n>_EL1[31:0] is architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

AArch64 System register DBGBCR<n>_EL1[31:0] is architecturally mapped to External register [DBGBCR<n>_EL1\[31:0\]](#).

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions

The DBGBCR<n>_EL1 bit assignments are:

Bits [63:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

- 0b0000 Unlinked instruction address match. [DBGBVR<n>_EL1](#) is the address of an instruction.
- 0b0001 As 0b0000, but linked to a Context matching breakpoint.
- 0b0010 Unlinked Context ID match. When [ARMv8.1-VHE](#) is implemented, EL2 is using AArch64, and the Effective value of [HCR_EL2.E2H](#) is 1, if either the PE is executing at EL0 with [HCR_EL2.TGE](#) set to 1 or the PE is executing at EL2, then [DBGBVR<n>_EL1.ContextID](#) must match the [CONTEXTIDR_EL2](#) value. Otherwise, [DBGBVR<n>_EL1.ContextID](#) must match the [CONTEXTIDR_EL1](#) value
- 0b0011 As 0b0010, with linking enabled.
- 0b0110 Unlinked [CONTEXTIDR_EL1](#) match. [DBGBVR<n>_EL1.ContextID](#) is a Context ID compared against [CONTEXTIDR_EL1](#).
- 0b0111 As 0b0110, with linking enabled.
- 0b1000 Unlinked VMID match. [DBGBVR<n>_EL1.VMID](#) is a VMID compared against [VTTBR_EL2.VMID](#).
- 0b1001 As 0b1000, with linking enabled.

- 0b1010 Unlinked VMID and Context ID match. [DBGBVR<n>_EL1](#).ContextID is a Context ID compared against [CONTEXTIDR_EL1](#), and [DBGBVR<n>_EL1](#).VMID is a VMID compared against [VTTBR_EL2](#).VMID.
- 0b1011 As 0b1010, with linking enabled.
- 0b1100 Unlinked [CONTEXTIDR_EL2](#) match. [DBGBVR<n>_EL1](#).ContextID2 is a Context ID compared against [CONTEXTIDR_EL2](#).
- 0b1101 As 0b1100, with linking enabled.
- 0b1110 Unlinked Full Context ID match. [DBGBVR<n>_EL1](#).ContextID is compared against [CONTEXTIDR_EL1](#), and [DBGBVR<n>_EL1](#).ContextID2 is compared against [CONTEXTIDR_EL2](#).
- 0b1111 As 0b1110, with linking enabled.

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-2305](#) and [Reserved DBGBCR<n>_EL1.BT values on page D2-2309](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of [DBGBCR<n>_EL1.E](#) is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information on the operation of the SSC, HMC, and PMC fields, and the effect of programming the fields to a reserved set of values, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-2305](#) and [Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values on page D2-2310](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-2305](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64 only implementation, this field is reserved, RES1.

The permitted values depend on the breakpoint type.
For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved. For more information, see [Reserved DBGBCR<n>_EL1.BAS values on page D2-2311](#).

For more information on using the BAS field in address match breakpoints, see [Using the BAS field in Address Match breakpoints on page G2-5379](#).

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-2305](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint DBGBVR<n>_EL1. Possible values are:

- 0b0 Breakpoint disabled.
- 0b1 Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGBCR<n>_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGBCR<n>_EL1	10	0000	000	101	n<3:0>

- <CRm> is in the range 0 - 15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If the register access does not generate an exception then, if EDSCR.TDA == 1 && halting is allowed && OLSR_EL1.OSLK == 0, then accesses to this register from EL1, EL2, and EL3 generate a Software Access debug event.

D12.3.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>_EL1](#).

Configurations

AArch64 System register DBGBVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register [DBGBVR<n>\[31:0\]](#).

If the breakpoint is context-aware and EL2 is implemented then AArch64 System register DBGBVR<n>_EL1[63:32] is architecturally mapped to AArch32 System register [DBG BXVR<n>](#). Otherwise there is no System register access to [DBGBVR<n>_EL1\[63:32\]](#) from AArch32 state.

AArch64 System register DBGBVR<n>_EL1[63:0] is architecturally mapped to External register [DBGBVR<n>_EL1\[63:0\]](#).

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

How this register is interpreted depends on the value of [DBGBCR<n>_EL1.BT](#).

- When [DBGBCR<n>_EL1.BT](#) is 0b000x, this register holds a virtual address.
- When [DBGBCR<n>_EL1.BT](#) is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>_EL1.BT](#) is 0b100x, this register holds a VMID.
- When [DBGBCR<n>_EL1.BT](#) is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>_EL1.BT](#) is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>_EL1.BT](#), this register is RES0.

Field descriptions

The DBGBVR<n>_EL1 bit assignments are:

When [DBGBCR<n>_EL1.BT == 0b000x:](#)

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

It is IMPLEMENTATION DEFINED whether:

- Reads return the value of the most significant bit of the VA for every bit in this field.
- Reads return the last value written.

The PE ignores this field.

VA[52:49], bits [52:49]

When ARMv8.2-LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When **ARMv8.2-LVA** is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When $DBGBCR<n>_{EL1.BT} == 0b001x$:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR_EL2](#) when **ARMv8.1-VHE** is implemented, [HCR_EL2.E2H](#) is 1, and either:

- The PE is executing at EL2.
- [HCR_EL2.TGE](#) is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against [CONTEXTIDR_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR<n>_{EL1.BT} == 0b011x$:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR<n>_{EL1.BT} == 0b100x$ and $IsExceptionLevelImplemented(EL2)$:

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When *ARMv8.1-VMID16* is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When $DBGBCR<n>_{EL1.BT} == 0b101x$ and $IsExceptionLevelImplemented(EL2)$:

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When *ARMv8.1-VMID16* is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR<n>_{EL1}.BT == 0b110x$ and $IsExceptionLevelImplemented(EL2)$:

ContextID2, bits [63:32]

When ARMv8.1-VHE is implemented:

Context ID value for comparison against [CONTEXTIDR_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

When $DBGBCR<n>_{EL1}.BT == 0b111x$, $IsExceptionLevelImplemented(EL2)$ and $ARMv8.1-VHE$ is implemented:

ContextID2, bits [63:32]

When ARMv8.1-VHE is implemented:

Context ID value for comparison against [CONTEXTIDR_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGBVR<n>_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGBVR<n>_EL1	10	0000	000	100	n<3:0>

- <CRm> is in the range 0 - 15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If the register access does not generate an exception then, if EDSCR.TDA == 1 && halting is allowed && OLSR_EL1.OSLK == 0, then accesses to this register from EL1, EL2, and EL3 generate a Software Access debug event.

D12.3.4 DBGCLAIMCLR_EL1, Debug Claim Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear these bits to 0.
The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET_EL1](#) register.

Configurations

AArch64 System register DBGCLAIMCLR_EL1[31:0] is architecturally mapped to AArch32 System register [DBGCLAIMCLR](#)[31:0].

AArch64 System register DBGCLAIMCLR_EL1[31:0] is architecturally mapped to External register [DBGCLAIMCLR_EL1](#)[31:0].

An implementation must include 8 CLAIM tag bits.

This register is in the Cold reset domain. See the CLAIM field description for the effect of a Cold reset on the value returned by this register. This register is not affected by a Warm reset.

Attributes

DBGCLAIMCLR_EL1 is a 64-bit register.

Field descriptions

The DBGCLAIMCLR_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

Accessing the DBGCLAIMCLR_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGCLAIMCLR_EL1	10	0111	000	110	1001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.3.5 DBGCLAIMSET_EL1, Debug Claim Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

———— Note —————

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR_EL1](#) register.

Configurations

AArch64 System register DBGCLAIMSET_EL1[31:0] is architecturally mapped to AArch32 System register [DBGCLAIMSET](#)[31:0].

AArch64 System register DBGCLAIMSET_EL1[31:0] is architecturally mapped to External register [DBGCLAIMSET_EL1](#)[31:0].

An implementation must include 8 CLAIM tag bits.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGCLAIMSET_EL1 is a 64-bit register.

Field descriptions

The DBGCLAIMSET_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Set CLAIM tag bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

Accessing the DBGCLAIMSET_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGCLAIMSET_EL1	10	0111	000	110	1000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.3.6 DBGDTR_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR_EL0 characteristics are:

Purpose

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

Configurations

AArch64 System register DBGDTR_EL0[63:32] is architecturally mapped to AArch32 System register [DBGDTRRXint](#)[31:0] when written.

AArch64 System register DBGDTR_EL0[63:32] is architecturally mapped to External register [DBGDTRRX_EL0](#)[31:0] when written.

AArch64 System register DBGDTR_EL0[63:32] is architecturally mapped to AArch64 System register [DBGDTRRX_EL0](#)[31:0] when written.

AArch64 System register DBGDTR_EL0[63:32] is architecturally mapped to External register [DBGDTRTX_EL0](#)[31:0] when read.

AArch64 System register DBGDTR_EL0[63:32] is architecturally mapped to AArch32 System register [DBGDTRTXint](#)[31:0] when read.

AArch64 System register DBGDTR_EL0[63:32] is architecturally mapped to AArch64 System register [DBGDTRTX_EL0](#)[31:0] when read.

AArch64 System register DBGDTR_EL0[31:0] is architecturally mapped to AArch32 System register [DBGDTRTXint](#)[31:0] when written.

AArch64 System register DBGDTR_EL0[31:0] is architecturally mapped to External register [DBGDTRTX_EL0](#)[31:0] when written.

AArch64 System register DBGDTR_EL0[31:0] is architecturally mapped to AArch64 System register [DBGDTRTX_EL0](#)[31:0] when written.

AArch64 System register DBGDTR_EL0[31:0] is architecturally mapped to AArch64 System register [DBGDTRRX_EL0](#)[31:0] when read.

AArch64 System register DBGDTR_EL0[31:0] is architecturally mapped to AArch32 System register [DBGDTRRXint](#)[31:0] when read.

AArch64 System register DBGDTR_EL0[31:0] is architecturally mapped to External register [DBGDTRRX_EL0](#)[31:0] when read.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDTR_EL0 is a 64-bit register.

Field descriptions

The DBGDTR_EL0 bit assignments are:

HighWord, bits [63:32]

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads from this register return the value of DTRTX and do not change TXfull.

LowWord, bits [31:0]

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads from this register return the value of DTRRX and clear RXfull to 0.

Accessing the DBGDTR_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGDTR_EL0	10	0000	011	000	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `MDSCR_EL1.TDCC == 1 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `MDSCR_EL1.TDCC == 1 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.3.7 DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

Configurations

AArch64 System register DBGDTRRX_EL0[31:0] is architecturally mapped to AArch32 System register [DBGDTRRXint](#)[31:0].

AArch64 System register DBGDTRRX_EL0[31:0] is architecturally mapped to External register [DBGDTRRX_EL0](#)[31:0].

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGDTRRX_EL0 is a 64-bit register.

Field descriptions

The DBGDTRRX_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Update DTRRX.

If RXfull is set to 1, then reads of this register return the last value written to DTRRX and clear RXfull to 0.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRRX_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGDTRRX_EL0	10	0000	011	000	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `MDSR_EL1.TDCC == 1 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `MDSR_EL1.TDCC == 1 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1`, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.3.8 DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

Configurations

AArch64 System register DBGDTRTX_EL0[31:0] is architecturally mapped to AArch32 System register [DBGDTRTXint](#)[31:0].

AArch64 System register DBGDTRTX_EL0[31:0] is architecturally mapped to External register [DBGDTRTX_EL0](#)[31:0].

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGDTRTX_EL0 is a 64-bit register.

Field descriptions

The DBGDTRTX_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Return DTRTX.

If TXfull is set to 0, then writes of this register update the value in DTRTX and set TXfull to 1.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRTX_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGDTRTX_EL0	10	0000	011	000	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	WO	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	WO	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	WO	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `MDSR_EL1.TDCC == 1 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then write accesses at EL0 are trapped to EL1.
- If `MDSR_EL1.TDCC == 1 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1`, then write accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1`, then write accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.3.9 DBGPRCR_EL1, Debug Power Control Register

The DBGPRCR_EL1 characteristics are:

Purpose

Controls behavior of the PE on powerdown request.

Configurations

AArch64 System register DBGPRCR_EL1[31:0] is architecturally mapped to AArch32 System register [DBGPRCR](#)[31:0].

Bit [0] of this register is mapped to [EDPRCR](#).CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

This register is in the Cold reset domain. Some or all RW fields of this register have defined reset values. On a Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGPRCR_EL1 is a 64-bit register.

Field descriptions

The DBGPRCR_EL1 bit assignments are:

Bits [63:1]

Reserved, RES0.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR](#).COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state.

————— Note —————

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in [EDPRCR](#).COREPURQ.

Accessing the DBGPRCR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGPRCR_EL1	10	0001	000	100	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDOSA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDOSA == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.3.10 DBGVCR32_EL2, Debug Vector Catch Register

The DBGVCR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register [DBGVCR](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register DBGVCR32_EL2[31:0] is architecturally mapped to AArch32 System register [DBGVCR](#)[31:0].

If EL1 does not support AArch32, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

This register has no effect if EL2 is not enabled in the current Security state.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGVCR32_EL2 is a 64-bit register.

Field descriptions

The DBGVCR32_EL2 bit assignments are:

When IsExceptionLevelImplemented(EL3) and IsUsingAArch64(EL3):

Bits [63:32]

Reserved, RES0.

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.
The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.
The exception vector offset is 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.
The exception vector offset is 0x04.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.
The exception vector offset is 0x1C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.
The exception vector offset is 0x18.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.
The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.
The exception vector offset is 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When *!IsExceptionLevelImplemented(EL3)*:

Bits [63:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

D, bit [4]

Data Abort vector catch enable.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing the DBGVCR32_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGVCR32_EL2	10	0000	100	000	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL2 are trapped to EL3.

D12.3.11 DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>_EL1](#).

Configurations

AArch64 System register DBGWCR<n>_EL1[31:0] is architecturally mapped to AArch32 System register [DBGWCR<n>\[31:0\]](#).

AArch64 System register DBGWCR<n>_EL1[31:0] is architecturally mapped to External register [DBGWCR<n>_EL1\[31:0\]](#).

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGWCR<n>_EL1 is a 64-bit register.

Field descriptions

The DBGWCR<n>_EL1 bit assignments are:

Bits [63:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

0b00000 No mask.

0b00001 Reserved.

0b00010 Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

- 0b0 Unlinked data address match.
- 0b1 Linked data address match.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2305, and [Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values](#) on page D2-2310.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions](#) on page D2-2316.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>_EL1](#) is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where [DBGWVR<n>_EL1](#) addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If [DBGWVR<n>_EL1\[2\] == 1](#), only BAS[3:0] are used and BAS[7:4] are ignored. ARM deprecates setting [DBGWVR<n>_EL1\[2\] == 1](#).

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See [Reserved DBGWCR<n>_EL1.BAS values on page D2-2325](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- 0b01 Match instructions that load from a watchpointed address.
- 0b10 Match instructions that store to a watchpointed address.
- 0b11 Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2316](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

- 0b0 Watchpoint disabled.
- 0b1 Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGWCR<n>_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGWCR<n>_EL1	10	0000	000	111	n<3:0>

- <CRm> is in the range 0 - 15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If the register access does not generate an exception then, if EDSCR.TDA == 1 && halting is allowed && OLSR_EL1.OSLK == 0, then accesses to this register from EL1, EL2, and EL3 generate a Software Access debug event.

D12.3.12 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

Configurations

AArch64 System register DBGWVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

AArch64 System register DBGWVR<n>_EL1[63:0] is architecturally mapped to External register DBGWVR<n>_EL1[63:0].

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

The DBGWVR<n>_EL1 bit assignments are:

RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When ARMv8.2-LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When ARMv8.2-LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

ARM deprecates setting DBGWVR<n>_EL1[2] == 1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the DBGWVR<n>_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DBGWVR<n>_EL1	10	0000	000	110	n<3:0>

- <CRm> is in the range 0 - 15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If the register access does not generate an exception then, if EDSCR.TDA == 1 && halting is allowed && OLSR_EL1.OSLK == 0, then accesses to this register from EL1, EL2, and EL3 generate a Software Access debug event.

D12.3.13 DLR_EL0, Debug Link Register

The DLR_EL0 characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configurations

AArch64 System register DLR_EL0[31:0] is architecturally mapped to AArch32 System register [DLR](#).

Attributes

DLR_EL0 is a 64-bit register.

Field descriptions

The DLR_EL0 bit assignments are:

Bits [63:0]

Restart address.

Accessing the DLR_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DLR_EL0	11	011	0100	0101	001

Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

Access to this register is from Debug state only. During normal execution this register is unallocated.

D12.3.14 DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

Purpose

Holds the saved process state on entry to Debug state.

Configurations

AArch64 System register DSPSR_EL0[31:0] is architecturally mapped to AArch32 System register [DSPSR](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

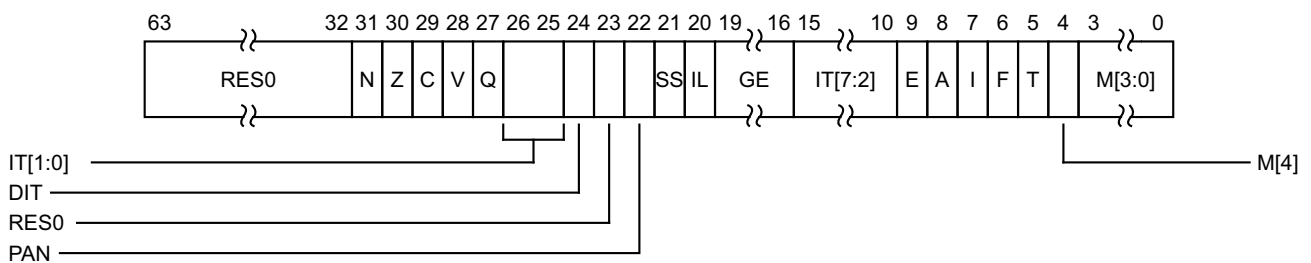

Attributes

DSPSR_EL0 is a 64-bit register.

Field descriptions

The DSPSR_EL0 bit assignments are:

When exiting Debug state to AArch32:

Bits [63:32]

Reserved, RES0.

N, bit [31]

Copied to PSTATE.N on exiting Debug state.

Z, bit [30]

Copied to PSTATE.Z on exiting Debug state.

C, bit [29]

Copied to PSTATE.C on exiting Debug state.

V, bit [28]

Copied to PSTATE.V on exiting Debug state.

Q, bit [27]

Copied to PSTATE.Q on exiting Debug state.

IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the PSTATE.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the Debug state entry was taken from.

0b0 Taken from A32 state.

0b1 Taken from T32 state.

M[4], bit [4]

Execution state that Debug state was entered from.

0b1 Exception taken from AArch32.

M[3:0], bits [3:0]

AArch32 mode that Debug state was entered from.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

0b0011 Supervisor.

0b0110 Monitor.

0b0111 Abort.

0b1010 Hyp.

0b1011 Undefined.

0b1111 System.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7231.

When entering Debug state from AArch64 and exiting Debug state to AArch64:

Bits [63:32]

Reserved, RES0.

N, bit [31]

Set to the value of the N condition flag on entering Debug state, and copied to the N condition flag on exiting Debug state.

Z, bit [30]

Set to the value of the Z condition flag on entering Debug state, and copied to the Z condition flag on exiting Debug state.

C, bit [29]

Set to the value of the C condition flag on entering Debug state, and copied to the C condition flag on exiting Debug state.

V, bit [28]

Set to the value of the V condition flag on entering Debug state, and copied to the V condition flag on exiting Debug state.

Bits [27:25]

Reserved, RES0.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When ARMv8.2-UAO is implemented:

User Access Override. This bit is set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

Bits [19:10]

Reserved, RES0.

D, bit [9]

Process state D mask.

0b0 Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.

0b1 Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state that Debug state was entered from.

0b0 Exception taken from AArch64.

M[3:0], bits [3:0]

AArch64 state (Exception level and selected SP) that Debug state was entered from.

0b0000 EL0t.

0b0100 EL1t.

0b0101 EL1h.

0b1000 EL2t.

0b1001 EL2h.

0b1100 EL3t.

0b1101 EL3h.

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:

- M[3:2] holds the Exception Level.
- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
 - 0 means the SP is always SP0.
 - 1 means the exception SP is determined by the EL.

Accessing the DSPSR_ELO

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DSPSR_EL0	11	0100	011	000	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Access to this register is from Debug state only. During normal execution this register is unallocated.

D12.3.15 MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configurations

AArch64 System register MDCCINT_EL1[31:0] is architecturally mapped to AArch32 System register [DBGDCCINT](#)[31:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MDCCINT_EL1 is a 64-bit register.

Field descriptions

The MDCCINT_EL1 bit assignments are:

Bits [63:31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

0b0 No interrupt request generated by DTRRX.

0b1 Interrupt request will be generated on RXfull == 1.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

0b0 No interrupt request generated by DTRTX.

0b1 Interrupt request will be generated on TXfull == 0.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

Bits [28:0]

Reserved, RES0.

Accessing the MDCCINT_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MDCCINT_EL1	10	0000	000	000	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.3.16 MDCCSR_EL0, Monitor DCC Status Register

The MDCCSR_EL0 characteristics are:

Purpose

Read-only register containing control status flags for the DCC.

Configurations

AArch64 System register MDCCSR_EL0[30:29] is architecturally mapped to External register [EDSCR](#)[30:29].

AArch64 System register MDCCSR_EL0[30:29] is architecturally mapped to AArch32 System register [DBGDSCRint](#)[30:29].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MDCCSR_EL0 is a 64-bit register.

Field descriptions

The MDCCSR_EL0 bit assignments are:

Bits [63:31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the [EDSCR](#).

TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the [EDSCR](#).

Bits [28:19]

Reserved, RES0.

Bits [18:15]

Reserved, RAZ.

Bits [14:13]

Reserved, RES0.

Bit [12]

Reserved, RAZ.

Bits [11:6]

Reserved, RES0.

Bits [5:2]

Reserved, RAZ.

Bits [1:0]

Reserved, RES0.

Accessing the MDCCSR_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MDCCSR_EL0	10	0000	011	000	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If $\text{MDSCR_EL1.TDCC} == 1$ && $(\text{HCR_EL2.TGE} == 0 \parallel (\text{SCR_EL3.NS} == 0 \text{ \&\& } \text{SCR_EL3.EEL2} == 0))$, then read accesses at EL0 are trapped to EL1.
- If $\text{MDSCR_EL1.TDCC} == 1$ && $\text{HCR_EL2.TGE} == 1$ && $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$, then read accesses at EL0 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64(EL2)}$ && $\text{MDCR_EL2.TDA} == 1$, then read accesses at EL0 or EL1 are trapped to EL2.
- If $\text{IsUsingAArch64(EL3)}$ && $\text{MDCR_EL3.TDA} == 1$, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.3.17 MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

Configurations

AArch64 System register MDCR_EL2[31:0] is architecturally mapped to AArch32 System register [HDCR](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

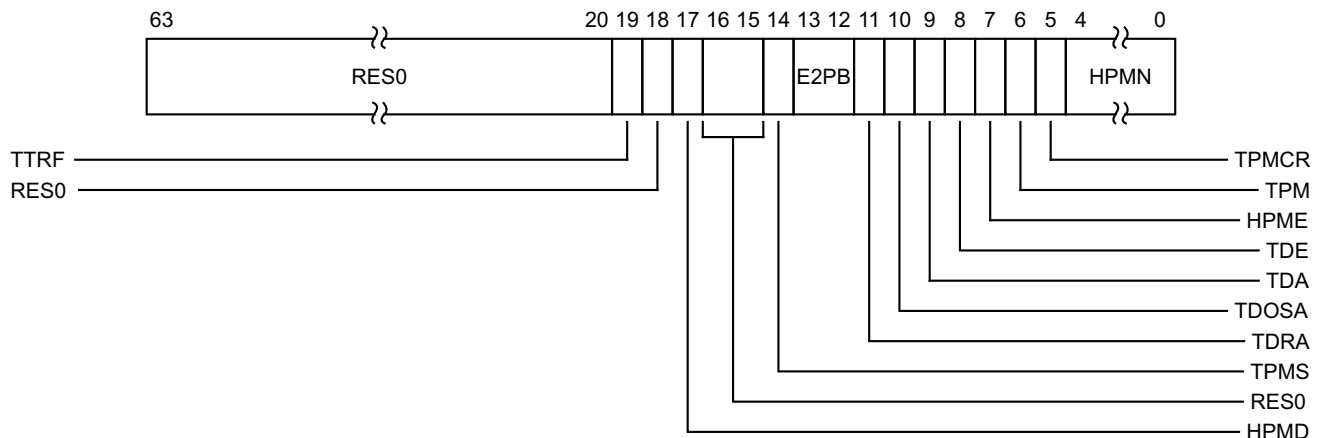

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MDCR_EL2 is a 64-bit register.

Field descriptions

The MDCR_EL2 bit assignments are:

Bits [63:20]

Reserved, RES0.

TTRF, bit [19]

When ARMv8.4-Trace is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2.

0b0 Accesses to [TRFCR_EL1](#) and [TRFCR](#) at EL1 are not affected by this control.

0b1 Accesses to [TRFCR_EL1](#) and [TRFCR](#) at EL1 generate a trap exception to EL2 when it is enabled in the current Security state.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

From ARMv8.1:

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

0b0 Event counting allowed at EL2.

0b1 Event counting prohibited at EL2.

In an ARMv8.1 implementation, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(HPMN-1)].
- If `PMCR_ELO.DP` is set to 1, `PMCCNTR_ELO`.

The other event counters are unaffected, and when `PMCR_ELO.DP` is set to 0, `PMCCNTR_ELO` is unaffected.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:15]

Reserved, RES0.

TPMS, bit [14]

From ARMv8.2:

Trap Performance Monitor Sampling. When the Statistical Profiling Extension is implemented, this field controls access to Statistical Profiling control registers from EL1.

0b0 Do not trap Statistical Profiling controls to EL2.

0b1 Accesses to Statistical Profiling controls at EL1 generate a Trap exception to EL2 when it is enabled in the current Security state.

When the Statistical Profiling Extension is not implemented, this field is reserved, RES0.

Otherwise:

Reserved, RES0.

E2PB, bits [13:12]

From ARMv8.2:

EL2 Profiling Buffer. When the Statistical Profiling Extension is implemented, this field controls the owning translation regime and access to Profiling Buffer control registers from EL1.

0b00 Profiling Buffer uses the EL2 stage 1 translation regime. Accesses to Profiling Buffer controls at EL1 generate a Trap exception to EL2 when it is enabled in the current Security state.

0b10 Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer controls at EL1 generate a Trap exception to EL2 when it is enabled in the current Security state.

0b11 Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer controls at EL1 are not trapped.

All other values are reserved. If this field is programmed with a reserved value, the PE behaves as if this field has a defined value, other than for a direct read of the register. Software must not rely on the behavior of reserved values, as they might change in a future version of the architecture.

If EL2 is not implemented, or is disabled in the current Security State, the PE behaves as if `E2PB == 0b11`, other than for a direct read of the register.

When the Statistical Profiling Extension is not implemented, this field is RES0.

Otherwise:

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when it is enabled in the current Security state. This trap is from:

- EL0 using AArch32.
- EL1, regardless of which Execution state it is using.

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when it is enabled in the current Security state, unless it is trapped by [DBGDSCRExt.UDCCdis](#) or [MDSCR_EL1.TDCC](#).

The registers for which accesses are trapped are as follows:

AArch64: [MDRAR_EL1](#).

AArch32: [DBGDRAR](#), [DBGDSAR](#).

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1.
- [HCR_EL2.TGE](#) == 1.
- When EL2 is enabled in the current Security state and the value of [HCR_EL2.E2H](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]

When ARMv8.0-DoubleLock is implemented:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states:

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 System register accesses to the powerdown debug registers are trapped to EL2 when it is enabled in the current Security state.

The registers for which accesses are trapped are as follows:

AArch64: [OSLAR_EL1](#), [OSLSR_EL1](#), [OSDLR_EL1](#), and [DBGPRCR_EL1](#).

AArch32: [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).

AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

———— **Note** ————

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1.
- [HCR_EL2.TGE](#) == 1.
- When EL2 is enabled in the current Security state and the value of [HCR_EL2.E2H](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states:

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 System register accesses to the powerdown debug registers are trapped to EL2 when it is enabled in the current Security state.

The registers for which accesses are trapped are as follows:

AArch64: [OSLAR_EL1](#), [OSLSR_EL1](#), and [DBGPRCR_EL1](#).

AArch32: [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).

AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [OSDLR_EL1](#) and [DBGOSDLR](#) are trapped.

———— **Note** ————

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1.
- [HCR_EL2.TGE](#) == 1.
- When EL2 is enabled in the current Security state and the value of [HCR_EL2.E2H](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL0 and EL1 System register accesses to those debug System registers that are not trapped by either of the following:

- [MDCR_EL2.TDRA](#).
- [MDCR_EL2.TDOSA](#).

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when it is enabled in the current Security state, unless the access generates a higher priority exception.

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#) are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1
- [HCR_EL2.TGE](#) == 1
- When EL2 is enabled in the current Security state and the value of [HCR_EL2.E2H](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDE, bit [8]

Trap Debug exceptions.

0b0 This control has no effect on the routing of debug exceptions, and has no effect on accesses to debug registers.

0b1 Debug exceptions generated at EL1 or EL0 are routed to EL2 when it is enabled in the current Security state. The [MDCR_EL2](#).{[TDRA](#), [TDOSA](#), [TDA](#)} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [HCR_EL2.TGE](#) == 1.
- When EL2 is enabled in the current Security state and the value of [HCR_EL2.E2H](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPME, bit [7]

Hypervisor Performance Monitors Counters Enable.

0b0 EL2 Performance Monitors counters disabled.

0b1 EL2 Performance Monitors counters enabled.

When the value of this bit is 1, the Performance Monitors counters that are reserved for use from EL2 or Secure state are enabled. For more information see the description of the HPMN field.

If the Performance Monitors Extension is not implemented, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPM, bit [6]

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitors registers to EL2 when it is enabled in the current Security state, from both Execution states:

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 and EL1 accesses to all Performance Monitors registers are trapped to EL2 when it is enabled in the current Security state.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors Extension is not implemented, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPMCR, bit [5]

Trap [PMCR_EL0](#) or [PMCR](#) accesses. Traps EL0 and EL1 accesses to the [PMCR_EL0](#) or [PMCR](#) to EL2 when it is enabled in the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 and EL1 accesses to the [PMCR_EL0](#) or [PMCR](#) are trapped to EL2 when it is enabled in the current Security state, unless it is trapped by [PMUSERENR.EN](#) or [PMUSERENR_EL0.EN](#).

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors Extension is not implemented, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPMN, bits [4:0]

Defines the number of Performance Monitors counters that are accessible from EL2 and EL3.

If the Performance Monitors Extension is not implemented, this field is RES0.

HPMN divides the Performance Monitors into two ranges: [0:(HPMN-1)] and [HPMN:PMCR_EL0.N].

For an event in the range [0:(HPMN-1)]:

- The counter is accessible from EL3, EL2, and EL1, and from EL0 if permitted by [PMUSERENR_EL0](#) or [PMUSERENR](#).
- The counter is enabled by [PMCR_EL0.E](#) and [PMCNTENSET_EL0](#).

For an event in the range [HPMN:PMCR_EL0.N]:

- The counter is accessible only from EL2 and EL3.
- If [ARMv8.4-SecEL2](#) is not implemented, the count is also accessible from Secure EL1 and from Secure EL0 if permitted by [PMUSERENR_EL0](#).

- The counter is enabled by MDCR_EL2.HPME and [PMCNTENSET_EL0](#).

If this field is set to 0, or to a value larger than [PMCR_EL0.N](#), then the following CONSTRAINED UNPREDICTABLE behavior applies:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
 - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN non-zero value less than [PMCR_EL0.N](#).
 - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

On a Warm reset, this field resets to the value in [PMCR_EL0.N](#).

Accessing the MDCR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MDCR_EL2	11	0001	100	001	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL2 are trapped to EL3.

D12.3.18 MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

Configurations

AArch64 System register MDCR_EL3[31:0] can be mapped to AArch32 System register SDCR[31:0], but this is not architecturally mandated.

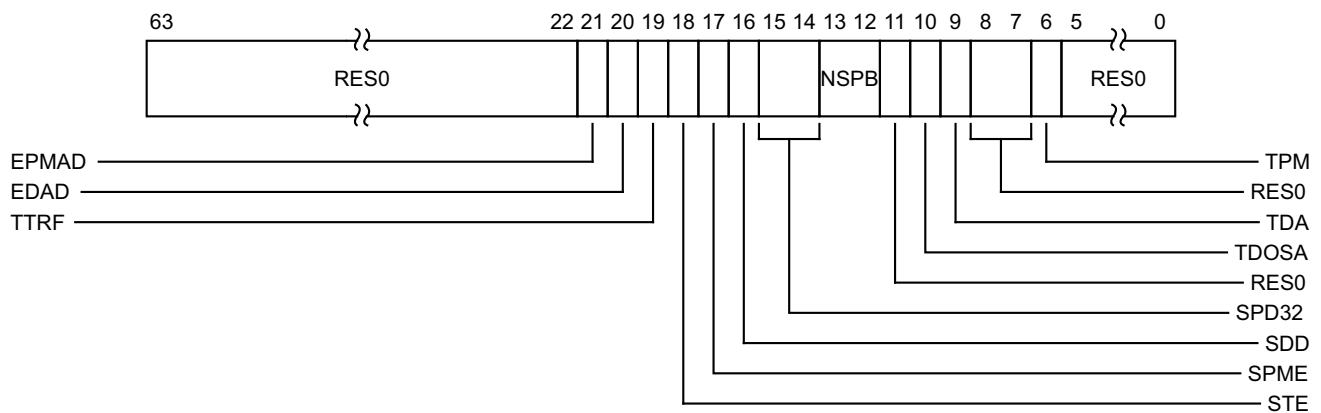

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MDCR_EL3 is a 64-bit register.

Field descriptions

The MDCR_EL3 bit assignments are:

Bits [63:22]

Reserved, RES0.

EPMAD, bit [21]

When ARMv8.4-Debug is implemented:

External debug interface Performance Monitors registers disable. This disables Non-secure access to these registers by an external debugger.

0b0 Non-secure access to Performance Monitors registers from external debugger is enabled.

0b1 Non-secure access to Performance Monitors registers from external debugger is disabled.

If the Performance Monitors Extension is not implemented, or does not support external debug interface accesses this bit is RES0.

If EL3 and EL2 are not implemented and the *Effective value* of SCR_EL3.NS is 0b0, then the *Effective value* of this bit is 0b1.

On a Warm reset, this field resets to 0.

From ARMv8.0:

External debug interface Performance Monitors registers disable. This disables access to these registers by an external debugger.

0b0 Access to Performance Monitors registers from external debugger is enabled.

0b1 Access to Performance Monitors registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension is not implemented, or does not support external debug interface accesses this bit is RES0.

If EL3 and EL2 are not implemented and the *Effective value* of SCR_EL3.NS is 0b0, then the *Effective value* of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]

When ARMv8.4-Debug is implemented:

External debug interface breakpoint and watchpoint register access disable. This disables access to these registers by an external debugger.

0b0 Non-secure access to debug registers from external debugger is enabled.

0b1 Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is disabled.

If EL3 and EL2 are not implemented and the *Effective value* of SCR_EL3.NS is 0b0, then the *Effective value* of this field is 0b1.

On a Warm reset, this field resets to 0.

When ARMv8.2-Debug is implemented:

External debug interface breakpoint and watchpoint register access disable. This disables access to these registers by an external debugger.

0b0 Access to debug registers, and to OSLAR_EL1 from external debugger is enabled.

0b1 Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 and EL2 are not implemented and the *Effective value* of SCR_EL3.NS is 0b0, then the *Effective value* of this field is 0b1.

On a Warm reset, this field resets to 0.

From ARMv8.0:

External debug interface breakpoint and watchpoint register access disable. This disables access to these registers by an external debugger.

0b0 Access to debug registers from external debugger is enabled.

0b1 Access to breakpoint and watchpoint registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

It is IMPLEMENTATION DEFINED whether this disable applies to the external register OSLAR_EL1.

If EL3 and EL2 are not implemented and the *Effective value* of SCR_EL3.NS is 0b0, then the *Effective value* of this field is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

TTRF, bit [19]

When ARMv8.4-Trace is implemented:

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

0b0 Accesses to [TRFCR_EL2](#), [TRFCR_EL12](#), [TRFCR_EL1](#), [HTRFCR](#) and [TRFCR](#) registers at EL2 and EL1 are not affected by this control.

0b1 Accesses to [TRFCR_EL2](#), [TRFCR_EL12](#), [TRFCR_EL1](#), [HTRFCR](#) and [TRFCR](#) registers at EL2 and EL1 generate a Trap exception to EL3.

Otherwise:

Reserved, RES0.

STE, bit [18]

When ARMv8.4-Trace is implemented:

Secure Trace enable. Enables tracing in Secure state.

0b0 Trace prohibited in Secure state unless overridden by the external debugger.

0b1 Trace allowed in Secure state unless prohibited by the Trace Filter control registers.

This bit also controls the level of authentication required by an external debugger to enable external tracing. If EL3 is not implemented and the PE is executing in Secure state, the *Effective value* of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

Secure Performance Monitors enable. This allows event counting in Secure state.

0b0 Event counting prohibited in Secure state.

In an ARMv8.0 or ARMv8.1 implementation, event counting is prohibited unless `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, meaning this control is overridden by the IMPLEMENTATION DEFINED authentication interface.

0b1 Event counting allowed in Secure state.

If the Performance Monitors Extension is not implemented, this field is RES0.

If EL3 and EL2 are not implemented and the *Effective value* of [SCR_EL3.NS](#) is 0b0, then the *Effective value* of this bit is 0b1.

On a Warm reset, this field resets to 0.

SDD, bit [16]

AArch64 Secure self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

0b0 Debug exceptions from Secure EL0 are enabled, and debug exceptions from Secure EL1 are enabled if the value of [MDSCR_EL1.KDE](#) is 1 and the value of [PSTATE.D](#) is 0.

0b1 Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The *Effective value* of [SCR_EL3.RW](#) is 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPD32, bits [15:14]

AArch32 Secure self-hosted privileged invasive debug control. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions. Valid values for this field are:

- 0b00 Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
- 0b10 Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
- 0b11 Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is:

- Ignored if the PE is either:
 - In Non-secure state.
 - In Secure state, if the *Effective value* of SCR_EL3.RW is 0b1.
- RES0 if the implementation does not support EL1 using AArch32.

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is 1.

If EL3 and EL2 are not implemented and the *Effective value* of SCR_EL3.NS is 0b0, then the *Effective value* of this field is 0b11.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSPB, bits [13:12]

From ARMv8.2:

Non-secure Profiling Buffer. When the Statistical Profiling Extension is implemented, this field controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers. The possible values of this field are:

- 0b00 Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer controls at EL2 and EL1 in both security states generate Trap exceptions to EL3.
- 0b01 Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer controls in Non-secure state generate Trap exceptions to EL3.
- 0b10 Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer controls at EL2 and EL1 in both security states generate Trap exceptions to EL3.
- 0b11 Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer controls in Secure state generate Trap exceptions to EL3.

If EL3 is not implemented and the PE is executing in Non-secure state, the *Effective value* of this field is 0b11.

If EL3 is not implemented and the PE is executing in Secure state, the *Effective value* of this field is 0b01.

When the Statistical Profiling Extension is not implemented, this field is RES0.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TDOSA, bit [10]

When ARMv8.0-DoubleLock is implemented:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

0b0 This control does not cause any instructions to be trapped.

0b1 EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by [HDCR.TDOSA](#) or [MDCR_EL2.TDOSA](#).

The registers for which accesses are trapped are as follows:

AArch64: [OSLAR_EL1](#), [OSLSR_EL1](#), [OSDLR_EL1](#), and [DBGPRCR_EL1](#).

AArch32: [DBGOSLAR](#), [DBGOSLSR](#), [DBGOSDLR](#), and [DBGPRCR](#).

AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

0b0 This control does not cause any instructions to be trapped.

0b1 EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by [HDCR.TDOSA](#) or [MDCR_EL2.TDOSA](#).

The registers for which accesses are trapped are as follows:

AArch64: [OSLAR_EL1](#), [OSLSR_EL1](#), and [DBGPRCR_EL1](#).

AArch32: [DBGOSLAR](#), [DBGOSLSR](#), and [DBGPRCR](#).

AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [OSDLR_EL1](#) and [DBGOSDLR](#) are trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the [MDCR_EL3.TDOSA](#) field. When [MDCR_EL3.TDA](#) is:

0b0 This control does not cause any instructions to be trapped.

0b1 EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by [MDCR_EL3.TDOSA](#), are trapped to EL3, from both Security states and both Execution states, unless it is trapped by [DBGDSCRExt.UDCCdis](#), [MDCR_EL1.TDCC](#), [HDCR.TDA](#) or [MDCR_EL2.TDA](#).

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#) are ignored in Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:7]

Reserved, RES0.

TPM, bit [6]

Trap Performance Monitors accesses. Traps EL2, EL1, and EL0 accesses to all Performance Monitors registers to EL3, from both Security states and both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 EL2, EL1, and EL0 System register accesses to all Performance Monitors registers are trapped to EL3, unless it is trapped by [HDCR.TPM](#) or [MDCR_EL2.TPM](#).

If the Performance Monitors Extension is not implemented, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [5:0]

Reserved, RES0.

Accessing the MDCR_EL3

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MDCR_EL3	11	0001	110	001	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.3.19 MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. ARMv8 deprecates any use of this register.

Configurations

AArch64 System register MDRAR_EL1[63:0] is architecturally mapped to AArch32 System register [DBGDRAR](#)[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

The MDRAR_EL1 bit assignments are:

Bits [63:52]

Reserved, RES0.

ROMADDR[51:48], bits [51:48]

When ARMv8.2-LPA is implemented:

Extension to ROMADDR[47:12]. See ROMADDR[47:12] for more details.

Otherwise:

Reserved, RES0.

ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

When [ARMv8.2-LPA](#) is implemented, ROMADDR[51:48] forms the upper part of the address value. Otherwise, ROMADDR[51:48] is RES0.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [51:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

ARM strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

0b00 ROM Table address is not valid. Software must ignore ROMADDR.

0b11 ROM Table address is valid.

Other values are reserved.

Accessing the MDRAR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MDRAR_EL1	10	0001	000	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDRA == 1, then read accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then read accesses at EL1 or EL2 are trapped to EL3.

D12.3.20 MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

Purpose

Main control register for the debug implementation.

Configurations

AArch64 System register MDSCR_EL1[31:0] is architecturally mapped to AArch32 System register [DBGDSCRExt](#)[31:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MDSCR_EL1 is a 64-bit register.

Field descriptions

The MDSCR_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

TFO, bit [31]

When ARMv8.4-Trace is implemented:

Trace Filter override. Used for save/restore of [EDSCR.TFO](#).

When the OS Lock is unlocked, [OSLSR_EL1.OSLK](#) == 0, this bit ignores writes, and software must treat it as UNK/SBZP.

When the OS Lock is locked, [OSLSR_EL1.OSLK](#) == 1, this bit is RW, and holds the value of [EDSCR.TFO](#).

Reads and writes of this bit are indirect accesses to [EDSCR.TFO](#).

Otherwise:

Reserved, RES0.

RXfull, bit [30]

Used for save/restore of [EDSCR.RXfull](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When `OSLSR_EL1.OSLK == 1`, this bit is RW and holds the value of `EDSCR.RXfull`.
Reads and writes of this bit are indirect accesses to `EDSCR.RXfull`.
The architected behavior of this field determines the value it returns after a reset.

TXfull, bit [29]

Used for save/restore of `EDSCR.TXfull`.
When `OSLSR_EL1.OSLK == 0`, this bit is RO, and software must treat it as UNK/SBZP.
When `OSLSR_EL1.OSLK == 1`, this bit is RW and holds the value of `EDSCR.TXfull`.
Reads and writes of this bit are indirect accesses to `EDSCR.TXfull`.
The architected behavior of this field determines the value it returns after a reset.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of `EDSCR.RXO`.
When `OSLSR_EL1.OSLK == 0`, this bit is RO, and software must treat it as UNK/SBZP.
When `OSLSR_EL1.OSLK == 1`, this bit is RW and holds the value of `EDSCR.RXO`.
Reads and writes of this bit are indirect accesses to `EDSCR.RXO`.
The architected behavior of this field determines the value it returns after a reset.

TXU, bit [26]

Used for save/restore of `EDSCR.TXU`.
When `OSLSR_EL1.OSLK == 0`, this bit is RO, and software must treat it as UNK/SBZP.
When `OSLSR_EL1.OSLK == 1`, this bit is RW and holds the value of `EDSCR.TXU`.
Reads and writes of this bit are indirect accesses to `EDSCR.TXU`.
The architected behavior of this field determines the value it returns after a reset.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of `EDSCR.INTdis`.
When `OSLSR_EL1.OSLK == 0`, this field is RO, and software must treat it as UNK/SBZP.
When `OSLSR_EL1.OSLK == 1`, this field is RW and holds the value of `EDSCR.INTdis`.
Reads and writes of this field are indirect accesses to `EDSCR.INTdis`.
The architected behavior of this field determines the value it returns after a reset.

TDA, bit [21]

Used for save/restore of `EDSCR.TDA`.
When `OSLSR_EL1.OSLK == 0`, this bit is RO, and software must treat it as UNK/SBZP.
When `OSLSR_EL1.OSLK == 1`, this bit is RW and holds the value of `EDSCR.TDA`.
Reads and writes of this bit are indirect accesses to `EDSCR.TDA`.
The architected behavior of this field determines the value it returns after a reset.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When ARMv8.1-VHE is implemented:

Used for save/restore of [EDSCR.SC2](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.SC2](#).

Reads and writes of this bit are indirect accesses to [EDSCR.SC2](#).

If the PC Sample-based Profiling Extension is not implemented, then this field is RES0.

Otherwise:

Reserved, RES0.

Bits [18:16]

RAZ/WI. Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

0b0 Breakpoint, Watchpoint, and Vector Catch exceptions disabled.

0b1 Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.HDE](#).

Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

KDE, bit [13]

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D .

Permitted values are:

0b0 Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D .

0b1 All debug exceptions enabled within EL_D .

RES0 if EL_D is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDCC, bit [12]

Traps EL0 accesses to the DCC registers to EL1, from both Execution states.

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 using AArch64: EL0 accesses to the [MDCCSR_EL0](#), [DBGDTR_EL0](#), [DBGDTRTX_EL0](#), and [DBGDTRRX_EL0](#) registers are trapped to EL1.

EL0 using AArch32: EL0 accesses to the [DBGDSCRint](#), [DBGDTRRXint](#), [DBGDTRTXint](#), [DBGDIDR](#), [DBGDSAR](#), and [DBGDRAR](#) registers are trapped to EL1.

———— **Note** —————

All accesses to these AArch32 registers are trapped, including LDC and STC accesses to [DBGDTRTXint](#) and [DBGDTRRXint](#), and MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#).

Traps of AArch32 accesses to the [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#) are ignored in Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of [EDSCR.ERR](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.ERR](#).

Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The architected behavior of this field determines the value it returns after a reset.

Bits [5:1]

Reserved, RES0.

SS, bit [0]

Software step control bit. If EL_D is using AArch64, enable Software step. Permitted values are:

0b0 Software step disabled

0b1 Software step enabled.

RES0 if EL_D is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the MDSCR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
MDSCR_EL1	10	0000	000	010	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x158]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Individual fields within this register might have restricted accessibility when [OSLSR_EL1.OSLK](#) == 0 (the OS lock is unlocked). See the field descriptions for more detail.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [MDCR_EL2.TDA](#) == 1, then accesses at EL1 are trapped to EL2.
- If [IsUsingAArch64\(EL3\)](#) && [MDCR_EL3.TDA](#) == 1, then accesses at EL2 are trapped to EL3.
- If [IsUsingAArch64\(EL3\)](#) && [MDCR_EL3.TDA](#) == 1, then accesses at EL1 are trapped to EL3.

D12.3.21 OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

Purpose

Used to control the OS Double Lock.

Configurations

AArch64 System register OSDLR_EL1[31:0] is architecturally mapped to AArch32 System register [DBGOSDLR](#)[31:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

OSDLR_EL1 is a 64-bit register.

Field descriptions

The OSDLR_EL1 bit assignments are:

Bits [63:1]

Reserved, RES0.

DLK, bit [0]

When *DBGDEVID.DoubleLock* == 0b1:

OS Double Lock control bit. Possible values are:

0b0 OS Double Lock unlocked.

0b1 OS Double Lock locked, if [DBGPRCR_EL1.CORENPDRQ](#) (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

Accessing the OSDLR_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
OSDLR_EL1	10	0001	000	100	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDOSA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDOSA == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.3.22 OSDTRRX_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX_EL1 characteristics are:

Purpose

Used for save/restore of [DBGDTRRX_EL0](#). It is a component of the Debug Communications Channel.

Configurations

AArch64 System register OSDTRRX_EL1[31:0] is architecturally mapped to AArch32 System register [DBGDTRRXext](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

OSDTRRX_EL1 is a 64-bit register.

Field descriptions

The OSDTRRX_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

Accessing the OSDTRRX_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
OSDTRRX_EL1	10	0000	000	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

ARM deprecates reads and writes of OSDTRRX_EL1 when the OS Lock is unlocked.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.3.23 OSDTRTX_EL1, OS Lock Data Transfer Register, Transmit

The OSDTRTX_EL1 characteristics are:

Purpose

Used for save/restore of [DBGDTRTX_EL0](#). It is a component of the Debug Communications Channel.

Configurations

AArch64 System register OSDTRTX_EL1[31:0] is architecturally mapped to AArch32 System register [DBGDTRTXext](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

OSDTRTX_EL1 is a 64-bit register.

Field descriptions

The OSDTRTX_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

Accessing the OSDTRTX_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
OSDTRTX_EL1	10	0000	000	010	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

ARM deprecates reads and writes of OSDTRTX_EL1 when the OS Lock is unlocked.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.3.24 OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of [EDECCR](#) that are otherwise invisible to software, so it can save/restore the contents of [EDECCR](#) over powerdown on behalf of the external debugger.

Configurations

AArch64 System register OSECCR_EL1[31:0] is architecturally mapped to AArch32 System register [DBGOSECCR](#)[31:0].

AArch64 System register OSECCR_EL1[31:0] is architecturally mapped to External register [EDECCR](#)[31:0].

If [OSLSR_EL1.OSLK](#) == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

OSECCR_EL1 is a 64-bit register.

Field descriptions

The OSECCR_EL1 bit assignments are:

When [OSLSR.OSLK](#) == 1:

Bits [63:32]

Reserved, RES0.

EDECCR, bits [31:0]

Used for save/restore to [EDECCR](#) over powerdown.

Reads or writes to this field are indirect accesses to [EDECCR](#).

Accessing the OSECCR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
OSECCR_EL1	10	0000	000	010	0110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.3.25 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configurations

AArch64 System register OSLAR_EL1[31:0] is architecturally mapped to AArch32 System register [DBGOSLAR](#)[31:0].

AArch64 System register OSLAR_EL1[31:0] is architecturally mapped to External register [OSLAR_EL1](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

OSLAR_EL1 is a 64-bit register.

Field descriptions

The OSLAR_EL1 bit assignments are:

Bits [63:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use [OSLSR_EL1.OSLK](#) to check the current status of the lock.

Accessing the OSLAR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
OSLAR_EL1	10	0001	000	100	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDOSA == 1, then write accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDOSA == 1, then write accesses at EL1 or EL2 are trapped to EL3.

D12.3.26 OSLSR_EL1, OS Lock Status Register

The OSLSR_EL1 characteristics are:

Purpose

Provides the status of the OS Lock.

Configurations

AArch64 System register OSLSR_EL1[31:0] is architecturally mapped to AArch32 System register [DBGOSLSR\[31:0\]](#).

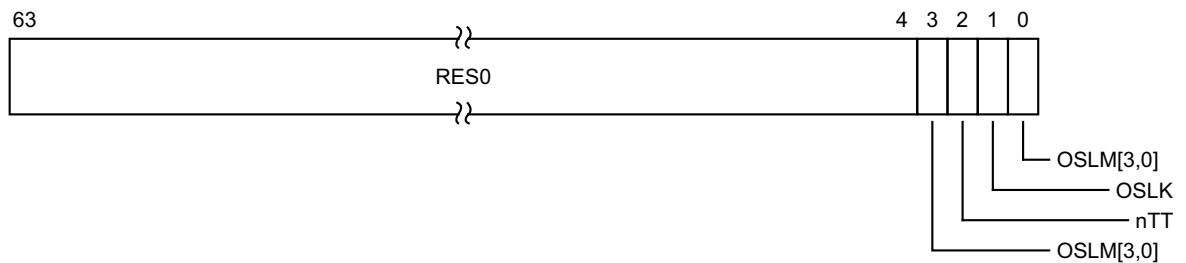

This register is in the Cold reset domain. Some or all RW fields of this register have defined reset values. On a Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

OSLSR_EL1 is a 64-bit register.

Field descriptions

The OSLSR_EL1 bit assignments are:

Bits [63:4]

Reserved, RES0.

OSLM[3,0], bit [3]

OS lock model implemented. Bits [3] and [0] interpreted together identify the form of OS save and restore mechanism implemented.

0b00 OS Lock not implemented.

0b10 OS Lock implemented.

All other values are reserved. In an ARMv8 implementation the value 0b00 is not permitted.

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status.

0b0 OS Lock unlocked.

0b1 OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

On a Cold reset, this field resets to 1.

OSLM[3,0], bit [0]

OS lock model implemented. Bits [3] and [0] interpreted together identify the form of OS save and restore mechanism implemented.

0b00 OS Lock not implemented.

0b10 OS Lock implemented.

All other values are reserved. In an ARMv8 implementation the value 0b00 is not permitted.

Accessing the OSLSR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
OSLSR_EL1	10	0001	000	100	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDOSA == 1, then read accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDOSA == 1, then read accesses at EL1 or EL2 are trapped to EL3.

D12.3.27 PMMIR_EL1, Performance Monitors Machine Identification Register

The PMMIR_EL1 characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configurations

This register is present only when ARMv8.4-PMU is implemented. Otherwise, direct accesses to PMMIR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMMIR_EL1 is a 64-bit register.

Field descriptions

The PMMIR_EL1 bit assignments are:

Bits [63:8]

Reserved, RES0.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

Accessing the PMMIR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMMIR_EL1	11	1001	000	110	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \&\& \text{MDCR_EL2.TPM} == 1$, then accesses at EL1 are trapped to EL2.
- If $\text{HaveEL}(\text{EL3}) \&\& \text{MDCR_EL3.TPM} == 1$, then accesses at EL1 or EL2 are trapped to EL3.

D12.3.28 SDER32_EL2, AArch32 Secure Debug Enable Register

The SDER32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register [SDER](#) from Secure EL2 and EL3 only.

Configurations

This register has no effect if EL2 is not enabled in the current Security state.

If EL1 is AArch64 only, this register is UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SDER32_EL2 is a 64-bit register.

Field descriptions

The SDER32_EL2 bit assignments are:

Bits [63:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable:

0b0 Performance Monitors event counting prohibited in Secure EL0 unless allowed by [MDCR_EL3.SPME](#) or the IMPLEMENTATION DEFINED authentication interface `ExternalSecureNoninvasiveDebugEnabled()`.

0b1 Performance Monitors event counting allowed in Secure EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SUIDEN, bit [0]

Secure User Invasive Debug Enable:

0b0 Debug exceptions other than Breakpoint Instruction exceptions from Secure EL0 are disabled, unless enabled by [MDCR_EL3.SPD32](#).

0b1 Debug exceptions from Secure EL0 are enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the SDER32_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
SDER32_EL2	11	0001	100	001	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	RW	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	RW	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0	-	-	-	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1	-	n/a	-	RW

D12.3.29 SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

Purpose

Allows access to the AArch32 register [SDER](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register SDER32_EL3[31:0] is architecturally mapped to AArch32 System register [SDER](#)[31:0].

If EL1 is AArch64 only, this register is UNDEFINED.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SDER32_EL3 is a 64-bit register.

Field descriptions

The SDER32_EL3 bit assignments are:

Bits [63:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable:

0b0 Performance Monitors event counting prohibited in Secure EL0 unless allowed by [MDCR_EL3.SPME](#) or the IMPLEMENTATION DEFINED authentication interface `ExternalSecureNoninvasiveDebugEnabled()`.

0b1 Performance Monitors event counting allowed in Secure EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SUIDEN, bit [0]

Secure User Invasive Debug Enable:

0b0 Debug exceptions other than Breakpoint Instruction exceptions from Secure EL0 are disabled, unless enabled by [MDCR_EL3.SPD32](#).

0b1 Debug exceptions from Secure EL0 are enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the SDER32_EL3

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
SDER_EL3	11	0001	110	001	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

D12.3.30 TRFCR_EL1, Trace Filter Control Register (EL1)

The TRFCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Trace.

Configurations

AArch64 System register TRFCR_EL1[31:0] is architecturally mapped to AArch32 System register TRFCR[31:0].

This register is present only when ARMv8.4-Trace is implemented. Otherwise, direct accesses to TRFCR_EL1 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TRFCR_EL1 is a 64-bit register.

Field descriptions

The TRFCR_EL1 bit assignments are:

Bits [63:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control

0b01 Virtual timestamp. The traced timestamp is the physical counter value, minus the value of [CNTVOFF_EL2](#).

0b11 Physical timestamp. The traced timestamp is the physical counter value.

All other values are reserved

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and [TRFCR_EL2](#).TS != 0b00.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

0b0 Trace is prohibited at EL1.

0b1 Trace is allowed at EL1.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

0b0 Trace is prohibited at EL0.

0b1 Trace is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE == 1.

On a Warm reset, this field resets to 0.

Accessing the TRFCR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
TRFCR_EL1	0001	11	000	001	0010
TRFCR_EL12	0001	11	101	001	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TRFCR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
TRFCR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
TRFCR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x880]	RW	RW
TRFCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
TRFCR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	TRFCR_EL2	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TRFCR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x880]	TRFCR_EL2	RW
TRFCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	TRFCR_EL2	RW
TRFCR_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
TRFCR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
TRFCR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x880]	-	-
TRFCR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
TRFCR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
TRFCR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x880]	RW	RW
TRFCR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

TRFCR_EL12 is present only if HaveEL(EL2) && IsFeatureImplemented(ARMv8.1-VHE) is true. Otherwise, direct accesses to TRFCR_EL12 are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && MDCR_EL2.TTRF == 1 && IsUsingAccessor(TRFCR_EL1), then accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && MDCR_EL3.TTRF == 1 && (IsUsingAccessor(TRFCR_EL1) || IsUsingAccessor(TRFCR_EL12)), then accesses at EL2 are trapped to EL3.
- If HaveEL(EL3) && MDCR_EL3.TTRF == 1 && (IsUsingAccessor(TRFCR_EL1) || IsUsingAccessor(TRFCR_EL12)), then accesses at EL1 are trapped to EL3.
- If (HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && HCR_EL2.NV == 1 && (HCR_EL2.NV1 == 1 || HCR_EL2.NV2 == 0) && IsUsingAccessor(TRFCR_EL12), then accesses at EL1 are trapped to EL2.

D12.3.31 TRFCR_EL2, Trace Filter Control Register (EL2)

The TRFCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Trace.

Configurations

AArch64 System register TRFCR_EL2[31:0] is architecturally mapped to AArch32 System register [HTRFCR](#)[31:0].

This register is present only when ARMv8.4-Trace is implemented. Otherwise, direct accesses to TRFCR_EL2 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TRFCR_EL2 is a 64-bit register.

Field descriptions

The TRFCR_EL2 bit assignments are:

Bits [63:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

0b00 Timestamp controlled by [TRFCR_EL1.TS](#) or [TRFCR.TS](#).

0b01 Virtual timestamp. The traced timestamp is the physical counter value, minus the value of [CNTVOFF_EL2](#).

0b11 Physical timestamp. The traced timestamp is the physical counter value.

This field is ignored if `SelfHostedTraceEnabled() == FALSE`.

On a Warm reset, this field resets to 0.

Bit [4]

Reserved, RES0.

CX, bit [3]

CONTEXTIDR_EL2 and VMID trace enable.

0b0 [CONTEXTIDR_EL2](#) and VMID trace prohibited.

0b1 [CONTEXTIDR_EL2](#) and VMID trace allowed.

This field is ignored if `SelfHostedTraceEnabled() == FALSE`.

On a Warm reset, this field resets to 0.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.

0b0 Trace is prohibited at EL2.

0b1 Trace is allowed at EL2.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

On a Warm reset, this field resets to 0.

E0HTRE, bit [0]

EL0 Trace Enable.

0b0 Trace is prohibited at EL0 when HCR_EL2.TGE == 1.

0b1 Trace is allowed at EL0 when HCR_EL2.TGE == 1.

This field is ignored if any of the following are true:

- HCR_EL2.TGE == 0.
- SelfHostedTraceEnabled() == FALSE.
- EL2 is disabled in the current security state.

On a Warm reset, this field resets to 0.

Accessing the TRFCR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
TRFCR_EL2	0001	11	100	001	0010
TRFCR_EL1	0001	11	000	001	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TRFCR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
TRFCR_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
TRFCR_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
TRFCR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	TRFCR_EL1	n/a	TRFCR_EL1
TRFCR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	TRFCR_EL1	TRFCR_EL1	TRFCR_EL1
TRFCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	TRFCR_EL1	TRFCR_EL1
TRFCR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	TRFCR_EL1	RW	TRFCR_EL1
TRFCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	TRFCR_EL1

If EL2 is not enabled, or if `HCR_EL2.NV == 0`, direct reads and writes using the register name `TRFCR_EL2` at EL1 are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && MDCR_EL2.TTRF == 1 && IsUsingAccessor(TRFCR_EL1)`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && MDCR_EL3.TTRF == 1 && (IsUsingAccessor(TRFCR_EL2) || IsUsingAccessor(TRFCR_EL1))`, then accesses at EL2 are trapped to EL3.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && HCR_EL2.NV == 1 && IsUsingAccessor(TRFCR_EL2)`, then accesses at EL1 are trapped to EL2.

D12.4 Performance Monitors registers

This section lists the Performance Monitoring registers in AArch64.

D12.4.1 PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Configurations

AArch64 System register PMCCFILTR_EL0[31:0] is architecturally mapped to AArch32 System register [PMCCFILTR](#)[31:0].

AArch64 System register PMCCFILTR_EL0[31:0] is architecturally mapped to External register [PMCCFILTR_EL0](#)[31:0].

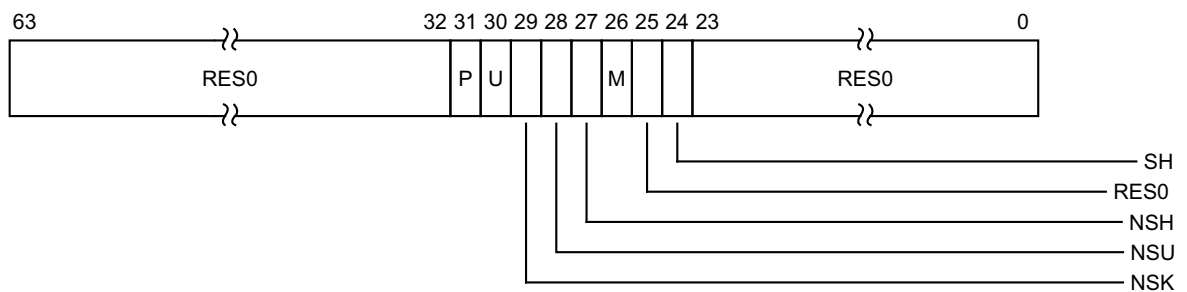

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions

The PMCCFILTR_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit. The possible values of this bit are:

0b0 Count cycles in EL1.

0b1 Do not count cycles in EL1.

This field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit. The possible values of this bit are:

0b0 Count cycles in EL0.

0b1 Do not count cycles in EL0.

This field resets to an architecturally UNKNOWN value.

NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

This field resets to an architecturally UNKNOWN value.

NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

This field resets to an architecturally UNKNOWN value.

NSH, bit [27]

EL2 (Hypervisor) filtering bit. Controls counting in EL2. If EL2 is not implemented, this bit is RES0. If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

0b0 Do not count cycles in EL2.

0b1 Count cycles in EL2.

This field resets to an architecturally UNKNOWN value.

M, bit [26]

Secure EL3 filtering bit. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

———— Note —————

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

This field resets to an architecturally UNKNOWN value.

Bit [25]

Reserved, RES0.

SH, bit [24]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is not implemented or is disabled, this field is RES0.

———— Note —————

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:0]

Reserved, RES0.

Accessing the PMCCFILTR_ELO

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMCCFILTR_ELO	11	1110	011	111	1111

PMCCFILTR_ELO can also be accessed by using [PMXEVTYPYPER_ELO](#) with [PMSELR_ELO](#).SEL set to 0b11111.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If [PMUSERENR_ELO](#).EN == 0 && ([HCR_EL2](#).TGE == 0 || ([SCR_EL3](#).NS == 0 && [SCR_EL3](#).EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If [PMUSERENR_ELO](#).EN == 0 && [HCR_EL2](#).TGE == 1 && ([SCR_EL3](#).NS == 1 || [SCR_EL3](#).EEL2 == 1), then accesses at EL0 are trapped to EL2.
- If ([SCR_EL3](#).NS == 1 || [SCR_EL3](#).EEL2 == 1) && IsUsingAArch64(EL2) && [MDCR_EL2](#).TPM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && [MDCR_EL3](#).TPM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.2 PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See [Time as measured by the Performance Monitors cycle counter on page D6-2539](#) for more information.

[PMCCFILTR_EL0](#) determines the modes and states in which the PMCCNTR_EL0 can increment.

Configurations

AArch64 System register PMCCNTR_EL0[63:0] is architecturally mapped to AArch32 System register [PMCCNTR](#)[63:0].

AArch64 System register PMCCNTR_EL0[63:0] is architecturally mapped to External register [PMCCNTR_EL0](#)[63:0].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

The PMCCNTR_EL0 bit assignments are:

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR_EL0](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR_EL0](#).C sets this field to 0.

This field resets to an architecturally UNKNOWN value.

Accessing the PMCCNTR_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMCCNTR_EL0	11	1001	011	000	1101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `PMUSERENR_EL0.CR == 0 && PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.CR == 0 && PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then write accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.3 PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

———— Note ————

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEID<n>_EL0 registers see [The PMU event number space and common events on page D6-2557](#).

Configurations

AArch64 System register PMCEID0_EL0[31:0] is architecturally mapped to AArch32 System register [PMCEID0](#)[31:0].

AArch64 System register PMCEID0_EL0[63:32] is architecturally mapped to AArch32 System register [PMCEID2](#)[31:0].

AArch64 System register PMCEID0_EL0[31:0] is architecturally mapped to External register [PMCEID0](#)[31:0].

AArch64 System register PMCEID0_EL0[63:32] is architecturally mapped to External register [PMCEID2](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCEID0_EL0 is a 64-bit register.

Field descriptions

The PMCEID0_EL0 bit assignments are:

IDhi<n>, bit [n+32], for n = 0 to 31

When ARMv8.1-PMU is implemented:

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

———— Note ————

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 0 to 31

ID[n] corresponds to common event n.

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing the PMCEID0_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMCEID0_EL0	11	1001	011	110	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then read accesses at EL0 are trapped to EL1.
- If PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then read accesses at EL0 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1, then read accesses at EL0 or EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.4 PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

Note

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEID<n>_EL0 registers see [The PMU event number space and common events on page D6-2557](#).

Configurations

AArch64 System register PMCEID1_EL0[31:0] is architecturally mapped to AArch32 System register [PMCEID1](#)[31:0].

AArch64 System register PMCEID1_EL0[63:32] is architecturally mapped to AArch32 System register [PMCEID3](#)[31:0].

AArch64 System register PMCEID1_EL0[31:0] is architecturally mapped to External register [PMCEID1](#)[31:0].

AArch64 System register PMCEID1_EL0[63:32] is architecturally mapped to External register [PMCEID3](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCEID1_EL0 is a 64-bit register.

Field descriptions

The PMCEID1_EL0 bit assignments are:

IDhi<n>, bit [n+32], for n = 0 to 31

From ARMv8.1:

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 0 to 31

ID[n] corresponds to common event (0x0020 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing the PMCEID1_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMCEID1_EL0	11	1001	011	111	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then read accesses at EL0 are trapped to EL1.
- If PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then read accesses at EL0 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1, then read accesses at EL0 or EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.5 PMCNTENCLR_ELO, Performance Monitors Count Enable Clear register

The PMCNTENCLR_ELO characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR_ELO](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configurations

AArch64 System register PMCNTENCLR_ELO[31:0] is architecturally mapped to AArch32 System register [PMCNTENCLR](#)[31:0].

AArch64 System register PMCNTENCLR_ELO[31:0] is architecturally mapped to External register [PMCNTENCLR_ELO](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCNTENCLR_ELO is a 64-bit register.

Field descriptions

The PMCNTENCLR_ELO bit assignments are:

Bits [63:32]

Reserved, RES0.

C, bit [31]

[PMCCNTR_ELO](#) disable bit. Disables the cycle counter register. Possible values are:

- 0b0 When read, means the cycle counter is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter disable bit for [PMEVCNTR<n>_ELO](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#). Otherwise, N is the value in [PMCR_EL0.N](#).

Possible values of each bit are:

- 0b0 When read, means that [PMEVCNTR<n>_ELO](#) is disabled. When written, has no effect.
- 0b1 When read, means that [PMEVCNTR<n>_ELO](#) is enabled. When written, disables [PMEVCNTR<n>_ELO](#).

This field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENCLR_ELO

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMCNTENCLR_ELO	11	1001	011	010	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.6 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configurations

AArch64 System register PMCNTENSET_EL0[31:0] is architecturally mapped to AArch32 System register [PMCNTENSET](#)[31:0].

AArch64 System register PMCNTENSET_EL0[31:0] is architecturally mapped to External register [PMCNTENSET_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCNTENSET_EL0 is a 64-bit register.

Field descriptions

The PMCNTENSET_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

C, bit [31]

[PMCCNTR_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

0b0 When read, means the cycle counter is disabled. When written, has no effect.

0b1 When read, means the cycle counter is enabled. When written, enables the cycle counter.

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter enable bit for [PMEVCNTR<n>_EL0](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#). Otherwise, N is the value in [PMCR_EL0.N](#).

Possible values of each bit are:

0b0 When read, means that [PMEVCNTR<n>_EL0](#) is disabled. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>_EL0](#) event counter is enabled. When written, enables [PMEVCNTR<n>_EL0](#).

This field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENSET_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMCNTENSET_ELO	11	1001	011	001	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.7 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configurations

AArch64 System register PMCR_EL0[31:0] is architecturally mapped to AArch32 System register [PMCR](#)[31:0].

AArch64 System register PMCR_EL0[6:0] is architecturally mapped to External register [PMCR_EL0](#)[6:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCR_EL0 is a 64-bit register.

Field descriptions

The PMCR_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

IMP, bits [31:24]

Implementer code. This field is RO with an IMPLEMENTATION DEFINED value.

The implementer codes are allocated by ARM. Values have the same interpretation as bits [31:24] of the [MIDR_EL1](#).

IDCODE, bits [23:16]

Identification code. This field is RO with an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that is specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

N, bits [15:11]

An RO field that indicates the number of event counters implemented. This value is in the range of 0b000000-0b111111. If the value is 0b000000 then only [PMCCNTR_EL0](#) is implemented. If the value is 0b111111 [PMCCNTR_EL0](#) and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of [MDCR_EL2](#).HPMN.

Access to this field is RO.

Bits [10:7]

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

0b0 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR_ELO](#)[31:0].

0b1 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR_ELO](#)[63:0].

ARM deprecates use of [PMCR_ELO](#).LC = 0.

In an AArch64 only implementation, this field is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

0b0 [PMCCNTR_ELO](#), if enabled, counts when event counting is prohibited.

0b1 [PMCCNTR_ELO](#) does not count when event counting is prohibited.

Counting events is never prohibited in Non-secure state. However, there are some restrictions on counting events in Secure state. For more information about the interaction between the Performance Monitors and EL3, see [Interaction with EL3 on page D6-2545](#).

When EL3 is not implemented, this field is RES0:

- When [ARMv8.1-PMU](#) is not implemented.
- When [ARMv8.1-PMU](#) is implemented, only if EL2 is not implemented.

Otherwise this field is RW.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

X, bit [4]

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:

0b0 Do not export events.

0b1 Export events where not prohibited.

This field enables the exporting of events over an event bus to another device, for example to an OPTIONAL PE trace unit. If the implementation does not include such an event bus then this field is RAZ/WI, otherwise it is an RW field.

In an implementation that includes an event bus, no events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

D, bit [3]

Clock divider. The possible values of this bit are:

0b0 When enabled, [PMCCNTR_ELO](#) counts every clock cycle.

0b1 When enabled, [PMCCNTR_ELO](#) counts once every 64 clock cycles.

In an AArch64 only implementation this field is RES0, otherwise it is an RW field. If [PMCR_ELO](#).LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of [PMCR_ELO](#).D = 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

0b0 No action.

0b1 Reset [PMCCNTR_EL0](#) to zero.

This bit is always RAZ.

Resetting [PMCCNTR_EL0](#) does not clear the [PMCCNTR_EL0](#) overflow bit to 0.

P, bit [1]

Event counter reset. This bit is WO. The effects of writing to this bit are:

0b0 No action.

0b1 Reset all event counters accessible in the current EL, not including [PMCCNTR_EL0](#), to zero.

This bit is always RAZ.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0 a write of 1 to this bit does not reset event counters that [MDCR_EL2](#).HPMN reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Resetting the event counters does not clear any overflow bits to 0.

E, bit [0]

Enable. The possible values of this bit are:

0b0 All counters that are accessible at Non-secure EL1, including [PMCCNTR_EL0](#), are disabled.

0b1 All counters that are accessible at Non-secure EL1 are enabled by [PMCNTESET_EL0](#).

This bit is RW.

If EL2 is implemented, this bit does not affect the operation of event counters that [MDCR_EL2](#).HPMN reserves for EL2 use.

On a Warm reset, this field resets to 0.

Accessing the PMCR_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMCR_EL0	11	1001	011	000	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPMCR == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.8 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configurations

AArch64 System register PMEVCNTR<n>_EL0[31:0] is architecturally mapped to AArch32 System register [PMEVCNTR<n>\[31:0\]](#).

AArch64 System register PMEVCNTR<n>_EL0[31:0] is architecturally mapped to External register [PMEVCNTR<n>_EL0\[31:0\]](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

The PMEVCNTR<n>_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

This field resets to an architecturally UNKNOWN value.

Accessing the PMEVCNTR<n>_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
PMEVCNTR<n>_EL0	1110	11	011	n<2:0>	10:n<4:3>

- <op2> is in the range 0 - 7.
- <CRm> is in the range 8 - 11.

PMEVCNTR<n>_EL0 can also be accessed by using [PMXEVCNTR_EL0](#) with [PMSCLR_EL0](#).SEL set to the value of <n>.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- For an access from EL1, or an access from EL0 when the value of PMUSERENR_EL0.EN is 1 and when EL2 is implemented and enabled in the current Security state, if n is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

Note

When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.ER == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then read accesses at EL0 are trapped to EL1.
- If PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.ER == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then read accesses at EL0 are trapped to EL2.
- If PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then write accesses at EL0 are trapped to EL1.
- If PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then write accesses at EL0 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.9 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configurations

AArch64 System register PMEVTYPER<n>_EL0[31:0] is architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

AArch64 System register PMEVTYPER<n>_EL0[31:0] is architecturally mapped to External register [PMEVTYPER<n>_EL0\[31:0\]](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions

The PMEVTYPER<n>_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit. The possible values of this bit are:

- 0b0 Count events in EL1.
- 0b1 Do not count events in EL1.

This field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit. The possible values of this bit are:

- 0b0 Count events in EL0.
- 0b1 Do not count events in EL0.

This field resets to an architecturally UNKNOWN value.

NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.P` bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

This field resets to an architecturally UNKNOWN value.

NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.U` bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

This field resets to an architecturally UNKNOWN value.

NSH, bit [27]

EL2 (Hypervisor) filtering bit. Controls counting in EL2. If EL2 is not implemented, this bit is RES0.

If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the `PMEVTYPER<n>_EL0.SH` bit.

0b0 Do not count events in EL2.

0b1 Count events in EL2.

This field resets to an architecturally UNKNOWN value.

M, bit [26]

Secure EL3 filtering bit. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.P` bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

———— Note —————

This field is not visible in the AArch32 `PMEVTYPER<n>` System register.

This field resets to an architecturally UNKNOWN value.

MT, bit [25]

Multithreading. When the implementation is multi-threaded, the valid values for this bit are:

0b0 Count events only on controlling PE.

0b1 Count events from any PE with the same affinity at level 1 and above as this PE.

When the implementation is not multi-threaded, this bit is RES0.

———— Note —————

- When the lowest level of [affinity](#) consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent. On such an implementation, when read at the highest implemented Exception level, the value of the `MPIDR_EL1.MT` bit is 0b1.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

This field resets to an architecturally UNKNOWN value.

SH, bit [24]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the `PMEVTYPER<n>_EL0.NSH` bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

If Secure EL2 is not implemented or is disabled, this field is RES0.

———— **Note** —————

This field is not visible in the AArch32 `PMEVTYPER<n>` System register.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When ARMv8.1-PMU is implemented:

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter `PMEVCNTR<n>_EL0`.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x000 to 0x03F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

———— **Note** —————

UNPREDICTABLE means the event must not expose privileged information.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

This field resets to an architecturally UNKNOWN value.

Accessing the `PMEVTYPER<n>_EL0`

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMEVTYPER<n>_EL0	11	1110	011	n<2:0>	11:n<4:3>

- <op2> is in the range 0 - 7.
- <CRm> is in the range 12 - 15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

PMEVTYPER<n>_EL0 can also be accessed by using [PMXEVTYPER_EL0](#) with [PMSELR_EL0.SEL](#) set to n.

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVTYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- For an access from EL1, or an access from EL0 when the value of the [PMUSERENR_EL0.EN](#) bit is 0b1, if n is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

————— Note —————

When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2.HPMN](#) identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.10 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_ELO](#), and the event counters [PMEVCNTR<n>_ELO](#). Reading the register shows which overflow interrupt requests are enabled.

Configurations

AArch64 System register PMINTENCLR_EL1[31:0] is architecturally mapped to AArch32 System register [PMINTENCLR](#)[31:0].

AArch64 System register PMINTENCLR_EL1[31:0] is architecturally mapped to External register [PMINTENCLR_EL1](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMINTENCLR_EL1 is a 64-bit register.

Field descriptions

The PMINTENCLR_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

C, bit [31]

[PMCCNTR_ELO](#) overflow interrupt request disable bit. Possible values are:

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>_ELO](#).

When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#). Otherwise, N is the value in [PMCR_ELO.N](#).

Bits [30:N] are RAZ/WI.

Possible values are:

- 0b0 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is disabled. When written, has no effect.
- 0b1 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is enabled. When written, disables the [PMEVCNTR<n>_ELO](#) interrupt request.

This field resets to an architecturally UNKNOWN value.

Accessing the PMINTENCLR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMINTENCLR_EL1	11	1001	000	010	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.4.11 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_ELO](#), and the event counters [PMEVCNTR<n>_ELO](#). Reading the register shows which overflow interrupt requests are enabled.

Configurations

AArch64 System register PMINTENSET_EL1[31:0] is architecturally mapped to AArch32 System register [PMINTENSET](#)[31:0].

AArch64 System register PMINTENSET_EL1[31:0] is architecturally mapped to External register [PMINTENSET_EL1](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMINTENSET_EL1 is a 64-bit register.

Field descriptions

The PMINTENSET_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

C, bit [31]

[PMCCNTR_ELO](#) overflow interrupt request enable bit. Possible values are:

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>_ELO](#).

When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#). Otherwise, N is the value in [PMCR_ELO.N](#).

Bits [30:N] are RAZ/WI.

Possible values are:

- 0b0 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is disabled. When written, has no effect.
- 0b1 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is enabled. When written, enables the [PMEVCNTR<n>_ELO](#) interrupt request.

This field resets to an architecturally UNKNOWN value.

Accessing the PMINTENSET_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMINTENSET_EL1	11	1001	000	001	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.4.12 PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSCLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configurations

AArch64 System register PMOVSCLR_EL0[31:0] is architecturally mapped to AArch32 System register [PMOVSRR\[31:0\]](#).

AArch64 System register PMOVSCLR_EL0[31:0] is architecturally mapped to External register [PMOVSCLR_EL0\[31:0\]](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMOVSCLR_EL0 is a 64-bit register.

Field descriptions

The PMOVSCLR_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

C, bit [31]

Cycle counter overflow clear bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow clear bit for [PMEVCNTR<n>_EL0](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

0b0 When read, means that [PMEVCNTR<n>_EL0](#) has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>_EL0](#) has overflowed since this bit was last cleared. When written, clears the [PMEVCNTR<n>_EL0](#) overflow bit to 0.

This field resets to an architecturally UNKNOWN value.

Accessing the PMOVSCLR_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMOVSLR_EL0	11	1001	011	011	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.13 PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Configurations

AArch64 System register PMOVSSET_EL0[31:0] is architecturally mapped to AArch32 System register [PMOVSSET](#)[31:0].

AArch64 System register PMOVSSET_EL0[31:0] is architecturally mapped to External register [PMOVSSET_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMOVSSET_EL0 is a 64-bit register.

Field descriptions

The PMOVSSET_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

C, bit [31]

Cycle counter overflow set bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow set bit for [PMEVCNTR<n>_EL0](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

0b0 When read, means that [PMEVCNTR<n>_EL0](#) has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>_EL0](#) has overflowed since this bit was last cleared. When written, sets the [PMEVCNTR<n>_EL0](#) overflow bit to 1.

This field resets to an architecturally UNKNOWN value.

Accessing the PMOVSSET_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMOVSSET_ELO	11	1001	011	011	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.14 PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

Purpose

Selects the current event counter [PMEVCNTR<n>](#) or the cycle counter, CCNT.

PMSELR_EL0 is used in conjunction with [PMXEVTYPER_EL0](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXEVCNTR_EL0](#), to determine the value of a selected event counter.

Configurations

AArch64 System register PMSELR_EL0[31:0] is architecturally mapped to AArch32 System register [PMSELR](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSELR_EL0 is a 64-bit register.

Field descriptions

The PMSELR_EL0 bit assignments are:

Bits [63:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER_EL0](#) or [PMXEVCNTR_EL0](#) occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR_EL0.SEL is 0b11111, it selects the cycle counter and:

- A read of the [PMXEVTYPER_EL0](#) returns the value of [PMCCFILTR_EL0](#).
- A write of the [PMXEVTYPER_EL0](#) writes to [PMCCFILTR_EL0](#).
- A read or write of [PMXEVCNTR_EL0](#) has CONSTRAINED UNPREDICTABLE effects, that can be one of the following:
 - Access to [PMXEVCNTR_EL0](#) is UNDEFINED.
 - Access to [PMXEVCNTR_EL0](#) behaves as a NOP.
 - Access to [PMXEVCNTR_EL0](#) behaves as if the register is RAZ/WI.
 - Access to [PMXEVCNTR_EL0](#) behaves as if the PMSELR_EL0.SEL field contains an UNKNOWN value.

If this field is set to a value greater than or equal to the number of accessible counters, but not equal to 31:

- Direct reads of this field return an UNKNOWN value.

- The results of access to `PMXEVTYPER_ELO` or `PMXEVCNTR_ELO` are CONSTRAINED UNPREDICTABLE, and can be one of the following:
 - Access to `PMXEVTYPER_ELO` or `PMXEVCNTR_ELO` is UNDEFINED.
 - Access to `PMXEVTYPER_ELO` or `PMXEVCNTR_ELO` behaves as a NOP.
 - Access to `PMXEVTYPER_ELO` or `PMXEVCNTR_ELO` behaves as if the register is RAZ/WI.
 - Access to `PMXEVTYPER_ELO` or `PMXEVCNTR_ELO` behaves as if the `PMSELR_ELO.SEL` field contains an UNKNOWN value.
 - Access to `PMXEVTYPER_ELO` behaves as if the `PMSELR_ELO.SEL` field contains `0b11111`.

This field resets to an architecturally UNKNOWN value.

Accessing the PMSELR_ELO

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSELR_ELO	11	1001	011	101	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `PMUSERENR_ELO.EN == 0 && PMUSERENR_ELO.ER == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_ELO.EN == 0 && PMUSERENR_ELO.ER == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.15 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see [SW_INCR](#).

Configurations

AArch64 System register PMSWINC_EL0[31:0] is architecturally mapped to AArch32 System register [PMSWINC](#)[31:0].

AArch64 System register PMSWINC_EL0[31:0] is architecturally mapped to External register [PMSWINC_EL0](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSWINC_EL0 is a 64-bit register.

Field descriptions

The PMSWINC_EL0 bit assignments are:

Bits [63:31]

Reserved, RES0.

P<n>, bit [n], for n = 0 to 30

Event counter software increment bit for [PMEVCNTR<n>_EL0](#).

Bits [30:N] are WI.

When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#). Otherwise, N is the value in [PMCR.N](#).

The effects of writing to this bit are:

0b0 No action. The write to this bit is ignored.

0b1 If [PMEVCNTR<n>_EL0](#) is enabled and configured to count the software increment event, increments [PMEVCNTR<n>_EL0](#) by 1. If [PMEVCNTR<n>_EL0](#) is disabled, or not configured to count the software increment event, the write to this bit is ignored.

Accessing the PMSWINC_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSWINC_EL0	11	1001	011	100	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	WO	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	WO	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	WO	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.SW == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then write accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.SW == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then write accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then write accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.16 PMUSERENR_EL0, Performance Monitors User Enable Register

The PMUSERENR_EL0 characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configurations

AArch64 System register PMUSERENR_EL0[31:0] is architecturally mapped to AArch32 System register [PMUSERENR](#)[31:0].

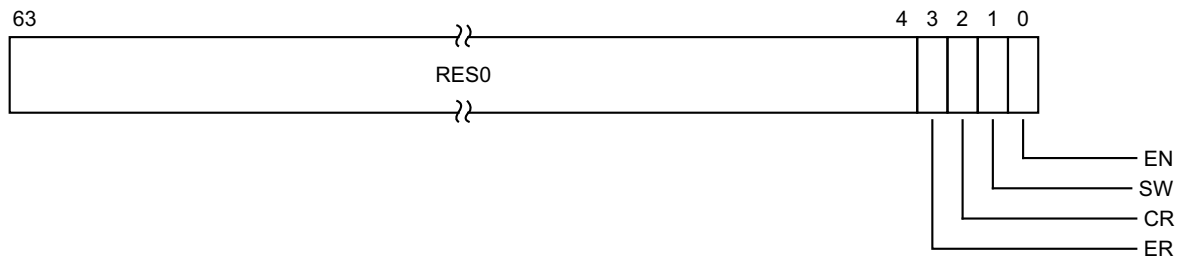

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMUSERENR_EL0 is a 64-bit register.

Field descriptions

The PMUSERENR_EL0 bit assignments are:

Bits [63:4]

Reserved, RES0.

ER, bit [3]

Event counter read trap control:

0b0 EL0 using AArch64: EL0 reads of the [PMXEVNTR_EL0](#) and [PMEVCNTR<n>_EL0](#), and EL0 read/write accesses to the [PMSELR_EL0](#), are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

EL0 using AArch32: EL0 reads of the [PMXEVNTR](#) and [PMEVCNTR<n>](#), and EL0 read/write accesses to the [PMSELR](#), are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

0b1 Overrides PMUSERENR_EL0.EN and enables RO access to [PMXEVNTR_EL0](#) and [PMEVCNTR<n>_EL0](#), and RW access to [PMSELR_EL0](#) and [PMSELR](#) at EL0.

This field resets to an architecturally UNKNOWN value.

CR, bit [2]

Cycle counter read trap control:

0b0 EL0 using AArch64: EL0 read accesses to the [PMCCNTR_EL0](#) are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

EL0 using AArch32: EL0 read accesses to the [PMCCNTR](#) are trapped to EL1 if PMUSERENR_EL0.EN is also 0.

0b1 Overrides PMUSERENR_EL0.EN and enables access to [PMCCNTR_EL0](#) and [PMCCNTR](#) at EL0.

SW, bit [1]

Software Increment write trap control:

- 0b0 EL0 using AArch64: EL0 writes to the [PMSWINC_EL0](#) are trapped to EL1 if [PMUSERENR_EL0.EN](#) is also 0.
EL0 using AArch32: EL0 writes to the [PMSWINC](#) are trapped to EL1 if [PMUSERENR_EL0.EN](#) is also 0.
- 0b1 Overrides [PMUSERENR_EL0.EN](#) and enables access to [PMSWINC_EL0](#) and [PMSWINC](#) at EL0.

This field resets to an architecturally UNKNOWN value.

EN, bit [0]

Traps EL0 accesses to the Performance Monitors registers to EL1, from both Execution states:

- 0b0 While at EL0, [PMUSERENR_EL0](#) is always RO. Accesses to the other Performance Monitors registers at EL0 are trapped to EL1, unless overridden by one of [PMUSERENR_EL0](#).{ER, CR, SW}.
- 0b1 While at EL0, software can access all PMU registers except [PMINTENSET_EL1](#), [PMINTENCLR_EL1](#), [PMINTENSET](#) and [PMINTENCLR](#).

This field resets to an architecturally UNKNOWN value.

Accessing the [PMUSERENR_EL0](#)

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMUSERENR_EL0	11	1001	011	000	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{MDCR_EL2.TPM} == 1$, then accesses at EL0 or EL1 are trapped to EL2.
- If $\text{IsUsingAArch64(EL3)} \ \&\& \ \text{MDCR_EL3.TPM} == 1$, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.17 PMXEVNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVNTR_EL0 characteristics are:

Purpose

Reads or writes the value of the selected event counter, [PMEVCNTR<n>_EL0](#). [PMSELR_EL0](#).SEL determines which event counter is selected.

Configurations

AArch64 System register PMXEVNTR_EL0[31:0] is architecturally mapped to AArch32 System register [PMXEVNTR](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMXEVNTR_EL0 is a 64-bit register.

Field descriptions

The PMXEVNTR_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, [PMEVCNTR<n>_EL0](#), where n is the value stored in [PMSELR_EL0](#).SEL.

This field resets to an architecturally UNKNOWN value.

Accessing the PMXEVNTR_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMXEVNTR_EL0	11	1001	011	010	1101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

If [PMSELR_EL0.SEL](#) is greater than or equal to the number of accessible counters then reads and writes of [PMXVCNTR_EL0](#) are CONstrained UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR_EL0.SEL](#) has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of [PMUSERENR_EL0.EN](#) is 1, if [PMSELR_EL0.SEL](#) is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

Note

When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2.HPMN](#) identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If [PMUSERENR_EL0.EN](#) == 0 && [PMUSERENR_EL0.ER](#) == 0 && ([HCR_EL2.TGE](#) == 0 || ([SCR_EL3.NS](#) == 0 && [SCR_EL3.EEL2](#) == 0)), then read accesses at EL0 are trapped to EL1.
- If [PMUSERENR_EL0.EN](#) == 0 && [PMUSERENR_EL0.ER](#) == 0 && [HCR_EL2.TGE](#) == 1 && ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1), then read accesses at EL0 are trapped to EL2.
- If [PMUSERENR_EL0.EN](#) == 0 && ([HCR_EL2.TGE](#) == 0 || ([SCR_EL3.NS](#) == 0 && [SCR_EL3.EEL2](#) == 0)), then write accesses at EL0 are trapped to EL1.
- If [PMUSERENR_EL0.EN](#) == 0 && [HCR_EL2.TGE](#) == 1 && ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1), then write accesses at EL0 are trapped to EL2.
- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [MDCR_EL2.TPM](#) == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If [IsUsingAArch64\(EL3\)](#) && [MDCR_EL3.TPM](#) == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.4.18 PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPER_EL0 characteristics are:

Purpose

When [PMSELR_EL0.SEL](#) selects an event counter, this accesses a [PMEVTYPER<n>_EL0](#) register. When [PMSELR_EL0.SEL](#) selects the cycle counter, this accesses [PMCCFILTR_EL0](#).

Configurations

AArch64 System register PMXEVTYPER_EL0[31:0] is architecturally mapped to AArch32 System register [PMXEVTYPER](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMXEVTYPER_EL0 is a 64-bit register.

Field descriptions

The PMXEVTYPER_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

Event type register or PMCCFILTR_EL0, bits [31:0]

When [PMSELR_EL0.SEL](#) == 31, this register accesses [PMCCFILTR_EL0](#).

Otherwise, this register accesses [PMEVTYPER<n>_EL0](#) where n is the value in [PMSELR_EL0.SEL](#).

This field resets to an architecturally UNKNOWN value.

Accessing the PMXEVTYPER_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMXEVTYPER_EL0	11	1001	011	001	1101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

If `PMSELR_EL0.SEL` is greater than or equal to the number of accessible counters then reads and writes of `PMXEVTYPER_EL0` are CONstrained UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if `PMSELR_EL0.SEL` has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if `PMSELR_EL0.SEL` is 31.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of `PMUSERENR_EL0.EN` is 1, if `PMSELR_EL0.SEL` is greater than or equal to the number of accessible counters but is less than the number of implemented counters but not equal to 31, the register access is trapped to EL2.

Note

When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, `MDCR_EL2.HPMN` identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.5 Activity Monitors registers

This section lists the Activity Monitors registers in AArch64.

D12.5.1 AMCFGR_EL0, Activity Monitors Configuration Register

The AMCFGR_EL0 characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch64 System register AMCFGR_EL0[31:0] is architecturally mapped to AArch32 System register [AMCFGR\[31:0\]](#).

AArch64 System register AMCFGR_EL0[31:0] is architecturally mapped to External register [AMCFGR\[31:0\]](#).

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCFGR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCFGR_EL0 is a 32-bit register.

Field descriptions

The AMCFGR_EL0 bit assignments are:

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is defined as [AMCFGR_EL0.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

In ARMv8, this feature must be supported, and so this bit is 0b1.

0b0 [AMCR_EL0.HDBG](#) is RES0.

0b1 [AMCR_EL0.HDBG](#) is read/write.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the activity monitors Extension is defined as $[AMCFGR_EL0.SIZE + 1]$.

In ARMv8, the counters are 64-bit, and so this field is 0b111111.

———— **Note** —————

Software also uses this field to determine the spacing of counters in the memory-map. In ARMv8, the counters are at doubleword-aligned addresses.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as $[AMCFGR_EL0.N + 1]$.

Accessing the AMCFGR_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMCFGR_EL0	11	1101	011	001	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.2 AMCGCR_EL0, Activity Monitors Counter Group Configuration Register

The AMCGCR_EL0 characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configurations

AArch64 System register AMCGCR_EL0[31:0] is architecturally mapped to AArch32 System register [AMCGCR](#)[31:0].

AArch64 System register AMCGCR_EL0[31:0] is architecturally mapped to External register [AMCGCR](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCGCR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCGCR_EL0 is a 32-bit register.

Field descriptions

The AMCGCR_EL0 bit assignments are:

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group. In AMUv1, the permitted range of values is 0x0 to 0x10.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group. In AMUv1, the value of this field is 0x4.

Accessing the AMCGCR_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMCGCR_EL0	11	1101	011	010	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.3 AMCNTENCLR0_EL0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0_EL0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>_EL0](#).

Configurations

AArch64 System register AMCNTENCLR0_EL0[31:0] is architecturally mapped to AArch32 System register [AMCNTENCLR0](#)[31:0].

AArch64 System register AMCNTENCLR0_EL0[31:0] is architecturally mapped to External register [AMCNTENCLR0](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0_EL0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCNTENCLR0_EL0 is a 32-bit register.

Field descriptions

The AMCNTENCLR0_EL0 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter disable bit for [AMEVCNTR0<n>_EL0](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR_EL0.CG0NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR0<n>_EL0](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR0<n>_EL0](#) is enabled. When written, disables [AMEVCNTR0<n>_EL0](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR0_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMCNTENCLR0_EL0	11	1101	011	100	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.4 AMCNTENCLR1_EL0, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1_EL0 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>_EL0](#).

Configurations

AArch64 System register AMCNTENCLR1_EL0[31:0] is architecturally mapped to AArch32 System register [AMCNTENCLR1](#)[31:0].

AArch64 System register AMCNTENCLR1_EL0[31:0] is architecturally mapped to External register [AMCNTENCLR1](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1_EL0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCNTENCLR1_EL0 is a 32-bit register.

Field descriptions

The AMCNTENCLR1_EL0 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter disable bit for [AMEVCNTR1<n>_EL0](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR_EL0.CG1NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR1<n>_EL0](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR1<n>_EL0](#) is enabled. When written, disables [AMEVCNTR1<n>_EL0](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR1_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMCNTENCLR1_EL0	11	1101	011	000	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— Note ————

The number of auxiliary activity monitor event counters implemented is zero exactly when [AMCFGR_EL0.NCG == 0b0000](#).

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.5 AMCNTENSET0_EL0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0_EL0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>_EL0](#).

Configurations

AArch64 System register AMCNTENSET0_EL0[31:0] is architecturally mapped to AArch32 System register [AMCNTENSET0](#)[31:0].

AArch64 System register AMCNTENSET0_EL0[31:0] is architecturally mapped to External register [AMCNTENSET0](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0_EL0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCNTENSET0_EL0 is a 32-bit register.

Field descriptions

The AMCNTENSET0_EL0 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter enable bit for [AMEVCNTR0<n>_EL0](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR_EL0.CG0NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR0<n>_EL0](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR0<n>_EL0](#) is enabled. When written, enables [AMEVCNTR0<n>_EL0](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENSET0_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMCNTENSET0_EL0	11	1101	011	101	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.6 AMCNTENSET1_EL0, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1_EL0 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>_EL0](#).

Configurations

AArch64 System register AMCNTENSET1_EL0[31:0] is architecturally mapped to AArch32 System register [AMCNTENSET1](#)[31:0].

AArch64 System register AMCNTENSET1_EL0[31:0] is architecturally mapped to External register [AMCNTENSET1](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1_EL0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCNTENSET1_EL0 is a 32-bit register.

Field descriptions

The AMCNTENSET1_EL0 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter enable bit for [AMEVCNTR1<n>_EL0](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR_EL0.CG1NC](#).

Possible values of each bit are:

- 0b0 When read, means that [AMEVCNTR1<n>_EL0](#) is disabled. When written, has no effect.
- 0b1 When read, means that [AMEVCNTR1<n>_EL0](#) is enabled. When written, enables [AMEVCNTR1<n>_EL0](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENSET1_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMCNTENSET1_EL0	11	1101	011	001	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— Note —————

The number of auxiliary activity monitor counters implemented is zero when AMCFGR_EL0.NCG == 0b0000.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.7 AMCR_EL0, Activity Monitors Control Register

The AMCR_EL0 characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch64 System register AMCR_EL0[31:0] is architecturally mapped to AArch32 System register AMCR[31:0].

AArch64 System register AMCR_EL0[31:0] is architecturally mapped to External register AMCR[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCR_EL0 is a 32-bit register.

Field descriptions

The AMCR_EL0 bit assignments are:

Bits [31:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

0b0 Activity monitors do not halt counting when the PE is halted in Debug state.

0b1 Activity monitors halt counting when the PE is halted in Debug state.

Bits [9:0]

Reserved, RAZ/WI.

Accessing the AMCR_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMCR_EL0	11	1101	011	000	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.8 AMEVCNTR0<n>_EL0, Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0<n>_EL0 characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configurations

AArch64 System register AMEVCNTR0<n>_EL0[63:0] is architecturally mapped to AArch32 System register [AMEVCNTR0<n>\[63:0\]](#).

AArch64 System register AMEVCNTR0<n>_EL0[63:0] is architecturally mapped to External register [AMEVCNTR0<n>\[63:0\]](#).

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n>_EL0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMEVCNTR0<n>_EL0 is a 64-bit register.

Field descriptions

The AMEVCNTR0<n>_EL0 bit assignments are:

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

Accessing the AMEVCNTR0<n>_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMEVCNTR0<n>_EL0	11	1101	011	n<2:0>	010:n<3>

- <op2> is in the range 0 - 7.
- <CRm> is in the range 4 - 5.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— Note ————

[AMCGCR_EL0.CG0NC](#) identifies the number of architected activity monitor event counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.9 AMEVCNTR1<n>_EL0, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n>_EL0 characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configurations

AArch64 System register AMEVCNTR1<n>_EL0[63:0] is architecturally mapped to AArch32 System register [AMEVCNTR1<n>\[63:0\]](#).

AArch64 System register AMEVCNTR1<n>_EL0[63:0] is architecturally mapped to External register [AMEVCNTR1<n>\[63:0\]](#).

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n>_EL0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMEVCNTR1<n>_EL0 is a 64-bit register.

Field descriptions

The AMEVCNTR1<n>_EL0 bit assignments are:

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

Accessing the AMEVCNTR1<n>_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMEVCNTR1<n>_EL0	11	1101	011	n<2:0>	110:n<3>

- <op2> is in the range 0 - 7.
- <CRm> is in the range 12 - 13.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— Note ————

[AMCGCR_EL0.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.10 AMEVTYPER0<n>_EL0, Activity Monitors Event Type Registers 0, n = 0 - 15

The AMEVTYPER0<n>_EL0 characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>_EL0](#) counts.

Configurations

AArch64 System register AMEVTYPER0<n>_EL0[31:0] is architecturally mapped to AArch32 System register [AMEVTYPER0<n>\[31:0\]](#).

AArch64 System register AMEVTYPER0<n>_EL0[31:0] is architecturally mapped to External register [AMEVTYPER0<n>\[31:0\]](#).

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n>_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMEVTYPER0<n>_EL0 is a 32-bit register.

Field descriptions

The AMEVTYPER0<n>_EL0 bit assignments are:

31	25 24	16 15	0
RAZ	RES0	evtCount	

Bits [31:25]

Reserved, RAZ.

Bits [24:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>_EL0](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

0x0011 **When n == 0** Processor frequency cycles

0x4004 **When n == 1** Constant frequency cycles

0x0008 **When n == 2** Instructions retired

0x4005 **When n == 3** Memory stall cycles

Accessing the AMEVTYPER0<n>_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMEVTYPER0<n>_EL0	11	1101	011	n<2:0>	011:n<3>

- <op2> is in the range 0 - 7.
- <CRm> is in the range 6 - 7.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

Note

[AMCGCR_EL0.CG0NC](#) identifies the number of architected activity monitor event counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.11 AMEVTYPER1<n>_EL0, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n>_EL0 characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>_EL0](#) counts.

Configurations

AArch64 System register AMEVTYPER1<n>_EL0[31:0] is architecturally mapped to AArch32 System register [AMEVTYPER1<n>\[31:0\]](#).

AArch64 System register AMEVTYPER1<n>_EL0[31:0] is architecturally mapped to External register [AMEVTYPER1<n>\[31:0\]](#).

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n>_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMEVTYPER1<n>_EL0 is a 32-bit register.

Field descriptions

The AMEVTYPER1<n>_EL0 bit assignments are:

31	25 24	16 15	0
RAZ	RES0	evtCount	

Bits [31:25]

Reserved, RAZ.

Bits [24:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>_EL0](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>_EL0](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by [AMEVCNTR1<n>_EL0](#) might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter [AMEVCNTR1<n>_EL0](#) is enabled, writes to this register have UNPREDICTABLE results.

Accessing the AMEVTYPER1<n>_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMEVTYPER1<n>_EL0	11	1101	011	n<2:0>	111:n<3>

- <op2> is in the range 0 - 7.
- <CRm> is in the range 14 - 15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n>_EL0 are CONstrained UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

Note

[AMCGCR_EL0.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

D12.5.12 AMUSERENR_EL0, Activity Monitors User Enable Register

The AMUSERENR_EL0 characteristics are:

Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch64 System register AMUSERENR_EL0[31:0] is architecturally mapped to AArch32 System register [AMUSERENR](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR_EL0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMUSERENR_EL0 is a 32-bit register.

Field descriptions

The AMUSERENR_EL0 bit assignments are:

Bits [31:4]

Reserved, RES0.

Bits [3:1]

Reserved, RAZ/WI.

EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1.

0b0 EL0 accesses to the activity monitors registers are trapped to EL1.

0b1 This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

Note

- AMUSERENR_EL0 can always be read at EL0 and is not governed by this bit.

Accessing the AMUSERENR_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
AMUSERENR_ELO	11	1101	011	011	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.

D12.6 Statistical Profiling Extension registers

This section lists the Statistical Profiling Extension registers in AArch64.

D12.6.1 PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

Purpose

Provides information to software as to whether the buffer can be programmed at the current Exception level.

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMBIDR_EL1 is a 64-bit register.

Field descriptions

The PMBIDR_EL1 bit assignments are:

Bits [63:6]

Reserved, RES0.

F, bit [5]

Flag Updates. Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state.

0b0 Hardware management of the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is always disabled for all translation stages.

0b1 Hardware management for the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is controlled in the same way as explicit memory accesses in the owning translation regime.

If hardware management of the Access Flag is disabled for a stage of translation, an access to Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

P, bit [4]

When ARMv8.4-SecEL2 is implemented:

Programming not allowed. The Profiling Buffer is owned by a higher Exception level or the other Security state.

0b0 Profiling Buffer is owned by the current or a lower Exception level in the current Security state.

0b1 Profiling Buffer is owned by a higher Exception level or the other Security state.

The value read from this field depends on the current Exception level and the values of MDCR_EL3.NSPB and MDCR_EL2.E2PB:

- If MDCR_EL3.NSPB == 0b00 or MDCR_EL3.NSPB == 0b01, this bit reads as one from Non-secure EL2 and Non-secure EL1.

- If MDCR_EL3.NSPB == 0b10 or MDCR_EL3.NSPB == 0b11, this bit reads as one from Secure EL1 and, if Secure EL2 is implemented and enabled, Secure EL2.
- If MDCR_EL2.E2PB == 0b00, this bit reads as one from Non-secure EL1, and if Secure EL2 is implemented and enabled, also from Secure EL1.
- Otherwise, this bit reads as zero.

From ARMv8.1:

Programming not allowed. The Profiling Buffer is owned by a higher Exception level or the other Security state.

0b0 Profiling Buffer is owned by the current or a lower Exception level in the current Security state.

0b1 Profiling Buffer is owned by a higher Exception level or the other Security state.

The value read from this field depends on the current Exception level and the values of MDCR_EL3.NSPB and MDCR_EL2.E2PB:

- If MDCR_EL3.NSPB == 0b00 or MDCR_EL3.NSPB == 0b01, this bit reads as one from EL2 and Non-secure EL1.
- If MDCR_EL3.NSPB == 0b10 or MDCR_EL3.NSPB == 0b11, this bit reads as one from Secure EL1.
- If MDCR_EL2.E2PB == 0b00, this bit reads as one from Non-secure EL1.
- Otherwise, this bit reads as zero.

Otherwise:

Reserved, RES0.

Align, bits [3:0]

Defines the minimum alignment constraint for PMBPTR_EL1. If this field is non-zero, then the PE must pad every record up to a multiple of this size.

- 0b0000 Byte
- 0b0001 Halfword.
- 0b0010 Word.
- 0b0011 Doubleword.
- 0b0100 16 Bytes.
- 0b0101 32 Bytes.
- 0b0110 64 Bytes.
- 0b0111 128 Bytes.
- 0b1000 256 Bytes.
- 0b1001 512 Bytes.
- 0b1010 1KB.
- 0b1011 2KB.

For more information, see [Restrictions on the current write pointer on page D8-2609](#).

Accessing the PMBIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMBIDR_EL1	11	1001	000	111	1010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

D12.6.2 PMBLIMITR_EL1, Profiling Buffer Limit Address Register

The PMBLIMITR_EL1 characteristics are:

Purpose

Defines the upper limit for the profiling buffer, and enables the profiling buffer

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMBLIMITR_EL1 is a 64-bit register.

Field descriptions

The PMBLIMITR_EL1 bit assignments are:

LIMIT, bits [63:12]

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, Log₂(smallest implemented translation granule).

This field resets to an architecturally UNKNOWN value.

Bits [11:3]

Reserved, RES0.

FM, bits [2:1]

Fill mode

0b00 Stop collection and raise maintenance interrupt on buffer fill.

All other values are reserved. If this field is programmed with a reserved value, the PE behaves as if this field has a defined value, other than for a direct read of the register. Software must not rely on the behavior of reserved values, as they might change in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

E, bit [0]

Profiling Buffer enable

0b0 All output is discarded.

0b1 Profiling buffer enabled.

On a Warm reset, this field resets to 0.

Accessing the PMBLIMITR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMBLIMITR_EL1	11	1001	000	000	1010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x800]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If (MDCR_EL2.E2PB == 0b00 || MDCR_EL2.E2PB == 0b10) && (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1), then accesses at EL1 are trapped to EL2.
- If MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0, then accesses at EL1 are trapped to EL3.
- If MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1, then accesses at EL2 are trapped to EL3.
- If MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1, then accesses at EL1 or EL2 are trapped to EL3.

D12.6.3 PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the profiling buffer.

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBPTR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMBPTR_EL1 is a 64-bit register.

Field descriptions

The PMBPTR_EL1 bit assignments are:

PTR, bits [63:0]

Current write address. Defines the virtual address of the next entry to be written to the buffer.

The architecture places restrictions on the values software can write to the pointer. For more information see [Restrictions on the current write pointer on page D8-2609](#).

Note

As a result, an implementation might treat some of bits[M:0], where M is defined by [PMBIDR_EL1](#).Align, as RES0.

On a management interrupt, PMBPTR_EL1 is frozen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMBPTR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMBPTR_EL1	11	1001	000	001	1010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x810]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (MDCR_EL2.E2PB == 0b00 || MDCR_EL2.E2PB == 0b10) && (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1), then accesses at EL1 are trapped to EL2.
- If MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0, then accesses at EL1 are trapped to EL3.
- If MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1, then accesses at EL2 are trapped to EL3.
- If MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1, then accesses at EL1 or EL2 are trapped to EL3.

D12.6.4 PMBSR_EL1, Profiling Buffer Status/syndrome Register

The PMBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software when the buffer is disabled because the management interrupt has been raised.

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBSR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMBSR_EL1 is a 64-bit register.

Field descriptions

The PMBSR_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception class

Top-level description of the cause of the buffer management event

EC == 0b100100

Stage 1 Data Abort on write to Profiling Buffer.

See [MSS encoding for a Data Abort or stage 2 Data Abort on write to buffer on page D12-3378](#).

EC == 0b100101

Stage 2 Data Abort on write to Profiling Buffer.

See [MSS encoding for a Data Abort or stage 2 Data Abort on write to buffer on page D12-3378](#).

EC == 0b000000

Other buffer management event. All buffer management events other than those described by other defined Exception class codes.

See [MSS encoding for other buffer management event on page D12-3378](#).

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

0b0 PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.

0b1 Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.

When the buffer management event was because of an asynchronous external abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]

External abort.

0b0 An external abort has not been asserted.

0b1 An external abort has been asserted and detected by the Statistical Profiling Extension.

This bit is RES0 if the PE never sets this bit as the result of an External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Service

0b0 PMBIRQ is not asserted.

0b1 PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

0b0 No collision events detected.

0b1 At least one collision event was recorded.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome.

Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for a Data Abort or stage 2 Data Abort on write to buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

0b0000xx Address Size fault. Bits [1:0] encode the level.

0b0001xx Translation fault. Bits [1:0] encode the level.

0b0010xx Access Flag fault. Bits [1:0] encode the level.

0b0011xx Permission fault. Bits [1:0] encode the level.

0b010000 Synchronous External abort on write.

0b0101xx Synchronous External abort on translation table walk or hardware update of translation table. Bits [1:0] encode the level.

0b010001 Asynchronous External abort on write.

0b100001 Alignment fault.

0b110000 TLB Conflict fault.

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see [Faults and watchpoints on page D8-2614](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for other buffer management event

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Buffer status code

0b000000 Buffer not filled

0b000001 Buffer filled

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMBSR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMBSR_EL1	11	1001	000	011	1010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x820]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (MDCR_EL2.E2PB == 0b00 || MDCR_EL2.E2PB == 0b10) && (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1), then accesses at EL1 are trapped to EL2.
- If MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0, then accesses at EL1 are trapped to EL3.
- If MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1, then accesses at EL2 are trapped to EL3.
- If MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1, then accesses at EL1 or EL2 are trapped to EL3.

D12.6.5 PMSCR_EL1, Statistical Profiling Control Register (EL1)

The PMSCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Statistical Profiling

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSCR_EL1 is a 64-bit register.

Field descriptions

The PMSCR_EL1 bit assignments are:

Bits [63:7]

Reserved, RES0.

PCT, bit [6]

When IsExceptionLevelImplemented(EL2):

Physical Timestamp.

If timestamp sampling is enabled, determines which counter is collected.

0b0 Virtual counter, CNTVCT_EL0, is collected.

0b1 Physical counter, CNTPCT_EL0, is collected.

If EL2 is implemented and enabled in the current Security state:

- If MDCR_EL2.E2PB != 0b00, this bit is combined with PMSCR_EL2.PCT to determine which counter is collected. For more information, see [Controlling the data that is collected on page D8-2606](#).
- If MDCR_EL2.E2PB == 0b00, this bit is ignored by the PE.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

TS, bit [5]

Timestamp Enable.

0b0 Timestamp sampling disabled.

0b1 Timestamp sampling enabled.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when `MDCR_EL2.E2PB == 0b00`.

This field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address Sample Enable.

0b0 Physical addresses are not collected.

0b1 Physical addresses are collected.

If EL2 is implemented and enabled in the current Security state:

- If `MDCR_EL2.E2PB != 0b00`, this bit is combined with `PMSCR_EL2.PA` to determine which address is collected. For more information, see [Controlling the data that is collected on page D8-2606](#).
- If `MDCR_EL2.E2PB == 0b00`, this bit is ignored by the PE.

This field resets to an architecturally UNKNOWN value.

CX, bit [3]

`CONTEXTIDR_EL1` Sample Enable.

0b0 `CONTEXTIDR_EL1` is not collected.

0b1 `CONTEXTIDR_EL1` is collected.

If EL2 is implemented and enabled in the current Security state:

- If the PE is at EL2, this bit is ignored by the PE.
- If `HCR_EL2.TGE == 1`, this bit is ignored by the PE.

This field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E1SPE, bit [1]

EL1 Statistical Profiling Enable.

0b0 Sampling disabled at EL1.

0b1 Sampling enabled at EL1.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when `HCR_EL2.TGE == 1`.

This field resets to an architecturally UNKNOWN value.

E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when `HCR_EL2.TGE == 0` or if EL2 is disabled or not implemented.

0b0 Sampling disabled at EL0.

0b1 Sampling enabled at EL0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when `HCR_EL2.TGE == 1`.

This field resets to an architecturally UNKNOWN value.

Accessing the PMSCR_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSCR_EL1	11	1001	000	000	1001
PMSCR_EL12	11	1001	101	000	1001

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
PMSCR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
PMSCR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
PMSCR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x828]	RW	RW
PMSCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
PMSCR_EL1	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	PMSCR_EL2	RW
PMSCR_EL1	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x828]	PMSCR_EL2	RW
PMSCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	PMSCR_EL2	RW
PMSCR_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
PMSCR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
PMSCR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x828]	-	-
PMSCR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
PMSCR_EL12	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
PMSCR_EL12	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x828]	RW	RW
PMSCR_EL12	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If `IsUsingAccessor(PMSCR_EL1) && MDCR_EL2.TPMS == 0b1 && (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1)`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(PMSCR_EL12) && MDCR_EL2.TPMS == 0b1 && (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1)`, then read accesses at EL1 are trapped to EL2.
- If `IsUsingAccessor(PMSCR_EL1) && MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0`, then accesses at EL1 are trapped to EL3.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(PMSCR_EL12) && MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1`, then accesses at EL1 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1`, then accesses at EL2 are trapped to EL3.
- If `IsUsingAccessor(PMSCR_EL1) && MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1`, then accesses at EL1 are trapped to EL3.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(PMSCR_EL12) && MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1`, then accesses at EL1 are trapped to EL3.
- If `IsUsingAccessor(PMSCR_EL1) && MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1`, then accesses at EL2 are trapped to EL3.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0) && IsUsingAccessor(PMSCR_EL12) && MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1 && SCR_EL3.EEL2 == 0b1`, then read accesses at EL2 are trapped to EL3.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && HCR_EL2.NV == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAccessor(PMSCR_EL12)`, then accesses at EL1 are trapped to EL2.

D12.6.6 PMSCR_EL2, Statistical Profiling Control Register (EL2)

The PMSCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Statistical Profiling

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSCR_EL2 is a 64-bit register.

Field descriptions

The PMSCR_EL2 bit assignments are:

Bits [63:7]

Reserved, RES0.

PCT, bit [6]

Physical Timestamp.

If timestamp sampling is enabled, determines which counter is collected.

0b0 Virtual counter, [CNTVCT_EL0](#), is collected.

0b1 Physical counter, [CNTPCT_EL0](#), is collected.

If [MDCR_EL2.E2PB](#) != 0b00, this bit is combined with [PMSCR_EL1.PCT](#) to determine which counter is collected. For more information, see [Controlling the data that is collected on page D8-2606](#).

If [MDCR_EL2.E2PB](#) == 0b00 and EL2 is disabled, this bit is ignored.

If EL2 is not implemented in the current Security state, the PE behaves as if this bit is set to 1, other than for a direct read of the register.

This field resets to an architecturally UNKNOWN value.

TS, bit [5]

Timestamp Enable.

0b0 Timestamp sampling disabled.

0b1 Timestamp sampling enabled.

If EL2 is disabled or not implemented in the current Security state, or if the PE is in Non-secure state and `MDCR_EL2.E2PB != 0b00`, this bit is ignored.

This field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address Sample Enable.

0b0 Physical addresses are not collected.

0b1 Physical addresses are collected.

If `MDCR_EL2.E2PB != 0b00`, this bit is combined with `PMSCR_EL1.PA` to determine which address is collected. For more information, see [Controlling the data that is collected on page D8-2606](#).

If EL2 is not implemented, the PE behaves as if this bit is set to 1, other than a direct read of the register.

This field resets to an architecturally UNKNOWN value.

CX, bit [3]

`CONTEXTIDR_EL2` Sample Enable.

0b0 `CONTEXTIDR_EL2` is not collected.

0b1 `CONTEXTIDR_EL2` is collected.

If EL2 is disabled in the current Security state, this bit is ignored by the PE

This field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2SPE, bit [1]

EL2 Statistical Profiling Enable.

0b0 Sampling disabled at EL2.

0b1 Sampling enabled at EL2.

This bit is RES0 if `MDCR_EL2.E2PB != 0b00`.

If EL2 is disabled in the current Security state, this bit is ignored by the PE.

This field resets to an architecturally UNKNOWN value.

E0HSPE, bit [0]

EL0 Statistical Profiling Enable.

0b0 Sampling disabled at EL0.

0b1 Sampling enabled at EL0.

If `MDCR_EL2.E2PB != 0b00`, this bit is RES0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when `HCR_EL2.TGE == 0`.

This field resets to an architecturally UNKNOWN value.

Accessing the PMSCR_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSCR_EL2	11	1001	100	000	1001
PMSCR_EL1	11	1001	000	000	1001

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
PMSCR_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
PMSCR_EL2	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
PMSCR_EL2	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
PMSCR_EL2	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
PMSCR_EL2	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
PMSCR_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	PMSCR_EL1	n/a	PMSCR_EL1
PMSCR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	PMSCR_EL1	PMSCR_EL1	PMSCR_EL1
PMSCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	PMSCR_EL1	PMSCR_EL1
PMSCR_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	PMSCR_EL1	RW	PMSCR_EL1
PMSCR_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	PMSCR_EL1

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1 && HCR_EL2.NV2 == 0, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1 && HCR_EL2.NV2 == 0, then accesses at EL1 are trapped to EL2.
- If MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1, then accesses at EL2 are trapped to EL3.
- If MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1, then accesses at EL2 are trapped to EL3.

D12.6.7 PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSEVFR_EL1 is a 64-bit register.

Field descriptions

The PMSEVFR_EL1 bit assignments are:

E[<z>], bit [z], for z = 48 to 63

E[<z>] is the event filter for event <z>. If event <z> is not implemented, or filtering on event <z> is not supported, the corresponding bit is RES0.

0b0 Event <z> is ignored.

0b1 Do not record samples that have event <z> == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

This field resets to an architecturally UNKNOWN value.

Bits [47:32]

Reserved, RES0.

E[<y>], bit [y], for y = 24 to 31

E[<y>] is the event filter for event <y>. If event <y> is not implemented, or filtering on event <y> is not supported, the corresponding bit is RES0.

0b0 Event <y> is ignored.

0b1 Do not record samples that have event <y> == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

This field resets to an architecturally UNKNOWN value.

Bits [23:19]

Reserved, RES0.

Bits [18:17]

Reserved, RES0.

Bit [16]

Reserved, RES0.

E[<x>], bit [x], for x = 12 to 15

E[<x>] is the event filter for event <x>. If event <x> is not implemented, or filtering on event <x> is not supported, the corresponding bit is RES0.

0b0 Event <x> is ignored.

0b1 Do not record samples that have event <x> == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

E[7], bit [7]

Mispredicted.

0b0 Mispredicted event is ignored.

0b1 Do not record samples that have the Mispredicted event == 0.

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

E[5], bit [5]

TLB walk.

0b0 TLB walk event is ignored.

0b1 Do not record samples that have the TLB walk event == 0.

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

This field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

E[3], bit [3]

Level 1 data or unified cache refill.

0b0 Level 1 data or unified cache refill event is ignored.

0b1 Do not record samples that have the Level 1 data or unified cache refill event == 0.

This bit is ignored by the PE when `PMSFCR_EL1.FE == 0`.

This field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E[1], bit [1]

When the PE supports sampling of speculative instructions:

Architecturally retired.

When the PE supports sampling of speculative instructions:

0b0 Architecturally retired event is ignored.

0b1 Do not record samples that have the Architecturally retired event == 0.

This bit is ignored by the PE when `PMSFCR_EL1.FE == 0`.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, UNKNOWN.

Bit [0]

Reserved, RES0.

Accessing the PMSEVFR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSEVFR_EL1	11	1001	000	101	1001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x830]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `MDCR_EL2.TPMS == 0b1 && (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1)`, then accesses at EL1 are trapped to EL2.
- If `MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0`, then accesses at EL1 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1`, then accesses at EL2 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.6.8 PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

Purpose

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if FE == 1 and FT == 1 only samples including the selected operation types and the selected events will be recorded

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are UNDEFINED.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSFCR_EL1 is a 64-bit register.

Field descriptions

The PMSFCR_EL1 bit assignments are:

Bits [63:19]

Reserved, RES0.

ST, bit [18]

Store filter enable

0b0 Do not record store operations

0b1 Record all store operations, including vector stores and all atomic operations

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

This field resets to an architecturally UNKNOWN value.

LD, bit [17]

Load filter enable

0b0 Do not record load operations

0b1 Record all load operations, including vector loads and atomic operations that return data

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

This field resets to an architecturally UNKNOWN value.

B, bit [16]

Branch filter enable

0b0 Do not record branch and exception return operations

0b1 Record all branch and exception return operations

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

This field resets to an architecturally UNKNOWN value.

Bits [15:3]

Reserved, RES0.

FL, bit [2]

Filter by latency

0b0 Latency filtering disabled

0b1 Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded

If this field is set to 1 and PMSLATFR_EL1.MINLAT is set to zero, it is CONstrained UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is set to 0

This field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

0b0 Type filtering disabled

0b1 Type filtering enabled. Samples not one of the selected operation types will not be recorded

If this field is set to 1 and the PMSFCR_EL1.{ST, LD, B} bits are all set to zero, it is CONstrained UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is set to 0

This field resets to an architecturally UNKNOWN value.

FE, bit [0]

Filter by event

0b0 Event filtering disabled

0b1 Event filtering enabled. Samples not including the events selected by PMSEVFR_EL1 will not be recorded

If this field is set to 1 and PMSEVFR_EL1 is set to zero, it is CONstrained UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE is set to 0

This field resets to an architecturally UNKNOWN value.

Accessing the PMSFCR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSFCR_EL1	11	1001	000	100	1001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `MDCR_EL2.TPMS == 0b1 && (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1)`, then accesses at EL1 are trapped to EL2.
- If `MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0`, then accesses at EL1 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1`, then accesses at EL2 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.6.9 PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

Purpose

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are UNDEFINED.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

The value of PMSICR_EL1 does not change whilst profiling is disabled.

Field descriptions

The PMSICR_EL1 bit assignments are:

ECOUNT, bits [63:56]

When PMSIDR_EL1.ERnd == 0b1:

Secondary sample interval counter.

When PMSIDR_EL1.ERnd is 1, this field provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

When PMSIDR_EL1.ERnd is 0, this field is RES1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

COUNT, bits [31:0]

Primary sample interval counter

Provides the primary counter used for sampling.

The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled

Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population

When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND

- If PMSIRR_EL1.RND == 0 or PMSIDR_EL1.ERnd == 0:
 - A member of the sampling population is selected for sampling
 - The primary counter is reloaded
- If PMSIRR_EL1.RND == 1 and PMSIDR_EL1.ERnd == 1:
 - The secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF
 - The primary counter is reloaded

This field resets to an architecturally UNKNOWN value.

Accessing the PMSICR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSICR_EL1	11	1001	000	010	1001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x838]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `MDCR_EL2.TPMS == 0b1` && (`SCR_EL3.NS == 0b1` || `SCR_EL3.EEL2 == 0b1`), then accesses at EL1 are trapped to EL2.
- If `MDCR_EL3.NSPB != 0b01` && `SCR_EL3.NS == 0b0`, then accesses at EL1 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b01` && `SCR_EL3.NS == 0b0` && `SCR_EL3.EEL2 == 0b1`, then accesses at EL2 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b11` && `SCR_EL3.NS == 0b1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.6.10 PMSIDR_EL1, Sampling Profiling ID Register

The PMSIDR_EL1 characteristics are:

Purpose

Describes the Statistical Profiling implementation to software

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSIDR_EL1 are UNDEFINED.

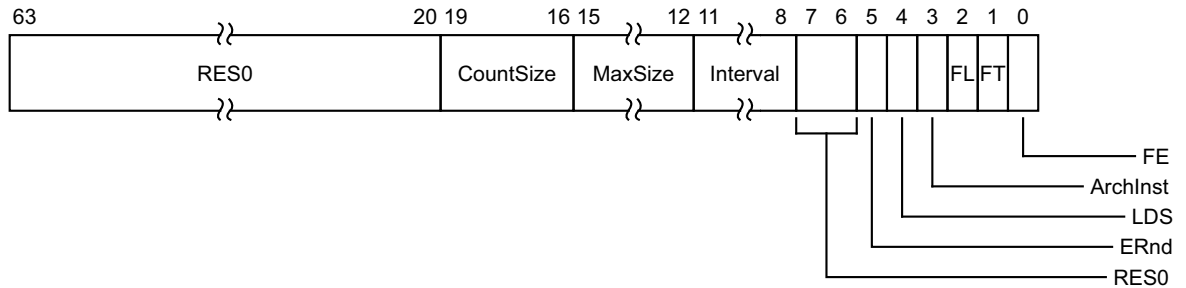

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSIDR_EL1 is a 64-bit register.

Field descriptions

The PMSIDR_EL1 bit assignments are:

Bits [63:20]

Reserved, RES0.

CountSize, bits [19:16]

Defines the size of the counters

0b0010 12-bit saturating counters

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR_EL1.Align), then each record is exactly this size

0b0100	16 bytes
0b0101	32 bytes
0b0110	64 bytes
0b0111	128 bytes
0b1000	256 bytes
0b1001	512 bytes
0b1010	1024 bytes
0b1011	2KB

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

Interval, bits [11:8]

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N.

0b0000	256
0b0010	512
0b0011	768
0b0100	1,024
0b0101	1,536
0b0110	2,048
0b0111	3,072
0b1000	4,096

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR_EL1.RND.

0b0	The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.
0b1	The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.

This field resets to an architecturally UNKNOWN value.

LDS, bit [4]

Data source indicator for sampled load instructions

0b0	Loaded data source not implemented
0b1	Loaded data source implemented

This field resets to an architecturally UNKNOWN value.

ArchInst, bit [3]

Architectural instruction profiling

0b0	Micro-op sampling implemented
0b1	Architecture instruction sampling implemented

This field resets to an architecturally UNKNOWN value.

FL, bit [2]

Filtering by latency. This bit is RAO.

This field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filtering by operation type. This bit is RAO.

This field resets to an architecturally UNKNOWN value.

FE, bit [0]

Filtering by events. This bit is RAO.

This field resets to an architecturally UNKNOWN value.

Accessing the PMSIDR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSIDR_EL1	11	1001	000	111	1001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `MDCR_EL2.TPMS == 0b1 && (SCR_EL3.NS == 0b1 || SCR_EL3.EEL2 == 0b1)`, then accesses at EL1 are trapped to EL2.
- If `MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0`, then accesses at EL1 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b01 && SCR_EL3.NS == 0b0 && SCR_EL3.EEL2 == 0b1`, then accesses at EL2 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b11 && SCR_EL3.NS == 0b1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.6.11 PMSIRR_EL1, Sampling Interval Reload Register

The PMSIRR_EL1 characteristics are:

Purpose

Defines the interval between samples

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSIRR_EL1 are UNDEFINED.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSIRR_EL1 is a 64-bit register.

Field descriptions

The PMSIRR_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

INTERVAL, bits [31:8]

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a non-zero value. If software sets this to zero, an UNKNOWN sampling interval is used. Software should set this to a value greater than the minimum indicated by PMSIDR_EL1.Interval

This field resets to an architecturally UNKNOWN value.

Bits [7:1]

Reserved, RES0.

RND, bit [0]

Controls randomization of the sampling interval

0b0 Disable randomization of sampling interval

0b1 Add (pseudo-)random jitter to sampling interval

The random number generator is not architected.

This field resets to an architecturally UNKNOWN value.

Accessing the PMSIRR_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSIRR_EL1	11	1001	000	011	1001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x840]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `MDCR_EL2.TPMS == 0b1` && (`SCR_EL3.NS == 0b1` || `SCR_EL3.EEL2 == 0b1`), then accesses at EL1 are trapped to EL2.
- If `MDCR_EL3.NSPB != 0b01` && `SCR_EL3.NS == 0b0`, then accesses at EL1 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b01` && `SCR_EL3.NS == 0b0` && `SCR_EL3.EEL2 == 0b1`, then accesses at EL2 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b11` && `SCR_EL3.NS == 0b1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.6.12 PMSLATFR_EL1, Sampling Latency Filter Register

The PMSLATFR_EL1 characteristics are:

Purpose

Controls sample filtering by latency

Configurations

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSLATFR_EL1 are UNDEFINED.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSLATFR_EL1 is a 64-bit register.

Field descriptions

The PMSLATFR_EL1 bit assignments are:

Bits [63:12]

Reserved, RES0.

MINLAT, bits [11:0]

Minimum latency. When PMSFCR_EL1.FL == 1, defines the minimum total latency for filtered operations. Samples with a total latency less than MINLAT will not be recorded

This field is ignored by the PE when PMSFCR_EL1.FL == 0.

This field resets to an architecturally UNKNOWN value.

Accessing the PMSLATFR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
PMSLATFR_EL1	11	1001	000	110	1001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x848]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `MDCR_EL2.TPMS == 0b1` && (`SCR_EL3.NS == 0b1` || `SCR_EL3.EEL2 == 0b1`), then accesses at EL1 are trapped to EL2.
- If `MDCR_EL3.NSPB != 0b01` && `SCR_EL3.NS == 0b0`, then accesses at EL1 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b01` && `SCR_EL3.NS == 0b0` && `SCR_EL3.EEL2 == 0b1`, then accesses at EL2 are trapped to EL3.
- If `MDCR_EL3.NSPB != 0b11` && `SCR_EL3.NS == 0b1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.7 RAS registers

This section lists the [RAS Extension](#) registers in AArch64.

D12.7.1 DISR_EL1, Deferred Interrupt Status Register

The DISR_EL1 characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configurations

AArch64 System register DISR_EL1[31:0] is architecturally mapped to AArch32 System register DISR[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to DISR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DISR_EL1 is a 64-bit register.

Field descriptions

The DISR_EL1 bit assignments are:

When DISR_EL1.IDS == 0:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError interrupt type.

0b0 Deferred error uses architecturally-defined format.

This field resets to an architecturally UNKNOWN value.

Bits [23:13]

Reserved, RES0.

AET, bits [12:10]

Asynchronous Error Type. See the description of ESR_ELx.AET for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External Abort Type. See the description of ESR_ELx.EA for an SError interrupt.
This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Fault Status Code. See the description of ESR_ELx.DFSC for an SError interrupt.
This field resets to an architecturally UNKNOWN value.

When DISR_EL1.IDS == 1:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.
This field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError interrupt type.
0b1 Deferred error uses IMPLEMENTATION DEFINED format.
This field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

IMPLEMENTATION DEFINED.
IMPLEMENTATION DEFINED syndrome. See the description of ESR_ELx[23:0] for an SError interrupt.
This field resets to an architecturally UNKNOWN value.
The following subsections describe each ISS format.

Accessing the DISR_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
DISR_EL1	11	1100	000	001	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
(SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1) && HCR_EL2.AMO == 1	-	VDISR_EL2	RW	RW
(SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0) HCR_EL2.AMO == 0	-	RW	RW	RW

An indirect write to DISR_EL1 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR_EL1 occurring in program order after the ESB instruction.

DISR_EL1 is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, [SCR_EL3.EA == 1](#), and any of the following apply:

- At EL2.
- At EL1 and (([SCR_EL3.NS == 0](#) && [SCR_EL3.EEL2 == 0](#)) || [HCR_EL2.AMO == 0](#)).

D12.7.2 ERRIDR_EL1, Error Record ID Register

The ERRIDR_EL1 characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configurations

AArch64 System register ERRIDR_EL1[31:0] is architecturally mapped to AArch32 System register [ERRIDR](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRIDR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERRIDR_EL1 is a 64-bit register.

Field descriptions

The ERRIDR_EL1 bit assignments are:

Bits [63:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

Accessing the ERRIDR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERRIDR_EL1	11	0101	000	000	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1, then read accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1, then read accesses at EL1 or EL2 are trapped to EL3.

D12.7.3 ERRSELR_EL1, Error Record Select Register

The ERRSELR_EL1 characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configurations

AArch64 System register ERRSELR_EL1[31:0] is architecturally mapped to AArch32 System register [ERRSELR](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRSELR_EL1 are UNDEFINED.

If [ERRIDR_EL1](#) indicates that zero records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR_EL1 is UNDEFINED or RES0.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERRSELR_EL1 is a 64-bit register.

Field descriptions

The ERRSELR_EL1 bit assignments are:

Bits [63:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the record accessed through the ERX registers.

For example, if ERRSELR_EL1.SEL is set to 0x4, then direct reads and writes of ERXSTATUS_EL1 access ERR4STATUS.

This field resets to an architecturally UNKNOWN value.

Accessing the ERRSELR_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERRSELR_EL1	11	0101	000	001	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.4 ERXADDR_EL1, Selected Error Record Address Register

The ERXADDR_EL1 characteristics are:

Purpose

Accesses ERR<n>ADDR for the error record selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch64 System register ERXADDR_EL1[31:0] is architecturally mapped to AArch32 System register [ERXADDR2](#)[31:0].

AArch64 System register ERXADDR_EL1[63:32] is architecturally mapped to AArch32 System register [ERXADDR2](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXADDR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXADDR_EL1 is a 64-bit register.

Field descriptions

The ERXADDR_EL1 bit assignments are:

Bits [63:0]

ERXADDR_EL1 accesses ERR<n>ADDR, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXADDR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXADDR_EL1	11	0101	000	011	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If [ERRIDR_EL1.NUM](#) == 0 or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- [ERXADDR_EL1](#) is RAZ/WI.
- Direct reads and writes of [ERXADDR_EL1](#) are NOPs.
- Direct reads and writes of [ERXADDR_EL1](#) are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.5 ERXCTLR_EL1, Selected Error Record Control Register

The ERXCTLR_EL1 characteristics are:

Purpose

Accesses ERR<n>CTLR for the error record selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch64 System register ERXCTLR_EL1[31:0] is architecturally mapped to AArch32 System register [ERXCTLR2](#)[31:0].

AArch64 System register ERXCTLR_EL1[63:32] is architecturally mapped to AArch32 System register [ERXCTLR2](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXCTLR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXCTLR_EL1 is a 64-bit register.

Field descriptions

The ERXCTLR_EL1 bit assignments are:

Bits [63:0]

ERXCTLR_EL1 accesses ERR<n>CTLR, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXCTLR_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXCTLR_EL1	11	0101	000	001	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If [ERRIDR_EL1.NUM == 0](#) or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- ERXCTLR_EL1 is RAZ/WI.
- Direct reads and writes of ERXCTLR_EL1 are NOPs.
- Direct reads and writes of ERXCTLR_EL1 are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.6 ERXFR_EL1, Selected Error Record Feature Register

The ERXFR_EL1 characteristics are:

Purpose

Accesses ERR<n>FR for the error record selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch64 System register ERXFR_EL1[31:0] is architecturally mapped to AArch32 System register [ERXFR](#)[31:0].

AArch64 System register ERXFR_EL1[63:32] is architecturally mapped to AArch32 System register [ERXFR2](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXFR_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXFR_EL1 is a 64-bit register.

Field descriptions

The ERXFR_EL1 bit assignments are:

Bits [63:0]

ERXFR_EL1 accesses ERR<n>FR, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXFR_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXFR_EL1	11	0101	000	000	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

If [ERRIDR_EL1.NUM == 0](#) or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- ERXFR_EL1 is RAZ/WI.
- Direct reads of ERXFR_EL1 are NOPs.
- Direct reads of ERXFR_EL1 are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1, then read accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1, then read accesses at EL1 or EL2 are trapped to EL3.

D12.7.7 ERXMISC0_EL1, Selected Error Record Miscellaneous Register 0

The ERXMISC0_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC0 for the error record selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch64 System register ERXMISC0_EL1[31:0] is architecturally mapped to AArch32 System register [ERXMISC2](#)[31:0].

AArch64 System register ERXMISC0_EL1[63:32] is architecturally mapped to AArch32 System register [ERXMISC3](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXMISC0_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC0_EL1 is a 64-bit register.

Field descriptions

The ERXMISC0_EL1 bit assignments are:

Bits [63:0]

ERXMISC0_EL1 accesses ERR<n>MISC0, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXMISC0_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXMISC0_EL1	11	0101	000	000	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If [ERRIDR_EL1.NUM == 0](#) or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- [ERXMISC0_EL1](#) is RAZ/WI.
- Direct reads and writes of [ERXMISC0_EL1](#) are NOPs.
- Direct reads and writes of [ERXMISC0_EL1](#) are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.8 ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1

The ERXMISC1_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC1 for the error record selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch64 System register ERXMISC1_EL1[31:0] is architecturally mapped to AArch32 System register [ERXMISC2](#)[31:0].

AArch64 System register ERXMISC1_EL1[63:32] is architecturally mapped to AArch32 System register [ERXMISC3](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXMISC1_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC1_EL1 is a 64-bit register.

Field descriptions

The ERXMISC1_EL1 bit assignments are:

Bits [63:0]

ERXMISC1_EL1 accesses ERR<n>MISC1, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXMISC1_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXMISC1_EL1	11	0101	000	001	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If [ERRIDR_EL1.NUM](#) == 0 or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- [ERXMISC1_EL1](#) is RAZ/WI.
- Direct reads and writes of [ERXMISC1_EL1](#) are NOPs.
- Direct reads and writes of [ERXMISC1_EL1](#) are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.9 ERXMISC2_EL1, Selected Error Record Miscellaneous Register 2

The ERXMISC2_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC2 for the error record selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch64 System register ERXMISC2_EL1[31:0] is architecturally mapped to AArch32 System register [ERXMISC4](#)[31:0].

AArch64 System register ERXMISC2_EL1[63:32] is architecturally mapped to AArch32 System register [ERXMISC5](#)[31:0].

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXMISC2_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC2_EL1 is a 64-bit register.

Field descriptions

The ERXMISC2_EL1 bit assignments are:

Bits [63:0]

ERXMISC2_EL1 accesses ERR<n>MISC2, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXMISC2_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXMISC2_EL1	11	0101	000	010	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If [ERRIDR_EL1.NUM == 0](#) or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- ERXMISC2_EL1 is RAZ/WI.
- Direct reads and writes of ERXMISC2_EL1 are NOPs.
- Direct reads and writes of ERXMISC2_EL1 are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.10 ERXMISC3_EL1, Selected Error Record Miscellaneous Register 3

The ERXMISC3_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC3 for the error record selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch64 System register ERXMISC3_EL1[31:0] is architecturally mapped to AArch32 System register [ERXMISC6](#)[31:0].

AArch64 System register ERXMISC3_EL1[63:32] is architecturally mapped to AArch32 System register [ERXMISC7](#)[31:0].

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXMISC3_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC3_EL1 is a 64-bit register.

Field descriptions

The ERXMISC3_EL1 bit assignments are:

Bits [63:0]

ERXMISC3_EL1 accesses ERR<n>MISC3, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXMISC3_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXMISC3_EL1	11	0101	000	011	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If [ERRIDR_EL1.NUM == 0](#) or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- ERXMISC3_EL1 is RAZ/WI.
- Direct reads and writes of ERXMISC3_EL1 are NOPs.
- Direct reads and writes of ERXMISC3_EL1 are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.11 ERXPFPGCDN_EL1, Selected Pseudo-fault Generation Countdown Register

The ERXPFPGCDN_EL1 characteristics are:

Purpose

Accesses the ERR<n>PFGCDN register for the error record selected by [ERRSELR_EL1.SEL](#). For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXPFPGCDN_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXPFPGCDN_EL1 is a 64-bit register.

Field descriptions

The ERXPFPGCDN_EL1 bit assignments are:

Bits [63:0]

ERXPFPGCDN_EL1 accesses ERR<n>PFGCDN, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXPFPGCDN_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXPFPGCDN_EL1	11	0101	000	110	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If [ERRIDR_EL1.NUM](#) == 0 or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- ERXPFPCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFPCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFPCDN_EL1 are UNDEFINED.

If [ERRSELR_EL1.SEL](#) selects an error record that does not implement the standard fault injection mechanism, then one of the following occurs:

- ERXPFPCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFPCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFPCDN_EL1 are UNDEFINED.

———— Note —————

An error record does not implement the standard fault injection mechanism when `ERR<n>FR.INJ == 0b00`.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.FIEN == 0, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.FIEN == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.12 ERXPFPGCTL_EL1, Selected Pseudo-fault Generation Control Register

The ERXPFPGCTL_EL1 characteristics are:

Purpose

Accesses the ERR<n>PFGCTL register for the error record selected by [ERRSELR_EL1.SEL](#). For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXPFPGCTL_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXPFPGCTL_EL1 is a 64-bit register.

Field descriptions

The ERXPFPGCTL_EL1 bit assignments are:

Bits [63:0]

ERXPFPGCTL_EL1 accesses ERR<n>PFGCTL, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXPFPGCTL_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXPFPGCTL_EL1	11	0101	000	101	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If [ERRIDR_EL1.NUM](#) == 0 or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- [ERXPGCTL_EL1](#) is RAZ/WI.
- Direct reads and writes of [ERXPGCTL_EL1](#) are NOPs.
- Direct reads and writes of [ERXPGCTL_EL1](#) are UNDEFINED.

If [ERRSELR_EL1.SEL](#) selects an error record that does not implement the standard fault injection mechanism, then one of the following occurs:

- [ERXPGCTL_EL1](#) is RAZ/WI.
- Direct reads and writes of [ERXPGCTL_EL1](#) are NOPs.
- Direct reads and writes of [ERXPGCTL_EL1](#) are UNDEFINED.

———— Note —————

An error record does not implement the standard fault injection mechanism when [ERR<n>FR.INJ](#) == 0b00.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191*. Subject to the prioritization rules:

- If HaveEL(EL2) && ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && IsUsingAArch64(EL2) && [HCR_EL2.FIEN](#) == 0, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && [SCR_EL3.FIEN](#) == 0, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.13 ERXPFGF_EL1, Selected Pseudo-fault Generation Feature Register

The ERXPFGF_EL1 characteristics are:

Purpose

Accesses the ERR<n>PFGF register for the error record selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXPFGF_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXPFGF_EL1 is a 64-bit register.

Field descriptions

The ERXPFGF_EL1 bit assignments are:

Bits [63:0]

ERXPFGF_EL1 accesses ERR<n>PFGF, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXPFGF_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXPFGF_EL1	11	0101	000	100	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

If `ERRIDR_EL1.NUM == 0` or `ERRSELR_EL1.SEL` is set to a value greater than or equal to `ERRIDR_EL1.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXPFGF_EL1` is RAZ/WI.
- Direct reads and writes of `ERXPFGF_EL1` are NOPs.
- Direct reads and writes of `ERXPFGF_EL1` are UNDEFINED.

If `ERRSELR_EL1.SEL` selects an error record that does not implement the standard fault injection mechanism, then one of the following occurs:

- `ERXPFGF_EL1` is RAZ/WI.
- Direct reads and writes of `ERXPFGF_EL1` are NOPs.
- Direct reads and writes of `ERXPFGF_EL1` are UNDEFINED.

———— **Note** —————

An error record does not implement the standard fault injection mechanism when `ERR<n>FR.INJ == 0b00`.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.FIEN == 0`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.FIEN == 0`, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.14 ERXSTATUS_EL1, Selected Error Record Primary Status Register

The ERXSTATUS_EL1 characteristics are:

Purpose

Accesses ERR<n>STATUS for the error record selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch64 System register ERXSTATUS_EL1[31:0] is architecturally mapped to AArch32 System register [ERXSTATUS](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXSTATUS_EL1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXSTATUS_EL1 is a 64-bit register.

Field descriptions

The ERXSTATUS_EL1 bit assignments are:

Bits [63:0]

ERXSTATUS_EL1 accesses ERR<n>STATUS, where n is the value in [ERRSELR_EL1.SEL](#).

Accessing the ERXSTATUS_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
ERXSTATUS_EL1	11	0101	000	010	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If [ERRIDR_EL1.NUM](#) == 0 or [ERRSELR_EL1.SEL](#) is set to a value greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN record is selected.
- [ERXSTATUS_EL1](#) is RAZ/WI.
- Direct reads and writes of [ERXSTATUS_EL1](#) are NOPs.
- Direct reads and writes of [ERXSTATUS_EL1](#) are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.

D12.7.15 VDISR_EL2, Virtual Deferred Interrupt Status Register

The VDISR_EL2 characteristics are:

Purpose

Records that a virtual SError interrupt has been consumed by an ESB instruction executed at EL1. An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of [DISR_EL1](#) or [DISR](#) occurring in program order after the ESB instruction.

Configurations

AArch64 System register VDISR_EL2[31:0] is architecturally mapped to AArch32 System register [VDISR](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to VDISR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VDISR_EL2 is a 64-bit register.

Field descriptions

The VDISR_EL2 bit assignments are:

When Using AArch64(EL1):

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

The value copied from [VSESR_EL2.IDS](#).

This field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

The value copied from [VSESR_EL2.ISS](#).

This field resets to an architecturally UNKNOWN value.

The following subsections describe each ISS format.

When IsUsingAArch32(EL1) and VDISR_EL2.LPAE == 0:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.
This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VSESr_EL2.AET](#).
This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VSESr_EL2.ExT](#).
This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bit [10]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt. The possible values of this field are:
0b10110 Asynchronous SError interrupt.
All other values are reserved. Reserved values might be defined in a future version of the architecture.
This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.
Set to [TTBCr.EAE](#) when an ESB instruction defers a virtual SError interrupt.
0b0 Using the Short-descriptor translation table format.
This field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

FS, bits [3:0]

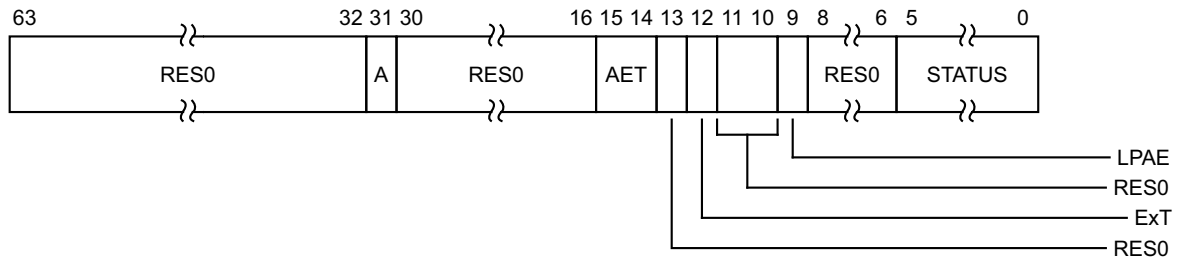

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt. The possible values of this field are:

0b10110 Asynchronous SError interrupt.

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

When IsUsingAArch32(EL1) and VDISR_EL2.LPAE == 1:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VSESR_EL2.AET.

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VSESR_EL2.ExT.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

0b1 Using the Long-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt. The possible values of this field are:

0b010001 Asynchronous SError interrupt.

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

Accessing the VDISR_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VDISR_EL2	11	1100	100	001	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1) && HCR_EL2.TGE == 0	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1) && HCR_EL2.TGE == 0	-	[VNCR_EL2.BADDR << 12 + 0x500]	RW	RW
(SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1) && HCR_EL2.TGE == 1	-	n/a	RW	RW

If [HCR_EL2](#).{NV2, NV} == {1, 1} for a Security state, reads or writes of VDISR_EL2 from EL1 in the same Security state are treated as loads or stores respectively with offset [VNCR_EL2.BADDR](#) <<12 + 0x500.

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of [DISR_EL1](#) or [DISR](#) occurring in program order after the ESB instruction.

D12.7.16 VESR_EL2, Virtual Deferred Interrupt Status Register

The VESR_EL2 characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt is taken to EL1 using AArch64, then the syndrome value is reported in [ESR_EL1](#).

When the virtual SError interrupt is taken to EL1 using AArch32, then the syndrome value is reported in [DFSR](#).{AET, ExT} and the remainder of [DFSR](#) is set as defined by VMSAv8-32. For more information, see [Chapter G5 The AArch32 Virtual Memory System Architecture](#).

When the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to [VDISR_EL2](#).

Configurations

AArch64 System register VESR_EL2[31:0] is architecturally mapped to AArch32 System register [VDFSR](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to VESR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VESR_EL2 is a 64-bit register.

Field descriptions

The VESR_EL2 bit assignments are:

When Using AArch32(EL1):

Bits [63:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[15:4] is set to VESR_EL2.AET.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2](#)[15:4] is set to VESR_EL2.AET.

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR\[12\]](#) is set to VESER_EL2.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2\[12\]](#) is set to VESER_EL2.ExT.

This field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

When IsUsingAArch64(EL1):

Bits [63:25]

Reserved, RES0.

IDS, bit [24]

When a virtual SError interrupt is taken to EL1 using AArch64, [ESR_EL1\[24\]](#) is set to VESER_EL2.IDS.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2\[24\]](#) is set to VESER_EL2.IDS.

This field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

When a virtual SError interrupt is taken to EL1 using AArch64, [ESR_EL1\[23:0\]](#) is set to VESER_EL2.ISS.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2\[23:0\]](#) is set to VESER_EL2.ISS.

This field resets to an architecturally UNKNOWN value.

The following subsections describe each ISS format.

Accessing the VESER_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
VESER_EL2	11	0101	100	011	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1) && HCR_EL2.TGE == 0	-	RW	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1) && HCR_EL2.TGE == 0	-	[VNCR_EL2.BADDR << 12 + 0x508]	RW	RW
(SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1) && HCR_EL2.TGE == 1	-	n/a	RW	RW

If [HCR_EL2](#).{NV2, NV} == {1, 1} for a Security state, reads or writes of VSESR_EL2 from EL1 in the same Security state are treated as loads or stores respectively with offset [VNCR_EL2](#).BADDR <<12 + 0x508.

D12.8 Generic Timer registers

This section lists the Generic Timer registers in AArch64.

D12.8.1 CNTFRQ_EL0, Counter-timer Frequency register

The CNTFRQ_EL0 characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configurations

AArch64 System register CNTFRQ_EL0[31:0] is architecturally mapped to AArch32 System register CNTFRQ[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTFRQ_EL0 is a 64-bit register.

Field descriptions

The CNTFRQ_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTFRQ_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTFRQ_EL0	11	1110	011	000	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If HCR_EL2.E2H == 0 && CNTKCTL_EL1.EL0PCTEN == 0 && CNTKCTL_EL1.EL0VCTEN == 0, then read accesses at EL0 are trapped to EL1.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0PCTEN == 0 && CNTKCTL_EL1.EL0VCTEN == 0, then read accesses at EL0 are trapped to EL1.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PCTEN == 0 && CNTHCTL_EL2.EL0VCTEN == 0, then read accesses at EL0 are trapped to EL2.

D12.8.2 CNTHCTL_EL2, Counter-timer Hypervisor Control register

The CNTHCTL_EL2 characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

Configurations

AArch64 System register CNTHCTL_EL2[31:0] is architecturally mapped to AArch32 System register CNTHCTL[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHCTL_EL2 is a 64-bit register.

Field descriptions

The CNTHCTL_EL2 bit assignments are:

When HCR_EL2.E2H == 0:

This format applies in all ARMv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.

Bits [63:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register CNTPCT_ELO is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTPCT_ELO trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0b0 A 0 to 1 transition of the trigger bit triggers an event.

0b1 A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT_EL0](#):

- 0b0 Disables the event stream.
- 0b1 Enables the event stream.

This field resets to 0.

EL1PCEN, bit [1]

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when it is enabled for the current Security state.

- 0b0 From AArch64 state: EL0 and EL1 accesses to the [CNTP_CTL_EL0](#), [CNTP_CVAL_EL0](#), and [CNTP_TVAL_EL0](#) are trapped to EL2 when it is enabled for the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PTEN](#).
From AArch32 state: EL0 and EL1 accesses to the [CNTP_CTL](#), [CNTP_CVAL](#), and [CNTP_TVAL](#) are trapped to EL2 when it is enabled for the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PTEN](#) or [CNTKCTL.PL0PTEN](#).
- 0b1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [0]

Traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when it is enabled for the current Security state.

- 0b0 From AArch64 state: EL0 and EL1 accesses to the [CNTPCT_EL0](#) are trapped to EL2 when it is enabled for the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PCTEN](#).
From AArch32 state: EL0 and EL1 accesses to the [CNTPCT](#) are trapped to EL2 when it is enabled for the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PCTEN](#) or [CNTKCTL.PL0PCTEN](#).
- 0b1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally UNKNOWN value.

When *HCR_EL2.E2H* == 1:

Bits [63:12]

Reserved, RES0.

EL1PTEN, bit [11]

From ARMv8.1:

When [HCR_EL2.TGE](#) is 0, traps EL0 and EL1 accesses to the E1 physical timer registers to EL2 when it is enabled for the current Security state.

0b0 From AArch64 state: EL0 and EL1 accesses to the [CNTP_CTL_EL0](#), [CNTP_CVAL_EL0](#), and [CNTP_TVAL_EL0](#) are trapped to EL2 when it is enabled for the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PTEN](#).

From AArch32 state: EL0 and EL1 accesses to the [CNTP_CTL](#), [CNTP_CVAL](#), and [CNTP_TVAL](#) are trapped to EL2 when it is enabled for the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PTEN](#) or [CNTKCTL.PL0PTEN](#).

0b1 This control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PCTEN, bit [10]

From ARMv8.1:

When [HCR_EL2.TGE](#) is 0, traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when it is enabled for the current Security state.

0b0 From AArch64 state: EL0 and EL1 accesses to the [CNTPCT_EL0](#) are trapped to EL2 when it is enabled for the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PCTEN](#).

From AArch32 state: EL0 and EL1 accesses to the [CNTPCT](#) are trapped to EL2 when it is enabled for the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PCTEN](#) or [CNTKCTL.PL0PCTEN](#).

0b1 This control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL0PTEN, bit [9]

From ARMv8.1:

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, traps EL0 accesses to the physical timer registers to EL2.

0b0 EL0 using AArch64: EL0 accesses to the [CNTP_CTL_EL0](#), [CNTP_CVAL_EL0](#), and [CNTP_TVAL_EL0](#) registers are trapped to EL2.

EL0 using AArch32: EL0 accesses to the [CNTP_CTL](#), [CNTP_CVAL](#) and [CNTP_TVAL](#) registers are trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL0VTEN, bit [8]

From ARMv8.1:

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, traps EL0 accesses to the virtual timer registers to EL2.

0b0 EL0 using AArch64: EL0 accesses to the `CNTV_CTL_EL0`, `CNTV_CVAL_EL0`, and `CNTV_TVAL_EL0` registers are trapped to EL2.

EL0 using AArch32: EL0 accesses to the `CNTV_CTL`, `CNTV_CVAL`, and `CNTV_TVAL` registers are trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVNTI, bits [7:4]

From ARMv8.1:

Selects which bit (0 to 15) of the counter register `CNTPCT_EL0` is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVNTDIR, bit [3]

From ARMv8.1:

Controls which transition of the counter register `CNTPCT_EL0` trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0b0 A 0 to 1 transition of the trigger bit triggers an event.

0b1 A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVNTEN, bit [2]

From ARMv8.1:

Enables the generation of an event stream from the counter register `CNTPCT_EL0`:

0b0 Disables the event stream.

0b1 Enables the event stream.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL0VCTEN, bit [1]

From ARMv8.1:

When `HCR_EL2.TGE` is 0, this control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

0b0 EL0 using AArch64: EL0 accesses to the `CNTVCT_EL0` are trapped to EL2.

EL0 using AArch64: EL0 accesses to the `CNTFRQ_EL0` register are trapped to EL2, if `CNTHCTL_EL2.EL0PCTEN` is also 0.

EL0 using AArch32: EL0 accesses to the `CNTVCT` are trapped to EL2.

EL0 using AArch32: EL0 accesses to the `CNTFRQ` register are trapped to EL2, if `CNTHCTL.EL0PCTEN` is also 0.

0b1 This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL0PCTEN, bit [0]

From ARMv8.1:

When `HCR_EL2.TGE` is 0, this control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

- 0b0 EL0 using AArch64: EL0 accesses to the `CNTPCT_EL0` are trapped to EL2.
EL0 using AArch64: EL0 accesses to the `CNTPFRQ_EL0` register are trapped to EL2, if `CNTHCTL_EL2.EL0VCTEN` is also 0.
EL0 using AArch32: EL0 accesses to the `CNTPCT` are trapped to EL2.
EL0 using AArch32: EL0 accesses to the `CNTPFRQ` and register are trapped to EL2, if `CNTHCTL_EL2.EL0VCTEN` is also 0.
- 0b1 This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the CNTHCTL_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHCTL_EL2	11	1110	100	000	0001
CNTPCTL_EL1	11	1110	000	000	0001

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTHCTL_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
CNTHCTL_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTHCTL_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTKCTL_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	CNTKCTL_EL1	n/a	CNTKCTL_EL1
CNTKCTL_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	CNTKCTL_EL1	CNTKCTL_EL1	CNTKCTL_EL1
CNTKCTL_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	CNTKCTL_EL1	CNTKCTL_EL1
CNTKCTL_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	CNTKCTL_EL1	RW	CNTKCTL_EL1
CNTKCTL_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	CNTKCTL_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHCTL_EL2](#) or [CNTKCTL_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.

D12.8.3 CNTHP_CTL_EL2, Counter-timer Hypervisor Physical Timer Control register

The CNTHP_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 physical timer.

Configurations

AArch64 System register CNTHP_CTL_EL2[31:0] is architecturally mapped to AArch32 System register [CNTHP_CTL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHP_CTL_EL2 is a 64-bit register.

Field descriptions

The CNTHP_CTL_EL2 bit assignments are:

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

0b0 Timer condition is not met.

0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D10-2653](#) and [Operation of the TimerValue views of the timers on page D10-2653](#).

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

0b0 Timer interrupt is not masked by the IMASK bit.

0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP_TVAL_EL2](#) continues to count down.

———— Note ————

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHP_CTL_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHP_CTL_EL2	11	1110	100	001	0010
CNTP_CTL_EL0	11	1110	011	001	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTHP_CTL_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
CNTHP_CTL_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTHP_CTL_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CNTP_CTL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	CNTP_CTL_EL0
CNTP_CTL_EL0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	CNTP_CTL_EL0	CNTP_CTL_EL0	n/a	CNTP_CTL_EL0

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTP_CTL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTP_CTL_EL0	CNTP_CTL_EL0	CNTP_CTL_EL0	CNTP_CTL_EL0
CNTP_CTL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTP_CTL_EL0	n/a	CNTP_CTL_EL0	CNTP_CTL_EL0
CNTP_CTL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTP_CTL_EL0	CNTP_CTL_EL0	RW	CNTP_CTL_EL0

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHP_CTL_EL2](#) or [CNTP_CTL_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [CNTP_CTL_EL0](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 1 \ \&\& \ \text{CNTHCTL_EL2.EL0PTEN} == 0$, then accesses at EL0 are trapped to EL2.

D12.8.4 CNTHP_CVAL_EL2, Counter-timer Physical Timer CompareValue register (EL2)

The CNTHP_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 physical timer.

Configurations

AArch64 System register CNTHP_CVAL_EL2[63:0] is architecturally mapped to AArch32 System register [CNTHP_CVAL](#)[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHP_CVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHP_CVAL_EL2 bit assignments are:

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHP_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHP_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHP_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHP_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHP_CVAL_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHP_CVAL_EL2	11	1110	100	010	0010
CNTP_CVAL_EL0	11	1110	011	010	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTHP_CVAL_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
CNTHP_CVAL_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTHP_CVAL_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CNTP_CVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	CNTP_CVAL_EL0
CNTP_CVAL_EL0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	CNTP_CVAL_EL0	CNTP_CVAL_EL0	n/a	CNTP_CVAL_EL0
CNTP_CVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTP_CVAL_EL0	CNTP_CVAL_EL0	CNTP_CVAL_EL0	CNTP_CVAL_EL0
CNTP_CVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTP_CVAL_EL0	n/a	CNTP_CVAL_EL0	CNTP_CVAL_EL0
CNTP_CVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTP_CVAL_EL0	CNTP_CVAL_EL0	RW	CNTP_CVAL_EL0

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHP_CVAL_EL2](#) or [CNTP_CVAL_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [CNTP_CVAL_EL0](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 1 \ \&\& \ \text{CNTHCTL_EL2.EL0PTEN} == 0$, then accesses at EL0 are trapped to EL2.

D12.8.5 CNTHP_TVAL_EL2, Counter-timer Physical Timer TimerValue register (EL2)

The CNTHP_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 physical timer.

Configurations

AArch64 System register CNTHP_TVAL_EL2[31:0] is architecturally mapped to AArch32 System register [CNTHP_TVAL](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHP_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHP_TVAL_EL2 bit assignments are:

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHP_CVAL_EL2](#) - [CNTPCT_EL0](#)).

On a write of this register, [CNTHP_CVAL_EL2](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - [CNTHP_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHP_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHP_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHP_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHP_TVAL_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHP_TVAL_EL2	11	1110	100	000	0010
CNTP_TVAL_EL0	11	1110	011	000	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTHP_TVAL_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
CNTHP_TVAL_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTHP_TVAL_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CNTP_TVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	CNTP_TVAL _EL0
CNTP_TVAL_EL0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	CNTP_TVAL _EL0	CNTP_TVAL _EL0	n/a	CNTP_TVAL _EL0
CNTP_TVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTP_TVAL _EL0	CNTP_TVAL _EL0	CNTP_TVAL _EL0	CNTP_TVAL _EL0
CNTP_TVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTP_TVAL _EL0	n/a	CNTP_TVAL _EL0	CNTP_TVAL _EL0
CNTP_TVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTP_TVAL _EL0	CNTP_TVAL _EL0	RW	CNTP_TVAL _EL0

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHP_TVAL_EL2](#) or [CNTP_TVAL_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 1 \ \&\& \ \text{CNTHCTL_EL2.EL0PTEN} == 0$, then accesses at EL0 are trapped to EL2.

D12.8.6 CNTHPS_CTL_EL2, Counter-timer Secure Physical Timer Control register (EL2)

The CNTHPS_CTL_EL2 characteristics are:

Purpose

Control register for the Secure EL2 physical timer.

Configurations

AArch64 System register CNTHPS_CTL_EL2[31:0] is architecturally mapped to AArch32 System register [CNTHPS_CTL\[31:0\]](#).

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHPS_CTL_EL2 is a 64-bit register.

Field descriptions

The CNTHPS_CTL_EL2 bit assignments are:

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D10-2653](#) and [Operation of the TimerValue views of the timers on page D10-2653](#).

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHPS_TVAL_EL2](#) continues to count down.

———— Note ————

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHPS_CTL_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHPS_CTL_EL2	11	1110	100	001	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	RW	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	RW	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	-	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PTEN == 0, then accesses at EL0 are trapped to EL2.

D12.8.7 CNTHPS_CVAL_EL2, Counter-timer Secure Physical Timer CompareValue register (EL2)

The CNTHPS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 physical timer.

Configurations

AArch64 System register CNTHPS_CVAL_EL2[31:0] is architecturally mapped to AArch32 System register CNTHPS_CVAL[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHPS_CVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHPS_CVAL_EL2 bit assignments are:

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHPS_CVAL_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHPS_CVAL_EL2	11	1110	100	010	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	RW	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	RW	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	-	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PTEN == 0, then accesses at EL0 are trapped to EL2.

D12.8.8 CNTHPS_TVAL_EL2, Counter-timer Secure Physical Timer TimerValue register (EL2)

The CNTHPS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 physical timer.

Configurations

AArch64 System register CNTHPS_TVAL_EL2[31:0] is architecturally mapped to AArch32 System register [CNTHPS_TVAL](#)[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHPS_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHPS_TVAL_EL2 bit assignments are:

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHPS_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHPS_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHPS_CVAL_EL2](#) - [CNTPCT_EL0](#)).

On a write of this register, [CNTHPS_CVAL_EL2](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHPS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - [CNTHPS_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHPS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHPS_TVAL_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHPS_TVAL_EL2	11	1110	100	000	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	RW	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	RW	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	-	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PTEN == 0, then accesses at EL0 are trapped to EL2.

D12.8.9 CNTHV_CTL_EL2, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 virtual timer.

Configurations

AArch64 System register CNTHV_CTL_EL2[31:0] is architecturally mapped to AArch32 System register [CNTHV_CTL](#)[31:0].

This register is present only from ARMv8.1. Otherwise, direct accesses to CNTHV_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

CNTHV_CTL_EL2 is a 64-bit register.

Field descriptions

The CNTHV_CTL_EL2 bit assignments are:

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

From ARMv8.1:

The status of the timer. This bit indicates whether the timer condition is met:

0b0 Timer condition is not met.

0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers](#) on page D10-2653 and [Operation of the TimerValue views of the timers](#) on page D10-2653.

This bit is read-only.

Otherwise:

Reserved, RES0.

IMASK, bit [1]

From ARMv8.1:

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLE, bit [0]

From ARMv8.1:

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV_TVAL_EL2](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the CNTHV_CTL_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
CNTHV_CTL_EL2	1110	11	100	001	0011
CNTV_CTL_EL0	1110	11	011	001	0011

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTHV_CTL_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
CNTHV_CTL_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTHV_CTL_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CNTV_CTL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	CNTV_CTL_EL0
CNTV_CTL_EL0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	CNTV_CTL_EL0	CNTV_CTL_EL0	n/a	CNTV_CTL_EL0
CNTV_CTL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CTL_EL0	CNTV_CTL_EL0	CNTV_CTL_EL0	CNTV_CTL_EL0
CNTV_CTL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CTL_EL0	n/a	CNTV_CTL_EL0	CNTV_CTL_EL0
CNTV_CTL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CTL_EL0	CNTV_CTL_EL0	RW	CNTV_CTL_EL0

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHV_CTL_EL2](#) or [CNTV_CTL_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [CNTV_CTL_EL0](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 1 \ \&\& \ \text{CNTVCTL_EL2.EL0VTEN} == 0$, then accesses at EL0 are trapped to EL2.

D12.8.10 CNTHV_CVAL_EL2, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 virtual timer.

Configurations

AArch64 System register CNTHV_CVAL_EL2[63:0] is architecturally mapped to AArch32 System register [CNTHV_CVAL](#)[63:0].

This register is present only from ARMv8.1. Otherwise, direct accesses to CNTHV_CVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

CNTHV_CVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHV_CVAL_EL2 bit assignments are:

CompareValue, bits [63:0]

From ARMv8.1:

Holds the EL2 virtual timer CompareValue.

When [CNTHV_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHV_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHV_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHV_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT_EL0](#) continues to count.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the CNTHV_CVAL_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
CNTHV_CVAL_EL2	1110	11	100	010	0011
CNTV_CVAL_EL0	1110	11	011	010	0011

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTHV_CVAL_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
CNTHV_CVAL_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTHV_CVAL_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CNTV_CVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	CNTV_CVAL _EL0
CNTV_CVAL_EL0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	CNTV_CVAL _EL0	CNTV_CVAL _EL0	n/a	CNTV_CVAL _EL0
CNTV_CVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CVAL _EL0	CNTV_CVAL _EL0	CNTV_CVAL _EL0	CNTV_CVAL _EL0
CNTV_CVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CVAL _EL0	n/a	CNTV_CVAL _EL0	CNTV_CVAL _EL0
CNTV_CVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CVAL _EL0	CNTV_CVAL _EL0	RW	CNTV_CVAL _EL0

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHV_CVAL_EL2](#) or [CNTV_CVAL_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

If an [_EL1](#) accessor is used, refer to [CNTV_CVAL_EL0](#) for information on the effect of [HCR_EL2.NV2](#) on this accessor.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 1 \ \&\& \ \text{CNTHCTL_EL2.ELOVTEN} == 0$, then accesses at EL0 are trapped to EL2.

D12.8.11 CNTHV_TVAL_EL2, Counter-timer Virtual Timer TimerValue Register (EL2)

The CNTHV_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 virtual timer.

Configurations

AArch64 System register CNTHV_TVAL_EL2[31:0] is architecturally mapped to AArch32 System register [CNTHV_TVAL](#)[31:0].

This register is present only from ARMv8.1. Otherwise, direct accesses to CNTHV_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

CNTHV_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHV_TVAL_EL2 bit assignments are:

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

From ARMv8.1:

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHV_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHV_CVAL_EL2](#) - [CNTVCT_EL0](#)).

On a write of this register, [CNTHV_CVAL_EL2](#) is set to ([CNTVCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT_EL0](#) - [CNTHV_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHV_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHV_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHV_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the CNTHV_TVAL_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	CRn	op0	op1	op2	CRm
CNTHV_TVAL_EL2	1110	11	100	000	0011
CNTV_TVAL_EL0	1110	11	011	000	0011

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTHV_TVAL_EL2	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
CNTHV_TVAL_EL2	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTHV_TVAL_EL2	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CNTV_TVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	CNTV_TVAL _EL0
CNTV_TVAL_EL0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	CNTV_TVAL _EL0	CNTV_TVAL _EL0	n/a	CNTV_TVAL _EL0
CNTV_TVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_TVAL _EL0	CNTV_TVAL _EL0	CNTV_TVAL _EL0	CNTV_TVAL _EL0
CNTV_TVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_TVAL _EL0	n/a	CNTV_TVAL _EL0	CNTV_TVAL _EL0
CNTV_TVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_TVAL _EL0	CNTV_TVAL _EL0	RW	CNTV_TVAL _EL0

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL2 using the mnemonic `CNTHV_TVAL_EL2` or `CNTV_TVAL_EL0` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.ELOVTEN == 0`, then accesses at EL0 are trapped to EL2.

D12.8.12 CNTHVS_CTL_EL2, Counter-timer Secure Virtual Timer Control register (EL2)

The CNTHVS_CTL_EL2 characteristics are:

Purpose

Control register for the Secure EL2 virtual timer.

Configurations

AArch64 System register CNTHVS_CTL_EL2[31:0] is architecturally mapped to AArch32 System register [CNTHVS_CTL](#)[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHVS_CTL_EL2 is a 64-bit register.

Field descriptions

The CNTHVS_CTL_EL2 bit assignments are:

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

From ARMv8.1:

The status of the timer. This bit indicates whether the timer condition is met:

0b0 Timer condition is not met.

0b1 Timer condition is met.

When the value of the CNTHVS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers](#) on page D10-2653 and [Operation of the TimerValue views of the timers](#) on page D10-2653.

This bit is read-only.

Otherwise:

Reserved, RES0.

IMASK, bit [1]

From ARMv8.1:

Timer interrupt mask bit. Permitted values are:

0b0 Timer interrupt is not masked by the IMASK bit.

0b1 Timer interrupt is masked by the IMASK bit.
For more information, see the description of the CNTHVS_CTL_EL2.ISTATUS bit.
This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLE, bit [0]

From ARMv8.1:

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHVS_TVAL_EL2](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the CNTHVS_CTL_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHVS_CTL_EL2	11	1110	100	001	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	RW	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	RW	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	-	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.NV} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 1 \ \&\& \ \text{CNTHCTL_EL2.ELOVTEN} == 0$, then accesses at EL0 are trapped to EL2.

D12.8.13 CNTHVS_CVAL_EL2, Counter-timer Secure Virtual Timer CompareValue register (EL2)

The CNTHVS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 virtual timer.

Configurations

AArch64 System register CNTHVS_CVAL_EL2[63:0] is architecturally mapped to AArch32 System register [CNTHVS_CVAL](#)[63:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHVS_CVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHVS_CVAL_EL2 bit assignments are:

CompareValue, bits [63:0]

From ARMv8.1:

Holds the Secure EL2 virtual timer CompareValue.

When [CNTHVS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHVS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHVS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT_EL0](#) continues to count.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the CNTHVS_CVAL_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHVS_CVAL_EL2	11	1110	100	010	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	RW	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	RW	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	-	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0VTEN == 0, then accesses at EL0 are trapped to EL2.

D12.8.14 CNTHVS_TVAL_EL2, Counter-timer Secure Virtual Timer TimerValue register (EL2)

The CNTHVS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 virtual timer.

Configurations

AArch64 System register CNTHVS_TVAL_EL2[31:0] is architecturally mapped to AArch32 System register [CNTHVS_TVAL](#)[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL_EL2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHVS_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHVS_TVAL_EL2 bit assignments are:

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

From ARMv8.1:

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHVS_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHVS_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHVS_CVAL_EL2](#) - [CNTVCT_EL0](#)).

On a write of this register, [CNTHVS_CVAL_EL2](#) is set to ([CNTVCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHVS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when (([CNTVCT_EL0](#) - [CNTHVS_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHVS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHVS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the CNTHVS_TVAL_EL2

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTHVS_TVAL_EL2	11	1110	100	000	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	RW	RW
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	RW	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0	-	-	-	RW
SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1	-	n/a	-	RW

D12.8.15 CNTKCTL_EL1, Counter-timer Kernel Control register

The CNTKCTL_EL1 characteristics are:

Purpose

When [ARMv8.1-VHE](#) is not implemented, or when [HCR_EL2](#).{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When [ARMv8.1-VHE](#) is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by [CNTHTCTL_EL2](#).

Configurations

AArch64 System register CNTKCTL_EL1[31:0] is architecturally mapped to AArch32 System register [CNTKCTL](#)[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTKCTL_EL1 is a 64-bit register.

Field descriptions

The CNTKCTL_EL1 bit assignments are:

Bits [63:10]

Reserved, RES0.

ELOPTEN, bit [9]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR_EL2](#).{E2H, TGE} is not {1, 1}, traps EL0 accesses to the physical timer registers to EL1.

0b0 EL0 using AArch64: EL0 accesses to [CNTNP_CTL_EL0](#), [CNTNP_CVAL_EL0](#), and [CNTNP_TVAL_EL0](#) are trapped to EL1.

EL0 using AArch32: EL0 accesses to [CNTNP_CTL](#), [CNTNP_CVAL](#), and [CNTNP_TVAL](#) are trapped to EL1.

When [HCR_EL2](#).TGE is 1, this trap is routed to EL2.

0b1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR_EL2](#).{E2H, TGE} is not {1, 1}, traps EL0 accesses to the virtual timer registers to EL1.

- 0b0 EL0 using AArch64: EL0 accesses to [CNTV_CTL_EL0](#), [CNTV_CVAL_EL0](#), and [CNTV_TVAL_EL0](#) are trapped to EL1.
EL0 using AArch32: EL0 accesses to [CNTV_CTL](#), [CNTV_CVAL](#), and [CNTV_TVAL](#) are trapped to EL1.
When [HCR_EL2](#).TGE is 1, this trap is routed to EL2.

- 0b1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register [CNTVCT_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register [CNTVCT_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

- 0b0 A 0 to 1 transition of the trigger bit triggers an event.
0b1 A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR_EL2](#).{E2H, TGE} is not {1, 1}, enables the generation of an event stream from the counter register [CNTVCT_EL0](#):

- 0b0 Disables the event stream.
0b1 Enables the event stream.

When [ARMv8.1-VHE](#) is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not enable the event stream.

This field resets to 0.

EL0VCTEN, bit [1]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR_EL2](#).{E2H, TGE} is not {1, 1}, traps EL0 accesses to the frequency register and virtual counter register to EL1.

- 0b0 EL0 using AArch64: EL0 accesses to [CNTVCT_EL0](#) are trapped to EL1.
EL0 using AArch64: EL0 accesses to [CNTFRQ_EL0](#) are trapped to EL1, if [CNTKCTL_EL1](#).EL0PCTEN is also 0.
EL0 using AArch32: EL0 accesses to [CNTVCT](#) are trapped to EL1.
EL0 using AArch32: EL0 accesses to [CNTFRQ](#) are trapped to EL1, if [CNTKCTL_EL1](#).EL0PCTEN is also 0.
When [HCR_EL2](#).TGE is 1, this trap is routed to EL2.

- 0b1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR_EL2](#).{E2H, TGE} is not {1, 1}, traps EL0 accesses to the frequency register and physical counter register to EL1.

0b0 EL0 using AArch64: EL0 accesses to [CNTPCT_EL0](#) are trapped to EL1.
 EL0 using AArch64: EL0 accesses to [CNTFRQ_EL0](#) are trapped to EL1, if [CNTKCTL_EL1](#).EL0VCTEN is also 0.
 EL0 using AArch32: EL0 accesses to [CNTPCT](#) are trapped to EL1.
 EL0 using AArch32: EL0 accesses to [CNTFRQ](#) are trapped to EL1, if [CNTKCTL_EL1](#).EL0VCTEN is also 0.
 When [HCR_EL2](#).TGE is 1, this trap is routed to EL2.

0b1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTKCTL_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTKCTL_EL1	11	1110	000	000	0001
CNTKCTL_EL12	11	1110	101	000	0001

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTKCTL_EL1	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
CNTKCTL_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
CNTKCTL_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW
CNTKCTL_EL1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	CNTHCTL_EL2	RW
CNTKCTL_EL1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	CNTHCTL_EL2	RW
CNTKCTL_EL12	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTKCTL_EL12	$HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ (SCR_EL3.NS == 1 \ \ SCR_EL3.EEL2 == 1)$	-	-	-	-
CNTKCTL_EL12	$HCR_EL2.TGE == 1 \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ (SCR_EL3.NS == 1 \ \ SCR_EL3.EEL2 == 1)$	-	n/a	-	-
CNTKCTL_EL12	$HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ (SCR_EL3.NS == 1 \ \ SCR_EL3.EEL2 == 1)$	-	-	RW	RW
CNTKCTL_EL12	$HCR_EL2.TGE == 1 \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ (SCR_EL3.NS == 1 \ \ SCR_EL3.EEL2 == 1)$	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL_EL1 or CNTKCTL_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \ || \ SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ IsUsingAccessor(CNTKCTL_EL12) \ \&\& \ HCR_EL2.NV == 1$, then accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \ || \ SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ IsUsingAccessor(CNTKCTL_EL12) \ \&\& \ HCR_EL2.NV == 1$, then accesses at EL1 are trapped to EL2.

D12.8.16 CNTP_CTL_EL0, Counter-timer Physical Timer Control register

The CNTP_CTL_EL0 characteristics are:

Purpose

Control register for the EL1 physical timer.

Configurations

AArch64 System register CNTP_CTL_EL0[31:0] is architecturally mapped to AArch32 System register CNTP_CTL[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTP_CTL_EL0 is a 64-bit register.

Field descriptions

The CNTP_CTL_EL0 bit assignments are:

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

0b0 Timer condition is not met.

0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers](#) on page D10-2653 and [Operation of the TimerValue views of the timers](#) on page D10-2653.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

0b0 Timer interrupt is not masked by the IMASK bit.

0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

0b0 Timer disabled.

0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL_ELO](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CTL_ELO

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTP_CTL_ELO	11	1110	011	001	0010
CNTP_CTL_ELO2	11	1110	101	001	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTP_CTL_ELO	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CTL_EL0 or CNTP_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0` && `CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 0 || HCR_EL2.NV == 0)` && `IsUsingAccessor(CNTP_CTL_EL0)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0)` && `IsUsingAccessor(CNTP_CTL_EL02)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0` && `CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `IsUsingAccessor(CNTP_CTL_EL02)` && `HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 0 || HCR_EL2.NV == 0)` && `IsUsingAccessor(CNTP_CTL_EL0)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0)` && `IsUsingAccessor(CNTP_CTL_EL02)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0` && `CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `IsUsingAccessor(CNTP_CTL_EL02)` && `HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 1` && `CNTHCTL_EL2.EL0PTEN == 0`, then accesses at EL0 are trapped to EL2.

D12.8.17 CNTP_CVAL_EL0, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configurations

AArch64 System register CNTP_CVAL_EL0[63:0] is architecturally mapped to AArch32 System register CNTP_CVAL[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTP_CVAL_EL0 is a 64-bit register.

Field descriptions

The CNTP_CVAL_EL0 bit assignments are:

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CVAL_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTP_CVAL_EL0	11	1110	011	010	0010
CNTP_CVAL_EL02	11	1110	101	010	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CVAL_EL0 or CNTP_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0` && `CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 0 || HCR_EL2.NV == 0)` && `IsUsingAccessor(CNTP_CVAL_EL0)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0)` && `IsUsingAccessor(CNTP_CVAL_EL02)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0` && `CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `IsUsingAccessor(CNTP_CVAL_EL02)` && `HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 0 || HCR_EL2.NV == 0)` && `IsUsingAccessor(CNTP_CVAL_EL0)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1 || HCR_EL2.NV == 0)` && `IsUsingAccessor(CNTP_CVAL_EL02)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0` && `CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1)` && `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `IsUsingAccessor(CNTP_CVAL_EL02)` && `HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 1` && `CNTHCTL_EL2.EL0PTEN == 0`, then accesses at EL0 are trapped to EL2.

D12.8.18 CNTP_TVAL_ELO, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL_ELO characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configurations

AArch64 System register CNTP_TVAL_ELO[31:0] is architecturally mapped to AArch32 System register CNTP_TVAL[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTP_TVAL_ELO is a 64-bit register.

Field descriptions

The CNTP_TVAL_ELO bit assignments are:

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL_ELO.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL_ELO.ENABLE is 1, the value returned is (CNTP_CVAL_ELO - CNTPCT_ELO).

On a write of this register, CNTP_CVAL_ELO is set to (CNTPCT_ELO + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL_ELO.ENABLE is 1, the timer condition is met when (CNTPCT_ELO - CNTP_CVAL_ELO) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL_ELO.ISTATUS is set to 1.
- If CNTP_CTL_ELO.IMASK is 0, an interrupt is generated.

When CNTP_CTL_ELO.ENABLE is 0, the timer condition is not met, but CNTPCT_ELO continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_TVAL_ELO

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTP_TVAL_EL0	11	1110	011	000	0010
CNTP_TVAL_EL02	11	1110	101	000	0010

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTP_TVAL_EL0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW

CNTP_TVAL_EL02	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1	-	n/a	RW	RW
CNTP_TVAL_EL02	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
CNTP_TVAL_EL02	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
CNTP_TVAL_EL02	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTP_TVAL_EL02	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [CNTP_TVAL_EL0](#) or [CNTP_TVAL_EL02](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0` && `CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0` && `CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0` && `IsUsingAccessor(CNTP_TVAL_EL02) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0` && `CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `IsUsingAccessor(CNTP_TVAL_EL02) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 1` && `CNTHCTL_EL2.EL0PTEN == 0`, then accesses at EL0 are trapped to EL2.

D12.8.19 CNTPCT_EL0, Counter-timer Physical Count register

The CNTPCT_EL0 characteristics are:

Purpose

Holds the 64-bit physical count value.

Configurations

AArch64 System register CNTPCT_EL0[63:0] is architecturally mapped to AArch32 System register CNTPCT[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTPCT_EL0 is a 64-bit register.

Field descriptions

The CNTPCT_EL0 bit assignments are:

Bits [63:0]

Physical count value.

Accessing the CNTPCT_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTPCT_EL0	11	1110	011	001	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If $\text{HCR_EL2.E2H} == 0 \ \&\& \ \text{CNTKCTL_EL1.ELOPCTEN} == 0$, then read accesses at EL0 are trapped to EL1.
- If $(\text{SCR_EL3.NS} == 1 \ \|\ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{CNTHCTL_EL2.EL1PCTEN} == 0$, then read accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \ \|\ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{CNTHCTL_EL2.EL1PCTEN} == 0 \ \&\& \ \text{CNTKCTL_EL1.ELOPCTEN} == 1$, then read accesses at EL0 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \ \|\ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{CNTHCTL_EL2.EL1PCTEN} == 0$, then read accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \ \|\ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{CNTHCTL_EL2.EL1PCTEN} == 0 \ \&\& \ \text{CNTKCTL_EL1.ELOPCTEN} == 1$, then read accesses at EL0 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \ \|\ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{CNTKCTL_EL1.ELOPCTEN} == 0$, then read accesses at EL0 are trapped to EL1.
- If $(\text{SCR_EL3.NS} == 1 \ \|\ \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 1 \ \&\& \ \text{CNTHCTL_EL2.ELOPCTEN} == 0$, then read accesses at EL0 are trapped to EL2.

D12.8.20 CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS_CTL_EL1 characteristics are:

Purpose

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTPS_CTL_EL1 is a 64-bit register.

Field descriptions

The CNTPS_CTL_EL1 bit assignments are:

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D10-2653](#) and [Operation of the TimerValue views of the timers on page D10-2653](#).

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTPS_TVAL_EL1](#) continues to count down.

———— **Note** ————

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTPS_CTL_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTPS_CTL_EL1	11	1110	111	001	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.ST == 0 && SCR_EL3.EEL2 == 0`, then accesses at EL1 are trapped to EL3.

D12.8.21 CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS_CVAL_EL1 characteristics are:

Purpose

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTPS_CVAL_EL1 is a 64-bit register.

Field descriptions

The CNTPS_CVAL_EL1 bit assignments are:

CompareValue, bits [63:0]

Holds the secure physical timer CompareValue.

When [CNTPS_CTL_EL1.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTPS_CTL_EL1.ISTATUS](#) is set to 1.
- If [CNTPS_CTL_EL1.IMASK](#) is 0, an interrupt is generated.

When [CNTPS_CTL_EL1.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTPS_CVAL_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTPS_CVAL_EL1	11	1110	111	010	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.ST == 0 && SCR_EL3.EEL2 == 0`, then accesses at EL1 are trapped to EL3.

D12.8.22 CNTPS_TVAL_EL1, Counter-timer Physical Secure Timer TimerValue register

The CNTPS_TVAL_EL1 characteristics are:

Purpose

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTPS_TVAL_EL1 is a 64-bit register.

Field descriptions

The CNTPS_TVAL_EL1 bit assignments are:

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the secure physical timer.

On a read of this register:

- If [CNTPS_CTL_EL1.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTPS_CTL_EL1.ENABLE](#) is 1, the value returned is ([CNTPS_CVAL_EL1](#) - [CNTPCT_EL0](#)).

On a write of this register, [CNTPS_CVAL_EL1](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTPS_CTL_EL1.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - [CNTPS_CVAL_EL1](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTPS_CTL_EL1.ISTATUS](#) is set to 1.
- If [CNTPS_CTL_EL1.IMASK](#) is 0, an interrupt is generated.

When [CNTPS_CTL_EL1.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTPS_TVAL_EL1

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTPS_TVAL_EL1	11	1110	111	000	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.ST == 0 && SCR_EL3.EEL2 == 0`, then accesses at EL1 are trapped to EL3.

D12.8.23 CNTV_CTL_EL0, Counter-timer Virtual Timer Control register

The CNTV_CTL_EL0 characteristics are:

Purpose

Control register for the virtual timer.

Configurations

AArch64 System register CNTV_CTL_EL0[31:0] is architecturally mapped to AArch32 System register CNTV_CTL[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTV_CTL_EL0 is a 64-bit register.

Field descriptions

The CNTV_CTL_EL0 bit assignments are:

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

0b0 Timer condition is not met.

0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D10-2653](#) and [Operation of the TimerValue views of the timers on page D10-2653](#).

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

0b0 Timer interrupt is not masked by the IMASK bit.

0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

0b0 Timer disabled.

0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL_ELO](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CTL_ELO

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTV_CTL_ELO	11	1110	011	001	0011
CNTV_CTL_ELO2	11	1110	101	001	0011

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTV_CTL_ELO	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic `CNTV_CTL_EL0` or `CNTV_CTL_EL02` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0` && `CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(CNTV_CTL_EL02) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(CNTV_CTL_EL02) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0VTEN == 0`, then accesses at EL0 are trapped to EL2.

D12.8.24 CNTV_CVAL_EL0, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configurations

AArch64 System register CNTV_CVAL_EL0[63:0] is architecturally mapped to AArch32 System register CNTV_CVAL[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTV_CVAL_EL0 is a 64-bit register.

Field descriptions

The CNTV_CVAL_EL0 bit assignments are:

CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CVAL_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTV_CVAL_EL0	11	1110	011	010	0011
CNTV_CVAL_EL02	11	1110	101	010	0011

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTV_CVAL_EL0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW

CNTV_CVAL_EL02	(HCR_EL2.NV == 0 HCR_EL2.NV1 == 1 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTV_CVAL_EL02	HCR_EL2.NV == 1 && HCR_EL2.NV1 == 0 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x168]	RW	RW
CNTV_CVAL_EL02	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic `CNTV_CVAL_EL0` or `CNTV_CVAL_EL02` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0` && `CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && IsUsingAccessor(CNTV_CVAL_EL02) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(HCR_EL2.NV2 == 0 || HCR_EL2.NV1 == 1) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && IsUsingAccessor(CNTV_CVAL_EL02) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0VTEN == 0`, then accesses at EL0 are trapped to EL2.

D12.8.25 CNTV_TVAL_EL0, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL_EL0 characteristics are:

Purpose

Holds the timer value for the EL1 virtual timer.

Configurations

AArch64 System register CNTV_TVAL_EL0[31:0] is architecturally mapped to AArch32 System register [CNTV_TVAL](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTV_TVAL_EL0 is a 64-bit register.

Field descriptions

The CNTV_TVAL_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If [CNTV_CTL_EL0.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV_CTL_EL0.ENABLE](#) is 1, the value returned is ([CNTV_CVAL_EL0](#) - [CNTVCT_EL0](#)).

On a write of this register, [CNTV_CVAL_EL0](#) is set to ([CNTVCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTV_CTL_EL0.ENABLE](#) is 1, the timer condition is met when ([CNTVCT_EL0](#) - [CNTV_CVAL_EL0](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV_CTL_EL0.ISTATUS](#) is set to 1.
- If [CNTV_CTL_EL0.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL_EL0.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_TVAL_EL0

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTV_TVAL_EL0	11	1110	011	000	0011
CNTV_TVAL_EL02	11	1110	101	000	0011

Accessibility

The register is accessible as follows:

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTV_TVAL_EL0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
CNTV_TVAL_EL0	SCR_EL3.NS == 0 && HCR_EL2.TGE == 0 && SCR_EL3.EEL2 == 1	RW	RW	RW	RW
CNTV_TVAL_EL0	SCR_EL3.NS == 0 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && SCR_EL3.EEL2 == 1	RW	n/a	RW	RW
CNTV_TVAL_EL0	SCR_EL3.NS == 0 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && SCR_EL3.EEL2 == 1	CNTHVS_TVAL_EL2	RW	CNTHVS_TVAL_EL2	RW
CNTV_TVAL_EL0	SCR_EL3.NS == 0 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && SCR_EL3.EEL2 == 1	RW	RW	CNTHVS_TVAL_EL2	RW
CNTV_TVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && SCR_EL3.NS == 1	RW	RW	CNTHVS_TVAL_EL2	RW
CNTV_TVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && SCR_EL3.NS == 1	RW	n/a	RW	RW
CNTV_TVAL_EL0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && SCR_EL3.NS == 1	RW	RW	CNTHV_TVAL_EL2	RW
CNTV_TVAL_EL0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && SCR_EL3.NS == 1	CNTHV_TVAL_EL2	n/a	CNTHV_TVAL_EL2	RW
CNTV_TVAL_EL02	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-

<systemreg>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
CNTV_TVAL_EL02	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0	-	-	-	-
CNTV_TVAL_EL02	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0	-	n/a	-	-
CNTV_TVAL_EL02	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1	-	-	RW	RW
CNTV_TVAL_EL02	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 1 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1	-	n/a	RW	RW
CNTV_TVAL_EL02	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
CNTV_TVAL_EL02	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-
CNTV_TVAL_EL02	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
CNTV_TVAL_EL02	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [CNTV_TVAL_EL0](#) or [CNTV_TVAL_EL02](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0` && `CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0` && `IsUsingAccessor(CNTV_TVAL_EL02) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `IsUsingAccessor(CNTV_TVAL_EL02) && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 1` && `CNTHCTL_EL2.EL0VTEN == 0`, then accesses at EL0 are trapped to EL2.

D12.8.26 CNTVCT_EL0, Counter-timer Virtual Count register

The CNTVCT_EL0 characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in [CNTPCT_EL0](#) minus the virtual offset visible in [CNTVOFF_EL2](#).

Configurations

AArch64 System register CNTVCT_EL0[63:0] is architecturally mapped to AArch32 System register [CNTVCT](#)[63:0].

The value of this register is the same as the value of [CNTPCT_EL0](#) in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented, [HCR_EL2.E2H](#) is 1, and this register is read from EL2.
- When EL2 is implemented and enabled in the current Security state, [HCR_EL2](#).{E2H, TGE} is {1, 1}, and this register is read from EL0 or EL2.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTVCT_EL0 is a 64-bit register.

Field descriptions

The CNTVCT_EL0 bit assignments are:

Bits [63:0]

Virtual count value.

Accessing the CNTVCT_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTVCT_EL0	11	1110	011	010	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If [HCR_EL2.E2H == 0 && CNTKCTL_EL1.EL0VCTEN == 0](#), then read accesses at EL0 are trapped to EL1.
- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\) && IsUsingAArch64\(EL2\) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0VCTEN == 0](#), then read accesses at EL0 are trapped to EL1.
- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\) && IsUsingAArch64\(EL2\) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PCTEN == 0](#), then read accesses at EL0 are trapped to EL2.

D12.8.27 CNTVOFF_EL2, Counter-timer Virtual Offset register

The CNTVOFF_EL2 characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in [CNTPCT_EL0](#) and the virtual count value visible in [CNTVCT_EL0](#).

Configurations

AArch64 System register CNTVOFF_EL2[63:0] is architecturally mapped to AArch32 System register [CNTVOFF](#)[63:0].

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

This register has no effect if EL2 is not enabled in the current Security state.

———— Note ————

When EL2 is implemented and enabled in the current Security state, and is using AArch64, the virtual counter uses a fixed virtual offset of zero in the following situations:

- [HCR_EL2.E2H](#) is 1, and [CNTVCT_EL0](#) is read from EL2.
- [HCR_EL2.{E2H, TGE}](#) is {1, 1}, and either:
 - [CNTVCT_EL0](#) is read from EL0 or EL2.
 - [CNTVCT](#) is read from EL0.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTVOFF_EL2 is a 64-bit register.

Field descriptions

The CNTVOFF_EL2 bit assignments are:

Bits [63:0]

Virtual offset.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTVOFF_EL2

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	CRn	op1	op2	CRm
CNTVOFF_EL2	11	1110	100	011	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	RW
(HCR_EL2.NV == 0 HCR_EL2.NV2 == 0) && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	RW
HCR_EL2.NV == 1 && HCR_EL2.NV2 == 1 && HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	[VNCR_EL2.BADDR << 12 + 0x60]	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#). Subject to the prioritization rules:

- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.
- If `HCR_EL2.NV2 == 0 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.NV == 1`, then accesses at EL1 are trapped to EL2.

Part E

The AArch32 Application Level Architecture

Chapter E1

The AArch32 Application Level Programmers' Model

This chapter gives an Application level description of the programmers' model for software executing in AArch32 state. This means it describes execution in EL0 when EL0 is using AArch32. It contains the following sections:

- *About the Application level programmers' model on page E1-3530.*
- *The Application level programmers' model in AArch32 state on page E1-3531.*
- *Advanced SIMD and floating-point instructions on page E1-3542.*
- *About the AArch32 System register interface on page E1-3553.*
- *Exceptions on page E1-3554.*

E1.1 About the Application level programmers' model

This chapter contains the programmers' model information required for the development of applications that will execute in AArch32 state.

The information in this chapter is distinct from the system information required to service and support application execution under an operating system, or higher level of system software. However, some knowledge of that system information is needed to put the Application level programmers' model into context.

Depending on the implementation, the architecture supports multiple levels of execution privilege. These privilege levels are indicated by different *Exception levels* that number upwards from EL0, where EL0 corresponds to the lowest privilege level and is often described as *unprivileged*. The Application level programmers' model is the programmers' model for software executing at EL0. For more information see [ARMv8 architectural concepts on page A1-36](#).

System software determines the Exception level, and therefore the level of privilege, at which application software runs. When an operating system supports execution at both EL1 and EL0, an application usually runs unprivileged. This has the following effects:

- It means that the operating system can allocate system resources to an application in a unique or shared manner.
- It provides a degree of protection from other processes, and so helps protect the operating system from malfunctioning software.

This chapter indicates where some System level understanding is helpful, and if appropriate it gives a reference to the System level description.

Application level software is generally unaware of its Security state, and of any virtualization. For more information, see [The ARMv8-A security model on page G1-5215](#) and [The effect of implementing EL2 on the Exception model on page G1-5220](#).

Note

- When an implementation includes EL3, application and operating system software normally executes in Non-secure state.
 - Older documentation, describing implementations or architecture versions that support only two privilege levels, often refers to execution at EL1 as *privileged* execution.
 - In this manual, the terms *CONSTRAINED UNPREDICTABLE*, *IMPLEMENTATION DEFINED*, *OPTIONAL*, *RES0*, *RES1*, *UNDEFINED*, *UNKNOWN*, and *UNPREDICTABLE* have ARM-specific meanings, as defined in the [Glossary](#). In body text, these terms are shown in SMALL CAPS, for example IMPLEMENTATION DEFINED.
-

E1.2 The Application level programmers' model in AArch32 state

The following sections give more information about the Application level programmers' model in AArch32 state:

- [Instruction sets, arithmetic operations, and register files.](#)
- [Core data types and arithmetic in AArch32 state.](#)
- [The general-purpose registers, and the PC, in AArch32 state on page E1-3533.](#)
- [Process state, PSTATE on page E1-3535.](#)
- [Jazelle support on page E1-3541.](#)

E1.2.1 Instruction sets, arithmetic operations, and register files

The A32 and T32 instruction sets both provide a wide range of integer arithmetic and logical operations, that operate on a register file of sixteen 32-bit registers, that are comprised of the AArch32 general-purpose registers and the PC. As described in [The general-purpose registers, and the PC, in AArch32 state on page E1-3533](#), these registers include the registers SP (R13) and LR (R14), which have specialized uses. [Core data types and arithmetic in AArch32 state](#) gives more information about these operations.

In addition, an implementation that implements the T32 and A32 instruction sets includes both:

- Scalar floating-point instructions.
- The Advanced SIMD vector instructions.

Floating-point and vector instructions operate on a separate common register file, described in [The SIMD and floating-point register file on page E1-3542](#). [Advanced SIMD and floating-point instructions on page E1-3542](#) gives more information about these instructions.

E1.2.2 Core data types and arithmetic in AArch32 state

When executing in AArch32 state, a PE supports the following data types in memory:

Byte	8 bits.
Halfword	16 bits.
Word	32 bits.
Doubleword	64 bits.

PE registers are 32 bits in size. The instruction sets provide instructions that use the following data types for data held in registers:

- 32-bit pointers.
- Unsigned or signed 32-bit integers.
- Unsigned 16-bit or 8-bit integers, held in zero-extended form.
- Signed 16-bit or 8-bit integers, held in sign-extended form.
- Two 16-bit integers packed into a register.
- Four 8-bit integers packed into a register.
- Unsigned or signed 64-bit integers held in two registers.

Load and store operations can transfer bytes, halfwords, or words to and from memory. Loads of bytes or halfwords zero-extend or sign-extend the data as it is loaded, as specified in the appropriate load instruction.

The instruction sets include load and store operations that transfer two or more words to and from memory. Software can load and store doublewords using these instructions.

———— **Note** ————

For information about the atomicity of memory accesses see [Atomicity in the ARM architecture on page E2-3558](#).

When any of the data types is described as *unsigned*, the N-bit data value represents a non-negative integer in the range 0 to 2^N-1 , using normal binary format.

When any of these types is described as *signed*, the N-bit data value represents an integer in the range $-2^{(N-1)}$ to $+2^{(N-1)}-1$, using two's complement format.

The instructions that operate on packed halfwords or bytes include some multiply instructions that use only one of two halfwords, and SIMD instructions that perform parallel addition or subtraction on all of the halfwords or bytes.

———— **Note** —————

These SIMD instructions operate on values held in the general-purpose registers, and must not be confused with the Advanced SIMD instructions that operate on a separate register file that provides registers of up to 128 bits.

Direct instruction support for 64-bit integers is limited, and most 64-bit operations require sequences of two or more instructions to synthesize them.

Integer arithmetic

The instruction set provides a wide range of operations on the values in registers, including bitwise logical operations, shifts, additions, subtractions, multiplications, and divisions. The pseudocode described in [Appendix K12 ARM Pseudocode Definition](#) defines these operations, usually in one of three ways:

- By direct use of the pseudocode operators and built-in functions defined in [Operators on page K12-7374](#).
- By use of pseudocode helper functions defined in the main text. See [Appendix K12 Pseudocode Index](#).
- By a sequence of the form:
 1. Use of the `SInt()`, `UInt()`, and `Int()` built-in functions defined in [Converting bitstrings to integers on page K12-7386](#) to convert the bitstring contents of the instruction operands to the unbounded integers that they represent as two's complement or unsigned integers.
 2. Use of mathematical operators, built-in functions and helper functions on those unbounded integers to calculate other such integers.
 3. Use of either the bitstring extraction operator defined in [Bitstring concatenation and slicing on page K12-7375](#) or of the saturation helper functions described in [Pseudocode description of saturation on page E1-3533](#) to convert an unbounded integer result into a bitstring result that can be written to a register.

Shift and rotate operations

The following types of shift and rotate operations are used in instructions:

Logical Shift Left

The `LSL()` pseudocode function moves each bit of a bitstring left by a specified number of bits. Zeros are shifted in at the right end of the bitstring. Bits that are shifted off the left end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

Logical Shift Right

The `LSR()` pseudocode function moves each bit of a bitstring right by a specified number of bits. Zeros are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

Arithmetic Shift Right

The `ASR()` pseudocode function moves each bit of a bitstring right by a specified number of bits. Copies of the leftmost bit are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

Rotate Right The `ROR()` pseudocode function moves each bit of a bitstring right by a specified number of bits. Each bit that is shifted off the right end of the bitstring is re-introduced at the left end. The last bit shifted off the right end of the bitstring can be produced as a carry output.

Rotate Right with Extend

The `RRX()` pseudocode function moves each bit of a bitstring right by one bit. A carry input is shifted in at the left end of the bitstring. The bit shifted off the right end of the bitstring can be produced as a carry output.

Pseudocode description of addition and subtraction

In pseudocode, addition and subtraction can be performed on any combination of unbounded integers and bitstrings, provided that if they are performed on two bitstrings, the bitstrings must be identical in length. The result is another unbounded integer if both operands are unbounded integers, and a bitstring of the same length as the bitstring operand or operands otherwise. For the definition of these operations, see [Addition and subtraction on page K12-7376](#).

The main addition and subtraction instructions can produce status information about both unsigned carry and signed overflow conditions. When necessary, multi-word additions and subtractions can be synthesized from this status information. In pseudocode the `AddWithCarry()` function provides an addition with a carry input and a set of output Condition flags including carry output and overflow:

An important property of the `AddWithCarry()` function is that if:

```
(result, nzcvc) = AddWithCarry(x, NOT(y), carry_in)
```

Then:

- If `carry_in == '1'`, then `result == x-y` with:
 - `nzcvc<0> == '1'` if signed overflow occurred during the subtraction.
 - `nzcvc<1> == '1'` if unsigned borrow did not occur during the subtraction, that is, if $x \geq y$.
- If `carry_in == '0'`, then `result == x-y-1` with:
 - `nzcvc<0> == '1'` if signed overflow occurred during the subtraction.
 - `nzcvc<1> == '1'` if unsigned borrow did not occur during the subtraction, that is, if $x \geq y$.

Taken together, this means that the `carry_in` and `nzcvc<1>` output in `AddWithCarry()` calls can act as NOT borrow flags for subtractions as well as carry flags for additions.

Pseudocode description of saturation

Some instructions perform *saturation arithmetic*, that is, if the result of the arithmetic overflows the destination signed or unsigned N-bit integer range, the result produced is the largest or smallest value in that range, rather than wrapping around modulo 2^N . This is supported in pseudocode by:

- The `SignedSatQ()` and `UnsignedSatQ()` functions when an operation requires, in addition to the saturated result, a Boolean argument that indicates whether saturation occurred.
- The `SignedSat()` and `UnsignedSat()` functions when only the saturated result is required.

`SatQ(i, N, unsigned)` returns either `UnsignedSatQ(i, N)` or `SignedSatQ(i, N)` depending on the value of its third argument, and `Sat(i, N, unsigned)` returns either `UnsignedSat(i, N)` or `SignedSat(i, N)` depending on the value of its third argument.

E1.2.3 The general-purpose registers, and the PC, in AArch32 state

In the AArch32 Application level view, a PE has:

- Fifteen general-purpose 32-bit registers, R0 to R14, of which R13 and R14 have alternative names reflecting how they are, or can be, used:
 - R13 is usually identified as SP.
 - R14 is usually identified as LR.
- The PC (*program counter*), that can be described as R15.

The specialized uses of the SP (R13), LR (R14), and PC (R15) are:

SP, the stack pointer

The PE uses SP as a pointer to the active stack.

In the T32 instruction set, some instructions cannot access SP. Instructions that can access SP can use SP as a general-purpose register.

The A32 instruction set provides more general access to SP, and it can be used as a general-purpose register.

———— **Note** ————

Using SP for any purpose other than as a stack pointer might break the requirements of operating systems, debuggers, and other software systems, causing them to malfunction.

Software can refer to SP as R13.

LR, the link register

The link register can be used to hold return link information, and some cases described in this manual require this use of the LR. When software does not require the LR for linking, it can use it for other purposes. Software can refer to LR as R14.

PC, the program counter

- When executing an A32 instruction, PC reads as the address of the current instruction plus 8.
- When executing a T32 instruction, PC reads as the address of the current instruction plus 4.
- Writing an address to PC causes a branch to that address.

Most T32 instructions cannot access PC.

The A32 instruction set provides more general access to the PC, and many A32 instructions can use the PC as a general-purpose register. However, ARM deprecates the use of PC for any purpose other than as the program counter. See *Writing to the PC* for more information.

Software can refer to PC as R15.

See *AArch32 general-purpose registers, the PC, and the Special-purpose registers* on page G1-5227 for the system level view of these registers.

———— **Note** ————

In general, ARM strongly recommends using the names SP, LR and PC instead of R13, R14 and R15. However, sometimes it is simpler to use the R13-R15 names when referring to a group of registers. For example, it is simpler to refer to *registers R8 to R15*, rather than to *registers R8 to R12, the SP, LR and PC*. These two descriptions of the group of registers have exactly the same meaning.

Writing to the PC

In the A32 and T32 instruction sets, many data-processing instructions can write to the PC. Writes to the PC are handled as follows:

- In T32 state, the following 16-bit T32 instruction encodings branch to the value written to the PC:
 - Encoding T2 of *ADD, ADDS (register)* on page F5-3824.
 - Encoding T1 of *MOV, MOVS (register)* on page F5-4081.The value written to the PC is forced to be halfword-aligned by ignoring its least significant bit, treating that bit as being 0.
- The B, BL, CBNZ, CBZ, CHKA, HB, HBL, HBLP, HBP, TBB, and TBH instructions remain in the same instruction set state and branch to the value written to the PC.
The definition of each of these instructions ensures that the value written to the PC is correctly aligned for the current instruction set state.
- The BLX (immediate) instruction switches between A32 and T32 states and branches to the value written to the PC. Its definition ensures that the value written to the PC is correctly aligned for the new instruction set state.
- The following instructions write a value to the PC, treating that value as an interworking address to branch to, with low-order bits that determine the new instruction set state:
 - BLX (register), BX, and BXJ.

- LDR instructions with <Rt> equal to the PC.
- POP and all forms of LDM except LDM (exception return), when the register list includes the PC.
- In A32 state only, ADC, ADD, ADR, AND, ASR (immediate), BIC, EOR, LSL (immediate), LSR (immediate), MOV, MVN, ORR, ROR (immediate), RRX, RSB, RSC, SBC, and SUB instructions with <Rd> equal to the PC and without flag-setting specified.

For details of how an interworking address specifies the new instruction set state and instruction address, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC](#).

———— **Note** —————

The register-shifted register instructions, that are available only in the A32 instruction set and are summarized in [Data-processing register \(register shift\) on page F4-3761](#), are CONSTRAINED UNPREDICTABLE if they attempt to write to the PC, see [Using R15 on page K1-7195](#).

- Some instructions are treated as exception return instructions, and write both the PC and the CPSR. For more information, including which instructions are exception return instructions, see [Exception return to an Exception level using AArch32 on page G1-5261](#).
- Some instructions cause an exception, and the exception handler address is written to the PC as part of the exception entry.

Pseudocode description of operations on the AArch32 general-purpose registers and the PC

In pseudocode, the uses of the [R\[\]](#) function, with an index parameter *n*, are:

- Reading or writing R0-R12, SP, and LR, using *n* = 0-12, 13, and 14 respectively.
- Reading the PC, using *n* = 15.

[Pseudocode description of general-purpose register and PC operations on page G1-5229](#) describes accesses to these registers.

Descriptions of A32 store instructions that store the PC value use the [PCStoreValue\(\)](#) pseudocode function to specify the PC value stored by the instruction.

Writing an address to the PC causes either a simple branch to that address or an *interworking* branch that also selects the instruction set to execute after the branch. A simple branch is performed by the [BranchWritePC\(\)](#) function.

An interworking branch is performed by the [BXWritePC\(\)](#) function.

The [LoadWritePC\(\)](#) and [ALUWritePC\(\)](#) functions are used for two cases where the behavior was systematically modified between architecture versions.

E1.2.4 Process state, PSTATE

Process state or [PSTATE](#) is an abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

———— **Note** —————

In this chapter, references to [PSTATE](#) link to the more appropriate of:

- The Application-level view of [PSTATE](#) given in this section.
- The System-level description in [Process state, PSTATE on page G1-5231](#).

The following **PSTATE** information is accessible at EL0:

The Condition flags

Flag-setting instructions set these. They are:

- N** Negative Condition flag. If the result of the instruction is regarded as a two's complement signed integer, the PE sets this to:
 - 1 if the result is negative.
 - 0 if the result is positive or zero.
- Z** Zero Condition flag. Set to:
 - 1 if the result of the instruction is zero.
 - 0 otherwise.

A result of zero often indicates an equal result from a comparison.
- C** Carry Condition flag. Set to:
 - 1 if the instruction results in a carry condition, for example an unsigned overflow that is the result of an addition.
 - 0 otherwise.
- V** Overflow Condition flag. Set to:
 - 1 if the instruction results in an overflow condition, for example a signed overflow that is the result of an addition.
 - 0 otherwise.

Conditional instructions test the N, Z, C, and V Condition flags, combining them with the *Condition code* for the instruction, to determine whether the instruction must be executed. In this way, execution of the instruction is conditional on the result of a previous operation. For more information about conditional execution, see [Conditional execution on page F2-3655](#).

The overflow or saturation flag

- Q** Some instructions can set this. For those instructions that can, the PE:
 - Sets it to 1 if the instruction indicates overflow or saturation.
 - Leaves it unchanged otherwise.

For more information, see [Pseudocode description of saturation on page E1-3533](#).

The greater than or equal flags

- GE[3:0]** The instructions described in [Parallel addition and subtraction instructions on page F1-3622](#) update these to indicate the results from individual bytes or halfwords of the operation. These flags can control a later SEL instruction. For more information, see [SEL on page F5-4237](#).

PSTATE also contains *PE state controls*. There is no direct access to these from application level instructions, but they can be changed by side-effects of application level instructions. They are:

Instruction set state

- J, T** The current instruction set state, as shown in [Table E1-1](#). In ARMv8, the J bit is RES0, see the Note in this section.

Table E1-1 PSTATE.{J, T} encoding

J	T	Instruction set state
0	0	A32
0	1	T32

- A32** The PE is executing the A32 instruction set, summarized in [Chapter F4.A32 Instruction Set Encoding](#).

T32 The PE is executing the T32 instruction set, summarized in [Chapter F3 T32 Instruction Set Encoding](#).

———— **Note** —————

Encoding with J==1 before ARMv8, Jazelle and T32EE states

In previous versions of the ARM architecture, the encoding {1, 0} selected Jazelle state, and encoding {1, 1} selected T32EE state. ARMv8 does not support either of these states, and these are encodings for unimplemented instruction set states, see [Unimplemented instruction sets on page G1-5237](#). ARMv8 AArch32 state requires a Trivial Jazelle implementation, see [Trivial implementation of the Jazelle extension on page G1-5237](#).

The IT block state

IT[7:0] The If-Then controls for the T32 IT instruction, that applies to the *IT block* of instructions that immediately follow the IT instruction. See [IT on page F5-3942](#) for a description of the IT instruction and its associated IT block.
For more information about the use of `PSTATE.IT` see [Use of PSTATE.IT on page E1-3538](#).

Endianness mapping

E For data accesses, controls the endianness:
0 Little-endian.
1 Big-endian.
If an implementation does not provide:

- Big-endian support for data accesses, this bit is RES0.
- Little-endian support for data accesses, this bit is RES1.

Instruction fetches are always little-endian, and ignore `PSTATE.E`.

Timing control bits

DIT *Data Independent Timing* (DIT) bit. For more information, see [About the DIT bit on page E1-3540](#).
This bit is implemented only when [ARMv8.4-DIT](#) is implemented.
On a reset to AArch32 state, this bit is set to 0.

Accessing PSTATE fields at EL0

The following sections describe which `PSTATE` fields can be directly accessed at EL0, and how they can be accessed:

- [The Application Program Status Register, APSR](#).
