This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c10, c3, 1	100	001	1010	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If [SCR_EL3.NS == 1](#) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H == 0](#) && [HSTR_EL2.T10 == 1](#), then accesses at EL1 are trapped to EL2.
- If [SCR_EL3.NS == 1](#) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H == 1](#) && [HCR_EL2.TGE == 0](#) && [HSTR_EL2.T10 == 1](#), then accesses at EL1 are trapped to EL2.
- If [SCR_EL3.NS == 1](#) && [IsUsingAArch32\(EL2\)](#) && [HSTR.T10 == 1](#), then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.60 HCPTR, Hyp Architectural Feature Trap Register

The HCPTR characteristics are:

Purpose

Controls:

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

Note

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the [CPACR](#) and [NSACR](#).
- From Hyp mode are also affected by settings in the [NSACR](#).

Exceptions generated by the [CPACR](#) and [NSACR](#) controls are higher priority than those generated by the HCPTR controls.

Configurations

AArch32 System register HCPTR[31:0] is architecturally mapped to AArch64 System register [CPTR_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

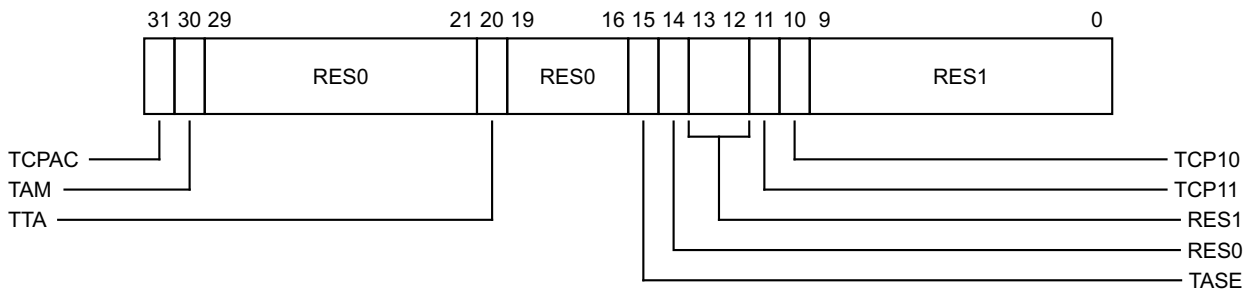

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HCPTR is a 32-bit register.

Field descriptions

The HCPTR bit assignments are:

TCPAC, bit [31]

Traps Non-secure EL1 accesses to the [CPACR](#) to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 accesses to the [CPACR](#) are trapped to Hyp mode.

Note

The [CPACR](#) is not accessible at EL0.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TAM, bit [30]

When AMUv1 is implemented:

Trap Activity Monitor access. Traps Non-secure EL1 and EL0 accesses to all Activity Monitor registers to EL2.

- 0b0 Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are not trapped.
- 0b1 Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are trapped to Hyp mode.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps Non-secure System register accesses to all implemented trace registers to Hyp mode.

- 0b0 This control does not cause any instructions to be trapped.
- 0b1 Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates:

- A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.
- An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, it is IMPLEMENTATION DEFINED whether this bit:

- Is RES0.
- Is RES1.
- Can be written from Hyp mode, and from Secure Monitor mode when SCR.NS is 1.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Bits [19:16]

Reserved, RES0.

TASE, bit [15]

Traps Non-secure execution of Advanced SIMD instructions to Hyp mode when the value of HCPTR.TCP10 is 0.

0b0 This control does not cause any instructions to be trapped.

0b1 When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:

- A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.
- An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see *Controls of Advanced SIMD operation that do not apply to floating-point operation* on page E1-3548.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [14]

Reserved, RES0.

Bits [13:12]

Reserved, RES1.

TCP11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TCP10, bit [10]

Trap Non-secure accesses to Advanced SIMD and floating-point functionality to Hyp mode:

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempted access to Advanced SIMD and floating-point functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:

- A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.
- An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of `NSACR.cp10` is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Bits [9:0]

Reserved, RES1.

Accessing the HCPTR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 2	100	010	0001	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `IsUsingAArch64(EL3) && CPTR_EL3.TCPAC == 1`, then accesses at EL2 are trapped to EL3.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T1 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.61 HCR, Hyp Configuration Register

The HCR characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to Hyp mode.

Configurations

AArch32 System register HCR[31:0] is architecturally mapped to AArch64 System register [HCR_EL2\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HCR is a 32-bit register.

Field descriptions

The HCR bit assignments are:

Bit [31]

Reserved, RES0.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which read accesses are trapped are as follows:

[SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIRO](#), [MAIR1](#), [AMAIRO](#), [AMAIR1](#), [CONTEXTIDR](#).

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

HCD, bit [29]

HVC instruction disable. Disables Non-secure EL1 and EL2 execution of HVC instructions, when EL2 is enabled in the current Security state.

0b0 HVC instruction execution is enabled at EL2 and EL1.

0b1 HVC instructions are UNDEFINED at EL2 and Non-secure EL1.
The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed.

————— Note —————

HVC instructions are always UNDEFINED at EL0.

This bit is only implemented if EL3 is not implemented. Otherwise, it is RES0.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [28]

Reserved, RES0.

TGE, bit [27]

Trap General Exceptions, from Non-secure EL0.

0b0 This control has no effect on execution at EL0.

0b1 When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0.

When EL2 is enabled in the current Security state, then:

- All exceptions that would be routed to EL1 are routed to EL2.
- The [SCTLR.M](#) bit is treated as being 0 for all purposes other than returning the result of a direct read of [SCTLR](#).
- The [HCR.{FMO, IMO, AMO}](#) bits are treated as being 1 for all purposes other than returning the result of a direct read of [HCR](#).
- All virtual interrupts are disabled.
- Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.
- An exception return to EL1 is treated as an illegal exception return.
- Monitor mode execution of an MSR or CPS instruction that changes [CPSR.M](#) to a Non-secure EL1 mode is an illegal change to [PSTATE.M](#). For more information see [Illegal changes to PSTATE.M on page G1-5235](#).

Also, when [HCR.TGE](#) is 1:

- If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing [SCR.NS](#) from 0 to 1 results in [SCR.NS](#) remaining as 0.
- The [HDCR.{TDRA, TDOSA, TDA, TDE}](#) bits are ignored and treated as being 1 other than for the purpose of a direct read of [HDCR](#).

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TVM, bit [26]

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which write accesses are trapped are as follows:

SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 write accesses to the specified virtual memory control registers are trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS, ITLBIALL, ITLBIMVA, ITLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBIMVAAL

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 accesses to the specified TLB maintenance instructions are trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- ICIMVAU, ICIALLU, ICIALLUIS, DCCMVAU.

———— Note ————

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TPC, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- DCIMVAC, DCCIMVAC, DCCMVAC.

———— Note ————

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps Non-secure EL1 execution of those cache maintenance instructions by set/way to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- [DCISW](#), [DCCSW](#), [DCCISW](#).

———— Note ————

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TAC, bit [21]

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states.

This applies to the following register accesses:

[ACTLR](#) and, if implemented, [ACTLR2](#).

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 accesses to the specified registers are trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps Non-secure EL1 accesses to the encodings for IMPLEMENTATION DEFINED System Registers to EL2, when EL2 is enabled in the current Security state.

MCR and MRC instructions accessing the following encodings:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 =={0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

When HCR.TIDCP is set to 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from Non-secure EL0 is trapped to EL2. Otherwise, it is UNDEFINED and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TSC, bit [19]

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of [SCR.SCD](#).

The ARMv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

————— **Note** —————

- This trap is only implemented if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TID3, bit [18]

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

[ID_PFR0](#), [ID_PFR1](#), [ID_DFR0](#), [ID_AFR0](#), [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), [ID_MMFR3](#), [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), [ID_ISAR5](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [ID_MMFR4](#), except that if [ID_MMFR4](#) is implemented as RAZ/WI then it is IMPLEMENTATION DEFINED whether accesses to [ID_MMFR4](#) are trapped.

Also, an MRC access to any of the following encodings:

- coproc==p15, opc1 == 0, CRn == c0, CRm == {c3-c7}, opc2 == {0,1}.
- coproc==p15, opc1 == 0, CRn == c0, CRm == c3, opc2 == 2.
- coproc==p15, opc1 == 0, CRn == c0, CRm == c5, opc2 == {4,5}.

It is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to the following encodings:

- coproc==p15, opc1 == 0, CRn == c0, CRm == c2, opc2 == 7.
- coproc==p15, opc1 == 0, CRn == c0, CRm == c3, opc2 == {3-7}.
- coproc==p15, opc1 == 0, CRn == c0, CRm == {c4, c6, c7}, opc2 == {2-7}.
- coproc==p15, opc1 == 0, CRn == c0, CRm == c5, opc2 == {2, 3, 6, 7}.

0b0 This control does not cause any instructions to be trapped.

0b1 The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 and EL0 reads of the [CTR](#), [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- Non-secure EL1 and EL0 writes to the [CSSELR](#).

0b0 This control does not cause any instructions to be trapped.

0b1 The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TID1, bit [16]

Trap ID group 1. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

[TCMTR](#), [TLBTR](#), [REVIDR](#), [AIDR](#).

0b0 This control does not cause any instructions to be trapped.

0b1 The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to EL2. In a system where the PE resets into EL2 or EL3, this field resets to 0.

TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 reads of the **JIDR** and **FPSID**.
- If the **JIDR** is RAZ from Non-secure EL0, Non-secure EL0 reads of the **JIDR**.

———— **Note** ————

- It is IMPLEMENTATION DEFINED whether the **JIDR** is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The **FPSID** is not accessible at EL0.
- Writes to the **FPSID** are ignored, and not trapped by this control.

0b0 This control does not cause any instructions to be trapped.

0b1 The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to EL2. In a system where the PE resets into EL2 or EL3, this field resets to 0.

TWE, bit [14]

Traps Non-secure EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by **SCTLR.nTWE**.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TWI, bit [13]

Traps Non-secure EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by **SCTLR.nTWI**.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

DC, bit [12]

Default Cacheability.

0b0 This control has no effect on the Non-secure EL1&0 translation regime.

0b1 In Non-secure state:

- The `SCTLR.M` field behaves as 0 for all purposes other than a direct read of the value of the field.
- The `HCR.VM` field behaves as 1 for all purposes other than a direct read of the value of the field.
- The memory type produced by the first stage of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2 and EL3 translation regimes.

This field is permitted to be cached in a TLB.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:

0b00 No effect.

0b01 Inner Shareable.

0b10 Outer Shareable.

0b11 Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

`BPIALL`, `TLBIALL`, `TLBIMVA`, `TLBIASID`, `DTLBIALL`, `DTLBIMVA`, `DTLBIASID`,
`ITLBIALL`, `ITLBIMVA`, `ITLBIASID`, `TLBIMVAA`, `ICIALLU`, `TLBIMVAL`, `TLBIMVAAL`.

0b0 This field has no effect on the operation of the specified instructions.

0b1 When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

VA, bit [8]

Virtual SError interrupt exception.

0b0 This mechanism is not making a virtual SError interrupt pending.

0b1 A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is enabled only when the value of `HCR.{TGE, AMO}` is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

VI, bit [7]

Virtual IRQ exception.

0b0 This mechanism is not making a virtual IRQ pending.

0b1 A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of `HCR.{TGE, IMO}` is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception. In a system where the PE resets into EL2 or EL3, this field resets to 0.

VF, bit [6]

Virtual FIQ exception.

0b0 This mechanism is not making a virtual FIQ pending.

0b1 A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception. In a system where the PE resets into EL2 or EL3, this field resets to 0.

AMO, bit [5]

SError interrupt Mask Override. When this bit is set to 1, it overrides the effect of CPSR.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then virtual SError interrupts are enabled in Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

IMO, bit [4]

IRQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

FMO, bit [3]

FIQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

PTW, bit [2]

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

0b0 The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.

0b1 The memory access generates a stage 2 Permission fault.

This field is permitted to be cached in a TLB.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

SWIO, bit [1]

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

0b0 This control has no effect on the operation of data cache invalidate by set/way instructions.

0b1 Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When this bit is set to 1, **DCISW** performs the same invalidation as a **DCCISW** instruction.

As a result of changes to the behavior of **DCISW**, this bit is redundant in ARMv8. This bit can be implemented as RES1.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime.

0b0 Non-secure EL1&0 stage 2 address translation disabled.

0b1 Non-secure EL1&0 stage 2 address translation enabled.

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing the HCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 0	100	000	0001	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `HSTR.T1 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.62 HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

Purpose

Provides additional configuration controls for virtualization.

Configurations

AArch32 System register HCR2[31:0] is architecturally mapped to AArch64 System register [HCR_EL2](#)[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HCR2 is a 32-bit register.

Field descriptions

The HCR2 bit assignments are:

Bits [31:7]

Reserved, RES0.

MIOCNCEN, bit [6]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure PL1&0 translation regime.

0b0 For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

0b1 For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information see [Mismatched memory attributes](#) on page E2-3596.

This field can be implemented as RAZ/WI.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

TEA, bit [5]

Route synchronous External abort exceptions from EL0 and EL1 to EL2. If the RAS Extension is implemented, the possible values of this bit are:

- 0b0 Does not route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2.
- 0b1 Route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3.

When the RAS Extension is not implemented, this field is RES0.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

TERR, bit [4]

When RAS is implemented:

Trap Error record accesses from EL1 to EL2. Trap accesses to the following registers from EL1 to EL2:

[ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#). When ARMv8.4-RAS is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

- 0b0 This control does not cause any instructions to be trapped.
- 0b1 Accesses to the specified registers from EL1 generate a Trap exception to EL2.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

ID, bit [1]

Stage 2 Instruction access cacheability disable. For the Non-secure PL1&0 translation regime, when [HCR.VM==1](#), this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

- 0b0 This control has no effect on stage 2 of the Non-secure PL1&0 translation regime.
- 0b1 For the Non-secure PL1&0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

CD, bit [0]

Stage 2 Data access cacheability disable. When [HCR.VM==1](#), this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.

- 0b0 This control has no effect on stage 2 of the Non-secure PL1&0 translation regime for data accesses and translation table walks.
- 0b1 For the Non-secure PL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing the HCR2

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 4	100	100	0001	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T1 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.63 HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

Configurations

AArch32 System register HDFAR[31:0] is architecturally mapped to AArch64 System register FAR_EL2[31:0].

AArch32 System register HDFAR[31:0] is architecturally mapped to AArch32 System register DFAR[31:0] (S) when IsExceptionLevelImplemented(EL2).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HDFAR is a 32-bit register.

Field descriptions

The HDFAR bit assignments are:

Bits [31:0]

VA of faulting address of synchronous Data Abort exception taken to Hyp mode.

On a Prefetch Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Accessing the HDFAR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c6, c0, 0	100	000	0110	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T6 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T6 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T6 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.64 HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

Configurations

AArch32 System register HIFAR[31:0] is architecturally mapped to AArch64 System register FAR_EL2[63:32].

AArch32 System register HIFAR[31:0] is architecturally mapped to AArch32 System register IFAR[31:0] (S) when IsExceptionLevelImplemented(EL2).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HIFAR is a 32-bit register.

Field descriptions

The HIFAR bit assignments are:

Bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode.

On a Data Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Accessing the HIFAR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c6, c0, 2	100	010	0110	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T6 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T6 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T6 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.65 HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

Purpose

Along with [HMAIR1](#), provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, [HMAIR1](#) is used.

Configurations

AArch32 System register HMAIR0[31:0] is architecturally mapped to AArch64 System register [MAIR_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HMAIR0 is a 32-bit register.

Field descriptions

The HMAIR0 bit assignments are:

When *TTBCR.EAE* == 1:

Attr<n>, bits [8n+7:8n], for n = 0 to 3

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the HMAIR0

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c10, c2, 0	100	000	1010	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T10 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T10 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T10 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.66 HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

Purpose

Along with [HMAIR0](#), provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIdx[2] indicates the HMAIR register to be used:

- When AttrIdx[2] is 0, [HMAIR0](#) is used.
- When AttrIdx[2] is 1, HMAIR1 is used.

Configurations

AArch32 System register HMAIR1[31:0] is architecturally mapped to AArch64 System register [MAIR_EL2](#)[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HMAIR1 is a 32-bit register.

Field descriptions

The HMAIR1 bit assignments are:

When *TTBCR.EAE* == 1:

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the HMAIR1

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c10, c2, 1	100	001	1010	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T10 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T10 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T10 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.67 HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

Configurations

AArch32 System register HPFAR[31:0] is architecturally mapped to AArch64 System register [HPFAR_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HPFAR is a 32-bit register.

Field descriptions

The HPFAR bit assignments are:

Execution in any Non-secure mode other than Hyp mode makes this register UNKNOWN.

FIPA[39:12], bits [31:4]

Bits [39:12] of the faulting intermediate physical address.

This field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing the HPFAR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c6, c0, 4	100	100	0110	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T6 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T6 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T6 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.68 HRMR, Hyp Reset Management Register

The HRMR characteristics are:

Purpose

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configurations

AArch32 System register HRMR[31:0] is architecturally mapped to AArch64 System register RMR_EL2[31:0].

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

Attributes

HRMR is a 32-bit register.

Field descriptions

The HRMR bit assignments are:

Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

AA64, bit [0]

When EL2 can use AArch64, determines which Execution state the PE boots into after a Warm reset:

- 0b0 AArch32.
- 0b1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

Accessing the HRMR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c12, c0, 2	100	010	1100	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a

When HRMR is not implemented, the encoding for this register is UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T12 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T12 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T12 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.69 HSCTLR, Hyp System Control Register

The HSCTLR characteristics are:

Purpose

Provides top level control of the system operation in Hyp mode.

Configurations

AArch32 System register HSCTLR[31:0] is architecturally mapped to AArch64 System register SCTL_R_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

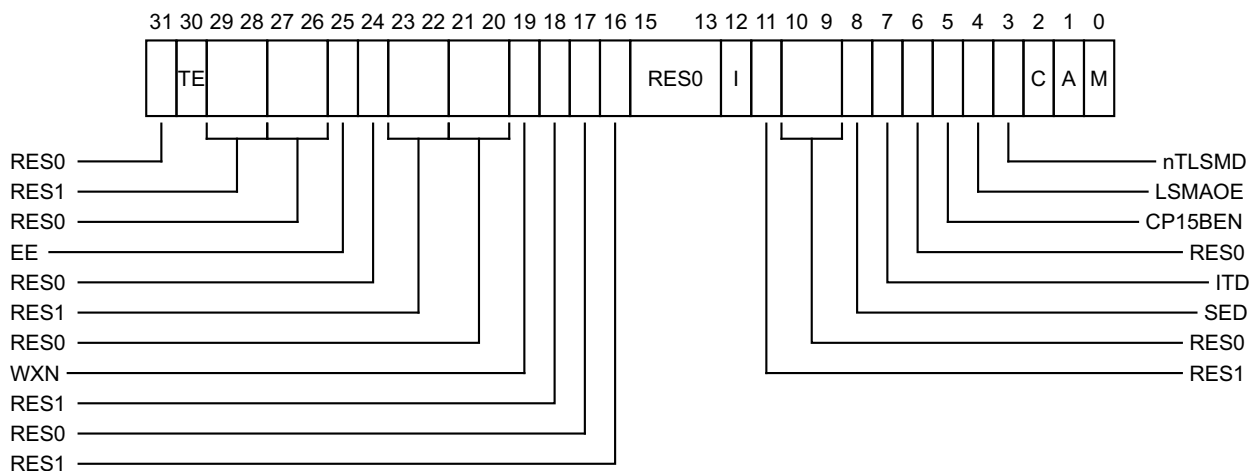

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HSCTLR is a 32-bit register.

Field descriptions

The HSCTLR bit assignments are:

Bit [31]

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

0b0 Exceptions, including reset, taken to A32 state.

0b1 Exceptions, including reset, taken to T32 state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bits [29:28]

Reserved, RES1.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the EL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

- 0b0 Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are little-endian.
- 0b1 Big-endian. PSTATE.E is set to 1 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bits [23:22]

Reserved, RES1.

Bits [21:20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- 0b0 This control has no effect on memory access permissions.
- 0b1 Any region that is writable in the EL2 translation regime is forced to XN for accesses from software executing at EL2.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:13]

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

- 0b0 All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache.
If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1 All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache.
If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the PL1&0 translation regime.

In a system where the PE resets into EL2, this field resets to 0.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL2.

0b0 SETEND instruction execution is enabled at EL2.

0b1 SETEND instructions are UNDEFINED at EL2.

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL2.

0b0 All IT instruction functionality is enabled at EL2.

0b1 Any attempt at EL2 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with hw1[3:0]! = 1000.
- All encodings of the subsequent instruction with the following values for hw1:
 - 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
 - 1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the ARMv8 ARM, section F3.2.5.
 - 10100xxxxxxxxxxxx: ADD Rd, PC, #imm
 - 01001xxxxxxxxxxxx: LDR Rd, [PC, #imm]
 - 0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
 - 010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see [Changes to an ITD control by an instruction in an IT block on page E1-3540](#)

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAZ/WI.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL2:

0b0 EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.

0b1 EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAO/WI.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

LSMAOE, bit [4]

When ARMv8.2-LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

0b0 For all memory accesses at EL2, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.

0b1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL2 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

0b0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

0b1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL2:

0b0 All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.

0b1 All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache.

This bit has no effect on the PL1&0 translation regime.

In a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

- 0b0 Alignment fault checking disabled when executing at EL2.
Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed.
- 0b1 Alignment fault checking enabled when executing at EL2.
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

- 0b0 EL2 stage 1 address translation disabled.
See the HSCTLR.I field for the behavior of instruction accesses to Normal memory.
- 0b1 EL2 stage 1 address translation enabled.

In a system where the PE resets into EL2, this field resets to 0.

Accessing the HSCTLR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c0, 0	100	000	0001	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `HSTR.T1 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.70 HSR, Hyp Syndrome Register

The HSR characteristics are:

Purpose

Holds syndrome information for an exception taken to Hyp mode.

Configurations

AArch32 System register HSR[31:0] is architecturally mapped to AArch64 System register [ESR_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HSR is a 32-bit register.

Field descriptions

The HSR bit assignments are:

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:

EC == 0b000000

Unknown reason.

See [ISS encoding for exceptions with an unknown reason](#).

EC == 0b000001

Trapped WFI or WFE instruction execution.

Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

See [ISS encoding for an exception from a WFI or WFE instruction](#).

EC == 0b000011

Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.

See [ISS encoding for an exception from an MCR or MRC access](#).

EC == 0b000100

Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.

See [ISS encoding for an exception from an MCRR or MRRC access](#).

EC == 0b000101

Trapped MCR or MRC access with (coproc==0b1110).

See [ISS encoding for an exception from an MCR or MRC access](#).

EC == 0b000110

Trapped LDC or STC access.

The only architected uses of these instructions are:

- An STC to write data to memory from [DBGDTRRXint](#).
- An LDC to read data from memory to [DBGDTRXint](#).

See [ISS encoding for an exception from an LDC or STC instruction](#).

EC == 0b000111

Access to Advanced SIMD or floating-point functionality trapped by a [HCPTR](#). {TASE, TCP10} control.

Excludes exceptions generated because Advanced SIMD and floating-point are not implemented. These are reported with EC value [0b000000](#).

See [ISS encoding for an exception from an access to SIMD or floating-point functionality, resulting from HCPTR](#).

EC == 0b001000

Trapped VMRS access, from ID group trap, that is not reported using EC [0b000111](#).

See [ISS encoding for an exception from an MCR or MRC access](#).

EC == 0b001100

Trapped MRRC access with (coproc==[0b1110](#)).

See [ISS encoding for an exception from an MCRR or MRRC access](#).

EC == 0b001110

Illegal exception return to AArch32 state.

See [ISS encoding for an exception from an Illegal state or PC alignment fault](#).

EC == 0b010001

Exception on SVC instruction execution in AArch32 state routed to EL2.

See [ISS encoding for an exception from HVC or SVC instruction execution](#).

EC == 0b010010

HVC instruction execution in AArch32 state, when HVC is not disabled.

See [ISS encoding for an exception from HVC or SVC instruction execution](#).

EC == 0b010011

Trapped execution of SMC instruction in AArch32 state.

See [ISS encoding for an exception from SMC instruction execution](#).

EC == 0b100000

Prefetch Abort from a lower Exception level.

See [ISS encoding for an exception from a Prefetch Abort](#).

EC == 0b100001

Prefetch Abort taken without a change in Exception level.

See [ISS encoding for an exception from a Prefetch Abort](#).

EC == 0b100010

PC alignment fault exception.

See [ISS encoding for an exception from an Illegal state or PC alignment fault](#).

EC == 0b100100

Data Abort from a lower Exception level.

See [ISS encoding for an exception from a Data Abort](#).

EC == 0b100101

Data Abort taken without a change in Exception level.

See [ISS encoding for an exception from a Data Abort](#).

All other EC values are reserved by ARM, and:

- Unused values in the range [0b000000](#) - [0b101100](#) ([0x00](#) - [0x2C](#)) are reserved for future use for synchronous exceptions.

- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7231.

This field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

- 0b0 16-bit instruction trapped.
- 0b1 32-bit instruction trapped.

This field is RES1 and not valid for the following cases:

- When the EC field is 0b000000, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Aborts for which the HSR.ISS.ISV field is 0.
- When the EC value is 0b001110, indicating an Illegal state exception.

———— Note —————

This is a change from the behavior in ARMv7, where the IL field is UNK/SBZP for the corresponding cases.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

This field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

The following subsections describe each ISS format.

ISS encoding for exceptions with an unknown reason

Bits [24:0]

Reserved, RES0.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction in the current PE mode in the current Security state, including:
 - A read access using a System register encoding pattern that is not allocated for reads at the current Exception level and Security state.
 - A write access using a System register encoding pattern that is not allocated for writes at the current Exception level and Security state.
 - Instruction encodings for instructions not implemented in the implementation.

0b1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

0b0 WFI trapped.

0b1 WFE trapped.

This field resets to an architecturally UNKNOWN value.

[Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions on page G1-5333](#) describes the configuration settings for this trap.

ISS encoding for an exception from an MCR or MRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

0b0 The COND field is not valid.

0b1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

This field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0 Write to System register space. MCR instruction.

0b1 Read from System register space. MRC or VMRS instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for traps that are reported using EC value 0b000011:

- *Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers on page G1-5330.*
- *Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page G1-5329.*
- *Traps to Hyp mode of Non-secure EL1 execution of cache maintenance instructions on page G1-5328.*
- *Traps to Hyp mode of Non-secure EL1 execution of TLB maintenance instructions on page G1-5327.*
- *Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register on page G1-5328.*
- *Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers on page G1-5341.*
- *Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers on page G1-5333.*
- *Traps to Hyp mode of Non-secure EL1 accesses to the CPACR on page G1-5335.*
- *Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers on page G1-5326.*
- *General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 0b1111) encoding space on page G1-5337.*

The following sections describe configuration settings for traps that are reported using EC value 0b000101:

- *ID group 0, Primary device identification registers on page G1-5331.*
- *Traps to Hyp mode of Non-secure System register accesses to trace registers on page G1-5336.*
- *Trapping Non-secure System register accesses to Debug ROM registers on page G1-5339.*
- *Trapping Non-secure System register accesses to powerdown debug registers on page G1-5339.*

The following sections describes configuration settings for traps that are reported using EC value 0b001000:

- *ID group 0, Primary device identification registers on page G1-5331.*
- *ID group 3, Detailed feature identification registers on page G1-5332.*

ISS encoding for an exception from an MCRR or MRRC access

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bits [15:14]

Reserved, RES0.

Rt2, bits [13:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.
This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.
This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

- 0b0 Write to System register space. MCRR instruction.
- 0b1 Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for traps that are reported using EC value 0b000100:

- [Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers on page G1-5326.](#)
- [Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers on page G1-5341.](#)
- [Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers on page G1-5333.](#)
- [Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the Generic Timer registers on page G1-5340.](#)
- [General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the \(coproc==0b1111\) encoding space on page G1-5337.](#)

The following sections describe configuration settings for traps that are reported using EC value 0b001100:

- [Traps to Hyp mode of Non-secure System register accesses to trace registers on page G1-5336.](#)
- [Trapping Non-secure System register accesses to Debug ROM registers on page G1-5339.](#)

ISS encoding for an exception from an LDC or STC instruction

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bits [11:9]

Reserved, RES0.

Rn, bits [8:5]

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

- 0b0 Subtract offset.
- 0b1 Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

- 0b000 Immediate unindexed.
- 0b001 Immediate post-indexed.
- 0b010 Immediate offset.
- 0b011 Immediate pre-indexed.
- 0b100 Literal unindexed.

LDC instruction in A32 instruction set only.

For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.

0b110 Literal offset.
LDC instruction only.
For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

0b0 Write to memory. STC instruction.
0b1 Read from memory. LDC instruction.

This field resets to an architecturally UNKNOWN value.

Trapping general Non-secure System register accesses to debug registers on page G1-5339 describes the configuration settings for the trap that is reported using EC value 0b000110.

ISS encoding for an exception from an access to SIMD or floating-point functionality, resulting from HCPTR

Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of HCR.TGE or HCR_EL2.TGE is 1. These are reported with EC value 0b000000.

CV, bit [24]

Condition code valid. Possible values of this bit are:

0b0 The COND field is not valid.
0b1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:6]

Reserved, RES0.

TA, bit [5]

Indicates trapped use of Advanced SIMD functionality. The possible values of this bit are:

- 0b0 Exception was not caused by trapped use of Advanced SIMD functionality.
- 0b1 Exception was caused by trapped use of Advanced SIMD functionality.

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the HCPTR sets this bit to 1.

For a list of these instructions, see [Controls of Advanced SIMD operation that do not apply to floating-point operation on page E1-3548](#).

This field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

coproc, bits [3:0]

When the TA field returns the value 1, this field returns the value 1010, otherwise this field is RES0.

This field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- [General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers on page G1-5334](#).
- [Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality on page G1-5335](#).

ISS encoding for an exception from HVC or SVC instruction execution

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- For the T32 instruction, this field is zero-extended from the imm8 field of the instruction. For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

Supervisor Call exception, when the value of HCR.TGE is 1 on page G1-5255 describes the configuration settings for the trap reported with EC value 0b010001.

ISS encoding for an exception from SMC instruction execution

CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0b0 The COND field is not valid.
- 0b1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.

- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

0b0 The instruction was unconditional, or was conditional and passed its condition code check.

0b1 The instruction was conditional, and might have failed its condition code check.

This field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

Traps to Hyp mode of Non-secure EL1 execution of SMC instructions on page G1-5330 describes the configuration settings for this trap, for instructions executed in Non-secure EL1.

ISS encoding for an exception from a Prefetch Abort

Bits [24:11]

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0b0 HIFAR is valid.

0b1 HIFAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.

0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

0b000000 Address size fault, translation table base register.

0b000001 Address size fault, level 1.

0b000010 Address size fault, level 2.

0b000011 Address size fault, level 3.

0b000101 Translation fault, level 1.

0b000110 Translation fault, level 2.

0b000111 Translation fault, level 3.

0b001001 Access flag fault, level 1.

0b001010 Access flag fault, level 2.

0b001011 Access flag fault, level 3.

0b001101 Permission fault, level 1.

0b001110 Permission fault, level 2.

0b001111 Permission fault, level 3.

0b010000 Synchronous External abort, not on translation table walk.

0b010101 Synchronous External abort, on translation table walk, level 1.

0b010110 Synchronous External abort, on translation table walk, level 2.

0b010111 Synchronous External abort, on translation table walk, level 3.

0b011000 Synchronous parity or ECC error on memory access, not on translation table walk.

0b011101 Synchronous parity or ECC error on memory access on translation table walk, level 1.

0b011110 Synchronous parity or ECC error on memory access on translation table walk, level 2.

0b011111 Synchronous parity or ECC error on memory access on translation table walk, level 3.

0b100010 Debug exception.

0b110000 TLB conflict abort.

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011101, 0b011110, and 0b011111, are reserved.

Note

ARMv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Long-descriptor translation table lookup on page G5-5566](#).

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- [Abort exceptions, when the value of HCR.TGE is 1 on page G1-5255.](#)
- [Routing debug exceptions to EL2 using AArch32 on page G1-5256.](#)

ISS encoding for an exception from an Illegal state or PC alignment fault

Bits [24:0]

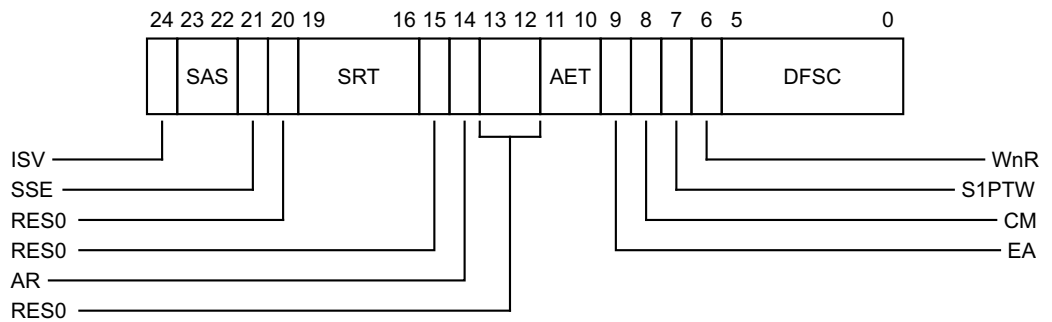

Reserved, RES0.

For more information about the Illegal state exception, see:

- [Illegal changes to PSTATE.M on page G1-5235.](#)
- [Illegal return events from AArch32 state on page G1-5262.](#)
- [Legal returns that set PSTATE.IL to 1 on page G1-5264.](#)
- [The Illegal Execution state exception on page G1-5264.](#)

For more information about the PC alignment fault exception, see [Branching to an unaligned PC on page K1-7196.](#)

ISS encoding for an exception from a Data Abort

ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

- 0b0 No valid instruction syndrome. ISS[23:14] are RES0.
- 0b1 ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults except Data Aborts generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
- The instruction is not performing register writeback.

- The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, as described in *Data Aborts in Memory access mode* on page H4-6486, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

———— **Note** ————

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

ISV is set to 0 on a stage 2 abort on a stage 1 translation table walk.

When the RAS Extension is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

This field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

Bit [20]

Reserved, RES0.

SRT, bits [19:16]

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

0b0 Instruction did not have acquire/release semantics.

0b1 Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

Bits [13:12]

Reserved, RES0.

AET, bits [11:10]

Asynchronous Error Type.

When the RAS Extension is implemented and the value returned in the DFSC field is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

0b00 Uncontainable error (UC) or uncategorized.

0b01 Unrecoverable error (UEU).

0b10 Restartable error (UEO) or Corrected error (CE).

0b11 Recoverable error (UER).

On a synchronous Data Abort, this field is RES0.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

———— Note —————

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

When the RAS Extension is not implemented, or when DFSC is not 0b010001:

- Bit[11] is RES0.
- Bit[10] forms the FnV field.

———— Note —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:

0b0 Fault not generated by a cache maintenance or address translation instruction.

0b1 Fault generated by a cache maintenance or address translation instruction.

For an asynchronous Data Abort exception, this bit is 0.

This field resets to an architecturally UNKNOWN value.

SIPTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0b0 Fault not on a stage 2 translation for a stage 1 translation table walk.

0b1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction. The possible values of this bit are:

0b0 Abort caused by a read instruction.

0b1 Abort caused by a write instruction.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

On an asynchronous Data Abort:

- When the RAS Extension is not implemented, this bit is UNKNOWN.
- When the RAS Extension is implemented, this bit is RES0.

————— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

0b000000 Address size fault, translation table base register.

0b000001 Address size fault, level 1.

0b000010 Address size fault, level 2.

0b000011 Address size fault, level 3.

0b000101 Translation fault, level 1.

0b000110 Translation fault, level 2.

0b000111 Translation fault, level 3.

0b001001 Access flag fault, level 1.

0b001010 Access flag fault, level 2.

0b001011 Access flag fault, level 3.

0b001101 Permission fault, level 1.

0b001110 Permission fault, level 2.

0b001111 Permission fault, level 3.

0b010000 Synchronous External abort, not on translation table walk.

0b010001 SError interrupt.

0b010101 Synchronous External abort, on translation table walk, level 1.

0b010110 Synchronous External abort, on translation table walk, level 2.

0b010111 Synchronous External abort, on translation table walk, level 3.

0b011000 Synchronous parity or ECC error on memory access, not on translation table walk.

0b011001 SError interrupt from a parity or ECC error on memory access.

- 0b011101 Synchronous parity or ECC error on memory access on translation table walk, level 1.
- 0b011110 Synchronous parity or ECC error on memory access on translation table walk, level 2.
- 0b011111 Synchronous parity or ECC error on memory access on translation table walk, level 3.
- 0b100001 Alignment fault.
- 0b100010 Debug exception.
- 0b110000 TLB conflict abort.
- 0b110100 IMPLEMENTATION DEFINED fault (Lockdown).
- 0b110101 IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011001, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Long-descriptor translation table lookup on page G5-5566](#).

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100100:

- [Abort exceptions, when the value of HCR.TGE is 1 on page G1-5255](#).
- [Routing debug exceptions to EL2 using AArch32 on page G1-5256](#).

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of 0b100000 or 0b100100:

- [Hyp mode control of Non-secure access permissions on page G5-5511](#).
- [Memory fault reporting in Hyp mode on page G5-5570](#).

Accessing the HSR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c5, c2, 0	100	000	0101	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.71 HSTR, Hyp System Trap Register

The HSTR characteristics are:

Purpose

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to System registers in the coproc == 0b1111 encoding space:

- By the CRn value used to access the register using MCR or MRC instruction.
- By the CRm value used to access the register using MCRR or MRRC instruction.

Configurations

AArch32 System register HSTR[31:0] is architecturally mapped to AArch64 System register HSTR_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

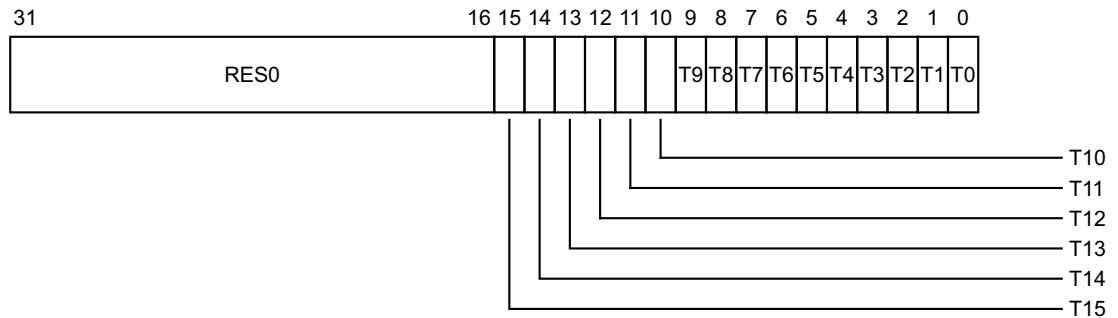

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HSTR is a 32-bit register.

Field descriptions

The HSTR bit assignments are:

Bits [31:16]

Reserved, RES0.

T<n>, bit [n], for n = 0 to 15

Fields T14 and T4 are RES0.

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space are trapped to Hyp mode:

- 0b0 This control has no effect on Non-secure EL0 or EL1 accesses to System registers.
- 0b1 Any Non-secure EL1 MCR or MRC access with coproc == 0b1111 and CRn == <n> is trapped to Hyp mode. A Non-secure EL0 MCR or MRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0.
 Any Non-secure EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == <n> is trapped to Hyp mode. A Non-secure EL0 MCRR or MRRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0.

For example, when HSTR.T7 is 1, for instructions executed at Non-secure EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to Hyp mode.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to Hyp mode.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing the HSTR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 3	100	011	0001	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T1 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.72 HTCR, Hyp Translation Control Register

The HTCR characteristics are:

Purpose

The control register for stage 1 of the EL2 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configurations

AArch32 System register HTCR[31:0] is architecturally mapped to AArch64 System register [TCR_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

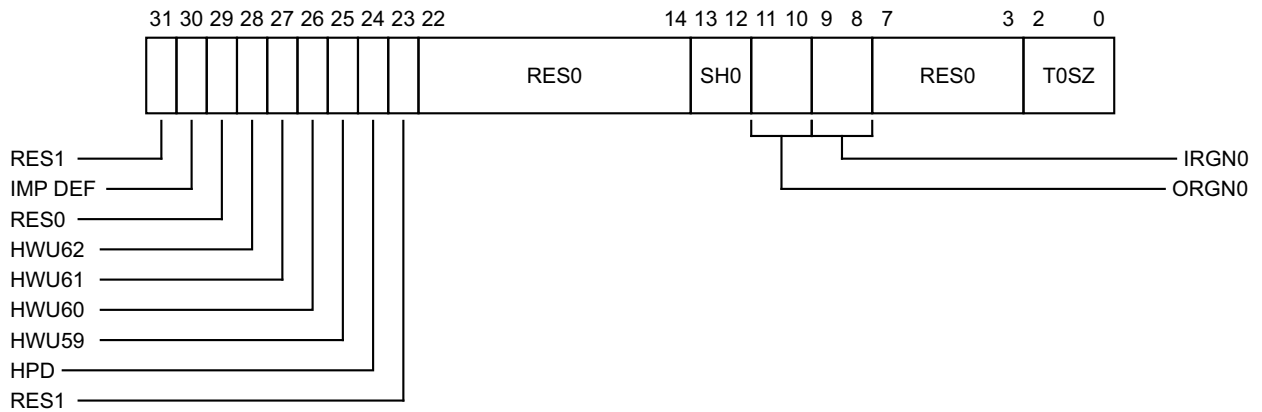

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HTCR is a 32-bit register.

Field descriptions

The HTCR bit assignments are:

Bit [31]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

HWU62, bit [28]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

0b0 Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The *Effective value* of this field is 0 if the value of HTCR.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

0b0 Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The *Effective value* of this field is 0 if the value of HTCR.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

0b0 Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The *Effective value* of this field is 0 if the value of HTCR.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

0b0 Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The *Effective value* of this field is 0 if the value of HTCR.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When ARMv8.2-AA32HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the PL2 translation regime.

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

Bits [22:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [HTTBR](#).

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7216](#).

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [HTTBR](#).

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [HTTBR](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

Bits [7:3]

Reserved, RES0.

T0SZ, bits [2:0]

The size offset of the memory region addressed by [HTTBR](#). The region size is $2^{(32-T0SZ)}$ bytes.

This field resets to an architecturally UNKNOWN value.

Accessing the HTCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c2, c0, 2	100	010	0010	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T2 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T2 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T2 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.73 HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

Purpose

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

The PE makes no use of this register.

Configurations

AArch32 System register HTPIDR[31:0] is architecturally mapped to AArch64 System register [TPIDR_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Note

The PE never updates this register.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HTPIDR is a 32-bit register.

Field descriptions

The HTPIDR bit assignments are:

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level. This field resets to an architecturally UNKNOWN value.

Accessing the HTPIDR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c13, c0, 2	100	010	1101	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T13 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T13 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T13 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.74 HTTBR, Hyp Translation Table Base Register

The HTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

Configurations

AArch32 System register HTTBR[47:1] is architecturally mapped to AArch64 System register [TTBR0_EL2](#)[47:1].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HTTBR is a 64-bit register.

Field descriptions

The HTTBR bit assignments are:

Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [HTCR.T0SZ](#) as follows:

- If [HTCR.T0SZ](#) is 0 or 1, $x = 5 - \text{HTCR.T0SZ}$.
- If [HTCR.T0SZ](#) is greater than 1, $x = 14 - \text{HTCR.T0SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by HTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

0b0 The translation table entries pointed to by HTTBR are permitted to differ from corresponding entries for HTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of HTTBR.CnP on those other PEs.

0b1 The translation table entries pointed to by HTTBR are the same as the translation table entries pointed to by HTTBR on every other PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

Note

If the value of the HTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those HTTBRs do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see *CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-7199*.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the HTTBR

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 4, <Rt>, <Rt2>, c2	0100	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243* for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T2 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T2 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T2 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.75 HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

Purpose

Holds the vector base address for any exception that is taken to Hyp mode.

Configurations

AArch32 System register HVBAR[31:0] is architecturally mapped to AArch64 System register [VBAR_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HVBAR is a 32-bit register.

Field descriptions

The HVBAR bit assignments are:

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

This field resets to an architecturally UNKNOWN value.

Bits [4:0]

Reserved, RES0.

Accessing the HVBAR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c12, c0, 0	100	000	1100	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T12 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T12 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T12 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.76 ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

Purpose

Invalidate all instruction caches to PoU. If branch predictors are architecturally visible, also flush branch predictors.

Configurations

AArch32 System instruction ICIALLU performs the same function as AArch64 System instruction [IC IALLU](#).

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ICIALLU is a 32-bit System instruction.

Field descriptions

ICIALLU ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the ICIALLU instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c5, 0	000	000	0111	1111	0101

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [ICIALLUIS](#).

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TPU} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HSTR_EL2.T7} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TPU} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HSTR_EL2.T7} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HCR.TPU} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HSTR.T7} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.77 ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

Purpose

Invalidate all instruction caches Inner Shareable to PoU. If branch predictors are architecturally visible, also flush branch predictors.

Configurations

AArch32 System instruction ICIALLUIS performs the same function as AArch64 System instruction [IC IALLUIS](#).

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ICIALLUIS is a 32-bit System instruction.

Field descriptions

ICIALLUIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the ICIALLUIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c1, 0	000	000	0111	1111	0001

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TPU} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HSTR_EL2.T7} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TPU} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HSTR_EL2.T7} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HCR.TPU} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HSTR.T7} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.78 ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

Purpose

Invalidate instruction cache line by virtual address to PoU.

Configurations

AArch32 System instruction ICIMVAU performs the same function as AArch64 System instruction [IC IVAU](#).

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ICIMVAU is a 32-bit System instruction.

Field descriptions

The ICIMVAU input value bit assignments are:

Bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the ICIMVAU instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c5, 1	000	001	0111	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see [AArch32 instruction cache maintenance instructions \(IC*\)](#) on page G4-5436.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TPU} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HSTR_EL2.T7} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TPU} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HSTR_EL2.T7} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HCR.TPU} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HSTR.T7} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.79 ID_AFR0, Auxiliary Feature Register 0

The ID_AFR0 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_AFR0[31:0] is architecturally mapped to AArch64 System register ID_AFR0_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_AFR0 is a 32-bit register.

Field descriptions

The ID_AFR0 bit assignments are:

Bits [31:16]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [15:12]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [11:8]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [7:4]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED, bits [3:0]

IMPLEMENTATION DEFINED.

Accessing the ID_AFR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 3	000	011	0000	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.80 ID_DFR0, Debug Feature Register 0

The ID_DFR0 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G8-5638](#).

Configurations

AArch32 System register ID_DFR0[31:0] is architecturally mapped to AArch64 System register [ID_DFR0_EL1\[31:0\]](#).

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_DFR0 is a 32-bit register.

Field descriptions

The ID_DFR0 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
TraceFilt	PerfMon	MProfDbg	MMapTrc	CopTrc	MMapDbg	CopSDBG	CopDbg	

TraceFilt, bits [31:28]

ARMv8.4 Self-hosted Trace Extension version. Defined values are:

0b0000 ARMv8.4 Self-hosted Trace Extension not implemented.

0b0001 ARMv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

[ARMv8.4-Trace](#) implements the functionality added by the value 0b0001.

From ARMv8.3, the permitted values are 0b0000 and 0b0001.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in [Alternative ID scheme used for the Performance Monitors Extension version on page G8-5640](#).

Defined values are:

0b0000 Performance Monitors Extension not implemented.

0b0001 Performance Monitors Extension version 1 implemented, PMUv1.

0b0010 Performance Monitors Extension version 2 implemented, PMUv2.

0b0011 Performance Monitors Extension version 3 implemented, PMUv3.

0b0100 PMUv3 for ARMv8.1. As 0b0011, and also includes support for:

- Extended 16-bit [PMEVTYPER<n>.evtCount](#) field.
- If EL2 is implemented, the [HDCR.HPMD](#) control bit.

0b0101 PMUv3 for ARMv8.4. As 0b0100 and also includes support for the [PMMIR](#) register.

0b1111 IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations.

ARMv8.1-PMU implements the functionality added by the value 0b0100.

ARMv8.4-PMU implements the functionality added by the value 0b0101.

All other values are reserved.

In any ARMv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From ARMv8.1, the value 0b0011 is not permitted.

From ARMv8.4, the value 0b0100 is not permitted.

———— **Note** —————

In ARMv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an ARMv8 implementation.

MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

0b0000 Not supported.

0b0001 Support for M profile Debug architecture, with memory-mapped access.

All other values are reserved.

In ARMv8-A, the only permitted value is 0b0000.

MMapTrc, bits [19:16]

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

0b0000 Not supported.

0b0001 Support for ARM trace architecture, with memory-mapped access.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

0b0000 Not supported.

0b0001 Support for ARM trace architecture, with System registers access.

All other values are reserved.

In ARMv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

MMapDbg, bits [11:8]

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In ARMv8-A, this field is RES0.

The optional memory map defined by ARMv8 is not compatible with ARMv7.

CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:

- 0b0000 Not supported.
- 0b0010 Support for ARMv6, v6 Debug architecture, with System registers access.
- 0b0011 Support for ARMv6, v6.1 Debug architecture, with System registers access.
- 0b0100 Support for ARMv7, v7 Debug architecture, with System registers access.
- 0b0101 Support for ARMv7, v7.1 Debug architecture, with System registers access.
- 0b0110 Support for ARMv8 debug architecture, with System registers access.
- 0b0111 Support for ARMv8 debug architecture, with System registers access, and Virtualization Host extensions.
- 0b1000 Support for ARMv8.2 debug architecture.
- 0b1001 Support for ARMv8.4 debug architecture.

All other values are reserved.

In any ARMv8 implementation, the values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

If [ARMv8.1-VHE](#) is not implemented, the only permitted value is 0b0110.

In an ARMv8.0 implementation, the value 0b1000 is not permitted.

Accessing the ID_DFR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 2	000	010	0000	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.TID3 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HCR.TID3 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HSTR.T0 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.81 ID_ISAR0, Instruction Set Attribute Register 0

The ID_ISAR0 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_ISAR0[31:0] is architecturally mapped to AArch64 System register ID_ISAR0_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR0 is a 32-bit register.

Field descriptions

The ID_ISAR0 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
RES0	Divide	Debug	Coprocc	CmpBranch	BitField	BitCount	Swap	

Bits [31:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds SDIV and UDIV in the T32 instruction set.

0b0010 As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds BKPT.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Coprocc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

0b0000 None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.

0b0001 Adds generic CDP, LDC, MCR, MRC, and STC.

0b0010 As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.

0b0011 As for 0b0010, and adds generic MCRR and MRRC.

0b0100 As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set.

Defined values are:

0b0000 None implemented.

0b0001 Adds CBNZ and CBZ.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds CLZ.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

0b0000 None implemented.

0b0001 Adds SWP and SWPB.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

Accessing the ID_ISAR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 0	000	000	0000	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.82 ID_ISAR1, Instruction Set Attribute Register 1

The ID_ISAR1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_ISAR1[31:0] is architecturally mapped to AArch64 System register ID_ISAR1_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR1 is a 32-bit register.

Field descriptions

The ID_ISAR1 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
Jazelle	Interwork	Immediate	IfThen	Extend	Except_AR	Except	Endian	

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

0b0000 No support for Jazelle.

0b0001 Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the BX instruction, and the T bit in the PSR.

0b0010 As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.

0b0011 As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0011.

Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

0b0000 None implemented.

0b0001 Adds:

- The MOVT instruction
- The MOV instruction encodings with zero-extended 16-bit immediates.

- The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

0b0000 None implemented.

0b0001 Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

0b0000 No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.

0b0001 Adds the SXTB, SXTH, UXTB, and UXTH instructions.

0b0010 As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

Except_AR, bits [11:8]

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

0b0000 Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.

0b0001 Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

Accessing the ID_ISAR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 1	000	001	0000	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.83 ID_ISAR2, Instruction Set Attribute Register 2

The ID_ISAR2 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_ISAR2[31:0] is architecturally mapped to AArch64 System register ID_ISAR2_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR2 is a 32-bit register.

Field descriptions

The ID_ISAR2 bit assignments are:

Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the REV, REV16, and REVSH instructions.
- 0b0010 As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

PSR_AR, bits [27:24]

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

- 0b0000 None implemented.

0b0001 Adds the UMULL and UMLAL instructions.
 0b0010 As for 0b0001, and adds the UMAAL instruction.
 All other values are reserved.
 In ARMv8-A the only permitted value is 0b0010.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

0b0000 None implemented.
 0b0001 Adds the SMULL and SMLAL instructions.
 0b0010 As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
 0b0011 As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.
 All other values are reserved.
 In ARMv8-A the only permitted value is 0b0011.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

0b0000 No additional instructions implemented. This means only MUL is implemented.
 0b0001 Adds the MLA instruction.
 0b0010 As for 0b0001, and adds the MLS instruction.
 All other values are reserved.
 In ARMv8-A the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

0b0000 No support. This means the LDM and STM instructions are not interruptible.
 0b0001 LDM and STM instructions are restartable.
 0b0010 LDM and STM instructions are continuable.
 All other values are reserved.
 In ARMv8-A the only permitted value is 0b0000.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

0b0000 None implemented.
 0b0001 Adds the PLD instruction.
 0b0010 Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
 0b0011 As for 0b0001 (or 0b0010), and adds the PLI instruction.
 0b0100 As for 0b0011, and adds the PLDW instruction.
 All other values are reserved.
 In ARMv8-A the only permitted value is 0b0100.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

0b0000 No additional load/store instructions implemented.
 0b0001 Adds the LDRD and STRD instructions.

0b0010 As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

Accessing the ID_ISAR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 2	000	010	0000	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.84 ID_ISAR3, Instruction Set Attribute Register 3

The ID_ISAR3 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_ISAR3[31:0] is architecturally mapped to AArch64 System register ID_ISAR3_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR3 is a 32-bit register.

Field descriptions

The ID_ISAR3 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
T32EE	TrueNOP	T32Copy	TabBranch	SynchPrim	SVC	SIMD	Saturate	

T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

0b0000 None implemented. This means there are no NOP instructions that do not have any register dependencies.

0b0001 Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

0b0000 Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.

0b0001 Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

- 0b0000 None implemented.
 - 0b0001 Adds the TBB and TBH instructions.
- All other values are reserved.
- In ARMv8-A the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

- 0b0000 If SynchPrim_frac == 0b000, no Synchronization Primitives implemented.
- 0b0001 If SynchPrim_frac == 0b000, adds the LDREX and STREX instructions.
If SynchPrim_frac == 0b011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
- 0b0010 If SynchPrim_frac == 0b000, as for [0b001, 0b011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In ARMv8-A the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

- 0b0000 Not implemented.
- 0b0001 Adds the SVC instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
- 0b0011 As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

- 0b0000 None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
 - 0b0001 Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.
- All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Accessing the ID_ISAR3

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 3	000	011	0000	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.85 ID_ISAR4, Instruction Set Attribute Register 4

The ID_ISAR4 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR5.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_ISAR4[31:0] is architecturally mapped to AArch64 System register ID_ISAR4_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR4 is a 32-bit register.

Field descriptions

The ID_ISAR4 bit assignments are:

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

0b0000 SWP or SWPB instructions not implemented.

0b0001 SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if the ID_ISAR0.Swap_insts field is 0b0000.

In ARMv8-A the only permitted value is 0b0000.

PSR_M, bits [27:24]

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

0b0000 None implemented.

0b0001 Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

0b0000 If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.

0b0011 If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In ARMv8-A the only permitted value is 0b0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

0b0000 None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.

0b0001 Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the SMC instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

0b0000 Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.

0b0001 Adds support for all of the writeback addressing modes.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

0b0000 Nonzero shifts supported only in MOV and shift instructions.

0b0001 Adds support for shifts of loads and stores over the range LSL 0-3.

0b0011 As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.

0b0100 As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0100.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

0b0000 None implemented. No T variant instructions are implemented.

0b0001 Adds the LDRBT, LDRT, STRBT, and STRT instructions.

0b0010 As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

Accessing the ID_ISAR4

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 4	000	100	0000	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.86 ID_ISAR5, Instruction Set Attribute Register 5

The ID_ISAR5 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR4.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_ISAR5[31:0] is architecturally mapped to AArch64 System register ID_ISAR5_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR5 is a 32-bit register.

Field descriptions

The ID_ISAR5 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
VCMA	RDM	RES0	CRC32	SHA2	SHA1	AES	SEVL	

VCMA, bits [31:28]

From ARMv8.3:

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

0b0000 The VCMLA and VCADD instructions are not implemented in AArch32.

0b0001 The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

In ARMv8.0, ARMv8.1 and ARMv8.2 the only permitted value is 0b0000.

From ARMv8.3 the only permitted value is 0b0001. This feature is identified as [ARMv8.3-CompNum](#).

Otherwise:

Reserved, RES0.

RDM, bits [27:24]

From ARMv8.1:

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

0b0000 No VQRDMLAH and VQRDMLSH instructions implemented.

0b0001 VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

[ARMv8.1-RDMA](#) implements the functionality identified by the value 0b0001.

From ARMv8.1 the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

0b0000 No CRC32 instructions implemented.

0b0001 CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In ARMv8.0 the permitted values are 0b0000 and 0b0001.

From ARMv8.1 the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

0b0000 No SHA2 instructions implemented.

0b0001 SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

0b0000 No SHA1 instructions implemented.

0b0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

0b0000 No AES instructions implemented.

0b0001 AESE, AESD, AESMC, and AESIMC implemented.

0b0010 As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0010.

SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

0b0000 SEVL is implemented as a NOP.

0b0001 SEVL is implemented as Send Event Local.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Accessing the ID_ISAR5

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 5	000	101	0000	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.87 ID_ISAR6, Instruction Set Attribute Register 6

The ID_ISAR6 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#) and [ID_ISAR5](#).

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_ISAR6[31:0] is architecturally mapped to AArch64 System register [ID_ISAR6_ELI](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_ISAR6 is a 32-bit register.

Field descriptions

The ID_ISAR6 bit assignments are:

31	12 11	8 7	4 3	0
RES0	FHM	DP	JSCVT	

Bits [31:12]

Reserved, RES0.

FHM, bits [11:8]

From ARMv8.2:

Indicates whether VFMAL and VFMSL instructions are implemented.

0b0000 VFMAL and VMFSL instructions not implemented.

0b0001 VFMAL and VMFSL instructions implemented.

[ARMv8.2-FHM](#) implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

DP, bits [7:4]

From ARMv8.2:

Indicates the support for dot product instructions in AArch32 state.

0b0000 No dot product instructions implemented.

0b0001 VUDOT and VSDOT instructions implemented.

All other values are reserved.

[ARMv8.2-DotProd](#) implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

JSCVT, bits [3:0]

From ARMv8.3:

Indicates whether the Javascript conversion instruction is implemented in AArch32 state. Defined values are:

0b0000 The VJCVT instruction is not implemented.

0b0001 The VJCVT instruction is implemented.

All other values are reserved.

In ARMv8.0, ARMv8.1 and ARMv8.2 the only permitted value is 0b0000.

From ARMv8.3 the only permitted value is 0b0001. This feature is identified as [ARMv8.3-JSConv](#).

Otherwise:

Reserved, RES0.

Accessing the ID_ISAR6

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 7	000	111	0000	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.TID3 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HCR.TID3 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HSTR.T0 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.88 ID_MMFR0, Memory Model Feature Register 0

The ID_MMFR0 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR1, ID_MMFR2, ID_MMFR3, and ID_MMFR4.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_MMFR0[31:0] is architecturally mapped to AArch64 System register ID_MMFR0_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_MMFR0 is a 32-bit register.

Field descriptions

The ID_MMFR0 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
InnerShr	FCSE	AuxReg	TCM	ShareLvl	OuterShr	PMSA	VMSA	

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

- 0b0000 Implemented as Non-cacheable.
- 0b0001 Implemented with hardware coherency support.
- 0b1111 Shareability ignored.

All other values are reserved.

In ARMv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0.ShareLvl having the value 0b0001.

When ID_MMFR0.ShareLvl is zero, this field is UNK.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support for FCSE.

All other values are reserved.

In ARMv8 the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

- 0b0000 None supported.
- 0b0001 Support for Auxiliary Control Register only.

0b0010 Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

In ARMv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

0b0000 Not supported.

0b0001 Support is IMPLEMENTATION DEFINED. ARMv7 requires this setting.

0b0010 Support for TCM only, ARMv6 implementation.

0b0011 Support for TCM and DMA, ARMv6 implementation.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

0b0000 One level of shareability implemented.

0b0001 Two levels of shareability implemented.

All other values are reserved.

In ARMv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

0b0000 Implemented as Non-cacheable.

0b0001 Implemented with hardware coherency support.

0b1111 Shareability ignored.

All other values are reserved.

In ARMv8 the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

0b0000 Not supported.

0b0001 Support for IMPLEMENTATION DEFINED PMSA.

0b0010 Support for PMSAv6, with a Cache Type Register implemented.

0b0011 Support for PMSAv7, with support for memory subsections. ARMv7-R profile.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

0b0000 Not supported.

0b0001 Support for IMPLEMENTATION DEFINED VMSA.

0b0010 Support for VMSAv6, with Cache and TLB Type Registers implemented.

- 0b0011 Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile.
 - 0b0100 As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
 - 0b0101 As for 0b0100, and adds support for the Long-descriptor translation table format.
- All other values are reserved.
- In ARMv8-A the only permitted value is 0b0101.

Accessing the ID_MMFR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 4	000	100	0000	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.89 ID_MMFR1, Memory Model Feature Register 1

The ID_MMFR1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0, ID_MMFR2, ID_MMFR3, and ID_MMFR4.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_MMFR1[31:0] is architecturally mapped to AArch64 System register ID_MMFR1_ELI[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_MMFR1 is a 32-bit register.

Field descriptions

The ID_MMFR1 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
BPred	L1TstCln	L1Uni	L1Hvd	L1UniSW	L1HvdSW	L1UniVA	L1HvdVA	

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

0b0000 No branch predictor, or no MMU present. Implies a fixed MPU configuration.

0b0001 Branch predictor requires flushing on:

- Enabling or disabling a stage of address translation.
- Writing new data to instruction locations.
- Writing new mappings to the translation tables.
- Changes to the [TTBR0](#), [TTBR1](#), or [TTBCR](#) registers.
- Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.

0b0010 Branch predictor requires flushing on:

- Enabling or disabling a stage of address translation.
- Writing new data to instruction locations.
- Writing new mappings to the translation tables.
- Any change to the [TTBR0](#), [TTBR1](#), or [TTBCR](#) registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.

0b0011 Branch predictor requires flushing only on writing new data to instruction locations.

0b0100 For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In ARMv8-A the permitted values are 0b0010, 0b0011, or 0b0100. For values other than 0b0000 and 0b0100 the ARM Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 data cache test and clean operations are:
- Test and clean data cache.
- 0b0010 As for 0001, and adds:
- Test, clean, and invalidate data cache.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported entire Level 1 cache operations are:
- Invalidate cache, including branch predictor if appropriate.
 - Invalidate branch predictor, if appropriate.
- 0b0010 As for 0001, and adds:
- Clean cache, using a recursive model that uses the cache dirty status bit.
 - Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported entire Level 1 cache operations are:
- Invalidate instruction cache, including branch predictor if appropriate.
 - Invalidate branch predictor, if appropriate.
- 0b0010 As for 0001, and adds:
- Invalidate data cache.
 - Invalidate data cache and instruction cache, including branch predictor if appropriate.
- 0b0011 As for 0010, and adds:
- Clean data cache, using a recursive model that uses the cache dirty status bit.
 - Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

- 0b0000 None supported.

0b0001 Supported Level 1 unified cache line maintenance operations by set/way are:

- Clean cache line by set/way.

0b0010 As for 0001, and adds:

- Clean and invalidate cache line by set/way.

0b0011 As for 0010, and adds:

- Invalidate cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

0b0000 None supported.

0b0001 Supported Level 1 Harvard cache line maintenance operations by set/way are:

- Clean data cache line by set/way.
- Clean and invalidate data cache line by set/way.

0b0010 As for 0001, and adds:

- Invalidate data cache line by set/way.

0b0011 As for 0010, and adds:

- Invalidate instruction cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

0b0000 None supported.

0b0001 Supported Level 1 unified cache line maintenance operations by VA are:

- Clean cache line by VA.
- Invalidate cache line by VA.
- Clean and invalidate cache line by VA.

0b0010 As for 0001, and adds:

- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

0b0000 None supported.

0b0001 Supported Level 1 Harvard cache line maintenance operations by VA are:

- Clean data cache line by VA.
- Invalidate data cache line by VA.
- Clean and invalidate data cache line by VA.
- Clean instruction cache line by VA.

0b0010 As for 0001, and adds:

- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.
In ARMv8-A the only permitted value is 0b0000.

Accessing the ID_MMFR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

p15, 0, <Rt>, c0, c1, 5	000	101	0000	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.90 ID_MMFR2, Memory Model Feature Register 2

The ID_MMFR2 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0, ID_MMFR1, ID_MMFR3, and ID_MMFR4.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_MMFR2[31:0] is architecturally mapped to AArch64 System register ID_MMFR2_ELI[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_MMFR2 is a 32-bit register.

Field descriptions

The ID_MMFR2 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
HWAccFlg	WFIStall	MemBarr	UniTLB	HvdTLB	L1HvdRng	L1HvdBG	L1HvdFG	

HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the ARM Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

0b0000 Not supported.

0b0001 Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

In ARMv8 the only permitted value is 0b000.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

0b0000 Not supported.

0b0001 Support for WFI stalling.

All other values are reserved.

In ARMv8 the permitted values are 0b000 and 0b001.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==1111) encoding space:

0b0000 None supported.

0b0001 Supported memory barrier System instructions are:

- Data Synchronization Barrier (DSB).

0b0010 As for 0b001, and adds:

- Instruction Synchronization Barrier (ISB).

- Data Memory Barrier (DMB).

All other values are reserved.

In ARMv8 the only permitted value is 0b010.

ARM deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

- | | |
|--------|--|
| 0b0000 | Not supported. |
| 0b0001 | Supported unified TLB maintenance operations are: <ul style="list-style-type: none"> • Invalidate all entries in the TLB. • Invalidate TLB entry by VA. |
| 0b0010 | As for 0b001, and adds: <ul style="list-style-type: none"> • Invalidate TLB entries by ASID match. |
| 0b0011 | As for 0b010, and adds: <ul style="list-style-type: none"> • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation |
| 0b0100 | As for 0b011, and adds: <ul style="list-style-type: none"> • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB. |
| 0b0101 | As for 0b100, and adds the following operations: TLBIMVALIS , TLBIMVAALIS , TLBIMVALHIS , TLBIMVAL , TLBIMVAAL , TLBIMVALH . |
| 0b0110 | As for 0b101, and adds the following operations: TLBIIPAS2IS , TLBIIPAS2LIS , TLBIIPAS2 , TLBIIPAS2L . |

All other values are reserved.

In ARMv8-A the only permitted value is 0b110.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. ARM deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

- | | |
|--------|--|
| 0b0000 | Not supported. |
| 0b0001 | Supported Level 1 Harvard cache maintenance range operations are: <ul style="list-style-type: none"> • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA. |

All other values are reserved.

In ARMv8 the only permitted value is 0b0000.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

- 0b0000 Not supported.
- 0b0001 Supported Level 1 Harvard cache background fetch operations are:
 - Fetch instruction cache range by VA.
 - Fetch data cache range by VA.

All other values are reserved.
 In ARMv8 the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

- 0b0000 Not supported.
- 0b0001 Supported Level 1 Harvard cache foreground fetch operations are:
 - Fetch instruction cache range by VA.
 - Fetch data cache range by VA.

All other values are reserved.
 In ARMv8 the only permitted value is 0b0000.

Accessing the ID_MMFR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 6	000	110	0000	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.TID3 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HCR.TID3 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HSTR.T0 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.91 ID_MMFR3, Memory Model Feature Register 3

The ID_MMFR3 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0, ID_MMFR1, ID_MMFR2, and ID_MMFR4.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_MMFR3[31:0] is architecturally mapped to AArch64 System register ID_MMFR3_ELI[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_MMFR3 is a 32-bit register.

Field descriptions

The ID_MMFR3 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
Supersec	CMemSz	CohWalk	PAN	MaintBcst	BPMaint	CMaintSW	CMaintVA	

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported.

Defined values are:

0b0000 Supersections supported.

0b1111 Supersections not supported.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b1111.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

0b0000 4GB, corresponding to a 32-bit physical address range.

0b0001 64GB, corresponding to a 36-bit physical address range.

0b0010 1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000, 0b0001, and 0b0010.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

0b0000 Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

0b0001 Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

PAN, bits [19:16]

From ARMv8.1:

Privileged Access Never. Indicates support for the PAN bit in **CPSR**, **SPSR**, and **DSPSR** in AArch32 state. Defined values are:

0b0000 PAN not supported.

0b0001 PAN supported.

0b0010 PAN supported and **ATS1CPRP** and **ATS1CPWP** instructions supported.

All other values are reserved.

ARMv8.1-PAN implements the functionality identified by the value 0b0001.

ARMv8.2-ATS1E1 implements the functionality added by the value 0b0010.

In ARMv8.1 the value 0b0000 is not permitted.

From ARMv8.2, the only permitted value is 0b0010.

Otherwise:

Reserved, RES0.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

0b0000 Cache, TLB, and branch predictor operations only affect local structures.

0b0001 Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.

0b0010 Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

0b0000 None supported.

0b0001 Supported branch predictor maintenance operations are:

- Invalidate all branch predictors.

0b0010 As for 0001, and adds:

- Invalidate branch predictors by VA.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

0b0000 None supported.

0b0001 Supported hierarchical cache maintenance instructions by set/way are:

- Invalidate data cache by set/way.
- Clean data cache by set/way.
- Clean and invalidate data cache by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

0b0000 None supported.

0b0001 Supported hierarchical cache maintenance operations by VA are:

- Invalidate data cache by VA.
- Clean data cache by VA.
- Clean and invalidate data cache by VA.
- Invalidate instruction cache by VA.
- Invalidate all instruction cache entries.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Accessing the ID_MMFR3

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 7	000	111	0000	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.TID3 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HCR.TID3 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HSTR.T0 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.92 ID_MMFR4, Memory Model Feature Register 4

The ID_MMFR4 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), and [ID_MMFR3](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G8-5638](#).

Configurations

AArch32 System register ID_MMFR4[31:0] is architecturally mapped to AArch64 System register [ID_MMFR4_ELI](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_MMFR4 is a 32-bit register.

Field descriptions

The ID_MMFR4 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
RES0	CCIDX	LSM	HPDS	CnP	XNX	AC2	SpecSEI	

Bits [31:28]

Reserved, RES0.

CCIDX, bits [27:24]

From ARMv8.3:

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated.

Defined values are:

0b0000 32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.

0b0001 64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

From ARMv8.3, the permitted values are 0b0000 and 0b0001. This feature is identified as [ARMv8.3-CCIDX](#).

From ARMv8.2, or if ARMv8.1 or ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

LSM, bits [23:20]

From ARMv8.2:

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

0b0000 LSMAOE and nTLSMD bits not supported.

0b0001 LSMAOE and nTLSMD bits supported.

All other values are reserved.

[ARMv8.2-LSMAOC](#) implements the functionality identified by the value 0b0001.

From ARMv8.1, or if ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

HPDS, bits [19:16]

From ARMv8.2:

Hierarchical permission disables bits in translation tables. Defined values are:

0b0000 Disabling of hierarchical controls not supported.

0b0001 Supports disabling of hierarchical controls using the [TTBCR2.HPD0](#), [TTBCR2.HPD1](#), and [HTCR.HPD](#) bits.

0b0010 As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

[ARMv8.2-AA32HPD](#) implements the functionality identified by the value 0b0001.

[ARMv8.2-TTPBHA](#) implements the functionality added by the value 0b0010.

Note

The value 0b0000 implies that the encoding for [TTBCR2](#) is unallocated.

From ARMv8.1, or if ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

CnP, bits [15:12]

From ARMv8.2:

Common not Private translations. Defined values are:

0b0000 Common not Private translations not supported.

0b0001 Common not Private translations supported.

All other values are reserved.

[ARMv8.2-TTCNP](#) implements the functionality identified by the value 0b0001.

From ARMv8.2 the only permitted value is 0b0001.

From ARMv8.1, or if ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

XNX, bits [11:8]

From ARMv8.2:

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

0b0000 Distinction between EL0 and EL1 execute-never control at stage 2 not supported.

0b0001 Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

[ARMv8.2-TTS2UXN](#) implements the functionality identified by the value 0b0001.

When [ARMv8.2-TTS2UXN](#) is implemented:

- If all of the following conditions are true it is IMPLEMENTATION DEFINED whether the value of `ID_MMFR4.XNX` is `0b0000` or `0b0001`:
 - `ID_AA64MMFR1_EL1.XNX` == 1.
 - EL2 cannot use AArch32.
 - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is `0b0001`.

From ARMv8.1, or if ARMv8.0:

Reserved, RAZ.

Otherwise:

Reserved, RES0.

AC2, bits [7:4]

Indicates the extension of the `ACTLR` and `HACTLR` registers using `ACTLR2` and `HACTLR2`.
 Defined values are:

`0b0000` `ACTLR2` and `HACTLR2` are not implemented.

`0b0001` `ACTLR2` and `HACTLR2` are implemented.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the permitted values are `0b0000` and `0b0001`.

From ARMv8.2, the only permitted value is `0b0001`.

SpecSEI, bits [3:0]

When RAS is implemented:

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

`0b0000` The PE never generates an SError interrupt due to an External abort on a speculative read.

`0b0001` The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

Otherwise:

Reserved, RES0. This provides no information about whether the PE generates a speculative SError interrupt.

Accessing the ID_MMFR4

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 6	000	110	0000	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0):
 - If HCR_EL2.TID3==1 and the register is not RAZ/WI, Non-secure read accesses to this register from EL1 are trapped to EL2 using AArch64.
 - If HCR_EL2.TID3==1 and the register is RAZ/WI, it is IMPLEMENTATION DEFINED whether Non-secure read accesses to this register from EL1 are trapped to EL2 using AArch64.
 - If HSTR_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0):
 - If HCR_EL2.TID3==1 and the register is not RAZ/WI, Non-secure read accesses to this register from EL1 are trapped to EL2 using AArch64.
 - If HCR_EL2.TID3==1 and the register is RAZ/WI, it is IMPLEMENTATION DEFINED whether Non-secure read accesses to this register from EL1 are trapped to EL2 using AArch64.
 - If HSTR_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR_EL3.NS == 1:
 - If HCR.TID3==1 and the register is not RAZ/WI, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
 - If HCR.TID3==1 and the register is RAZ/WI, it is IMPLEMENTATION DEFINED whether Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
 - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.93 ID_PFR0, Processor Feature Register 0

The ID_PFR0 characteristics are:

Purpose

Gives top-level information about the instruction sets and other features supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_PFR0[31:0] is architecturally mapped to AArch64 System register ID_PFR0_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_PFR0 is a 32-bit register.

Field descriptions

The ID_PFR0 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
RAS	DIT	AMU	RES0	State3	State2	State1	State0	

RAS, bits [31:28]

RAS Extension version. The defined values of this field are:

0b0000 No RAS Extension.

0b0001 RAS Extension present.

0b0010 ARMv8.4-RAS present. As 0b0001, and adds support for additional ERXMISC<m> System registers.

Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

From ARMv8.4, the only permitted value is 0b0010.

[ARMv8.4-RAS](#) implements the functionality identified by the value 0b0010.

In ARMv8.2, the only permitted value is 0b0001.

In ARMv8.1 and ARMv8.0, the permitted values are 0b0000 and 0b0001.

DIT, bits [27:24]

From ARMv8.4:

Data Independent Timing. Defined values are:

0b0000 AArch32 does not guarantee constant execution time of any instructions.

0b0001 AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

[ARMv8.4-DIT](#) implements the functionality identified by the value 0b0001.

From ARMv8.4, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

AMU, bits [23:20]

From ARMv8.4:

Activity Monitors Extension. Defined values are:

0b0000 Activity Monitors Extension is not implemented.

0b0001 Activity Monitors Extension Version 1 is implemented.

All other values are reserved.

AMUv1 implements the functionality identified by the value 0b0001.

In ARMv8.0, ARMv8.1, ARMv8.2, and ARMv8.3, the only permitted value is 0b0000.

From ARMv8.4, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

0b0000 Not implemented.

0b0001 T32EE instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

0b0000 Not implemented.

0b0001 Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.

0b0010 Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

State1, bits [7:4]

T32 instruction set support. Defined values are:

0b0000 T32 instruction set not implemented.

0b0001 T32 encodings before the introduction of Thumb-2 technology implemented:

- All instructions are 16-bit.
- A BL or BLX is a pair of 16-bit instructions
- 32-bit instructions other than BL and BLX cannot be encoded.

0b0011 T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0011.

State0, bits [3:0]

A32 instruction set support. Defined values are:
 0b0000 A32 instruction set not implemented.
 0b0001 A32 instruction set implemented.
 All other values are reserved.
 In ARMv8-A the only permitted value is 0b0001.

Accessing the ID_PFR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 0	000	000	0000	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.94 ID_PFR1, Processor Feature Register 1

The ID_PFR1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_PFR1[31:0] is architecturally mapped to AArch64 System register ID_PFR1_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_PFR1 is a 32-bit register.

Field descriptions

The ID_PFR1 bit assignments are:

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

- 0b0000 No System register interface to the GIC CPU interface is supported.
 - 0b0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
- All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

- 0b0000 No features from the ARMv7 Virtualization Extensions are implemented.
- 0b0001 The following features of the ARMv7 Virtualization Extensions are implemented:
 - The SCR.SIF bit, if EL3 is implemented.
 - The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.
 - The MSR (banked register) and MRS (banked register) instructions.
 - The ERET instruction.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1.Virtualization is 0, otherwise it holds the value 0b0000.

———— **Note** —————

The ID_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

0b0000 No features from the ARMv7 Security Extensions are implemented.

0b0001 The following features from the ARMv7 Security Extensions are implemented:

- The VBAR register.
- The TTBCR.PD0 and TTBCR.PD1 bits.

0b0010 As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1.Security is 0, otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

0b0000 Not implemented.

0b0001 Generic Timer implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

0b0000 EL2, Hyp mode, and the HVC instruction not implemented.

0b0001 EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

———— **Note** —————

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M profile programmers' model support. Defined values are:

0b0000 Not supported.

0b0010 Support for two-stack programmers' model.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

Security, bits [7:4]

Security support. Defined values are:

- 0b0000 EL3, Monitor mode, and the SMC instruction not implemented.
- 0b0001 EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
- 0b0010 As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in ARMv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

- 0b0000 Not supported.
- 0b0001 Supported.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0001.

Accessing the ID_PFR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 1	000	001	0000	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.TID3 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HCR.TID3 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HSTR.T0 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.95 ID_PFR2, Processor Feature Register 2

The ID_PFR2 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0 and ID_PFR1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G8-5638.

Configurations

AArch32 System register ID_PFR2[31:0] is architecturally mapped to AArch64 System register ID_PFR2_EL1[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ID_PFR2 is a 32-bit register.

Field descriptions

The ID_PFR2 bit assignments are:

Bits [31:12]

Reserved, RES0.

RAS_frac, bits [11:8]

When ARMv8.4-RAS is implemented:

RAS Extension fractional field.

0b0000 If ID_PFR0.RAS == 0b0001, RAS Extension implemented.

0b0001 If ID_PFR0.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers.

Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

This field is valid only if ID_PFR0.RAS == 0b0001.

Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

Accessing the ID_PFR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c3, 4	000	100	0000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.96 IFAR, Instruction Fault Address Register

The IFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

Configurations

AArch32 System register IFAR[31:0](NS) is architecturally mapped to AArch64 System register FAR_EL1[63:32].

AArch32 System register IFAR[31:0](S) is architecturally mapped to AArch32 System register HIFAR[31:0] when IsExceptionLevelImplemented(EL2).

AArch32 System register IFAR[31:0](S) is architecturally mapped to AArch64 System register FAR_EL2[63:32] when IsExceptionLevelImplemented(EL2).

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

IFAR is a 32-bit register.

Field descriptions

The IFAR bit assignments are:

Bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception.

This field resets to an architecturally UNKNOWN value.

Accessing the IFAR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c6, c0, 2	000	010	0110	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	IFAR_s
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	IFAR
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	IFAR
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	IFAR
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	IFAR
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	IFAR
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	IFAR
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	IFAR_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	IFAR_ns

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T6 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T6 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TVM == 1, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TRVM == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T6 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.97 IFSR, Instruction Fault Status Register

The IFSR characteristics are:

Purpose

Holds status information about the last instruction fault.

Configurations

AArch32 System register IFSR[31:0] is architecturally mapped to AArch64 System register [IFSR32_EL2](#)[31:0].

The current translation table format determines which format of the register is used.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

IFSR is a 32-bit register.

Field descriptions

The IFSR bit assignments are:

When *TTBCR.EAE* == 0:

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0b0 [IFAR](#) is valid.

0b1 [IFAR](#) is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bit [10]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

0b00001	PC alignment fault
0b00010	Debug exception
0b00011	Access flag fault, level 1
0b00101	Translation fault, level 1
0b00110	Access flag fault, level 2
0b00111	Translation fault, level 2
0b01000	Synchronous External abort, not on translation table walk
0b01001	Domain fault, level 1
0b01011	Domain fault, level 2
0b01100	Synchronous External abort, on translation table walk, level 1
0b01101	Permission fault, level 1
0b01110	Synchronous External abort, on translation table walk, level 2
0b01111	Permission fault, level 2
0b10000	TLB conflict abort
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault)
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk
0b11100	Synchronous parity or ECC error on translation table walk, level 1
0b11110	Synchronous parity or ECC error on translation table walk, level 2

All other values are reserved.

When the RAS Extension is implemented, 0b11001, 0b11100, and 0b11110, are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Short-descriptor translation table lookup on page G5-5564](#).

This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

FS, bits [3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

0b00001	PC alignment fault
0b00010	Debug exception
0b00011	Access flag fault, level 1
0b00101	Translation fault, level 1
0b00110	Access flag fault, level 2

0b00111	Translation fault, level 2
0b01000	Synchronous External abort, not on translation table walk
0b01001	Domain fault, level 1
0b01011	Domain fault, level 2
0b01100	Synchronous External abort, on translation table walk, level 1
0b01101	Permission fault, level 1
0b01110	Synchronous External abort, on translation table walk, level 2
0b01111	Permission fault, level 2
0b10000	TLB conflict abort
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault)
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk
0b11100	Synchronous parity or ECC error on translation table walk, level 1
0b11110	Synchronous parity or ECC error on translation table walk, level 2

All other values are reserved.

When the RAS Extension is implemented, 0b11001, 0b11100, and 0b11110, are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Short-descriptor translation table lookup on page G5-5564](#).

This field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0b0 **IFAR** is valid.

0b1 **IFAR** is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

0b0 Using the Short-descriptor translation table formats.

0b1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

0b000000 Address size fault in [TTBR0](#) or [TTBR1](#).

0b000001 Address size fault, level 1.

0b000010 Address size fault, level 2.

0b000011 Address size fault, level 3.

0b000101 Translation fault, level 1.

0b000110 Translation fault, level 2.

0b000111 Translation fault, level 3.

0b001001 Access flag fault, level 1.

0b001010 Access flag fault, level 2.

0b001011 Access flag fault, level 3.

0b001101 Permission fault, level 1.

0b001110 Permission fault, level 2.

0b001111 Permission fault, level 3.

0b010000 Synchronous External abort, not on translation table walk.

0b010101 Synchronous External abort, on translation table walk, level 1.

0b010110 Synchronous External abort, on translation table walk, level 2.

0b010111 Synchronous External abort, on translation table walk, level 3.

0b011000 Synchronous parity or ECC error on memory access, not on translation table walk.

0b011101 Synchronous parity or ECC error on memory access on translation table walk, level 1.

0b011110 Synchronous parity or ECC error on memory access on translation table walk, level 2.

0b011111 Synchronous parity or ECC error on memory access on translation table walk, level 3.

0b100001 PC alignment fault.

0b100010 Debug exception.

0b110000 TLB conflict abort.

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Long-descriptor translation table lookup on page G5-5566](#).

This field resets to an architecturally UNKNOWN value.

Accessing the IFSR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c0, 1	000	001	0101	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	IFSR
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	IFSR
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	IFSR
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	IFSR
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	IFSR
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	IFSR
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	IFSR_s
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	IFSR_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	IFSR_ns

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HCR_EL2.TVM == 1$, then write accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HCR_EL2.TRVM == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T5 == 1$, then accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.TVM == 1$, then write accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.TRVM == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T5 == 1$, then accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HCR.TVM == 1$, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HCR.TRVM == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HSTR.T5 == 1$, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.98 ISR, Interrupt Status Register

The ISR characteristics are:

Purpose

Shows the pending status of the IRQ, FIQ, or SError.

When executing at EL2, EL3, or Secure EL1, when `SCR_EL3.EEL2 == 0b0`, this shows the pending status of the physical interrupts.

When executing at Non-secure EL1, or at Secure EL1, when `SCR_EL3.EEL2 == 0b01`:

- If the `HCR.{IMO,FMO,AMO}` bit has a value of 1, the corresponding ISR.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the `HCR.{IMO,FMO,AMO}` bit has a value of 0, the corresponding ISR.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

Configurations

AArch32 System register `ISR[31:0]` is architecturally mapped to AArch64 System register `ISR_EL1[31:0]`.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ISR is a 32-bit register.

Field descriptions

The ISR bit assignments are:

Bits [31:9]

Reserved, RES0.

A, bit [8]

SError interrupt pending bit:

0b0 No pending SError interrupt.

0b1 An SError interrupt is pending.

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

0b0 No pending IRQ.

0b1 An IRQ interrupt is pending.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

0b0 No pending FIQ.

0b1 An FIQ interrupt is pending.

Bits [5:0]

Reserved, RES0.

Accessing the ISR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c1, 0	000	000	1100	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T12 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T12 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T12 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.99 ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at Secure EL1 when EL3 is using AArch64, all entries that would be required for the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at Non-secure EL1, all stage 1 translation table entries that would be required for the Non-secure PL1&0 translation regime and, if EL2 is implemented, they must match the current VMID.
- If executed at EL2, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this instruction.

ARM deprecates the use of this instruction. It is only provided for backwards compatibility with earlier versions of the ARM architecture.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ITLBIALL is a 32-bit System instruction.

Field descriptions

ITLBIALL ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the ITLBIALL instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c5, 0	000	000	1000	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIALLS](#) operating on instruction TLBs only.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TTLB} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HSTR_EL2.T8} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TTLB} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HSTR_EL2.T8} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32(EL2)} \ \&\& \ \text{HCR.TTLB} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32(EL2)} \ \&\& \ \text{HSTR.T8} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.100 ITLBIASID, Instruction TLB Invalidate by ASID match

The ITLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

ARM deprecates the use of this instruction. It is only provided for backwards compatibility with earlier versions of the ARM architecture.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ITLBIASID is a 32-bit System instruction.

Field descriptions

The ITLBIASID input value bit assignments are:

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

Executing the ITLBIASID instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c5, 2	000	010	1000	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIASIDIS](#) operating on instruction TLBs only.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TTLB} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HSTR_EL2.T8} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TTLB} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HSTR_EL2.T8} == 1$, then execution of this instruction at EL1 is trapped to EL2.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HCR.TTLB} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HSTR.T8} == 1$, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.101 ITLBIMVA, Instruction TLB Invalidate by VA

The ITLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

ARM deprecates the use of this instruction. It is only provided for backwards compatibility with earlier versions of the ARM architecture.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ITLBIMVA is a 32-bit System instruction.

Field descriptions

The ITLBIMVA input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Executing the ITLBIMVA instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c5, 1	000	001	1000	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When HCR.FB is 1, at Non-secure EL1 this instruction executes as a [TLBIMVAIS](#) operating on instruction TLBs only.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.102 JIDR, Jazelle ID Register

The JIDR characteristics are:

Purpose

A Jazelle register, which identified the Jazelle architecture version.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

JIDR is a 32-bit register.

Field descriptions

The JIDR bit assignments are:

Bits [31:0]

RO, RAZ at EL1, EL2, and EL3. It is IMPLEMENTATION DEFINED whether this field is RAZ or UNDEFINED at EL0.

Accessing the JIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 7, <Rt>, c0, c0, 0	111	000	0000	1110	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	IMPLEMENTATION DEFINED	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	IMPLEMENTATION DEFINED	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	IMPLEMENTATION DEFINED	n/a	RO	RO

For accesses from EL0 it is IMPLEMENTATION DEFINED whether the register is RO or UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HCR_EL2.TID0 == 1$, then read accesses at EL0 or EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.TID0 == 1$, then read accesses at EL0 or EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HCR.TID0 == 1$, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.

G8.2.103 JMCR, Jazelle Main Configuration Register

The JMCR characteristics are:

Purpose

A Jazelle register, which provides control of the Jazelle extension.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

JMCR is a 32-bit register.

Field descriptions

The JMCR bit assignments are:

Bits [31:0]

RAZ/WI at EL1, EL2, and EL3. It is IMPLEMENTATION DEFINED whether this field is RAZ/WI or UNDEFINED at EL0.

Accessing the JMCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 7, <Rt>, c2, c0, 0	111	000	0010	1110	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	IMPLEMENTATION DEFINED	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	IMPLEMENTATION DEFINED	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	IMPLEMENTATION DEFINED	n/a	RW	RW

For accesses from EL0 it is IMPLEMENTATION DEFINED whether the register is RW or UNDEFINED.

G8.2.104 JOSCR, Jazelle OS Control Register

The JOSCR characteristics are:

Purpose

A Jazelle register, which provides operating system control of the Jazelle Extension.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

JOSCR is a 32-bit register.

Field descriptions

The JOSCR bit assignments are:

Bits [31:0]

RAZ/WI at EL1, EL2, and EL3. It is IMPLEMENTATION DEFINED whether this field is RAZ/WI or UNDEFINED at EL0.

Accessing the JOSCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 7, <Rt>, c1, c0, 0	111	000	0001	1110	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	IMPLEMENTATION DEFINED	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	IMPLEMENTATION DEFINED	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	IMPLEMENTATION DEFINED	n/a	RW	RW

For accesses from EL0 it is IMPLEMENTATION DEFINED whether the register is RW or UNDEFINED.

G8.2.105 MAIRO, Memory Attribute Indirection Register 0

The MAIRO characteristics are:

Purpose

Along with MAIR1, provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIdx[2] indicates the MAIR register to be used:

- When AttrIdx[2] is 0, MAIRO is used.
- When AttrIdx[2] is 1, MAIR1 is used.

Configurations

AArch32 System register MAIRO[31:0] is architecturally mapped to AArch64 System register MAIR_ELI[31:0].

MAIRO and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIRO.

When EL3 is using AArch32, write access to MAIRO(S) is disabled when the CP15SSDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MAIRO is a 32-bit register.

Field descriptions

The MAIRO bit assignments are:

When TTBCR.EAE == 1:

Attr<n>, bits [8n+7:8n], for n = 0 to 3

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIRO.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.

Attr<n>[7:4]	Meaning
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.
The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.
The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the MAIR0

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c2, 0	000	000	1010	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	MAIR0_s
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	MAIR0
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	MAIR0
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	MAIR0
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	MAIR0
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	MAIR0
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	MAIR0
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	MAIR0_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	MAIR0_ns

When EL3 is using AArch32, write access to MAIR0_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T10 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T10 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TVM == 1, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TRVM == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T10 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.106 MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

Purpose

Along with MAIR0, provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIdx[2] indicates the MAIR register to be used:

- When AttrIdx[2] is 0, MAIR0 is used.
- When AttrIdx[2] is 1, MAIR1 is used.

Configurations

AArch32 System register MAIR1[31:0] is architecturally mapped to AArch64 System register MAIR_EL1[63:32].

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the CP15SSDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MAIR1 is a 32-bit register.

Field descriptions

The MAIR1 bit assignments are:

When TTBCR.EAE == 1:

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.

Attr<n>[7:4]	Meaning
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the MAIR1

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c2, 1	000	001	1010	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	MAIR1_s
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	MAIR1_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	MAIR1_ns
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	MAIR1
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	MAIR1
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	MAIR1
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	MAIR1
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	MAIR1
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	MAIR1

When EL3 is using AArch32, write access to MAIR1_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T10 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T10 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TVM == 1, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TRVM == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T10 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.107 MIDR, Main ID Register

The MIDR characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configurations

AArch32 System register MIDR[31:0] is architecturally mapped to AArch64 System register [MIDR_EL1](#)[31:0].

AArch32 System register MIDR[31:0] is architecturally mapped to External register [MIDR_EL1](#)[31:0].

Some fields of the MIDR are IMPLEMENTATION DEFINED. For details of the values of these fields for a particular ARMv8 implementation, and any implementation-specific significance of these values, see the product documentation.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MIDR is a 32-bit register.

Field descriptions

The MIDR bit assignments are:

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

Hex representation	ISO8859-1 representation	Implementer
0x0	NUL	Reserved for software use
0xc0	À	Ampere Computing
0x41	A	ARM Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation

Hex representation	ISO8859-1 representation	Implementer
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

Architecture, bits [19:16]

The permitted values of this field are:

0b0001	ARMv4.
0b0010	ARMv4T.
0b0011	ARMv5 (obsolete).
0b0100	ARMv5T.
0b0101	ARMv5TE.
0b0110	ARMv5TEJ.
0b0111	ARMv6.
0b1111	Architectural features are individually identified in the ID_* registers, see ID registers on page K13-7436 .

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

Accessing the MIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 0	000	000	0000	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.108 MPIDR, Multiprocessor Affinity Register

The MPIDR characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

Configurations

AArch32 System register MPIDR[31:0] is architecturally mapped to AArch64 System register [MPIDR_EL1](#)[31:0].

In a uniprocessor system ARM recommends that each Aff<n> field of this register returns a value of 0.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MPIDR is a 32-bit register.

Field descriptions

The MPIDR bit assignments are:

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

- 0b0 This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
 - 0b1 This implementation includes the ARMv7 Multiprocessing Extensions functionality.
- In ARMv8 this bit is RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

- 0b0 Processor is part of a multiprocessor system.
- 0b1 Processor is part of a uniprocessor system.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of [affinity](#) consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

- 0b0 Performance of PEs at the lowest affinity level is largely independent.
- 0b1 Performance of PEs at the lowest affinity level is very interdependent.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the [affinity](#) level that is most significant for determining PE behavior. Higher [affinity](#) levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing the MPIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 5	000	101	0000	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.109 MVBAR, Monitor Vector Base Address Register

The MVBAR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, holds the vector base address for any exception that is taken to Monitor mode.

Secure software must program the MVBAR with the required initial value as part of the PE boot sequence.

Configurations

It is IMPLEMENTATION DEFINED whether MVBAR[0] has a fixed value and ignored writes, or takes the last value written to it.

Write access to MVBAR is disabled when the CP15SDISABLE signal is asserted HIGH.

On a reset into EL3 using AArch32, the reset value of MVBAR is an IMPLEMENTATION DEFINED choice between:

- MVBAR[31:5] = an IMPLEMENTATION DEFINED value, which might be UNKNOWN.
- MVBAR[4:1] = RES0.
- MVBAR[0] = 0.

And:

- MVBAR[31:1] = an IMPLEMENTATION DEFINED value that is bits[31:1] of the AArch32 reset address.
- MVBAR[0] = 1.

Attributes

MVBAR is a 32-bit register.

Field descriptions

The MVBAR bit assignments are:

When programmed with a vector base address:

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

Reserved, bits [4:0]

Reserved, see Configurations.

Accessing the MVBAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c0, 1	000	001	1100	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	-	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	-	RW

When EL3 is using AArch32, write access to MVBAR is UNDEFINED when the CP15SSDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T12 == 1), then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T12 == 1), then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T12 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 0, then accesses at EL1 are trapped to EL3.
- If SCR_EL3.NS == 0 && IsUsingAArch32(EL2), then accesses at EL1 are trapped to EL2.

G8.2.110 MVFR0, Media and VFP Feature Register 0

The MVFR0 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR1](#) and [MVFR2](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G8-5638](#).

Configurations

AArch32 System register MVFR0[31:0] is architecturally mapped to AArch64 System register [MVFR0_EL1\[31:0\]](#).

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MVFR0 is a 32-bit register.

Field descriptions

The MVFR0 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
FPRound	FPSHVec	FPSqrt	FPDivide	FPTrap	FPDP	FPSP	SIMDReg								

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

0b0000 Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the [FPSCR](#) setting.

0b0001 All rounding modes supported.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

FPSHVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

0b0000 Short vectors not supported.

0b0001 Short vector operation supported.

All other values are reserved.

In ARMv8-A the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

0b0000 Not supported in hardware.

0b0001 Supported.

All other values are reserved.

In ARMv8-A the permitted values are `0b0000` and `0b0001`.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

`0b0000` Not supported in hardware.

`0b0001` Supported.

All other values are reserved.

In ARMv8-A the permitted values are `0b0000` and `0b0001`.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

`0b0000` Not supported.

`0b0001` Supported.

All other values are reserved.

A value of `0b0001` indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

`0b0000` Not supported in hardware.

`0b0001` Supported, VFPv2.

`0b0010` Supported, VFPv3, VFPv4, or ARMv8. VFPv3 and ARMv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the permitted values are `0b0000` and `0b0010`.

A value of `0b0001` or `0b0010` indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is `0b0001`.
- VDIV.F64 is only available if the Divide field is `0b0001`.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

`0b0000` Not supported in hardware.

`0b0001` Supported, VFPv2.

`0b0010` Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

- 0b0000 The implementation has no Advanced SIMD and floating-point support.
- 0b0001 The implementation includes floating-point support with 16 x 64-bit registers.
- 0b0010 The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0010.

Accessing the MVFR0

This register can be read using VMRS with the following syntax:

VMRS <Rt>, <spec_reg>

This syntax is encoded with the following settings in the instruction encoding:

<spec_reg>	reg
MVFR0	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0` && `CPACR.cp10 == 0`, then read accesses to this register from PL1 are UNDEFINED.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && CPTR_EL2.TFP == 1`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CPTR_EL2.FPEN == 0`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CPTR_EL2.FPEN == 10`, then read accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCPTR.TCP10 == 1`, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCPTR.TCP10 == 1`, then Non-secure read accesses to this register from EL2 are UNDEFINED.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1`, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch32(EL3) && SCR_EL3.NS == 1 && NSACR.cp10 == 0`, then Non-secure read accesses to this register from EL1 and EL2 are UNDEFINED.
- If `IsUsingAArch64(EL3) && CPTR_EL3.TFP == 1`, then read accesses at EL1 or EL2 are trapped to EL3.

G8.2.111 MVFR1, Media and VFP Feature Register 1

The MVFR1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0](#) and [MVFR2](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G8-5638](#).

Configurations

AArch32 System register MVFR1[31:0] is architecturally mapped to AArch64 System register [MVFR1_EL1\[31:0\]](#).

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MVFR1 is a 32-bit register.

Field descriptions

The MVFR1 bit assignments are:

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

0b0000 Not supported.

0b0001 Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.

0b0010 As for 0b0001, and adds instructions for conversion between double-precision and half-precision.

0b0011 As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the [ARMv8.2-FP16](#) extension.
- 0b0011 in an implementation with floating-point support that includes the [ARMv8.2-FP16](#) extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support.

Defined values are:

- 0b0000 Not supported.
- 0b0001 SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
- 0b0010 As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0010 in an implementation with SIMD floating-point support that does not include the [ARMv8.2-FP16](#) extension.
- 0b0011 in an implementation with SIMD floating-point support that includes the [ARMv8.2-FP16](#) extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

- 0b0000 Not implemented.
- 0b0001 Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

SIMDIInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

0b0000 Not implemented, or hardware supports only the Default NaN mode.

0b0001 Hardware supports propagation of NaN values.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

FPPtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

0b0000 Not implemented, or hardware supports only the Flush-to-Zero mode of operation.

0b0001 Hardware supports full denormalized number arithmetic.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0001.

Accessing the MVFR1

This register can be read using VMRS with the following syntax:

VMRS <Rt>, <spec_reg>

This syntax is encoded with the following settings in the instruction encoding:

<spec_reg>	reg
MVFR1	0110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0 && CPACR.cp10 == 0`, then read accesses to this register from PL1 are UNDEFINED.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && CPTR_EL2.TFP == 1`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CPTR_EL2.FPEN == 0`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CPTR_EL2.FPEN == 10`, then read accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCPTR.TCP10 == 1`, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCPTR.TCP10 == 1`, then Non-secure read accesses to this register from EL2 are UNDEFINED.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1`, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch32(EL3) && SCR_EL3.NS == 1 && NSACR.cp10 == 0`, then Non-secure read accesses to this register from EL1 and EL2 are UNDEFINED.
- If `IsUsingAArch64(EL3) && CPTR_EL3.TFP == 1`, then read accesses at EL1 or EL2 are trapped to EL3.

G8.2.112 MVFR2, Media and VFP Feature Register 2

The MVFR2 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0](#) and [MVFR1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G8-5638](#).

Configurations

AArch32 System register MVFR2[31:0] is architecturally mapped to AArch64 System register [MVFR2_EL1\[31:0\]](#).

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MVFR2 is a 32-bit register.

Field descriptions

The MVFR2 bit assignments are:

Bits [31:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

0b0000 Not implemented, or no support for miscellaneous features.

0b0001 Support for Floating-point selection.

0b0010 As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.

0b0011 As 0b0010, and Floating-point Round to Integer Floating-point.

0b0100 As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0100.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

0b0000 Not implemented, or no support for miscellaneous features.

0b0001 Floating-point Conversion to Integer with Directed Rounding modes.

0b0010 As 0b0001, and Floating-point Round to Integer Floating-point.

0b0011 As 0b0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A the permitted values are 0b0000 and 0b0011.

Accessing the MVFR2

This register can be read using VMRS with the following syntax:

VMRS <Rt>, <spec_reg>

This syntax is encoded with the following settings in the instruction encoding:

<spec_reg>	reg
MVFR2	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0` && `CPACR.cp10 == 0`, then read accesses to this register from PL1 are UNDEFINED.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && CPTR_EL2.TFP == 1`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TID3 == 1`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CPTR_EL2.FPEN == 0`, then read accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CPTR_EL2.FPEN == 10`, then read accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCPTR.TCP10 == 1`, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCPTR.TCP10 == 1`, then Non-secure read accesses to this register from EL2 are UNDEFINED.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID3 == 1`, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch32(EL3) && SCR_EL3.NS == 1 && NSACR.cp10 == 0`, then Non-secure read accesses to this register from EL1 and EL2 are UNDEFINED.
- If `IsUsingAArch64(EL3) && CPTR_EL3.TFP == 1`, then read accesses at EL1 or EL2 are trapped to EL3.

G8.2.113 NMRR, Normal Memory Remap Register

The NMRR characteristics are:

Purpose

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the [PRRR](#).

Used in conjunction with the [PRRR](#).

Configurations

AArch32 System register NMRR[31:0] is architecturally mapped to AArch64 System register [MAIR_EL1](#)[63:32].

[MAIR1](#) and NMRR are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in [MAIR1](#).

When EL3 is using AArch32, write access to NMRR(S) is disabled when the CP15SSDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

NMRR is a 32-bit register.

Field descriptions

The NMRR bit assignments are:

When [TTBCR.EAE](#) == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OR7	OR6	OR5	OR4	OR3	OR2	OR1	OR0	IR7	IR6	IR5	IR4	IR3	IR2	IR1	IR0																

OR<n>, bits [2n+17:2n+16], for n = 0 to 7

Outer Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the [PRRR](#).TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:

- 0b00 Region is Non-cacheable.
- 0b01 Region is Write-Back, Write-Allocate.
- 0b10 Region is Write-Through, no Write-Allocate.
- 0b11 Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

IR<n>, bits [2n+1:2n], for n = 0 to 7

Inner Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the [PRRR](#).TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:

- 0b00 Region is Non-cacheable.
- 0b01 Region is Write-Back, Write-Allocate.

0b10 Region is Write-Through, no Write-Allocate.

0b11 Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the NMRR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c2, 1	000	001	1010	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	NMRR_s
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	NMRR
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	NMRR
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	NMRR
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	NMRR
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	NMRR
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	NMRR
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	NMRR_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	NMRR_ns

When EL3 is using AArch32, write access to NMRR_s is UNDEFINED when the CP15SSDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 0 \ \&\& \ \text{HSTR_EL2.T10} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 0 \ \&\& \ \text{HSTR_EL2.T10} == 1$, then accesses at EL1 are trapped to EL2.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32(EL2)} \ \&\& \ \text{HCR.TVM} == 1$, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32(EL2)} \ \&\& \ \text{HCR.TRVM} == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32(EL2)} \ \&\& \ \text{HSTR.T10} == 1$, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.114 NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, defines the Non-secure access permissions to Trace, Advanced SIMD and floating-point functionality. Also includes IMPLEMENTATION DEFINED bits that can define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

Configurations

———— Note ————

In AArch64 state, the NSACR controls are replaced by controls in [CPTR_EL3](#).

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

Attributes

NSACR is a 32-bit register.

Field descriptions

The NSACR bit assignments are:

If EL3 is implemented and is using AArch64 then:

- Any read of the NSACR from Non-secure EL2 or Non-secure EL1 returns a value of `0x00000C00`.
- Any read or write to NSACR from Secure EL1 is trapped as an exception to EL3.

If EL3 is not implemented, then any read of the NSACR from EL2 or EL1 returns a value of `0x00000C00`.

Bits [31:21]

Reserved, RES0.

NSTRCDIS, bit [20]

Disables Non-secure System register accesses to all implemented trace registers.

`0b0` This control has no effect on:

- System register access to implemented trace registers.
- The behavior of [CPACR.TRCDIS](#) and [HCPTR.TTA](#).

`0b1` Non-secure System register accesses to all implemented trace registers are disabled, meaning:

- [CPACR.TRCDIS](#) behaves as RAO/WI in Non-secure state, regardless of its actual value.
- [HCPTR.TTA](#) behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the [CPACR.TRCDIS](#) field:

- If [CPACR.TRCDIS](#) is RAZ/WI, this field is RAZ/WI.
- If [CPACR.TRCDIS](#) is RW, this field is RW.

———— **Note** —————

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

In a system where the PE resets into EL3, this field resets to 0.

Bit [19]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [18:16]

IMPLEMENTATION DEFINED.

NSASEDIS, bit [15]

Disables Non-secure access to the Advanced SIMD functionality.

0b0 This control has no effect on:

- Non-secure access to Advanced SIMD functionality.
- The behavior of [CPACR.ASEDIS](#) and [HCPTR.TASE](#).

0b1 Non-secure access to the Advanced SIMD functionality is disabled, meaning:

- [CPACR.ASEDIS](#) behaves as RAO/WI in Non-secure state, regardless of its actual value.
- [HCPTR.TASE](#) behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the [CPACR.ASEDIS](#) field:

- If [CPACR.ASEDIS](#) is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If [CPACR.ASEDIS](#) is RAZ/WI, this field is RAZ/WI.
- If [CPACR.ASEDIS](#) is RW, this field is RW.

In a system where the PE resets into EL3, this field resets to 0.

Bits [14:12]

Reserved, RES0.

cp11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

cp10, bit [10]

Enable Non-secure access to the Advanced SIMD and floating-point features. Possible values of the fields are:

0b0 Advanced SIMD and floating-point features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED.

When the PE is in Non-secure state:

- The CPACR.{cp11, cp10} fields ignore writes and read as 0b00, access denied.
- The HCPTR.{TCP11, TCP10} fields behave as RAO/WI, regardless of their actual values.

0b1 Advanced SIMD and floating-point features can be accessed from both Security states.

If Non-secure access to the Advanced SIMD and floating-point functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing the NSACR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c1, 2	000	010	0001	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	RO	RO	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RO	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HSTR_EL2.T1 == 1`, then read accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HSTR_EL2.T1 == 1`, then read accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `HSTR.T1 == 1`, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 0` && `SCR_EL3.EEL2 == 0`, then accesses at EL1 are trapped to EL3.
- If `SCR_EL3.NS == 0` && `IsUsingAArch64(EL2)` && `SCR_EL3.EEL2 == 1`, then accesses at EL1 are trapped to EL2.

G8.2.115 PAR, Physical Address Register

The PAR characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configurations

AArch32 System register PAR[63:0] is architecturally mapped to AArch64 System register [PAR_EL1](#)[63:0].

The PAR returns a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.
- When the PE is in Hyp mode and executes an [ATS12NSOPR](#), [ATS12NSOPW](#), [ATS12NSOUR](#), or [ATS12NSOUW](#) instruction when the value of [HCR.VM](#) is 0 and the value of [TTBCR.EAE](#) is 0.

In these cases, PAR[63:32] is RES0.

Otherwise, the PAR returns a 64-bit value. This means it returns a 64-bit value in the following cases:

- When using the Long-descriptor translation table format.
- If the stage 1 address translation is disabled and [TTBCR.EAE](#) is set to 1.
- In an implementation that includes EL2, for the result of an [ATS1Cxx](#) instruction performed from Hyp mode.

For PL1&0 stage 1 translations, [TTBCR.EAE](#) selects the translation table format.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

The Configurations section specifies the cases where each PAR format is used.

Field descriptions

The PAR bit assignments are:

When the instruction returned a 32-bit value to the PAR, PAR.F==0:

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the NOS, SH, Inner, and Outer fields.
- See the NS bit description for constraints on the value it returns.

PA, bits [31:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[31:12].

This field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

0b0 Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

This field resets to an architecturally UNKNOWN value.

NOS, bit [10]

Not Outer Shareable. When the returned value of PAR.SH is 1, indicates the Shareability attribute for the physical memory region:

0b0 Memory region is Outer Shareable.

0b1 Memory region is Inner Shareable.

When the returned value of PAR.SH is 0 the value returned to this field is UNKNOWN.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [8]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

SH, bit [7]

Shareability. Indicates whether the physical memory region is Non-shareable:

0b0 Memory is Non-shareable.

0b1 Memory is shareable, and PAR.NOS indicates whether the region is Outer Shareable or Inner Shareable.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

Inner[2:0], bits [6:4]

Inner cacheability attribute for the region. Permitted values are:

- 0b000 Non-cacheable.
- 0b001 Device-nGnRnE.
- 0b011 Device-nGnRE.
- 0b101 Write-Back, Write-Allocate.
- 0b110 Write-Through.
- 0b111 Write-Back, no Write-Allocate.

The values 0b010 and 0b100 are reserved.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

Outer[1:0], bits [3:2]

Outer cacheability attribute for the region. Permitted values are:

- 0b00 Non-cacheable.
- 0b01 Write-Back, Write-Allocate.
- 0b10 Write-Through, no Write-Allocate.
- 0b11 Write-Back, no Write-Allocate.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

SS, bit [1]

Supersection. Used to indicate if the result is a Supersection:

- 0b0 Result is not a Supersection. PAR[31:12] contains OA[31:12].
- 0b1 Result is a Supersection, and:
 - PAR[31:24] contains OA[31:24].
 - PAR[23:16] contains OA[39:32].
 - PAR[15:12] contains 0b0000.

If an implementation supports less than 40 bits of physical address, the bits in the PAR field that correspond to physical address bits that are not implemented are UNKNOWN.

This field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

- 0b0 Address translation completed successfully.

This field resets to an architecturally UNKNOWN value.

When the instruction returned a 32-bit value to the PAR, PAR.F==1:

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [31:16]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

LPAAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

0b0 Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

This field resets to an architecturally UNKNOWN value.

Bits [10:7]

Reserved, RES0.

FS, bits [6:1]

Fault status bits. Bits [12,10,3:0] from the [DFSR](#), indicating the source of the abort.

This field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

0b1 Address translation aborted.

This field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==0:

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the ATTR and SH fields.
- See the NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in [MAIR0](#) and [MAIR1](#).

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

Bits [55:40]

Reserved, RES0.

PA, bits [39:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[39:12].

This field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

0b1 Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

This field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

The value 0b01 is reserved.

———— **Note** —————

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

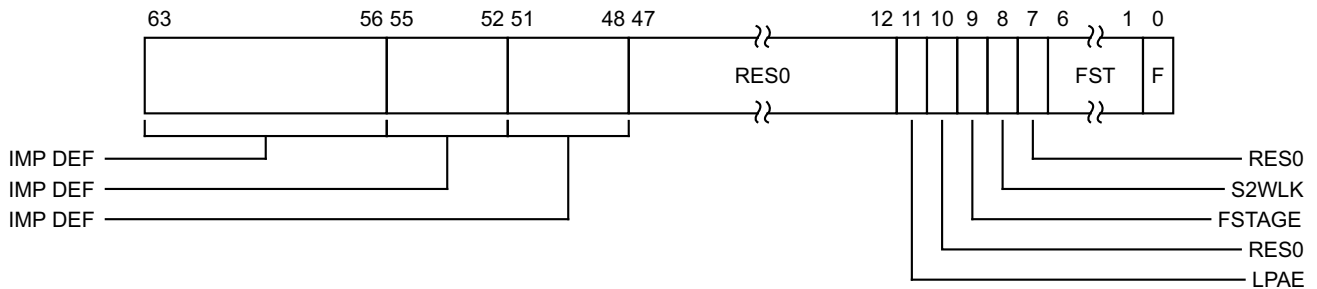

F, bit [0]

Indicates whether the instruction performed a successful address translation.

0b0 Address translation completed successfully.

This field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==1:

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Bits [47:12]

Reserved, RES0.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

0b1 Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

This field resets to an architecturally UNKNOWN value.

Bit [10]

Reserved, RES0.

FSTAGE, bit [9]

Indicates the translation stage at which the translation aborted:

0b0 Translation aborted because of a fault in the stage 1 translation.

0b1 Translation aborted because of a fault in the stage 2 translation.

This field resets to an architecturally UNKNOWN value.

S2WLK, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status field. Values are as in the [DFSR.STATUS](#) and [IFSR.STATUS](#) fields when using the Long-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

0b1 Address translation aborted.

This field resets to an architecturally UNKNOWN value.

Accessing the PAR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c4, 0	000	000	0111	1111	0100

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 0, <Rt>, <Rt2>, c7	0000	1111	0111

Accessibility

The register is accessible as follows:

<syntax>	Configuration	Accessibility				Instance
		EL0	EL1	EL2	EL3	
p15, 0, <Rt>, c7, c4, 0	!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	PAR
p15, 0, <Rt>, c7, c4, 0	HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	PAR

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T7 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T7 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T7 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.116 PRRR, Primary Region Remap Register

The PRRR characteristics are:

Purpose

Controls the top level mapping of the TEX[0], C, and B memory region attributes.

Configurations

AArch32 System register PRRR[31:0] is architecturally mapped to AArch64 System register MAIR_EL1[31:0].

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

When EL3 is using AArch32, write access to PRRR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

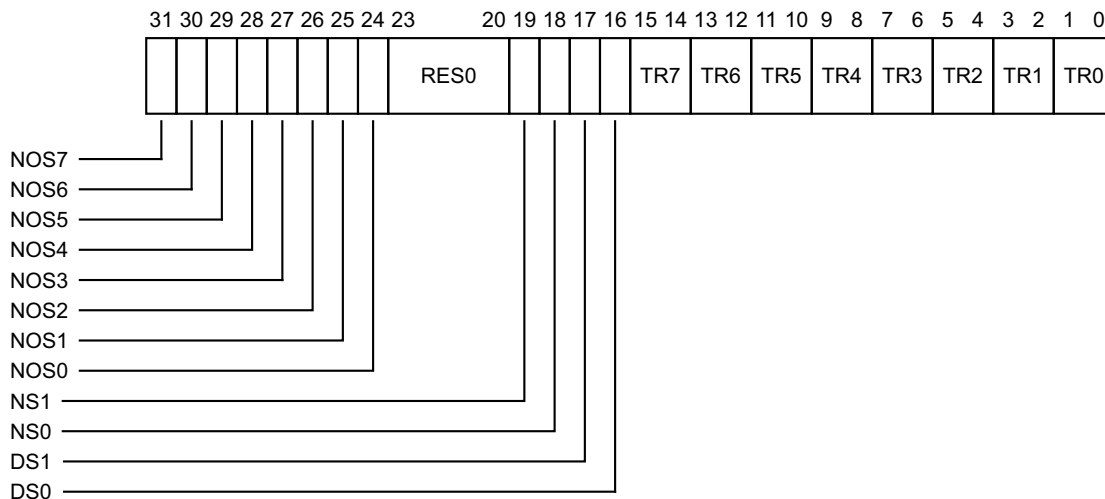

Attributes

PRRR is a 32-bit register.

Field descriptions

The PRRR bit assignments are:

When TTBCR.EAE == 0:

NOS<n>, bit [n+24], for n = 0 to 7

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR. {NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

- 0b0 Memory region is Outer Shareable.
- 0b1 Memory region is Inner Shareable.

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
 - Inner Non-cacheable, Outer Non-cacheable.
 - Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.

The meaning of the NOS6 field is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Bits [23:20]

Reserved, RES0.

NS1, bit [19]

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 1.

The possible values of this bit are:

- 0b0 Region is Non-shareable.
- 0b1 Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

This field resets to an architecturally UNKNOWN value.

NS0, bit [18]

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 0.

The possible values of this bit are:

- 0b0 Region is Non-shareable.
- 0b1 Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

This field resets to an architecturally UNKNOWN value.

DS1, bit [17]

Mapping of S = 1 attribute for Device memory. In ARMv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

This field resets to an architecturally UNKNOWN value.

DS0, bit [16]

Mapping of S = 0 attribute for Device memory. In ARMv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

This field resets to an architecturally UNKNOWN value.

TR<n>, bits [2n+1:2n], for n = 0 to 7

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values for each field other than TR6 are:

- 0b00 Device-nGnRnE memory
- 0b01 Device-nGnRE memory
- 0b10 Normal memory

The value 0b11 is reserved. The effect of programming a field to 0b11 is CONSTRAINED UNPREDICTABLE, see *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

The meaning of the TR6 field is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the PRRR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c2, 0	000	000	1010	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	PRRR
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	PRRR
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	PRRR
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	PRRR
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	PRRR
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	PRRR
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	PRRR_s
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	PRRR_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	PRRR_ns

When EL3 is using AArch32, write access to PRRR_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 0 \ \&\& \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 0 \ \&\& \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 0 \ \&\& \text{HSTR_EL2.T10} == 1$, then accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 1 \ \&\& \text{HCR_EL2.TGE} == 0 \ \&\& \text{HCR_EL2.TVM} == 1$, then write accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 1 \ \&\& \text{HCR_EL2.TGE} == 0 \ \&\& \text{HCR_EL2.TRVM} == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 1 \ \&\& \text{HCR_EL2.TGE} == 0 \ \&\& \text{HSTR_EL2.T10} == 1$, then accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \text{HCR.TVM} == 1$, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \text{HCR.TRVM} == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \text{HSTR.T10} == 1$, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.117 REVIDR, Revision ID Register

The REVIDR characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configurations

AArch32 System register REVIDR[31:0] is architecturally mapped to AArch64 System register [REVIDR_EL1](#)[31:0].

If REVIDR has the same value as [MIDR](#), then its contents have no significance.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

REVIDR is a 32-bit register.

Field descriptions

The REVIDR bit assignments are:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the REVIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 6	000	110	0000	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HCR_EL2.TID1 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.TID1 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HCR.TID1 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HSTR.T0 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.118 RMR, Reset Management Register

The RMR characteristics are:

Purpose

If EL1 or EL3 is the highest implemented Exception level and this register is implemented:

- A write to the register at the highest implemented Exception level can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configurations

AArch32 System register RMR[31:0] is architecturally mapped to AArch64 System register [RMR_EL1](#)[31:0] when `IsHighestEL(EL1)`.

AArch32 System register RMR[31:0] is architecturally mapped to AArch64 System register [RMR_EL3](#)[31:0] when `IsExceptionLevelImplemented(EL3)`.

Only implemented if EL1 or EL3 is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

Attributes

RMR is a 32-bit register.

Field descriptions

The RMR bit assignments are:

Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

AA64, bit [0]

When the highest implemented Exception level can use AArch64, determines which Execution state the PE boots into after a Warm reset:

0b0 AArch32.

0b1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

Accessing the RMR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c0, 2	000	010	1100	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	-	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && SCR_EL3.NS == 1	-	-	-	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && SCR_EL3.NS == 1	-	n/a	-	n/a
HighestEL(EL3) && SCR_EL3.NS == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && SCR_EL3.NS == 1	-	-	-	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && SCR_EL3.NS == 1	-	n/a	-	RW

The encoding for this register is UNDEFINED:

- If the RMR is not implemented.
- At all Exception levels other than the highest implemented Exception level.

When EL3 is implemented, ARM deprecates accessing this register from any PE mode other than Monitor mode.

G8.2.119 RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

Purpose

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

Configurations

This register is only implemented if the highest Exception level implemented is capable of using AArch32, and is not EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

RVBAR is a 32-bit register.

Field descriptions

The RVBAR bit assignments are:

Bits [31:1]

Reset Address[31:1]. Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

Bit [0]

Reserved, RES1.

Accessing the RVBAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c0, 1	000	001	1100	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	-	RO	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && SCR_EL3.NS == 1	-	-	RO	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && SCR_EL3.NS == 1	-	n/a	RO	n/a
HighestEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	-	-	-
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	-	-

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T12 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T12 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T12 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.120 SCR, Secure Configuration Register

The SCR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External abort occurs.
- Whether the CPSR.F or CPSR.A bits can be modified when SCR.NS==1.

Configurations

AArch32 System register SCR[31:0] can be mapped to AArch64 System register [SCR_EL3](#)[31:0], but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

Attributes

SCR is a 32-bit register.

Field descriptions

The SCR bit assignments are:

Bits [31:16]

Reserved, RES0.

TERR, bit [15]

When RAS is implemented:

Trap Error record accesses. Generate a Monitor Trap exception on accesses to the following registers from modes other than Monitor mode:

[ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#). When ARMv8.4-RAS is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), [ERXMISC7](#).

0b0 This control does not cause any instructions to be trapped.

0b1 Accesses to the specified registers from modes other than Monitor mode generate a Monitor Trap exception.

In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [14]

Reserved, RES0.

TWE, bit [13]

Traps WFE instructions to Monitor mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by [SCTLR.nTWE](#) or [HCR.TWE](#).

Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

———— **Note** —————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL3, this field resets to 0.

TWI, bit [12]

Traps WFI instructions to Monitor mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by [SCTLR.nTWI](#) or [HCR.TWI](#).

Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— **Note** —————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL3, this field resets to 0.

Bits [11:10]

Reserved, RES0.

SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory. The possible values for this bit are:

0b0 Secure state instruction fetches from Non-secure memory are permitted.

0b1 Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to 0.

HCE, bit [8]

Hypervisor Call instruction enable. If EL2 is enabled in the current Security state, enables execution of HVC instructions at EL1 and EL2.

0b0 HVC instructions are:

- UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1.
- UNPREDICTABLE at EL2. Behavior is one of the following:
 - The instruction is UNDEFINED.
 - The instruction executes as a NOP.

0b1 HVC instructions are enabled at EL1 and EL2.

———— Note ————

HVC instructions are always UNDEFINED at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

In a system where the PE resets into EL3, this field resets to 0.

SCD, bit [7]

Secure Monitor Call disable. Disables SMC instructions.

0b0 SMC instructions are enabled.

0b1 In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level. In Secure state, behavior is one of the following:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

———— Note ————

SMC instructions are always UNDEFINED at PL0.

In a system where the PE resets into EL3, this field resets to 0.

nET, bit [6]

Not Early Termination. This bit disables early termination. The possible values of this bit are:

0b0 Early termination permitted. Execution time of data operations can depend on the data values.

0b1 Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.

This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

In a system where the PE resets into EL3, this field resets to 0.

AW, bit [5]

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether CPSR.A masks an External abort taken from Non-secure state, and the possible values of this bit are:

0b0 External aborts taken from Non-secure state are not masked by CPSR.A, and are taken to EL3.

External aborts taken from Secure state are masked by CPSR.A.

0b1 External aborts taken from either Security state are masked by CPSR.A. When CPSR.A is 0, the abort is taken to EL3.

When SCR.EA is 0 or HCR.AMO is 1, this bit has no effect.

In a system where the PE resets into EL3, this field resets to 0.

FW, bit [4]

When the value of SCR.FIQ is 1 and the value of HCR.FMO is 0, this bit controls whether CPSR.F masks an FIQ interrupt taken from Non-secure state, and the possible values of this bit are:

0b0 An FIQ taken from Non-secure state is not masked by CPSR.F, and is taken to EL3.

An FIQ taken from Secure state is masked by CPSR.F.

0b1 An FIQ taken from either Security state is masked by CPSR.F. When CPSR.F is 0, the FIQ is taken to EL3.

When SCR.FIQ is 0 or HCR.FMO is 1, this bit has no effect.

In a system where the PE resets into EL3, this field resets to 0.

EA, bit [3]

External Abort handler. This bit controls which mode takes External aborts. The possible values of this bit are:

0b0 External aborts taken to Abort mode.

0b1 External aborts taken to Monitor mode.

In a system where the PE resets into EL3, this field resets to 0.

FIQ, bit [2]

FIQ handler. This bit controls which mode takes FIQ exceptions. The possible values of this bit are:

0b0 FIQs taken to FIQ mode.

0b1 FIQs taken to Monitor mode.

In a system where the PE resets into EL3, this field resets to 0.

IRQ, bit [1]

IRQ handler. This bit controls which mode takes IRQ exceptions. The possible values of this bit are:

0b0 IRQs taken to IRQ mode.

0b1 IRQs taken to Monitor mode.

In a system where the PE resets into EL3, this field resets to 0.

NS, bit [0]

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

0b0 PE is in Secure state.

0b1 PE is in Non-secure state.

If the HCR.TGE bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

In a system where the PE resets into EL3, this field resets to 0.

Accessing the SCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c1, 0	000	000	0001	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	-	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T1 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0`, then accesses at EL1 are trapped to EL3.
- If `SCR_EL3.NS == 0 && IsUsingAArch64(EL2) && SCR_EL3.EEL2 == 1`, then accesses at EL1 are trapped to EL2.

G8.2.121 SCTLR, System Control Register

The SCTLR characteristics are:

Purpose

Provides the top level control of the system, including its memory system.

Configurations

AArch32 System register SCTLR[31:0] is architecturally mapped to AArch64 System register [SCTLR_EL1](#)[31:0].

When EL3 is using AArch32, write access to SCTLR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SCTLR is a 32-bit register.

Field descriptions

The SCTLR bit assignments are:

Bit [31]

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to an Exception Level that is executing at PL1 are taken to A32 or T32 state:

- 0b0 Exceptions, including reset, taken to A32 state.
- 0b1 Exceptions, including reset, taken to T32 state.

This field resets to an IMPLEMENTATION DEFINED choice between:

- 0.
- a value determined by an input configuration signal.

AFE, bit [29]

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model. The possible values of this bit are:

- 0b0 In the translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.
- 0b1 In the translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

This field resets to 0.

TRE, bit [28]

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA. The possible values of this bit are:

- 0b0 TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.
- 0b1 TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.

When the value of [TTBCR.EAE](#) is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

This field resets to 0.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

- 0b0 Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian.
- 0b1 Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support for data accesses at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception Levels higher than EL0, this bit is RES1.

This field resets to an IMPLEMENTATION DEFINED choice between:

- 0.
- a value determined by an input configuration signal.

Bit [24]

Reserved, RES0.

SPAN, bit [23]

When ARMv8.1-PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

0b0 **CPSR.PAN** is set to 1 in the following situations:

- In Non-secure state, on taking an exception to EL1.
- In Secure state, when EL3 is using AArch64, on taking an exception to EL1.
- In Secure state, when EL3 is using AArch32, on taking an exception to EL3.

0b1 The value of **CPSR.PAN** is left unchanged on taking an exception to EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [22]

Reserved, RES1.

Bit [21]

Reserved, RES0.

UWXN, bit [20]

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1. The possible values of this bit are:

0b0 This control has no effect on memory access permissions.

0b1 Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.

The UWXN bit is permitted to be cached in a TLB.

This field resets to 0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

0b0 This control has no effect on memory access permissions.

0b1 Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

The WXN bit is permitted to be cached in a TLB.

This field resets to 0.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

0b0 Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

—————
This field resets to 1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to Undefined mode.

0b0 Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

—————
This field resets to 1.

Bits [15:14]

Reserved, RES0.

V, bit [13]

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

0b0 Normal exception vectors. Base address is held in [VBAR](#).

0b1 High exception vectors (Hivecs), base address 0xFFFF0000. This base address cannot be remapped.

This field resets to an IMPLEMENTATION DEFINED choice between:

- 0.
- a value determined by an input configuration signal.

I, bit [12]

Instruction access Cacheability control, for accesses at EL1 and EL0:

0b0 All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache.

If the value of SCTL.R.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1 All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache.

If the value of SCTL.R.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLRI bit if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

This field resets to 0.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

0b0 SETEND instruction execution is enabled at PL0 and PL1.

0b1 SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

This field resets to 0.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

0b0 All IT instruction functionality is enabled at PL1 and PL0.

0b1 Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with $hw1[3:0] \neq 1000$.
- All encodings of the subsequent instruction with the following values for $hw1$:
 - 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
 - 1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the ARMv8 ARM, section F3.2.5.
 - 10100xxxxxxxxxxx: ADD Rd, PC, #imm
 - 01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
 - 0100x1xxx111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
 - 010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see [Changes to an ITD control by an instruction in an IT block on page E1-3540](#).

ITD is optional, but if it is implemented in the SCTLRI then it must also be implemented in the SCTLRI_EL1. If it is not implemented then this bit is RAZ/WI.

This field resets to 0.

UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

This field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

0b0 PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.

0b1 PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

This field resets to 1.

LSMAOE, bit [4]

When ARMv8.2-LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

0b0 For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.

0b1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.

This field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

0b0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

0b1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

This field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

0b0 All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.

0b1 All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.

The PE ignores SCLTR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

This field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

- 0b0 Alignment fault checking disabled when executing at PL1 or PL0.
 Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
- 0b1 Alignment fault checking enabled when executing at PL1 or PL0.
 All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

This field resets to 0.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

- 0b0 EL1 and EL0 stage 1 address translation disabled.
 See the SCLTR.I field for the behavior of instruction accesses to Normal memory.
- 0b1 EL1 and EL0 stage 1 address translation enabled.

In the Non-secure state the PE behaves as if the value of the SCLTR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of HCR.{DC, TGE} is not {0, 0}.
- EL2 is using AArch64 and the value of HCR_EL2.{DC, TGE} is not {0, 0}.

This field resets to 0.

Accessing the SCLTR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c0, 0	000	000	0001	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	SCTLR
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	SCTLR
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	SCTLR
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	SCTLR
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	SCTLR
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	SCTLR
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	SCTLR_s
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	SCTLR_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	SCTLR_ns

When EL3 is using AArch32, write access to SCTLR_s is UNDEFINED when the CP15SSDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T1 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T1 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TVM == 1, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TRVM == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T1 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.122 SPSR, Saved Program Status Register

The SPSR characteristics are:

Purpose

Holds the saved process state for the current mode.

Configurations

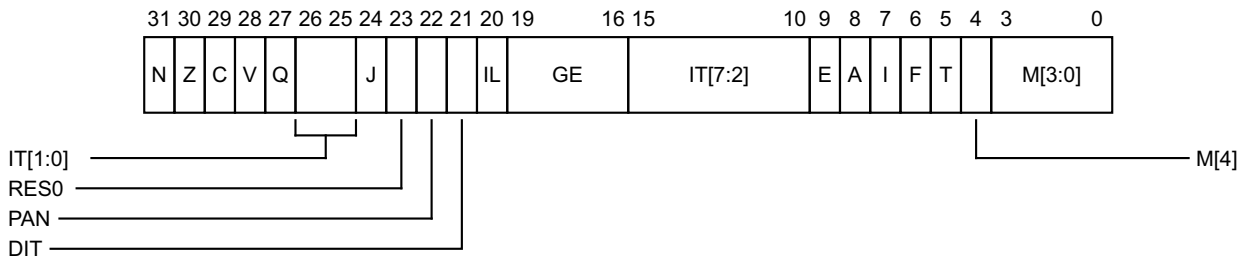

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR is a 32-bit register.

Field descriptions

The SPSR bit assignments are:

N, bit [31]

Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

Z, bit [30]

Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

C, bit [29]

Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

V, bit [28]

Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

Q, bit [27]

Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.

0b0 Taken from A32 state.

0b1 Taken from T32 state.

M[4], bit [4]

Execution state that the exception was taken from.

0b1 Exception taken from AArch32.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

0b0011 Supervisor.

0b0110 Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32).

0b0111 Abort.

0b1010 Hyp.

0b1011 Undefined.

0b1111 System.

Other values are reserved.

G8.2.123 SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configurations

AArch32 System register SPSR_abt[31:0] is architecturally mapped to AArch64 System register SPSR_abt[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR_abt is a 32-bit register.

Field descriptions

The SPSR_abt bit assignments are:

N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to Abort mode, and copied to [CPSR.N](#) on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to Abort mode, and copied to [CPSR.Z](#) on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to Abort mode, and copied to [CPSR.C](#) on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to Abort mode, and copied to [CPSR.V](#) on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to Abort mode, and copied to [CPSR.Q](#) on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

This field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of [CPSR.PAN](#) on taking an exception to Abort mode, and copied to [CPSR.PAN](#) on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of [CPSR.DIT](#) on taking an exception to Abort mode, and copied to [CPSR.DIT](#) on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of [PSTATE.IL](#) immediately before the exception was taken.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.

0b0 Taken from A32 state.

0b1 Taken from T32 state.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state that the exception was taken from.

0b1 Exception taken from AArch32.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

0b0011 Supervisor.

0b0110 Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32).

0b0111 Abort.

0b1011 Undefined.

0b1111 System.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_abt

This register can be read using MRS (banked register) with the following syntax:

MRS <Rd>, <banked_reg>

This register can be written using MSR (banked register) with the following syntax:

MSR <banked_reg>, <Rd>

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	M	R	M1
SPSR_abt	1	1	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than Abort mode. In Abort mode, it is accessible as the current SPSR.

G8.2.124 SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configurations

AArch32 System register SPSR_fiq[31:0] is architecturally mapped to AArch64 System register SPSR_fiq[31:0].

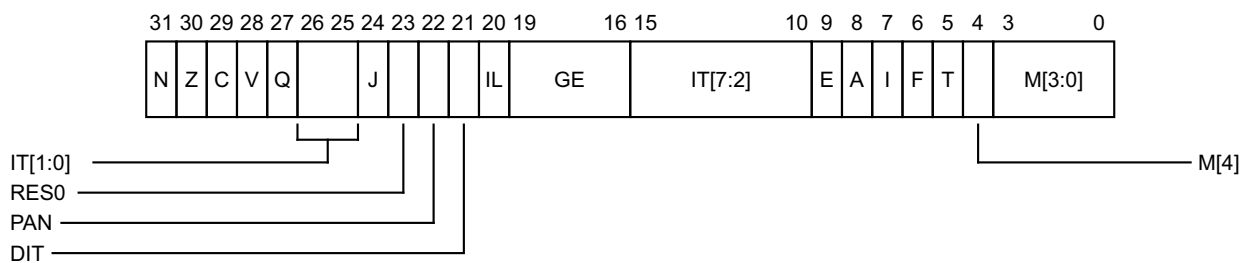

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR_fiq is a 32-bit register.

Field descriptions

The SPSR_fiq bit assignments are:

N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to FIQ mode, and copied to [CPSR.N](#) on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to FIQ mode, and copied to [CPSR.Z](#) on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to FIQ mode, and copied to [CPSR.C](#) on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to FIQ mode, and copied to [CPSR.V](#) on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to FIQ mode, and copied to [CPSR.Q](#) on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

This field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of CPSR.PAN on taking an exception to FIQ mode, and copied to CPSR.PAN on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of CPSR.DIT on taking an exception to FIQ mode, and copied to CPSR.DIT on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.

0b0 Taken from A32 state.

0b1 Taken from T32 state.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state that the exception was taken from.

0b1 Exception taken from AArch32.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

0b0011 Supervisor.

0b0110 Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32).

0b0111 Abort.

0b1011 Undefined.

0b1111 System.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_fiq

This register can be read using MRS (banked register) with the following syntax:

MRS <Rd>, <banked_reg>

This register can be written using MSR (banked register) with the following syntax:

MSR <banked_reg>, <Rd>

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	M	R	M1
SPSR_fiq	0	1	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than FIQ mode. In FIQ mode, it is accessible as the current SPSR.

G8.2.125 SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Configurations

AArch32 System register SPSR_hyp[31:0] is architecturally mapped to AArch64 System register SPSR_EL2[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions

The SPSR_hyp bit assignments are:

N, bit [31]

Set to the value of **CPSR.N** on taking an exception to Hyp mode, and copied to **CPSR.N** on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Set to the value of **CPSR.Z** on taking an exception to Hyp mode, and copied to **CPSR.Z** on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Set to the value of **CPSR.C** on taking an exception to Hyp mode, and copied to **CPSR.C** on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Set to the value of **CPSR.V** on taking an exception to Hyp mode, and copied to **CPSR.V** on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Set to the value of **CPSR.Q** on taking an exception to Hyp mode, and copied to **CPSR.Q** on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

This field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of [CPSR.PAN](#) on taking an exception to Hyp mode, and copied to [CPSR.PAN](#) on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of [CPSR.DIT](#) on taking an exception to Hyp mode, and copied to [CPSR.DIT](#) on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of [PSTATE.IL](#) immediately before the exception was taken.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.

0b0 Taken from A32 state.

0b1 Taken from T32 state.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state that the exception was taken from.

0b1 Exception taken from AArch32.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

0b0011 Supervisor.

0b0111 Abort.

0b1010 Hyp.

0b1011 Undefined.

0b1111 System.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_hyp

This register can be read using MRS (banked register) with the following syntax:

MRS <Rd>, <banked_reg>

This register can be written using MSR (banked register) with the following syntax:

MSR <banked_reg>, <Rd>

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	M	R	M1
SPSR_hyp	1	1	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	-	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	-	RW

Using MRS (banked register) and MSR (banked register) instructions, this register is only accessible from Monitor mode. In Hyp mode, this register is accessible as the current SPSR.

G8.2.126 SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configurations

AArch32 System register SPSR_irq[31:0] is architecturally mapped to AArch64 System register SPSR_irq[31:0].

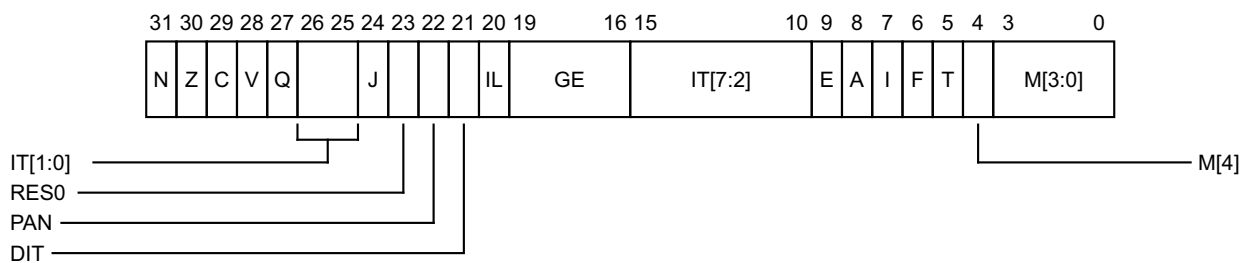

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR_irq is a 32-bit register.

Field descriptions

The SPSR_irq bit assignments are:

N, bit [31]

Set to the value of **CPSR.N** on taking an exception to IRQ mode, and copied to **CPSR.N** on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Set to the value of **CPSR.Z** on taking an exception to IRQ mode, and copied to **CPSR.Z** on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Set to the value of **CPSR.C** on taking an exception to IRQ mode, and copied to **CPSR.C** on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Set to the value of **CPSR.V** on taking an exception to IRQ mode, and copied to **CPSR.V** on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Set to the value of **CPSR.Q** on taking an exception to IRQ mode, and copied to **CPSR.Q** on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

This field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of CPSR.PAN on taking an exception to IRQ mode, and copied to CPSR.PAN on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of CPSR.DIT on taking an exception to IRQ mode, and copied to CPSR.DIT on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.

0b0 Taken from A32 state.

0b1 Taken from T32 state.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state that the exception was taken from.

0b1 Exception taken from AArch32.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

0b0011 Supervisor.

0b0110 Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32).

0b0111 Abort.

0b1011 Undefined.

0b1111 System.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_irq

This register can be read using MRS (banked register) with the following syntax:

MRS <Rd>, <banked_reg>

This register can be written using MSR (banked register) with the following syntax:

MSR <banked_reg>, <Rd>

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	M	R	M1
SPSR_irq	1	1	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than IRQ mode. In IRQ mode, it is accessible as the current SPSR.

G8.2.127 SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

Purpose

Holds the saved process state when an exception is taken to Monitor mode.

Configurations

AArch32 System register SPSR_mon[31:0] can be mapped to AArch64 System register [SPSR_EL3](#)[31:0], but this is not architecturally mandated.

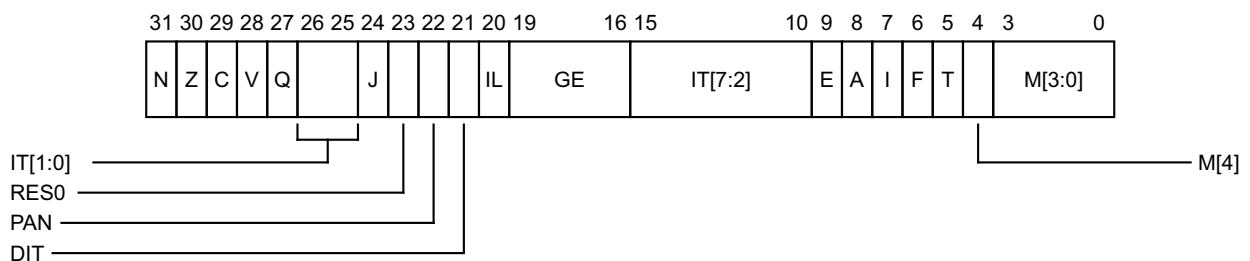

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR_mon is a 32-bit register.

Field descriptions

The SPSR_mon bit assignments are:

N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to Monitor mode, and copied to [CPSR.N](#) on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to Monitor mode, and copied to [CPSR.Z](#) on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to Monitor mode, and copied to [CPSR.C](#) on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to Monitor mode, and copied to [CPSR.V](#) on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to Monitor mode, and copied to [CPSR.Q](#) on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

This field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of [CPSR.PAN](#) on taking an exception to Monitor mode, and copied to [CPSR.PAN](#) on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of [CPSR.DIT](#) on taking an exception to Monitor mode, and copied to [CPSR.DIT](#) on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of [PSTATE.IL](#) immediately before the exception was taken.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.

0b0 Taken from A32 state.

0b1 Taken from T32 state.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state that the exception was taken from.

0b1 Exception taken from AArch32.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

- 0b0011 Supervisor.
- 0b0110 Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32).
- 0b0111 Abort.
- 0b1010 Hyp.
- 0b1011 Undefined.
- 0b1111 System.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_mon

This register can be read using MRS (banked register) with the following syntax:

MRS <Rd>, <banked_reg>

This register can be written using MSR (banked register) with the following syntax:

MSR <banked_reg>, <Rd>

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	M	R	M1
SPSR_mon	1	1	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	-	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	-	RW

Using MRS (banked register) and MSR (banked register) instructions, this register is only accessible from EL3 modes other than Monitor mode. In Monitor mode, it is accessible as the current SPSR.

G8.2.128 SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

Configurations

AArch32 System register SPSR_svc[31:0] is architecturally mapped to AArch64 System register SPSR_EL1[31:0].

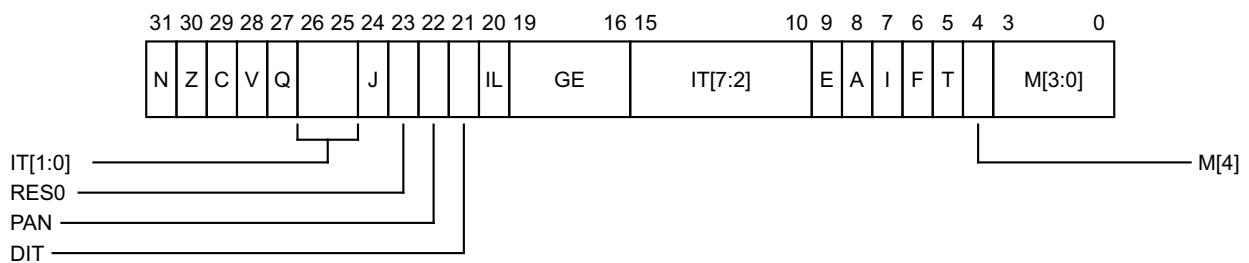

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR_svc is a 32-bit register.

Field descriptions

The SPSR_svc bit assignments are:

N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to Supervisor mode, and copied to [CPSR.N](#) on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to Supervisor mode, and copied to [CPSR.Z](#) on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to Supervisor mode, and copied to [CPSR.C](#) on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to Supervisor mode, and copied to [CPSR.V](#) on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to Supervisor mode, and copied to [CPSR.Q](#) on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

This field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of CPSR.PAN on taking an exception to Supervisor mode, and copied to CPSR.PAN on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of CPSR.DIT on taking an exception to Supervisor mode, and copied to CPSR.DIT on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.

0b0 Taken from A32 state.

0b1 Taken from T32 state.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state that the exception was taken from.

0b1 Exception taken from AArch32.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

- 0b0011 Supervisor.
- 0b0110 Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32).
- 0b0111 Abort.
- 0b1011 Undefined.
- 0b1111 System.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries on page K1-7216*.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_svc

This register can be read using MRS (banked register) with the following syntax:

MRS <Rd>, <banked_reg>

This register can be written using MSR (banked register) with the following syntax:

MSR <banked_reg>, <Rd>

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	M	R	M1
SPSR_svc	1	1	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than Supervisor mode. In Supervisor mode, it is accessible as the current SPSR.

G8.2.129 SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configurations

AArch32 System register SPSR_und[31:0] is architecturally mapped to AArch64 System register SPSR_und[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SPSR_und is a 32-bit register.

Field descriptions

The SPSR_und bit assignments are:

N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to Undefined mode, and copied to [CPSR.N](#) on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to Undefined mode, and copied to [CPSR.Z](#) on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to Undefined mode, and copied to [CPSR.C](#) on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to Undefined mode, and copied to [CPSR.V](#) on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to Undefined mode, and copied to [CPSR.Q](#) on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.
This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

This field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of CPSR.PAN on taking an exception to Undefined mode, and copied to CPSR.PAN on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of CPSR.DIT on taking an exception to Undefined mode, and copied to CPSR.DIT on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ mask bit.

0b0 Exception not masked.

0b1 Exception masked.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.

0b0 Taken from A32 state.

0b1 Taken from T32 state.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state that the exception was taken from.

0b1 Exception taken from AArch32.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 mode that an exception was taken from.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

- 0b0011 Supervisor.
- 0b0110 Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32).
- 0b0111 Abort.
- 0b1011 Undefined.
- 0b1111 System.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries on page K1-7216*.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_und

This register can be read using MRS (banked register) with the following syntax:

MRS <Rd>, <banked_reg>

This register can be written using MSR (banked register) with the following syntax:

MSR <banked_reg>, <Rd>

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	M	R	M1
SPSR_und	1	1	0110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than Undefined mode. In Undefined mode, it is accessible as the current SPSR.

G8.2.130 TCMTR, TCM Type Register

The TCMTR characteristics are:

Purpose

Provides information about the implementation of the TCM.

Configurations

If EL1 or above can use AArch32 then this register must be implemented.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TCMTR is a 32-bit register.

Field descriptions

The TCMTR bit assignments are:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the TCMTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 2	000	010	0000	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HCR_EL2.TID1 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.TID1 == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T0 == 1$, then read accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HCR.TID1 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HSTR.T0 == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.131 TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at Secure EL1 when EL3 is using AArch64, all entries that would be required for the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at Non-secure EL1, all stage 1 translation table entries that would be required for the Non-secure PL1&0 translation regime and, if EL2 is implemented, they must match the current VMID.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this instruction.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIALL is a 32-bit System instruction.

Field descriptions

TLBIALL ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBIALL instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 0	000	000	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When `HCR.FB` is 1, at Non-secure EL1 this instruction executes as a `TLBIALLS`.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1`, then execution of this instruction at EL1 is trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1`, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.132 TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this instruction.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIALLH is a 32-bit System instruction.

Field descriptions

TLBIALLH ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBIALLH instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c7, 0	100	000	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `HSTR.T8 == 1`, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.133 TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIALLHIS is a 32-bit System instruction.

Field descriptions

TLBIALLHIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBIALLHIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c3, 0	100	000	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `HSTR.T8 == 1`, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.134 TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at Secure EL1 when EL3 is using AArch64, all entries that would be required for the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at Non-secure EL1, all stage 1 translation table entries that would be required for the Non-secure PL1&0 translation regime and, if EL2 is implemented, they must match the current VMID.
- If executed at EL2 and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIALLIS is a 32-bit System instruction.

Field descriptions

TLBIALLIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBIALLIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 0	000	000	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.135 TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLNSNH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation only applies to the PE that executes this instruction.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIALLNSNH is a 32-bit System instruction.

Field descriptions

TLBIALLNSNH ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBIALLNSNH instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c7, 4	100	100	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `HSTR.T8 == 1`, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.136 TLBIALLNSNHIS, TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable

The TLBIALLNSNHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIALLNSNHIS is a 32-bit System instruction.

Field descriptions

TLBIALLNSNHIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBIALLNSNHIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c3, 4	100	100	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `HSTR.T8 == 1`, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.137 TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIASID is a 32-bit System instruction.

Field descriptions

The TLBIASID input value bit assignments are:

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

Executing the TLBIASID instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 2	000	010	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIASIDIS](#).

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.138 TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIASIDIS is a 32-bit System instruction.

Field descriptions

The TLBIASIDIS input value bit assignments are:

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

Executing the TLBIASIDIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 2	000	010	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.139 TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this instruction.

Configurations

———— Note ————

This System instruction is not implemented in architecture versions before ARMv8.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIIPAS2 is a 32-bit System instruction.

Field descriptions

The TLBIIPAS2 input value bit assignments are:

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2 instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c4, 1	100	001	1000	1111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If SCR.NS is 0, this instruction is a NOP.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.140 TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable

The TLBIIPAS2IS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- [SCR.NS](#) is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

———— Note ————

This System instruction is not implemented in architecture versions before ARMv8.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIIPAS2IS is a 32-bit System instruction.

Field descriptions

The TLBIIPAS2IS input value bit assignments are:

31	28 27	0
RES0	IPA[39:12]	

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2IS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c0, 1	100	001	1000	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If SCR.NS is 0, this instruction is a NOP.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.141 TLBIIPAS2L, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level

The TLBIIPAS2L characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- [SCR.NS](#) is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this instruction.

Configurations

———— Note ————

This System instruction is not implemented in architecture versions before ARMv8.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIIPAS2L is a 32-bit System instruction.

Field descriptions

The TLBIIPAS2L input value bit assignments are:

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2L instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c4, 5	100	101	1000	1111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If SCR.NS is 0, this instruction is a NOP.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.142 TLBIIPAS2LIS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable

The TLBIIPAS2LIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- [SCR.NS](#) is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

———— Note ————

This System instruction is not implemented in architecture versions before ARMv8.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIIPAS2LIS is a 32-bit System instruction.

Field descriptions

The TLBIIPAS2LIS input value bit assignments are:

31	28 27	0
RES0	IPA[39:12]	

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2LIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c0, 5	100	101	1000	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If SCR.NS is 0, this instruction is a NOP.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.143 TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions

The TLBIMVA input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Executing the TLBIMVA instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 1	000	001	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When `HCR.FB` is 1, at Non-secure EL1 this instruction executes as a `TLBIMVAIS`.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1`, then execution of this instruction at EL1 is trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1`, then execution of this instruction at EL1 is trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1`, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.144 TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVAA is a 32-bit System instruction.

Field descriptions

The TLBIMVAA input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAA instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 3	000	011	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIMVAAIS](#).

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\)](#) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H == 0](#) && [HCR_EL2.TTLB == 1](#), then execution of this instruction at EL1 is trapped to EL2.
- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\)](#) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H == 0](#) && [HSTR_EL2.T8 == 1](#), then execution of this instruction at EL1 is trapped to EL2.
- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\)](#) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H == 1](#) && [HCR_EL2.TGE == 0](#) && [HCR_EL2.TTLB == 1](#), then execution of this instruction at EL1 is trapped to EL2.
- If [\(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1\)](#) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H == 1](#) && [HCR_EL2.TGE == 0](#) && [HSTR_EL2.T8 == 1](#), then execution of this instruction at EL1 is trapped to EL2.
- If [SCR_EL3.NS == 1](#) && [IsUsingAArch32\(EL2\)](#) && [HCR.TTLB == 1](#), then execution of this instruction at EL1 is trapped to Hyp mode.
- If [SCR_EL3.NS == 1](#) && [IsUsingAArch32\(EL2\)](#) && [HSTR.T8 == 1](#), then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.145 TLBIMVAAIS, TLB Invalidate by VA, All ASID, Inner Shareable

The TLBIMVAAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVAAIS is a 32-bit System instruction.

Field descriptions

The TLBIMVAAIS input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAAIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 3	000	011	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.146 TLBIMVAAL, TLB Invalidate by VA, All ASID, Last level

The TLBIMVAAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

Configurations

———— Note ————

This System instruction is not implemented in architecture versions before ARMv8.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVAAL is a 32-bit System instruction.

Field descriptions

The TLBIMVAAL input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAAL instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 7	000	111	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIMVAALIS](#).

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.147 TLBIMVAALIS, TLB Invalidate by VA, All ASID, Last level, Inner Shareable

The TLBIMVAALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

———— Note ————

This System instruction is not implemented in architecture versions before ARMv8.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVAALIS is a 32-bit System instruction.

Field descriptions

The TLBIMVAALIS input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAALIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 7	000	111	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.148 TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this instruction.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVAH is a 32-bit System instruction.

Field descriptions

The TLBIMVAH input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAH instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c7, 1	100	001	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.149 TLBIMVAHIS, TLB Invalidate by VA, Hyp mode, Inner Shareable

The TLBIMVAHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVAHIS is a 32-bit System instruction.

Field descriptions

The TLBIMVAHIS input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAHIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c3, 1	100	001	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.150 TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVAIS is a 32-bit System instruction.

Field descriptions

The TLBIMVAIS input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Executing the TLBIMVAIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 1	000	001	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.151 TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

Configurations

This System instruction is not implemented in architecture versions before ARMv8.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVAL is a 32-bit System instruction.

Field descriptions

The TLBIMVAL input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Executing the TLBINVAL instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 5	000	101	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBINVALIS](#).

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.152 TLBIMVALH, TLB Invalidate by VA, Last level, Hyp mode

The TLBIMVALH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this instruction.

Configurations

This System instruction is not implemented in architecture versions before ARMv8.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVALH is a 32-bit System instruction.

Field descriptions

The TLBIMVALH input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVALH instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c7, 5	100	101	1000	1111	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.153 TLBIMVALHIS, TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable

The TLBIMVALHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

This System instruction is not implemented in architecture versions before ARMv8.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVALHIS is a 32-bit System instruction.

Field descriptions

The TLBIMVALHIS input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVALHIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c3, 5	100	101	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	WO
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	WO	WO
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.154 TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

Configurations

This System instruction is not implemented in architecture versions before ARMv8.
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBIMVALIS is a 32-bit System instruction.

Field descriptions

The TLBIMVALIS input value bit assignments are:

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Executing the TLBIMVALIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 5	000	101	1000	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TTLB == 1, then execution of this instruction at EL1 is trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T8 == 1, then execution of this instruction at EL1 is trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TTLB == 1, then execution of this instruction at EL1 is trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T8 == 1, then execution of this instruction at EL1 is trapped to Hyp mode.

G8.2.155 TLBTR, TLB Type Register

The TLBTR characteristics are:

Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TLBTR is a 32-bit register.

Field descriptions

The TLBTR bit assignments are:

IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB:

0b0 Unified TLB.

0b1 Separate Instruction and Data TLBs.

Accessing the TLBTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 3	000	011	0000	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TID1 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TID1 == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TID1 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

G8.2.156 TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch32 System register TPIDRPRW[31:0] is architecturally mapped to AArch64 System register [TPIDR_EL1](#)[31:0].

Note

The PE never updates this register.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDRPRW is a 32-bit register.

Field descriptions

The TPIDRPRW bit assignments are:

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

Accessing the TPIDRPRW

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c0, 4	000	100	1101	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	TPIDRPRW_s
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	TPIDRPRW
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	TPIDRPRW
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	TPIDRPRW
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	TPIDRPRW
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	TPIDRPRW
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	TPIDRPRW
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1 && IsUsingAArch32(EL3)	-	RW	RW	RW	TPIDRPRW_ns
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	TPIDRPRW_ns

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T13 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T13 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T13 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.157 TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch32 System register TPIDRURO[31:0] is architecturally mapped to AArch64 System register [TPIDRRO_EL0](#)[31:0].

————— Note —————

The PE never updates this register.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDRURO is a 32-bit register.

Field descriptions

The TPIDRURO bit assignments are:

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

Accessing the TPIDRURO

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c0, 3	000	011	1101	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	RO	n/a	n/a	RW	TPIDRURO_s
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1 && IsUsingAArch32(EL3)	RO	RW	RW	RW	TPIDRURO_ns
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1 && IsUsingAArch32(EL3)	RO	n/a	RW	RW	TPIDRURO_ns
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RW	n/a	n/a	TPIDRURO
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RW	RW	n/a	TPIDRURO
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a	TPIDRURO
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RW	n/a	n/a	TPIDRURO
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RW	RW	n/a	TPIDRURO
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a	TPIDRURO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T13 == 1, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

G8.2.158 TPIDRURW, PL0 Read/Write Software Thread ID Register

The TPIDRURW characteristics are:

Purpose

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch32 System register TPIDRURW[31:0] is architecturally mapped to AArch64 System register [TPIDR_EL0](#)[31:0].

Note

The PE never updates this register.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDRURW is a 32-bit register.

Field descriptions

The TPIDRURW bit assignments are:

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

Accessing the TPIDRURW

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c0, 2	000	010	1101	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	RW	n/a	n/a	RW	TPIDRURW_s
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1 && IsUsingAArch32(EL3)	RW	RW	RW	RW	TPIDRURW_ns
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1 && IsUsingAArch32(EL3)	RW	n/a	RW	RW	TPIDRURW_ns
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	n/a	TPIDRURW
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	n/a	TPIDRURW
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	n/a	TPIDRURW
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	n/a	TPIDRURW
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	n/a	TPIDRURW
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	n/a	TPIDRURW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T13 == 1, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

G8.2.159 TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using [TTBR0](#) and addresses translated using [TTBR1](#).
- The translation table format used by this stage of translation.

In ARMv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with [TTBCR2](#).

Configurations

AArch32 System register TTBCR[31:0] is architecturally mapped to AArch64 System register [TCR_EL1](#)[31:0].

The current translation table format determines which format of the register is used.

When EL3 is using AArch32, write access to TTBCR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

Attributes

TTBCR is a 32-bit register.

Field descriptions

The TTBCR bit assignments are:

When *TTBCR.EAE* == 0:

EAE, bit [31]

Extended Address Enable. The meanings of the possible values of this bit are:

0b0 Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

This field resets to 0.

Bits [30:6]

Reserved, RES0.

PD1, bit [5]

Translation table walk disable for translations using **TTBR1**. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using **TTBR1**. The encoding of this bit is:

- 0b0 Perform translation table walks using **TTBR1**.
- 0b1 A TLB miss on an address that is translated using **TTBR1** generates a Translation fault. No translation table walk is performed.

This field resets to 0.

PD0, bit [4]

Translation table walk disable for translations using **TTBR0**. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using **TTBR0**. The encoding of this bit is:

- 0b0 Perform translation table walks using **TTBR0**.
- 0b1 A TLB miss on an address that is translated using **TTBR0** generates a Translation fault. No translation table walk is performed.

This field resets to 0.

Bit [3]

Reserved, RES0.

N, bits [2:0]

Indicate the width of the base address held in **TTBR0**. In **TTBR0**, the base address field is bits[31:14-N]. The value of N also determines:

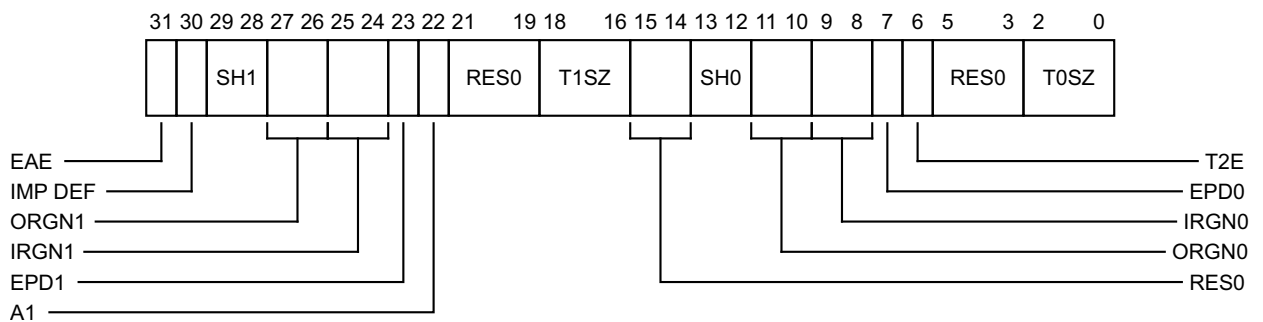

- Whether **TTBR0** or **TTBR1** is used as the base address for translation table walks.
- The size of the translation table pointed to by **TTBR0**.

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with ARMv5 and ARMv6.

This field resets to 0.

When TTBCR.EAE == 1:

EAE, bit [31]

Extended Address Enable. The meanings of the possible values of this bit are:

- 0b1 Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

This field resets to 0.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

This field resets to 0.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1](#). Defined values are:

- 0b00 Non-shareable.
- 0b10 Outer Shareable.
- 0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7216](#).

This field resets to 0.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1](#).

- 0b00 Normal memory, Outer Non-cacheable.
- 0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to 0.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1](#).

- 0b00 Normal memory, Inner Non-cacheable.
- 0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to 0.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#). The encoding of this bit is:

- 0b0 Perform translation table walks using [TTBR1](#).
- 0b1 A TLB miss on an address that is translated using [TTBR1](#) generates a Translation fault. No translation table walk is performed.

This field resets to 0.

A1, bit [22]

Selects whether [TTBR0](#) or [TTBR1](#) defines the ASID. The encoding of this bit is:

- 0b0 [TTBR0](#).ASID defines the ASID.
- 0b1 [TTBR1](#).ASID defines the ASID.

This field resets to 0.

Bits [21:19]

Reserved, RES0.

T1SZ, bits [18:16]

See [Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G5-5491](#) for how [TTBCR](#).{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

This field resets to 0.

Bits [15:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0](#).

- 0b00 Non-shareable
- 0b10 Outer Shareable
- 0b11 Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

This field resets to 0.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0](#).

- 0b00 Normal memory, Outer Non-cacheable.
- 0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to 0.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0](#).

- 0b00 Normal memory, Inner Non-cacheable.
- 0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to 0.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0](#). The encoding of this bit is:

- 0b0 Perform translation table walks using [TTBR0](#).
- 0b1 A TLB miss on an address that is translated using [TTBR0](#) generates a Translation fault. No translation table walk is performed.

This field resets to 0.

T2E, bit [6]

When ARMv8.2-AA32HPD is implemented:

TTBCR2 Enable.

- 0b0 [TTBCR2](#) is disabled. The contents of [TTBCR2](#) are treated as 0 for all purposes other than reading or writing the register.
- 0b1 [TTBCR2](#) is enabled.

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RES0.

Bits [5:3]

Reserved, RES0.

T0SZ, bits [2:0]

See [Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G5-5491](#) for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

This field resets to 0.

Accessing the TTBCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c2, c0, 2	000	010	0010	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	TTBCR
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	TTBCR
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	TTBCR
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	TTBCR
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	TTBCR
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	TTBCR
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	TTBCR_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	TTBCR_ns
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	TTBCR_s

When EL3 is using AArch32, write access to TTBCR_s is UNDEFINED when the CP15SSDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HCR_EL2.TVM == 1$, then write accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HCR_EL2.TRVM == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T2 == 1$, then accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.TVM == 1$, then write accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.TRVM == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T2 == 1$, then accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HCR.TVM == 1$, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HCR.TRVM == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HSTR.T2 == 1$, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.160 TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If [ARMv8.2-AA32HPD](#) is not implemented then this register is not implemented and its encoding is unallocated. Otherwise:

- When the value of [TTBCR](#).{EAE, T2E} is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of [TTBCR](#).{EAE, T2E} is {1, 1} TTBCR2 is used with [TTBCR](#).

Configurations

AArch32 System register TTBCR2[31:0] is architecturally mapped to AArch64 System register [TCR_EL1](#)[63:32].

This register is present only from ARMv8.2. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

When EL3 is using AArch32, write access to TTBCR2(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.2.

Attributes

TTBCR2 is a 32-bit register.

Field descriptions

The TTBCR2 bit assignments are:

Bits [31:19]

Reserved, RES0.

HWU162, bit [18]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

- 0b0 For translations using [TTBR1](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR1](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [17]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1.

- 0b0 For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [16]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1.

- 0b0 For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [15]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1.

- 0b0 For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The *Effective value* of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [14]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

- 0b0 For translations using [TTBR0](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [13]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

- 0b0 For translations using [TTBR0](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [12]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

- 0b0 For translations using [TTBR0](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [11]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

- 0b0 For translations using [TTBR0](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The *Effective value* of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [10]

When ARMv8.2-AA32HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR1](#).

- 0b0 Hierarchical permissions are enabled.
- 0b1 Hierarchical permissions are disabled if [TTBCR.T2E](#) == 1.

When disabled, the permissions are treated as if the bits are 0.

The *Effective value* of this field is 0 if the value of [TTBCR.T2E](#) is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [9]

When ARMv8.2-AA32HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR0](#).

- 0b0 Hierarchical permissions are enabled.
- 0b1 Hierarchical permissions are disabled if [TTBCR.T2E](#) == 1.

When disabled, the permissions are treated as if the bits are 0.

The *Effective value* of this field is 0 if the value of [TTBCR.T2E](#) is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:0]

Reserved, RES0.

Accessing the TTBCR2

This register can be written using MCR with the following syntax:

```
MCR <syntax>
```

This register can be read using MRC with the following syntax:

```
MRC <syntax>
```

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c2, c0, 3	000	011	0010	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	TTBCR2_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	TTBCR2_ns
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	TTBCR2
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	TTBCR2
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	TTBCR2
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	TTBCR2
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	TTBCR2
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	TTBCR2
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	TTBCR2_s

When EL3 is using AArch32, write access to TTBCR2_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HCR_EL2.TVM == 1$, then write accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HCR_EL2.TRVM == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ HSTR_EL2.T2 == 1$, then accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.TVM == 1$, then write accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HCR_EL2.TRVM == 1$, then read accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ HSTR_EL2.T2 == 1$, then accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HCR.TVM == 1$, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HCR.TRVM == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \ IsUsingAArch32(EL2) \ \&\& \ HSTR.T2 == 1$, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.161 TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configurations

AArch32 System register TTBR0[63:0] is architecturally mapped to AArch64 System register [TTBR0_EL1](#)[63:0].

[TTBCR.EAE](#) determines which TTBR0 format is used:

- [TTBCR.EAE](#) == 0b0: 32-bit format is used. TTBR0[63:32] are ignored.
- [TTBCR.EAE](#) == 0b1: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SSDISABLE signal is asserted HIGH.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR0.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

Field descriptions

The TTBR0 bit assignments are:

When [TTBCR.EAE](#) == 0:

TTB0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-([TTBCR.N](#)). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

This field resets to an architecturally UNKNOWN value.

IRGN, bit [6]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

- 0b00 Normal memory, Inner Non-cacheable.
- 0b01 Normal memory, Inner Write-Back Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Cacheable.
- 0b11 Normal memory, Inner Write-Back no Write-Allocate Cacheable.

———— **Note** —————

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

This field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

- 0b0 Memory is Outer Shareable.
- 0b1 Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

This field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

- 0b00 Normal memory, Outer Non-cacheable.
- 0b01 Normal memory, Outer Write-Back Write-Allocate Cacheable.
- 0b10 Normal memory, Outer Write-Through Cacheable.
- 0b11 Normal memory, Outer Write-Back no Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

This field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

- 0b0 Memory is Non-shareable.
- 0b1 Memory is shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

This field resets to an architecturally UNKNOWN value.

IRGN, bit [0]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

- 0b00 Normal memory, Inner Non-cacheable.

- 0b01 Normal memory, Inner Write-Back Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Cacheable.
- 0b11 Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

This field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either TTBR0.ASID or TTBR1.ASID.

This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.TOSZ](#) as follows:

- If [TTBCR.TOSZ](#) is 0 or 1, $x = 5 - \text{TTBCR.TOSZ}$.
- If [TTBCR.TOSZ](#) is greater than 1, $x = 14 - \text{TTBCR.TOSZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. When [TTBCR.EAE](#) == 1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

- 0b0 The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by:
 - The value of TTBR0.CnP on those other PEs.

- The value of `TTBCR.EAE` on those other PEs.
- The value of the current ASID or, for the Non-secure instance of `TTBR0`, the value of the current VMID.

0b1 The translation table entries pointed to by this instance of `TTBR0` are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of `TTBR0.CnP` is 1 for this instance of `TTBR0` and all of the following apply:

- The translation table entries are pointed to by this instance of `TTBR0`.
- The value of the applicable `TTBCR.EAE` field is 1.
- The ASID is the same as the current ASID.
- For the Non-secure instance of `TTBR0`, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the `CnP` bit is 1 for both stage 1 and stage 2.

———— **Note** —————

If the value of the `TTBR0.CnP` bit is 1 on multiple PEs in the same Inner Shareable domain and those `TTBR0`s do not point to the same translation table entries when the other conditions specified for the case when the value of `CnP` is 1 apply, then the results of translations are `CONSTRAINED UNPREDICTABLE`, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7199](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR0

TTBR0	SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	TTBR0_ns

When EL3 is using AArch32, write access to TTBR0_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T2 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TRVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T2 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TVM == 1, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TRVM == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T2 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.162 TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

Configurations

AArch32 System register TTBR1[63:0] is architecturally mapped to AArch64 System register [TTBR1_EL1](#)[63:0].

[TTBCR.EAE](#) determines which TTBR1 format is used:

- [TTBCR.EAE](#) == 0b0: 32-bit format is used. TTBR1[63:32] are ignored.
- [TTBCR.EAE](#) == 0b1: 64-bit format is used.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR1.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

Field descriptions

The TTBR1 bit assignments are:

When [TTBCR.EAE](#) == 0:

TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

This field resets to an architecturally UNKNOWN value.

IRGN, bit [6]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

- 0b00 Normal memory, Inner Non-cacheable.
- 0b01 Normal memory, Inner Write-Back Write-Allocate Cacheable.

- 0b10 Normal memory, Inner Write-Through Cacheable.
- 0b11 Normal memory, Inner Write-Back no Write-Allocate Cacheable.

———— **Note** ————

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

This field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

- 0b0 Memory is Outer Shareable.
- 0b1 Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

This field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

- 0b00 Normal memory, Outer Non-cacheable.
- 0b01 Normal memory, Outer Write-Back Write-Allocate Cacheable.
- 0b10 Normal memory, Outer Write-Through Cacheable.
- 0b11 Normal memory, Outer Write-Back no Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

This field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

- 0b0 Memory is Non-shareable.
- 0b1 Memory is shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

This field resets to an architecturally UNKNOWN value.

IRGN, bit [0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

- 0b00 Normal memory, Inner Non-cacheable.
- 0b01 Normal memory, Inner Write-Back Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Cacheable.
- 0b11 Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

This field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either TTBR0.ASID or TTBR1.ASID.

This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T1SZ](#) as follows:

- If [TTBCR.T1SZ](#) is 0 or 1, $x = 5 - \text{TTBCR.T1SZ}$.
- If [TTBCR.T1SZ](#) is greater than 1, $x = 14 - \text{TTBCR.T1SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. When [TTBCR.EAE](#) == 1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

0b0 The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by:

- The value of TTBR1.CnP on those other PEs.
- The value of [TTBCR.EAE](#) on those other PEs.
- The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.

- 0b1 The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply:
- The translation table entries are pointed to by this instance of TTBR1.
 - The value of the applicable [TTBCR.EAE](#) field is 1.
 - The ASID is the same as the current ASID.
 - For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

———— **Note** —————

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7199](#).

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HCR_EL2.TVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T2 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1, then write accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HCR_EL2.TVM == 1, then read accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T2 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TVM == 1, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.TVM == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T2 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.163 VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configurations

AArch32 System register VBAR[31:0] is architecturally mapped to AArch64 System register [VBAR_EL1](#)[31:0].

When EL3 is using AArch32, write access to VBAR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VBAR is a 32-bit register.

Field descriptions

The VBAR bit assignments are:

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

This field resets to an IMPLEMENTATION DEFINED value.

Bits [4:0]

Reserved, RES0.

Accessing the VBAR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c0, 0	000	000	1100	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	-	n/a	n/a	RW	VBAR_s
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && IsUsingAArch32(EL3)	-	RW	RW	RW	VBAR_ns
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && IsUsingAArch32(EL3)	-	n/a	RW	RW	VBAR_ns
!HaveEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	VBAR
HCR_EL2.TGE == 0 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	VBAR
HCR_EL2.TGE == 1 && !HaveEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	VBAR
IsUsingAArch64(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	n/a	VBAR
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	n/a	VBAR
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	n/a	VBAR

When EL3 is using AArch32, write access to VBAR_s is UNDEFINED when the CP15SSDISABLE signal is asserted HIGH.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T12 == 1, then accesses at EL1 are trapped to EL2.
- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T12 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T12 == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.164 VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of [MPIDR](#).

Configurations

AArch32 System register VMPIDR[31:0] is architecturally mapped to AArch64 System register [VMPIDR_EL2](#)[31:0].

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MPIDR](#).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VMPIDR is a 32-bit register.

Field descriptions

The VMPIDR bit assignments are:

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

- 0b0 This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
 - 0b1 This implementation includes the ARMv7 Multiprocessing Extensions functionality.
- In ARMv8 this bit is RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

- 0b0 Processor is part of a multiprocessor system.
- 0b1 Processor is part of a uniprocessor system.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.U](#).

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of [affinity](#) consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

- 0b0 Performance of PEs at the lowest affinity level is largely independent.
- 0b1 Performance of PEs at the lowest affinity level is very interdependent.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.MT](#).

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff2](#).

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff1](#).

Aff0, bits [7:0]

Affinity level 0. This is the [affinity](#) level that is most significant for determining PE behavior. Higher [affinity](#) levels are increasingly less significant in determining PE behavior. The assigned value of the [MPIDR](#).{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff0](#).

Accessing the VMPIDR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c0, c0, 5	100	101	0000	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HSTR_EL2.T0 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HSTR_EL2.T0 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `HSTR.T0 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.165 VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of [MIDR](#).

Configurations

AArch32 System register VPIDR[31:0] is architecturally mapped to AArch64 System register [VPIDR_EL2](#)[31:0].

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MIDR](#).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VPIDR is a 32-bit register.

Field descriptions

The VPIDR bit assignments are:

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

Hex representation	ASCII representation	Implementer
0x41	A	ARM Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR](#).Implementer.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR](#).Variant.

Architecture, bits [19:16]

The permitted values of this field are:

0b0001	ARMv4.
0b0010	ARMv4T.
0b0011	ARMv5 (obsolete).
0b0100	ARMv5T.
0b0101	ARMv5TE.
0b0110	ARMv5TEJ.
0b0111	ARMv6.
0b1111	Architectural features are individually identified in the ID_* registers, see ID registers on page K13-7436 .

All other values are reserved.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR](#).Architecture.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR](#).PartNum.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

In a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR](#).Revision.

Accessing the VPIDR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c0, c0, 0	100	000	0000	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T0 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T0 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T0 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.166 VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configurations

AArch32 System register VTCR[31:0] is architecturally mapped to AArch64 System register [VTCR_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

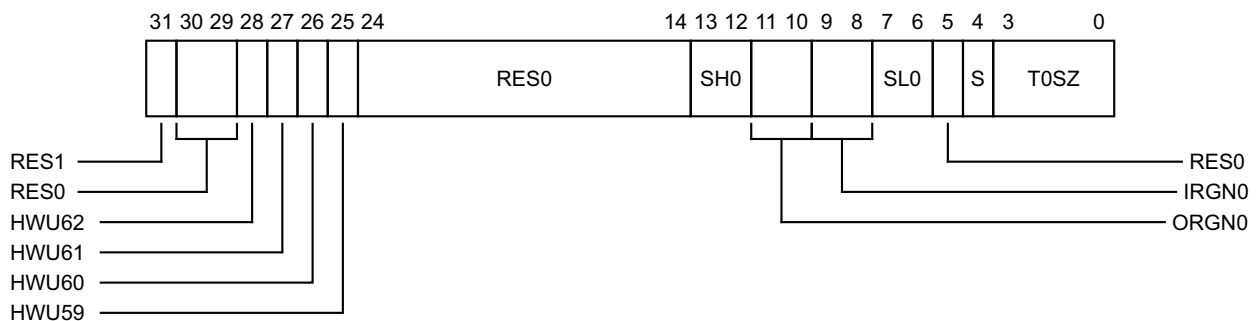

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VTCR is a 32-bit register.

Field descriptions

The VTCR bit assignments are:

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

0b0 Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

0b0 Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

0b0 Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

0b0 Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR](#).

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-7216](#).

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR](#).

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

Starting level for translation table walks using [VTTBR](#).

0b00 Start at level 2

0b01 Start at level 1

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the behavior is CONSTRAINED UNPREDICTABLE and the stage 2 T0SZ value is treated as an UNKNOWN value, see [Misprogramming VTCR.S on page K1-7213](#).

This field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]

The size offset of the memory region addressed by [VTTBR](#). The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

———— Note —————

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

Accessing the VTCR

This register can be written using MCR with the following syntax:

```
MCR <syntax>
```

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c2, c1, 2	100	010	0010	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T2 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T2 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T2 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.2.167 VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

Configurations

AArch32 System register VTTBR[63:0] is architecturally mapped to AArch64 System register [VTTBR_EL2](#)[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VTTBR is a 64-bit register.

Field descriptions

The VTTBR bit assignments are:

Bits [63:56]

Reserved, RES0.

VMID, bits [55:48]

The VMID for the translation table.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [VTCR.SL0](#) and [VTCR.T0SZ](#) as follows:

- If [VTCR.SL0](#) is 0b00, meaning that lookup starts at level 2, then x is 14 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is 0b01, meaning that lookup starts at level 1, then x is 5 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

- 0b0 The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
- 0b1 The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

———— **Note** ————

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONstrained UNpredictable, see [CONstrained UNpredictable behaviors due to caching of control or data values on page K1-7199](#).

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the VTTBR

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 6, <Rt>, <Rt2>, c2	0110	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `HSTR_EL2.T2 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `HSTR_EL2.T2 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `HSTR.T2 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.3 Debug registers

This section lists the Debug System registers in AArch32 state, in alphabetic order.

G8.3.1 DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configurations

AArch32 System register DBGAUTHSTATUS[31:0] is architecturally mapped to AArch64 System register [DBGAUTHSTATUS_EL1](#)[31:0].

AArch32 System register DBGAUTHSTATUS[31:0] is architecturally mapped to External register [DBGAUTHSTATUS_EL1](#)[31:0].

This register is required in all implementations.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGAUTHSTATUS is a 32-bit register.

Field descriptions

The DBGAUTHSTATUS bit assignments are:

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

When ARMv8.4-Debug is implemented:

Secure Non-Invasive Debug.

This field has the same value as DBGAUTHSTATUS.SID.

Otherwise:

Secure Non-Invasive Debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR.NS](#) is 1.

0b10 Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure Invasive Debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1.

0b10 Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When ARMv8.4-Debug is implemented:

Non-secure Non-invasive debug.

- 0b00 Not implemented. EL3 is not implemented and the Effective value of SCR.NS is 0.
 - 0b11 Implemented and enabled. EL3 is implemented or the Effective value of SCR.NS is 1.
- All other values are reserved.

Otherwise:

Non-secure Non-Invasive Debug.

- 0b00 Not implemented. EL3 is not implemented and the Effective value of SCR.NS is 0
 - 0b10 Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
 - 0b11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.
- All other values are reserved.

NSID, bits [1:0]

Non-secure Invasive Debug.

- 0b00 Not implemented. EL3 is not implemented or the Effective value of SCR_EL3.NS is 0.
 - 0b10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
 - 0b11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.
- All other values are reserved.

Accessing the DBGAUTHSTATUS

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c14, 6	000	110	0111	1110	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{MDCR_EL2.TDA} == 1$, then read accesses at EL1 are trapped to EL2.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32(EL2)} \ \&\& \ \text{HDCR.TDA} == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $\text{IsUsingAArch64(EL3)} \ \&\& \ \text{MDCR_EL3.TDA} == 1$, then read accesses at EL1 or EL2 are trapped to EL3.

G8.3.2 DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, [DBGBVR<n>](#) can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

Configurations

AArch32 System register DBGBCR<n>[31:0] is architecturally mapped to AArch64 System register [DBGBCR<n>_EL1](#)[31:0].

AArch32 System register DBGBCR<n>[31:0] is architecturally mapped to External register [DBGBCR<n>_EL1](#)[31:0].

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGBCR<n> is a 32-bit register.

Field descriptions

The DBGBCR<n> bit assignments are:

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

- 0b0000 Unlinked instruction address match. [DBGBVR<n>](#) is the address of an instruction.
- 0b0001 As 0b0000 with linking enabled.
- 0b0010 Unlinked Context ID match. When ARMv8.1-VHE is implemented, EL2 is using AArch64, and the Effective value of [HCR_EL2.E2H](#) is 1, if either the PE is executing at EL0 with [HCR_EL2.TGE](#) set to 0 or the PE is executing at EL2, then [DBGBVR<n>](#).ContextID must match the [CONTEXTIDR_EL2](#) value. Otherwise [DBGBVR<n>](#).ContextID must match the [CONTEXTIDR](#) value.
- 0b0011 As 0b0010 with linking enabled.
- 0b0100 Unlinked instruction address mismatch. [DBGBVR<n>](#) is the address of an instruction to be stepped.
- 0b0101 As 0b0100 with linking enabled.
- 0b0110 Unlinked [CONTEXTIDR_EL1](#) match. [DBGBVR<n>](#).ContextID is a Context ID compared against [CONTEXTIDR](#).

0b0111	As 0b0110 with linking enabled.
0b1000	Unlinked VMID match. DBGXVR<n>.VMID is a VMID compared against VTTBR.VMID .
0b1001	As 0b1000 with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGXVR<n>.ContextID is a Context ID compared against CONTEXTIDR , and DBGXVR<n>.VMID is a VMID compared against VTTBR.VMID .
0b1011	As 0b1010 with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGXVR<n>.ContextID2 is a Context ID compared against CONTEXTIDR_EL2 .
0b1101	As 0b1100 with linking enabled.
0b1110	Unlinked Full Context ID match. DBGXVR<n>.ContextID is compared against CONTEXTIDR , and DBGXVR<n>.ContextID2 is compared against CONTEXTIDR_EL2 .
0b1111	As 0b1110 with linking enabled.

For more information on Breakpoints and their constraints, see [Breakpoint exceptions on page G2-5366](#) and [Reserved DBGBCR<n>.BT values on page G2-5386](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of [DBGBCR<n>.E](#) is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-5375](#), and [Breakpoint usage constraints on page G2-5386](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-5375](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n>+2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see *Reserved DBGBCR<n>.{SSC, HMC, PMC} values on page G2-5387*.

For more information on using the BAS field in Address Match breakpoints, see *Using the BAS field in Address Match breakpoints on page G2-5379*.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Step instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n>+2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see *Reserved DBGBCR<n>.{SSC, HMC, PMC} values on page G2-5387*.

For more information on using the BAS field in address mismatch breakpoints, see *Using the BAS field in Address Match breakpoints on page G2-5379*.

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see *Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-5375*.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint DBGBVR<n>. Possible values are:

- 0b0 Breakpoint disabled.
- 0b1 Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGBCR<n>

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, <CRm>, 5	000	101	0000	1110	n<3:0>

- <CRm> is in the range c0 - c15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If the register access does not generate an exception then, if EDSCR.TDA == 1 && halting is allowed && DBGOSLSR.OSLK == 0, then accesses to this register from PL1 and PL2 generate a Software Access debug event.

G8.3.3 DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register [DBGBCR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register [DBGXVR<n>](#) for VMID matching.

Configurations

AArch32 System register DBGBVR<n>[31:0] is architecturally mapped to AArch64 System register [DBGBVR<n>_EL1](#)[31:0].

AArch32 System register DBGBVR<n>[31:0] is architecturally mapped to External register [DBGBVR<n>_EL1](#)[31:0].

Note

Writes to DBGBVR<n> do not modify [DBGBVR<n>_EL1](#)[63:32].

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

How this register is interpreted depends on the value of [DBGBCR<n>](#).BT.

- When [DBGBCR<n>](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>](#).BT is 0bxx1x, this register holds a Context ID.

For other values of [DBGBCR<n>](#).BT, this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the [DBGDIDR](#).CTX_CMPs field.

Field descriptions

The DBGBVR<n> bit assignments are:

When [DBGBCR<n>](#).BT == 0b0x0x:

VA[31:2], bits [31:2]

Bits[31:2] of the address value for comparison.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When $DBGBCR\langle n \rangle.BT == 0b001x$:

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR_EL2](#) when all of the following are true:

- [ARMv8.1-VHE](#) is implemented.
- [HCR_EL2](#).{E2H, TGE} is {1,1}.
- The PE is executing at EL0.
- EL2 is enabled in the current Security state, and is using AArch64.

Otherwise, the value is compared against [CONTEXTIDR](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR\langle n \rangle.BT == 0b101x$ and $IsExceptionLevelImplemented(EL2)$:

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR\langle n \rangle.BT == 0bx11x$, $IsExceptionLevelImplemented(EL2)$ and $ARMv8.1-VHE$ is implemented:

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the $DBGBVR\langle n \rangle$

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, <CRm>, 4	000	100	0000	1110	n<3:0>

- <CRm> is in the range c0 - c15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If the register access does not generate an exception then. if EDSCR.TDA == 1 && halting is allowed && DBGOSLSR.OSLK == 0, then accesses to this register from PL1 and PL2 generate a Software Access debug event.

G8.3.4 DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15

The DBGBXVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register [DBGBCR<n>](#) and a value register [DBGBVR<n>](#), where EL2 is implemented and breakpoint n supports Context matching.

Configurations

AArch32 System register DBGBXVR<n>[31:0] is architecturally mapped to AArch64 System register [DBGBVR<n>_EL1](#)[63:32].

AArch32 System register DBGBXVR<n>[31:0] is architecturally mapped to External register [DBGBVR<n>_EL1](#)[63:32].

———— Note ————

Writes to DBGBXVR<n> do not modify [DBGBVR<n>_EL1](#)[31:0].

This register is unallocated in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

For more information, see the description of the [DBGDIDR.CTX_CMPs](#) field.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

How this register is interpreted depends on the value of [DBGBCR<n>.BT](#).

- When [DBGBCR<n>.BT](#) is 0b10xx, this register holds a VMID.
- When [DBGBCR<n>.BT](#) is 0b11xx, this register holds a Context ID.

For other values of [DBGBCR<n>.BT](#), this register is RES0.

Field descriptions

The DBGBXVR<n> bit assignments are:

When [DBGBCR<n>.BT == 0b10xx](#) and [IsExceptionLevelImplemented\(EL2\)](#):

31	16 15	8 7	0
RES0	VMID[15:8]	VMID[7:0]	

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When *ARMv8.1-VMID16* is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [7:0]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When *DBGBCR<n>.BT == 0b11xx* and *IsExceptionLevelImplemented(EL2)*:

ContextID2, bits [31:0]

When ARMv8.1-VHE is implemented:

Context ID value for comparison against [CONTEXTIDR_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the DBG BXVR<n>

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, <CRm>, 1	000	001	0001	1110	n<3:0>

- <CRm> is in the range c0 - c15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If the register access does not generate an exception then, if EDSCR.TDA == 1 && halting is allowed && DBGOSLSR.OSLK == 0, then accesses to this register from PL1 and PL2 generate a Software Access debug event.

G8.3.5 DBGCLAIMCLR, Debug Claim Tag Clear register

The DBGCLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear these bits to 0.
The architecture does not define any functionality for the CLAIM tag bits.

———— Note —————

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET](#) register.

Configurations

AArch32 System register DBGCLAIMCLR[31:0] is architecturally mapped to AArch64 System register [DBGCLAIMCLR_ELI](#)[31:0].

AArch32 System register DBGCLAIMCLR[31:0] is architecturally mapped to External register [DBGCLAIMCLR_ELI](#)[31:0].

An implementation must include 8 CLAIM tag bits.

This register is in the Cold reset domain. See the CLAIM field description for the effect of a Cold reset on the value returned by this register. This register is not affected by a Warm reset.

Attributes

DBGCLAIMCLR is a 32-bit register.

Field descriptions

The DBGCLAIMCLR bit assignments are:

Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

Accessing the DBGCLAIMCLR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c9, 6	000	110	0111	1110	1001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.6 DBGCLAIMSET, Debug Claim Tag Set register

The DBGCLAIMSET characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR](#) register.

Configurations

AArch32 System register DBGCLAIMSET[31:0] is architecturally mapped to AArch64 System register [DBGCLAIMSET_EL1](#)[31:0].

AArch32 System register DBGCLAIMSET[31:0] is architecturally mapped to External register [DBGCLAIMSET_EL1](#)[31:0].

An implementation must include 8 CLAIM tag bits.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGCLAIMSET is a 32-bit register.

Field descriptions

The DBGCLAIMSET bit assignments are:

Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Set CLAIM tag bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

Accessing the DBGCLAIMSET

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c8, 6	000	110	0111	1110	1000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.7 DBGDCCINT, DCC Interrupt Enable Register

The DBGDCCINT characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configurations

AArch32 System register DBGDCCINT[31:0] is architecturally mapped to AArch64 System register MDCCINT_EL1[31:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDCCINT is a 32-bit register.

Field descriptions

The DBGDCCINT bit assignments are:

Bit [31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

0b0 No interrupt request generated by DTRRX.

0b1 Interrupt request will be generated on RXfull == 1.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

0b0 No interrupt request generated by DTRTX.

0b1 Interrupt request will be generated on TXfull == 0.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

Bits [28:0]

Reserved, RES0.

Accessing the DBGDCCINT

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c2, 0	000	000	0000	1110	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.8 DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

Configurations

This register is required in all implementations.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDEVID is a 32-bit register.

Field descriptions

The DBGDEVID bit assignments are:

CIDMask, bits [31:28]

Indicates the level of support for the Context ID matching breakpoint masking capability. Permitted values of this field are:

0b0000 Context ID masking is not implemented.

0b0001 Context ID masking is implemented.

All other values are reserved. The value of this for ARMv8 is 0b0000.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Permitted values for this field are:

0b0000 None supported.

0b0001 Support for External Debug Auxiliary Control Register, [EDACR](#).

All other values are reserved.

DoubleLock, bits [23:20]

OS Double Lock implemented. This field indicates the presence of the OS Double Lock and the behavior of the [DBGOSDLR](#), OS Double Lock Register. Permitted values of this field are:

0b0000 The OS Double Lock is not implemented. [DBGOSDLR](#) is RAZ/WI.

0b0001 The OS Double Lock is implemented. [DBGOSDLR](#) is RW.

All other values are reserved.

VirtExtns, bits [19:16]

Indicates whether EL2 is implemented. Permitted values of this field are:

0b0000 EL2 is not implemented.

0b0001 EL2 is implemented.

All other values are reserved.

VectorCatch, bits [15:12]

Defines the form of Vector Catch exception implemented. Permitted values of this field are:

- 0b0000 Address matching Vector Catch exception implemented.
- 0b0001 Exception matching Vector Catch exception implemented.

All other values are reserved.

BPAddrMask, bits [11:8]

Indicates the level of support for the instruction address matching breakpoint masking capability. Permitted values of this field are:

- 0b0000 Breakpoint address masking might be implemented. If not implemented, [DBGBCR<n>\[28:24\]](#) is RAZ/WI.
- 0b0001 Breakpoint address masking is implemented.
- 0b1111 Breakpoint address masking is not implemented. [DBGBCR<n>\[28:24\]](#) is RES0.

All other values are reserved. The value of this for ARMv8 is 0b1111.

WPAAddrMask, bits [7:4]

Indicates the level of support for the data address matching watchpoint masking capability. Permitted values of this field are:

- 0b0000 Watchpoint address masking might be implemented. If not implemented, [DBGWCR<n>.MASK](#) (Address mask) is RAZ/WI.
- 0b0001 Watchpoint address masking is implemented.
- 0b1111 Watchpoint address masking is not implemented. [DBGWCR<n>.MASK](#) (Address mask) is RES0.

All other values are reserved. The value of this for ARMv8 is 0b0001.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Permitted values of this field are:

- 0b0000 PC Sample-based Profiling Extension is not implemented in the external debug registers space.
- 0b0010 Only [EDPCSR](#) and [EDCIDSR](#) are implemented. This option is only permitted if EL3 and EL2 are not implemented.
- 0b0011 [EDPCSR](#), [EDCIDSR](#), and [EDVIDSR](#) are implemented.

All other values are reserved.

When [ARMv8.2-PCSample](#) is implemented, the only permitted value is 0b0000.

————— **Note** —————

[ARMv8.2-PCSample](#) implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID.PCSample](#).

Accessing the DBGDEVID

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c2, 7	000	111	0111	1110	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then read accesses at EL1 or EL2 are trapped to EL3.

G8.3.9 DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

Configurations

This register is required in all implementations.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDEVID1 is a 32-bit register.

Field descriptions

The DBGDEVID1 bit assignments are:

Bits [31:4]

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of [EDPCSR](#). Permitted values of this field in ARMv8 are:

0b0000 [EDPCSR](#) is not implemented.

0b0010 [EDPCSR](#) implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.

When [ARMv8.2-PCSample](#) is implemented, the only permitted value is 0b0000.

———— **Note** ————

[ARMv8.2-PCSample](#) implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID.PCSample](#).

Accessing the DBGDEVID1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c1, 7	000	111	0111	1110	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then read accesses at EL1 or EL2 are trapped to EL3.

G8.3.10 DBGDEVID2, Debug Device ID register 2

The DBGDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDEVID2 is a 32-bit register.

Field descriptions

The DBGDEVID2 bit assignments are:

Bits [31:0]

Reserved, RES0.

Accessing the DBGDEVID2

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c0, 7	000	111	0111	1110	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{MDCR_EL2.TDA} == 1$, then read accesses at EL1 are trapped to EL2.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32(EL2)} \ \&\& \ \text{HDCR.TDA} == 1$, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If $\text{IsUsingAArch64(EL3)} \ \&\& \ \text{MDCR_EL3.TDA} == 1$, then read accesses at EL1 or EL2 are trapped to EL3.

G8.3.11 DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

Purpose

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

Configurations

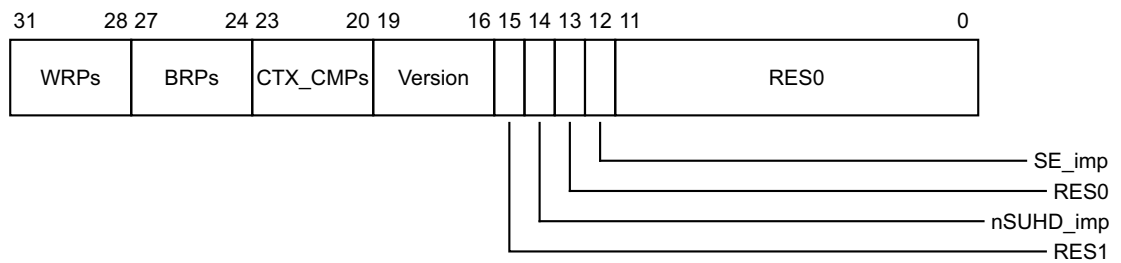

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDIDR is a 32-bit register.

Field descriptions

The DBGDIDR bit assignments are:

WRPs, bits [31:28]

The number of watchpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented watchpoints, to 0b1111 for 16 implemented watchpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as [ID_AA64DFR0_EL1.WRPs](#).

BRPs, bits [27:24]

The number of breakpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented breakpoint, to 0b1111 for 16 implemented breakpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as [ID_AA64DFR0_EL1.BRPs](#).

CTX_CMPs, bits [23:20]

The number of breakpoints that can be used for Context matching, minus 1.

Permitted values of this field are from 0b0000 for 1 Context matching breakpoint, to 0b1111 for 16 Context matching breakpoints.

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.

If AArch64 is implemented, this field has the same value as [ID_AA64DFR0_EL1.CTX_CMPs](#).

Version, bits [19:16]

The Debug architecture version. Defined values are:

- 0b0001 ARMv6, v6 Debug architecture.
- 0b0010 ARMv6, v6.1 Debug architecture.
- 0b0011 ARMv7, v7 Debug architecture, with baseline CP14 registers implemented.
- 0b0100 ARMv7, v7 Debug architecture, with all CP14 registers implemented.
- 0b0101 ARMv7, v7.1 Debug architecture.
- 0b0110 ARMv8, v8 Debug architecture.
- 0b0111 ARMv8.1, v8 Debug architecture, with Virtualization Host Extensions.
- 0b1000 ARMv8.2, v8.2 Debug architecture.
- 0b1001 ARMv8.4, v8.4 Debug architecture.

All other values are reserved.

In any ARMv8 implementation, the values 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

- If [ARMv8.1-VHE](#) is not implemented, the only permitted value is 0b0110.
- In an ARMv8.0 implementation, the value 0b1000 or higher is not permitted.

Bit [15]

Reserved, RES1.

nSUHD_imp, bit [14]

In ARMv7-A, was Secure User Halting Debug not implemented.

The value of this bit must match the value of the SE_imp bit.

Bit [13]

Reserved, RES0.

SE_imp, bit [12]

EL3 implemented. The meanings of the values of this bit are:

- 0b0 EL3 not implemented.
- 0b1 EL3 implemented.

The value of this bit must match the value of the nSUHD_imp bit.

Bits [11:0]

Reserved, RES0.

Accessing the DBGDIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c0, 0	000	000	0000	1110	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

ARM deprecates any access to this register from EL0.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `DBGDSCRExt.UDCCdis == 1`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `MDSCR_EL1.TDCC == 1 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `MDSCR_EL1.TDCC == 1 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDSCR_EL2.TDA == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1`, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDSCR_EL3.TDA == 1`, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.3.12 DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. ARMv8 deprecates any use of this register.

Configurations

AArch32 System register DBGDRAR[63:0] is architecturally mapped to AArch64 System register [MDRAR_EL1](#)[63:0].

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

Field descriptions

The DBGDRAR bit assignments are:

When accessing as a 32-bit register:

ROMADDR[31:12], bits [31:12]

Bits[31:12] of the ROM table physical address. Bits [11:0] of the address are zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

0b00 ROM Table address is not valid. Software must ignore ROMADDR.

0b11 ROM Table address is valid.

Other values are reserved.

When accessing as a 64-bit register:

Bits [63:48]

Reserved, RES0.

ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

ARM strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

0b00 ROM Table address is not valid. Software must ignore ROMADDR.

0b11 ROM Table address is valid.

Other values are reserved.

Accessing the DBGDRAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c0, 0	000	000	0001	1110	0000

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p14, 0, <Rt>, <Rt2>, c1	0000	1110	0001

Accessibility

The register is accessible as follows:

<syntax>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
p14, 0, <Rt>, c1, c0, 0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
p14, 0, <Rt>, c1, c0, 0	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
p14, 0, <Rt>, c1, c0, 0	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

<syntax>	Configura tion	Accessibility			
		EL0	EL1	EL2	EL3
DBGDRAR	SCR_EL3. NS == 0 && SCR_EL3. EEL2 == 0	RO	RO	n/a	RO
DBGDRAR	HCR_EL2. TGE == 0 && (SCR_EL3. NS == 1 SCR_EL3. EEL2 == 1)	RO	RO	RO	RO
DBGDRAR	HCR_EL2. TGE == 1 && (SCR_EL3. NS == 1 SCR_EL3. EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `DBGDSCRExt.UDCCdis == 1`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `MDSCR_EL1.TDCC == 1 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `MDSCR_EL1.TDCC == 1 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDSCR_EL2.TDRA == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDRA == 1`, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.

G8.3.13 DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

Purpose

In earlier versions of the ARM Architecture, this register defines the offset from the base address defined in [DBGDRAR](#) of the physical base address of the debug registers for the PE. ARMv8 deprecates any use of this register.

Configurations

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated. RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

Field descriptions

The DBGDSAR bit assignments are:

When accessing as a 32-bit register:

Offset, bits [31:0]

This register value is RAZ.

When accessing as a 64-bit register:

Offset, bits [63:0]

This register value is RAZ.

Accessing the DBGDSAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c2, c0, 0	000	000	0010	1110	0000

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p14, 0, <Rt>, <Rt2>, c2	0000	1110	0010

Accessibility

The register is accessible as follows:

<syntax>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
p14, 0, <Rt>, c2, c0, 0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
p14, 0, <Rt>, c2, c0, 0	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
p14, 0, <Rt>, c2, c0, 0	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

<syntax>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
DBGDSAR	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
DBGDSAR	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
DBGDSAR	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `DBGDSCRExt.UDCCdis == 1`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `MDSCR_EL1.TDCC == 1 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `MDSCR_EL1.TDCC == 1 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDSCR_EL2.TDRA == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDRA == 1`, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDSCR_EL3.TDA == 1`, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.3.14 DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

Purpose

Main control register for the debug implementation.

Configurations

AArch32 System register DBGDSCRext[31:0] is architecturally mapped to AArch64 System register [MDSR_EL1](#)[31:0].

AArch32 System register DBGDSCRext[15:2] is architecturally mapped to AArch32 System register [DBGDSCRint](#)[15:2].

This register is required in all implementations.

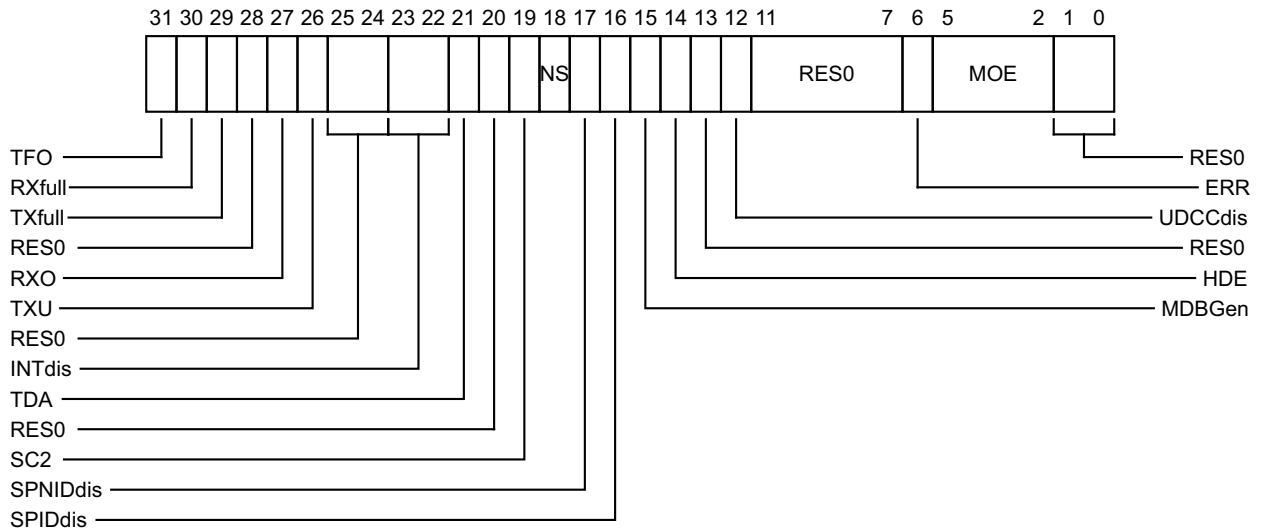

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDSCRext is a 32-bit register.

Field descriptions

The DBGDSCRext bit assignments are:

TFO, bit [31]

When ARMv8.4-Trace is implemented:

Trace Filter override. Used for save/restore of [EDSCR.TFO](#).

When the OS Lock is unlocked, [OSLSR_EL1.OSLK](#) == 0, this bit ignores writes and software must treat it as UNK/SBZP.

When the OS Lock is locked, [OSLSR_EL1.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.TFO](#).

Reads and writes of this bit are indirect accesses to [EDSCR.TFO](#).

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Used for save/restore of [EDSCR.RXfull](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.RXfull](#).

ARM deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRRX full status.

Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

The architected behavior of this field determines the value it returns after a reset.

TXfull, bit [29]

DTRTX full. Used for save/restore of [EDSCR.TXfull](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.TXfull](#).

ARM deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRTX full status.

Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

The architected behavior of this field determines the value it returns after a reset.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of [EDSCR.RXO](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.RXO](#).

Reads and writes of this bit are indirect accesses to [EDSCR.RXO](#).

The architected behavior of this field determines the value it returns after a reset.

TXU, bit [26]

Used for save/restore of [EDSCR.TXU](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.TXU](#).

Reads and writes of this bit are indirect accesses to [EDSCR.TXU](#).

The architected behavior of this field determines the value it returns after a reset.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of [EDSCR.INTdis](#).

When [OSLSR_EL1.OSLK](#) == 0, this field is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this field is RW and holds the value of [EDSCR.INTdis](#).

Reads and writes of this field are indirect accesses to [EDSCR.INTdis](#).

The architected behavior of this field determines the value it returns after a reset.

TDA, bit [21]

Used for save/restore of [EDSCR.TDA](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.TDA](#).

Reads and writes of this bit are indirect accesses to [EDSCR.TDA](#).
The architected behavior of this field determines the value it returns after a reset.

Bit [20]

Reserved, RES0.

SC2, bit [19]

From ARMv8.1:

Used for save/restore of [EDSCR.SC2](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.SC2](#).

Reads and writes of this bit are indirect accesses to [EDSCR.SC2](#).

If the PC Sample-based Profiling Extension is not implemented, then this field is RES0.

Otherwise:

Reserved, RES0.

NS, bit [18]

Non-secure status. Returns the inverse of [IsSecure\(\)](#). This bit is RO.

ARM deprecates use of this field.

SPNIDdis, bit [17]

Secure privileged profiling disabled status bit. This bit is RO. Permitted values are:

- 0b0 If EL3 is implemented, profiling allowed in Secure privileged modes.
- 0b1 If EL3 is implemented, profiling prohibited in Secure privileged modes.

This field is RES0 if EL3 is not implemented.

- Otherwise, the field reads as zero if any of the following applies, and reads as one otherwise:
 - ARMv8.2-Debug is not implemented and [ExternalSecureNoninvasiveDebugEnabled\(\)](#) returns TRUE.
 - EL3 is using AArch32 and the value of [MDCR_EL3.SPME](#) is 1.
 - EL3 is using AArch64 and the value of [MDCR_EL3.SPME](#) is 1.

ARM deprecates use of this field.

SPIDdis, bit [16]

Secure privileged AArch32 invasive self-hosted debug disabled status bit. This bit is RO and depends on the value of [SDCR.SPD](#) and the pseudocode function

[AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled\(\)](#). Permitted values are:

- 0b0 Self-hosted debug enabled in Secure privileged AArch32 modes.
- 0b1 Self-hosted debug disabled in Secure privileged AArch32 modes.

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- [MDCR_EL3.SPD](#) has the value 0b10.
- [MDCR_EL3.SPD](#) has the value 0b00 and [SelfHostedSecurePrivilegedInvasiveDebugEnabled\(\)](#) returns FALSE.

ARM deprecates use of this field.

MDBGen, bit [15]

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

- 0b0 Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
- 0b1 Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

On a Warm reset, this field resets to 0.

HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.HDE](#).

Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

Bit [13]

Reserved, RES0.

UDCCdis, bit [12]

Traps EL0 accesses to the DCC registers to Undefined mode.

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 accesses to the [DBGDSCRint](#), [DBGDTRRXint](#), [DBGDTRTXint](#), [DBGDIDR](#), [DBGDSAR](#), and [DBGDRAR](#) are trapped to Undefined mode.

———— Note —————

All accesses to these registers are trapped, including LDC and STC accesses to [DBGDTRTXint](#) and [DBGDTRRXint](#), and MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#).

Traps of EL0 accesses to the [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

On a Warm reset, this field resets to 0.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of [EDSCR.ERR](#).

When [OSLSR_EL1.OSLK](#) == 0, this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit is RW and holds the value of [EDSCR.ERR](#).

Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The architected behavior of this field determines the value it returns after a reset.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

0b0001 Breakpoint.

0b0011 Software breakpoint (BKPT) instruction.

0b0101 Vector catch.

0b1010 Watchpoint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the DBGDSCRext

This register can be written using MCR with the following syntax:

```
MCR <syntax>
```

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c2, 2	000	010	0000	1110	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Individual fields within this register might have restricted accessibility when the OS lock is unlocked, [DBGOSLSR.OSLK == 0](#). See the field descriptions for more detail.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.15 DBGDSCRint, Debug Status and Control Register, Internal View

The DBGDSCRint characteristics are:

Purpose

Main control register for the debug implementation. This is an internal, read-only view.

Configurations

AArch32 System register DBGDSCRint[30:29] is architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

AArch32 System register DBGDSCRint[15:2] is architecturally mapped to AArch32 System register DBGDSCRExt[15:2].

This register is required in all implementations.

DBGDSCRint.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} are UNKNOWN when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither UNPREDICTABLE nor return UNKNOWN values, it is permissible for an implementation to return the values of DBGDSCRExt.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

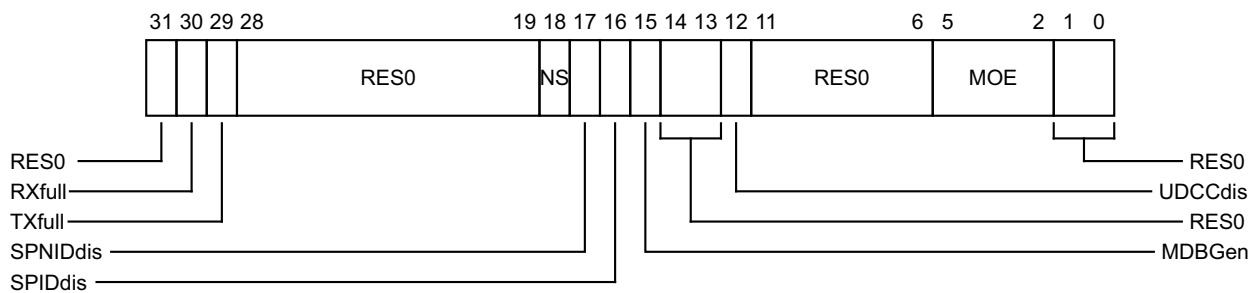

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDSCRint is a 32-bit register.

Field descriptions

The DBGDSCRint bit assignments are:

Bit [31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the [EDSCR](#).

TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the [EDSCR](#).

Bits [28:19]

Reserved, RES0.

NS, bit [18]

Non-secure status.

Read-only view of the equivalent bit in the [DBGDSCRext](#). ARM deprecates use of this field.

SPNIDdis, bit [17]

Secure privileged non-invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRext](#). ARM deprecates use of this field.

SPIDdis, bit [16]

Secure privileged invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRext](#). ARM deprecates use of this field.

MDBGGen, bit [15]

Monitor debug events enable.

Read-only view of the equivalent bit in the [DBGDSCRext](#).

Bits [14:13]

Reserved, RES0.

UDCCdis, bit [12]

User mode access to Debug Communications Channel disable.

Read-only view of the equivalent bit in the [DBGDSCRext](#). ARM deprecates use of this field.

Bits [11:6]

Reserved, RES0.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

- 0b0001 Breakpoint
- 0b0011 Software breakpoint (BKPT) instruction
- 0b0101 Vector catch
- 0b1010 Watchpoint

Read-only view of the equivalent bit in the [DBGDSCRext](#).

Bits [1:0]

Reserved, RES0.

Accessing the DBGDSCRint

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c1, 0	000	000	0000	1110	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `DBGDSCRExt.UDCCdis == 1`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `MDSCR_EL1.TDCC == 1 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `MDSCR_EL1.TDCC == 1 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1`, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1`, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.3.16 DBGDTRRText, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRText characteristics are:

Purpose

Used for save/restore of [DBGDTRRXint](#). It is a component of the Debug Communications Channel.

Configurations

AArch32 System register DBGDTRRText[31:0] is architecturally mapped to AArch64 System register [OSDTRRX_EL1](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDTRRText is a 32-bit register.

Field descriptions

The DBGDTRRText bit assignments are:

Bits [31:0]

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

This field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRRText

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c0, 2	000	010	0000	1110	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

ARM deprecates reads and writes of DBGDTRRText through the System register interface when the OS Lock is unlocked, `DBGOSLSR.OSLK == 0`.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1`, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.17 DBGDTRRXint, Debug Data Transfer Register, Receive

The DBGDTRRXint characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

Configurations

AArch32 System register DBGDTRRXint[31:0] is architecturally mapped to AArch64 System register [DBGDTRRX_EL0](#)[31:0].

AArch32 System register DBGDTRRXint[31:0] is architecturally mapped to External register [DBGDTRRX_EL0](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDTRRXint is a 32-bit register.

Field descriptions

The DBGDTRRXint bit assignments are:

Bits [31:0]

Update DTRRX.

If RXfull is set to 1, then reads of this register return the last value written to DTRRX and clear RXfull to 0.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRRXint

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c5, 0	000	000	0000	1110	0101

Data can be stored to memory from this register using [STC](#).

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `DBGDSCRExt.UDCCdis == 1`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `MDSCR_EL1.TDCC == 1 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `MDSCR_EL1.TDCC == 1 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1`, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1`, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.3.18 DBGDTRTText, Debug OS Lock Data Transfer Register, Transmit

The DBGDTRTText characteristics are:

Purpose

Used for save/restore of [DBGDTRTXint](#). It is a component of the Debug Communication Channel.

Configurations

AArch32 System register DBGDTRTText[31:0] is architecturally mapped to AArch64 System register [OSDTRTX_EL1](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDTRTText is a 32-bit register.

Field descriptions

The DBGDTRTText bit assignments are:

Bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRTText

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c3, 2	000	010	0000	1110	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

ARM deprecates reads and writes of DBGDTRTXext through the System register interface when the OS Lock is unlocked, `DBGOSLSR.OSLK == 0`.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1`, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.19 DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

Configurations

AArch32 System register DBGDTRTXint[31:0] is architecturally mapped to AArch64 register [DBGDTRTX_EL0](#)[31:0].

AArch32 System register DBGDTRTXint[31:0] is architecturally mapped to External register [DBGDTRTX_EL0](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDTRTXint is a 32-bit register.

Field descriptions

The DBGDTRTXint bit assignments are:

Bits [31:0]

Return DTRTX.

If TXfull is set to 0, then writes of this register update the value in DTRTX and set TXfull to 1.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRTXint

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c5, 0	000	000	0000	1110	0101

Data can be loaded from memory into this register using [LDC \(immediate\)](#) and [LDC \(literal\)](#).

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	WO	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	WO	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	WO	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `DBGDSCRext.UDCCdis == 1`, then write accesses to this register from EL0 are trapped to Undefined mode.
- If `MDSR_EL1.TDCC == 1 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then write accesses at EL0 are trapped to EL1.
- If `MDSR_EL1.TDCC == 1 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1`, then write accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1`, then Non-secure write accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1`, then write accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.3.20 DBGOSDLR, Debug OS Double Lock Register

The DBGOSDLR characteristics are:

Purpose

Locks out the external debug interface.

Configurations

AArch32 System register DBGOSDLR[31:0] is architecturally mapped to AArch64 System register [OSDLR_EL1](#)[31:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGOSDLR is a 32-bit register.

Field descriptions

The DBGOSDLR bit assignments are:

Bits [31:1]

Reserved, RES0.

DLK, bit [0]

When *DBGDEVID.DoubleLock* == 0b1:

OS Double Lock control bit. Possible values are:

0b0 OS Double Lock unlocked.

0b1 OS Double Lock locked, if [DBGPRCR.CORENPDRQ](#) (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

Accessing the DBGOSDLR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c3, 4	000	100	0001	1110	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDOSA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDOSA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDOSA == 1, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.21 DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of [EDECCR](#) that are otherwise invisible to software, so it can save/restore the contents of [EDECCR](#) over powerdown on behalf of the external debugger.

Configurations

AArch32 System register DBGOSECCR[31:0] is architecturally mapped to AArch64 System register [OSECCR_EL1](#)[31:0].

AArch32 System register DBGOSECCR[31:0] is architecturally mapped to External register [EDECCR](#)[31:0].

If [OSLSR.OSLK](#) == 0 then DBGOSECCR returns an UNKNOWN value on reads and ignores writes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGOSECCR is a 32-bit register.

Field descriptions

The DBGOSECCR bit assignments are:

When [OSLSR.OSLK](#) == 1:

EDECCR, bits [31:0]

Used for save/restore to [EDECCR](#) over powerdown.

Reads or writes to this field are indirect accesses to [EDECCR](#).

Accessing the DBGOSECCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c6, 2	000	010	0000	1110	0110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.22 DBGOSLAR, Debug OS Lock Access Register

The DBGOSLAR characteristics are:

Purpose

Provides a lock for the debug registers. The OS Lock also disables some debug exceptions and debug events.

Configurations

AArch32 System register DBGOSLAR[31:0] is architecturally mapped to AArch64 System register [OSLAR_EL1](#)[31:0].

AArch32 System register DBGOSLAR[31:0] is architecturally mapped to External register [OSLAR_EL1](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGOSLAR is a 32-bit register.

Field descriptions

The DBGOSLAR bit assignments are:

OS Lock Access, bits [31:0]

OS Lock Access. Writing the value 0xC5ACCE55 to the DBGOSLAR sets the OS lock to 1. Writing any other value sets the OS lock to 0.

Use [DBGOSLSR.OSLK](#) to check the current status of the lock.

Accessing the DBGOSLAR

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c0, 4	000	100	0001	1110	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDOSA == 1, then write accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDOSA == 1, then Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDOSA == 1, then write accesses at EL1 or EL2 are trapped to EL3.

G8.3.23 DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

Purpose

Provides status information for the OS Lock.

Configurations

AArch32 System register DBGOSLSR[31:0] is architecturally mapped to AArch64 System register [OSLSR_EL1](#)[31:0].

The OS Lock status is also visible in the external debug interface through EDPRSR.

This register is in the Cold reset domain. Some or all RW fields of this register have defined reset values. On a Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGOSLSR is a 32-bit register.

Field descriptions

The DBGOSLSR bit assignments are:

Bits [31:4]

Reserved, RES0.

OSLM[3,0], bit [3]

OS lock model implemented. Bits [3] and [0] interpreted together identify the form of OS save and restore mechanism implemented.

0b00 OS Lock not implemented.

0b10 OS Lock implemented.

All other values are reserved. In an ARMv8 implementation the value 0b00 is not permitted.

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status. The possible values are:

0b0 OS Lock unlocked.

0b1 OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

On a Cold reset, this field resets to 1.

OSLM[3,0], bit [0]

OS lock model implemented. Bits [3] and [0] interpreted together identify the form of OS save and restore mechanism implemented.

0b00 OS Lock not implemented.

0b10 OS Lock implemented.

All other values are reserved. In an ARMv8 implementation the value 0b00 is not permitted.

Accessing the DBGOSLSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c1, 4	000	100	0001	1110	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDOSA == 1, then read accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDOSA == 1, then Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDOSA == 1, then read accesses at EL1 or EL2 are trapped to EL3.

G8.3.24 DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

Purpose

Controls behavior of the PE on powerdown request.

Configurations

AArch32 System register DBGPRCR[31:0] is architecturally mapped to AArch64 System register [DBGPRCR_ELI](#)[31:0].

Bit [0] of this register is mapped to [EDPRCR.CORENPDRQ](#), bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

This register is in the Cold reset domain. Some or all RW fields of this register have defined reset values. On a Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGPRCR is a 32-bit register.

Field descriptions

The DBGPRCR bit assignments are:

Bits [31:1]

Reserved, RES0.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state.

————— Note —————

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

Accessing the DBGPRCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c4, 4	000	100	0001	1110	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDOSA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDOSA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDOSA == 1, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.25 DBGVCR, Debug Vector Catch Register

The DBGVCR characteristics are:

Purpose

Controls Vector Catch debug events.

Configurations

AArch32 System register DBGVCR[31:0] is architecturally mapped to AArch64 System register [DBGVCR32_EL2](#)[31:0].

This register is required in all implementations.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

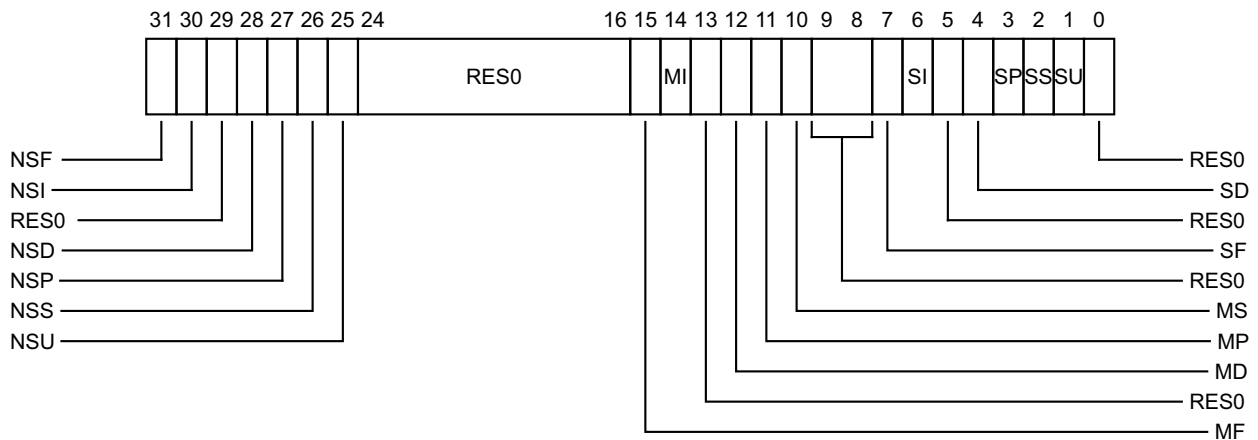

Attributes

DBGVCR is a 32-bit register.

Field descriptions

The DBGVCR bit assignments are:

When IsExceptionLevelImplemented(EL3) and IsUsingAArch32(EL3):

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:16]

Reserved, RES0.

MF, bit [15]

FIQ vector catch enable in Monitor mode.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MI, bit [14]

IRQ vector catch enable in Monitor mode.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

MD, bit [12]

Data Abort vector catch enable in Monitor mode.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MP, bit [11]

Prefetch Abort vector catch enable in Monitor mode.

The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MS, bit [10]

Secure Monitor Call (SMC) vector catch enable in Monitor mode.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is 0x1C.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.
 The exception vector offset is 0x18.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.
 The exception vector offset is 0x10.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.
 The exception vector offset is 0x0C.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.
 The exception vector offset is 0x08.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.
 The exception vector offset is 0x04.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When IsExceptionLevelImplemented(EL3) and IsUsingAArch64(EL3):

NSF, bit [31]

FIQ vector catch enable in Non-secure state.
 The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is $0x0C$.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.
 The exception vector offset is $0x08$.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.
 The exception vector offset is $0x04$.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When !IsExceptionLevelImplemented(EL3):

Bits [31:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.
 The exception vector offset is $0x1C$.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.
 The exception vector offset is $0x18$.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

D, bit [4]

Data Abort vector catch enable.
 The exception vector offset is $0x10$.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.
 The exception vector offset is $0x0C$.
 On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.
 The exception vector offset is $0x08$.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing the DBGVCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c7, 0	000	000	0000	1110	0111

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.26 DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>.

Configurations

AArch32 System register DBGWCR<n>[31:0] is architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

AArch32 System register DBGWCR<n>[31:0] is architecturally mapped to External register DBGWCR<n>_EL1[31:0].

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGWCR<n> is a 32-bit register.

Field descriptions

The DBGWCR<n> bit assignments are:

When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

0b00000 No mask.

0b00001 Reserved.

0b00010 Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

- 0b0 Unlinked data address match.
- 0b1 Linked data address match.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-5375](#), and [Breakpoint usage constraints on page G2-5386](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page G2-5393](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by `DBGWVR<n>` is being watched.

BAS	Description
0bxxxxxx1	Match byte at <code>DBGWVR<n></code>
0bxxxxxx1x	Match byte at <code>DBGWVR<n>+1</code>
0bxxxxxx1xx	Match byte at <code>DBGWVR<n>+2</code>
0bxxxx1xxx	Match byte at <code>DBGWVR<n>+3</code>

In cases where `DBGWVR<n>` addresses a double-word:

BAS	Description, if <code>DBGWVR<n>[2] == 0</code>
0bxxx1xxxx	Match byte at <code>DBGWVR<n>+4</code>
0bxx1xxxxx	Match byte at <code>DBGWVR<n>+5</code>
0bx1xxxxxx	Match byte at <code>DBGWVR<n>+6</code>
0b1xxxxxxx	Match byte at <code>DBGWVR<n>+7</code>

If `DBGWVR<n>[2] == 1`, only `BAS[3:0]` are used and `BAS[7:4]` are ignored. ARM deprecates setting `DBGWVR<n>[2] == 1`.

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See [Reserved DBGWCR<n>.BAS values on page G2-5401](#)

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- 0b01 Match instructions that load from a watchpointed address.
- 0b10 Match instructions that store to a watchpointed address.
- 0b11 Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page G2-5393](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

- 0b0 Watchpoint disabled.
- 0b1 Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGWCR<n>

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, <CRm>, 7	000	111	0000	1110	n<3:0>

- <CRm> is in the range c0 - c15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TDA == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If the register access does not generate an exception then, if EDSCR.TDA == 1 && halting is allowed && DBGOSLSR.OSLK == 0, then accesses to this register from PL1 and PL2 generate a Software Access debug event.

G8.3.27 DBGWFAR, Debug Watchpoint Fault Address Register

The DBGWFAR characteristics are:

Purpose

Previously returned information about the address of the instruction that accessed a watchpointed address. Is now deprecated and RES0.

Configurations

There are no configuration notes.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGWFAR is a 32-bit register.

Field descriptions

The DBGWFAR bit assignments are:

Bits [31:0]

Reserved, RES0.

Accessing the DBGWFAR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c6, 0	000	000	0000	1110	0110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{MDCR_EL2.TDA} == 1$, then accesses at EL1 are trapped to EL2.
- If $\text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HDCR.TDA} == 1$, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If $\text{IsUsingAArch64}(\text{EL3}) \ \&\& \ \text{MDCR_EL3.TDA} == 1$, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.28 DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>](#).

Configurations

AArch32 System register DBGWVR<n>[31:0] is architecturally mapped to AArch64 System register [DBGWVR<n>_EL1](#)[31:0].

AArch32 System register DBGWVR<n>[31:0] is architecturally mapped to External register [DBGWVR<n>_EL1](#)[31:0].

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGWVR<n> is a 32-bit register.

Field descriptions

The DBGWVR<n> bit assignments are:

VA, bits [31:2]

Bits[31:2] of the address value for comparison.

ARM deprecates setting [DBGWVR<n>](#)[2] = 1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the DBGWVR<n>

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, <CRm>, 6	000	110	0000	1110	n<3:0>

- <CRm> is in the range c0 - c15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TDA == 1, then accesses at EL1 are trapped to EL2.
- If IsUsingAArch64(EL3) && MDCR_EL3.TDA == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If the register access does not generate an exception then. if EDSCR.TDA == 1 && halting is allowed && DBGOSLSR.OSLK == 0, then accesses to this register from PL1 and PL2 generate a Software Access debug event.

G8.3.29 DLR, Debug Link Register

The DLR characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configurations

AArch32 System register DLR[31:0] is architecturally mapped to AArch64 System register [DLR_EL0](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DLR is a 32-bit register.

Field descriptions

The DLR bit assignments are:

Bits [31:0]

Restart address.

Accessing the DLR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 3, <Rt>, c4, c5, 1	011	001	0100	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Access to this register is from Debug state only. During normal execution this register is unallocated.

G8.3.30 DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

Purpose

Holds the saved process state on entry to Debug state.

Configurations

AArch32 System register DSPSR[31:0] is architecturally mapped to AArch64 System register [DSPSR_EL0](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DSPSR is a 32-bit register.

Field descriptions

The DSPSR bit assignments are:

When entering Debug state from AArch32 and exiting Debug state to AArch32:

N, bit [31]

Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

Z, bit [30]

Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

C, bit [29]

Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

V, bit [28]

Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

Q, bit [27]

Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state.

IT, bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.

- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. This bit is set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. This bit is set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

IT, bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation

0b1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the PSTATE.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

A, bit [8]

SError interrupt mask bit.

- 0b0 Exception not masked.
- 0b1 Exception masked.

I, bit [7]

IRQ mask bit.

- 0b0 Exception not masked.
- 0b1 Exception masked.

F, bit [6]

FIQ mask bit.

- 0b0 Exception not masked.
- 0b1 Exception masked.

T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the Debug state entry was taken from.

- 0b0 Taken from A32 state.
- 0b1 Taken from T32 state.

M[4], bit [4]

Execution state that Debug state was entered from.

- 0b1 Exception taken from AArch32.

M[3:0], bits [3:0]

AArch32 mode that Debug state was entered from.

- 0b0000 User.
- 0b0001 FIQ.
- 0b0010 IRQ.
- 0b0011 Supervisor.
- 0b0110 Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32).
- 0b0111 Abort.
- 0b1010 Hyp.
- 0b1011 Undefined.
- 0b1111 System.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-7216.

Accessing the DSPSR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 3, <Rt>, c4, c5, 0	011	000	0100	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Access to this register is from Debug state only. During normal execution this register is unallocated.

G8.3.31 HDCR, Hyp Debug Control Register

The HDCR characteristics are:

Purpose

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

Configurations

AArch32 System register HDCR[31:0] is architecturally mapped to AArch64 System register [MDCR_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if `HDCR.HPMN == PMCR_EL0.N`.

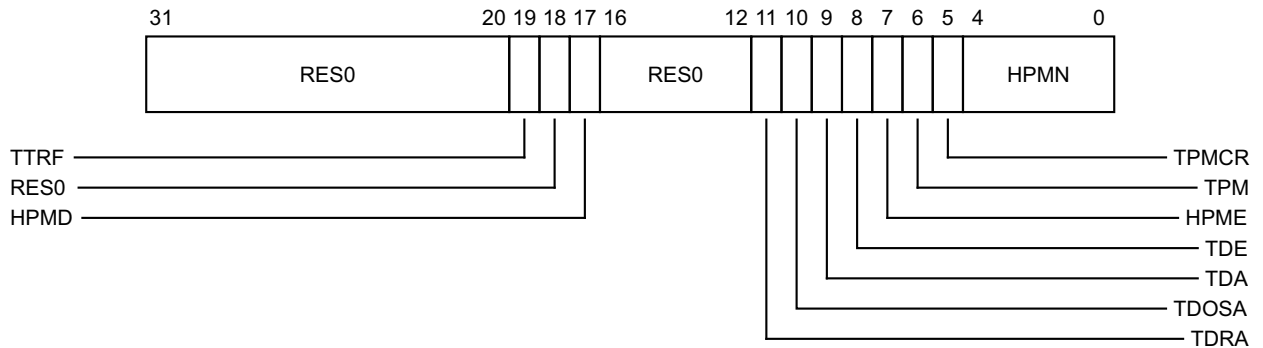

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HDCR is a 32-bit register.

Field descriptions

The HDCR bit assignments are:

Bits [31:20]

Reserved, RES0.

TTRF, bit [19]

When ARMv8.4-Trace is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2.

0b0 Accesses to [TRFCR](#) at EL1 are not affected by this control bit.

0b1 Accesses to [TRFCR](#) at EL1 generate a Hyp Trap exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

From ARMv8.1:

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

0b0 Event counting allowed in Hyp mode.

0b1 Event counting prohibited in Hyp mode.

In an ARMv8.1 implementation, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(HPMN-1)].
- If **PMCR.DP** is set to 1, **PMCCNTR**.

The other event counters are unaffected. When **PMCR.DP** is set to 0, **PMCCNTR** is unaffected.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:12]

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL0 and EL1 System register accesses to the **DBGDRAR** or **DBGDSAR** are trapped to Hyp mode, unless it is trapped by **DBGDSCRExt.UDCCdis**.

If **HCR.TGE** or **HDCR.TDE** is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDOSA, bit [10]

When ARMv8.0-DoubleLock is implemented:

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- **DBGOSLSR**, **DBGOSLAR**, **DBGOSDLR**, and **DBGPRCR**.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

———— **Note** —————

These registers are not accessible at EL0.

If **HCR.TGE** or **HDCR.TDE** is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [DBGOSDLR](#) are trapped.

———— **Note** ————

These registers are not accessible at EL0.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDA, bit [9]

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the (coproc==0b1110) encoding space that are not trapped by either of the following:

- [HDCR.TDRA](#).
- [HDCR.TDOSA](#).

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by [HDCR.TDRA](#) and [HDCR.TDOSA](#), are trapped to Hyp mode, unless it is trapped by [DBGDSCRext.UDCCdis](#).

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDE, bit [8]

Trap Debug exceptions. The possible values of this bit are:

0b0 This control has no effect on the routing of debug exceptions, and has no effect on Non-secure accesses to debug registers.

0b1 Debug exceptions generated at EL1 or EL0 are routed to EL2 when enabled in the current Security state. The [HDCR.{TDRA, TDOSA, TDA}](#) fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

When [HCR.TGE](#) == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

HPME, bit [7]

Hypervisor Performance Monitors Counters Enable. The possible values of this bit are:

0b0 Hyp mode Performance Monitors counters disabled.

0b1 Hyp mode Performance Monitors counters enabled.

When the value of this bit is 1, the Performance Monitors counters that are reserved for use from Hyp mode or Secure state are enabled. For more information see the description of the HPMN field.

If the Performance Monitors Extension is not implemented, this field is RES0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

TPM, bit [6]

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.

————— Note —————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors Extension is not implemented, this field is RES0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TPMCR, bit [5]

Trap **PMCR** accesses. Traps Non-secure EL0 and EL1 accesses to the **PMCR** to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL0 and EL1 accesses to the **PMCR** are trapped to Hyp mode, unless it is trapped by **PMUSERENR.EN**.

————— Note —————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors Extension is not implemented, this field is RES0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

HPMN, bits [4:0]

Defines the number of Performance Monitors counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If the Performance Monitors Extension is not implemented, this field is RES0.

In Non-secure state, HPMN divides the Performance Monitors counters into two ranges, [0:(HPMN-1)] and [HPMN:**PMCR.N**].

For an event in the range [0:(HPMN-1)]:

- The counter is accessible from EL1 and EL2, and from EL0 if unprivileged access to the counters is enabled.
- **PMCR.E** enables the operation of counters in this range.

For an event in the range [HPMN:**PMCR.N**]:

- The counter is accessible only from EL2 and from Secure state.
- **HDCR.HPME** enables the operation of counters in this range.

If this field is set to 0, or to a value larger than **PMCR.N**, then the following **CONSTRAINED UNPREDICTABLE** behavior applies:

- The value returned by a direct read of **HDCR.HPMN** is UNKNOWN.
- Either:
 - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if **HDCR.HPMN** is set to an UNKNOWN non-zero value less than **PMCR.N**.
 - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [PMCR.N](#).

Accessing the HDCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 1	100	001	0001	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If [SCR_EL3.NS](#) == 1 && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H](#) == 0 && [HSTR_EL2.T1](#) == 1, then accesses at EL1 are trapped to EL2.
- If [SCR_EL3.NS](#) == 1 && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H](#) == 1 && [HCR_EL2.TGE](#) == 0 && [HSTR_EL2.T1](#) == 1, then accesses at EL1 are trapped to EL2.
- If [SCR_EL3.NS](#) == 1 && [IsUsingAArch32\(EL2\)](#) && [HSTR.T1](#) == 1, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If [IsUsingAArch64\(EL3\)](#) && [MDCR_EL3.TDA](#) == 1, then accesses at EL2 are trapped to EL3.

G8.3.32 HTRFCR, Hyp Trace Filter Control Register

The HTRFCR characteristics are:

Purpose

Provides EL2 controls for Trace.

Configurations

AArch32 System register HTRFCR[31:0] is architecturally mapped to AArch64 System register [TRFCR_EL2](#)[31:0].

This register is present only when ARMv8.4-Trace is implemented. Otherwise, direct accesses to HTRFCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from Monitor mode when [SCR.NS](#) == 1.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HTRFCR is a 32-bit register.

Field descriptions

The HTRFCR bit assignments are:

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

0b00 The timestamp is controlled by [TRFCR.TS](#).

0b01 Virtual timestamp. The traced timestamp is the physical counter value minus the value of [CNTVOFF](#).

0b11 Physical timestamp. The traced timestamp is the physical counter value.

When `SelfHostedTraceEnabled() == FALSE`, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [4]

Reserved, RES0.

CX, bit [3]

VMID Trace Enable.

0b0 VMID tracing is not allowed.

0b1 VMID tracing is allowed.
When SelfHostedTraceEnabled() == FALSE, this field is ignored.
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.
0b0 Tracing is prohibited at EL2.
0b1 Tracing is allowed at EL2.
When SelfHostedTraceEnabled() == FALSE, this field is ignored.
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

E0HTRE, bit [0]

EL0 Trace Enable.
0b0 Tracing is prohibited at EL0 when HCR.TGE == 1.
0b1 Tracing is allowed at EL0 when HCR.TGE == 1.
This field is ignored if any of the following are true:

- The PE is in Secure state.
- SelfHostedTraceEnabled() == FALSE.
- HCR.TGE == 0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing the HTRFCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c2, 1	100	001	0001	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

HTRFCR is UNDEFINED at EL1 and EL0.

HTRFCR is UNDEFINED if EL3 is implemented and using AArch32 in:

- All Secure privileged modes other than Monitor mode.
- Monitor mode when SCR.NS == 0.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T1 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T1 == 1, then accesses at EL1 are trapped to EL2.
- If SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T1 == 1, then Accesses to this register from EL1 generate a Hyp Trap exception.
- If IsUsingAArch64(EL3) && MDCR_EL3.TTRF == 1, then accesses at EL2 are trapped to EL3.
- If IsUsingAArch32(EL3) && SDCR.TTRF == 1, then Accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.3.33 PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configurations

This register is present only when ARMv8.4-PMU is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMMIR is a 32-bit register.

Field descriptions

The PMMIR bit assignments are:

Bits [31:8]

Reserved, RES0.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

Accessing the PMMIR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 6	000	110	1001	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{MDCR_EL2.TPM} == 1$, then accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64}(\text{EL2}) \ \&\& \ \text{HSTR_EL2.T9} == 1$, then accesses at EL1 are trapped to EL2.
- If $\text{HaveEL}(\text{EL2}) \ \&\& \ \text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HDCR.TPM} == 1$, then Reads of this register from EL1 generate a Hyp Trap exception.
- If $\text{HaveEL}(\text{EL2}) \ \&\& \ \text{SCR_EL3.NS} == 1 \ \&\& \ \text{IsUsingAArch32}(\text{EL2}) \ \&\& \ \text{HSTR.T9} == 1$, then Reads of this register from EL1 generate a Hyp Trap exception.
- If $\text{HaveEL}(\text{EL3}) \ \&\& \ \text{IsUsingAArch64}(\text{EL3}) \ \&\& \ \text{MDCR_EL3.TPM} == 1$, then accesses at EL1 or EL2 are trapped to EL3.

G8.3.34 SDCR, Secure Debug Control Register

The SDCR characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

Configurations

AArch32 System register SDCR bits [31:0] can be mapped to AArch64 System register [MDCR_EL3](#)[31:0], but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

Attributes

SDCR is a 32-bit register.

Field descriptions

The SDCR bit assignments are:

Bits [31:22]

Reserved, RES0.

EPMAD, bit [21]

When ARMv8.4-Debug is implemented:

External debug interface Performance Monitors registers disable. This controls Non-secure access to Performance Monitors registers by an external debugger:

- 0 Non-secure access to Performance Monitors registers from an external debugger is permitted.
- 1 Non-secure access to Performance Monitors registers from an external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension is not implemented or does not support external debug interface accesses this bit is RES0.

In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

External debug interface Performance Monitors registers disable. This controls access to Performance Monitors registers by an external debugger:

- 0 Access to Performance Monitors registers from an external debugger is permitted.
- 1 Access to Performance Monitors registers from an external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension is not implemented or does not support external debug interface accesses this bit is RES0.

In a system where the PE resets into EL3, this field resets to 0.

EDAD, bit [20]

When ARMv8.4-Debug is implemented:

External debug register Non-secure access disable. Controls access to debug registers by an external debugger:

- 0 Non-secure access to debug registers from an external debugger is permitted.
- 1 Non-secure access to breakpoint registers, watchpoint registers and OSLAR_EL1 from an external debugger is not permitted.

In a system where the PE resets into EL3, this field resets to 0.

When ARMv8.2-Debug is implemented:

External debug access disable. This disables access to these registers by an external debugger:

- 0 Access to debug registers from an external debugger is permitted.
- 1 Access to breakpoint, watchpoint registers and OSLAR_EL1 from an external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

External debug access disable. This disables access to these registers by an external debugger:

- 0 Access to debug registers from an external debugger is permitted.
- 1 Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is also not permitted.

In a system where the PE resets into EL3, this field resets to 0.

TTRF, bit [19]

When ARMv8.4-Trace is implemented:

Trap Trace Filter controls. Controls whether accesses at EL2 and EL1 to the trace filter control registers are trapped to EL3.

- 0 Access to HTRFCR and TRFCR registers are not affected by this control bit.
- 1 When not in Monitor mode, accesses to HTRFCR and TRFCR registers generate a Monitor trap exception.

In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

STE, bit [18]

When ARMv8.4-Trace is implemented:

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

- 0 Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
- 1 Trace is allowed in Secure state unless prohibited by the Trace Filter control registers.

If EL3 is not implemented and the PE executes in Secure state, the PE behaves as if this bit is set to 1.

In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

From ARMv8.2:

Secure Performance Monitors enable. This allows event counting in Secure state:

- 0 Event counting prohibited in Secure state.
- 1 Event counting allowed in Secure state.

If the Performance Monitors Extension is not implemented, this field is RES0.

In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Secure Performance Monitors event counting is prohibited unless ExternalSecureNoninvasiveDebugEnabled() is TRUE, which means this field is overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension is not implemented this bit is RES0.

In a system where the PE resets into EL3, this field resets to 0.

Bit [16]

Reserved, RES0.

SPD, bits [15:14]

AArch32 Secure privileged debug. Enables or disables debug exceptions from Secure state, other than Breakpoint Instruction exceptions. Valid values for this field are:

- 00 Legacy mode. Debug exceptions from Secure EL1 are enabled by the authentication interface.
- 10 Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
- 11 Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONstrained UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if `SDER32_EL3.SUIDEN == 1`.

Ignored in Non-secure state. Debug exceptions from Breakpoint Instruction exceptions are always enabled.

In a system where the PE resets into EL3, this field resets to 0

Bits [13:0]

Reserved, RES0.

Accessing the SDCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c3, 1	000	001	0001	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	RW
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	-	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T1 == 1)`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T1 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && SCR_EL3.EEL2 == 0`, then accesses at EL1 are trapped to EL3.
- If `SCR_EL3.NS == 0 && IsUsingAArch32(EL2)`, then accesses at EL1 are trapped to EL2.

G8.3.35 SDER, Secure Debug Enable Register

The SDER characteristics are:

Purpose

Controls invasive and non-invasive debug in the Secure EL0 mode.

Configurations

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register [SDER32_EL3](#).

If EL3 is not implemented and EL1 supports AArch32, SDER is implemented only if the implemented Security state is Secure state.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SDER is a 32-bit register.

Field descriptions

The SDER bit assignments are:

Bits [31:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable:

- 0 Performance Monitors event counting prohibited in Secure EL0 unless allowed by [MDCR_EL3.SPME](#), [SDCR.SPME](#).
In an ARMv8.0 or ARMv8.1 implementation, event counting can also be allowed using the IMPLEMENTATION DEFINED authentication interface `ExternalSecureNoninvasiveDebugEnabled()`.

- 1 Performance Monitors event counting allowed in Secure EL0.

On a Warm reset, this field resets to 0.

SUIDEN, bit [0]

Secure User Invasive Debug Enable:

- 0 Debug exceptions other than Breakpoint Instruction exceptions from Secure EL0 are disabled, unless enabled by [MDCR_EL3.SPD32](#) or [SDCR.SPD](#).
- 1 Debug exceptions from Secure EL0 are enabled.

On a Warm reset, this field resets to 0.

Accessing the SDER

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c1, 1	000	001	0001	1111	0001

Accessibility

The register is accessible in software as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
!HaveEL(EL3) && SCR_EL3.NS == 0.	-	RW	n/a	n/a
HCR_EL2.TGE == 0 && !HaveEL(EL3) && SCR_EL3.NS == 1	-	-	-	n/a
HCR_EL2.TGE == 1 && !HaveEL(EL3) && SCR_EL3.NS == 1	-	n/a	-	n/a
IsUsingAArch64(EL3) && SCR_EL3.NS == 0	-	RW	n/a	n/a
HCR_EL2.TGE == 0 && IsUsingAArch64(EL3) && SCR_EL3.NS == 1	-	-	-	n/a
HCR_EL2.TGE == 1 && IsUsingAArch64(EL3) && SCR_EL3.NS == 1	-	n/a	-	n/a
IsUsingAArch32(EL3) && SCR_EL3.NS == 0	-	n/a	n/a	RW
HCR_EL2.TGE == 0 && IsUsingAArch32(EL3) && SCR_EL3.NS == 1	-	-	-	RW
HCR_EL2.TGE == 1 && IsUsingAArch32(EL3) && SCR_EL3.NS == 1	-	n/a	-	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T1 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T1 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G8.3.36 TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

Purpose

Provides EL1 controls for Trace.

Configurations

AArch32 System register TRFCR[31:0] is architecturally mapped to AArch64 System register [TRFCR_EL1](#)[31:0].

This register is present only from ARMv8.4, when ARMv8.4-Trace is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.4.

Attributes

TRFCR is a 32-bit register.

Field descriptions

The TRFCR bit assignments are:

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

0b01 Virtual timestamp. The traced timestamp is the physical counter value minus the value of [CNTVOFF](#).

0b11 Physical timestamp. The traced timestamp is the physical counter value.

All other values are reserved.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- [HTRFCR.TS](#) is not 0b00.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

0b0 Tracing is prohibited in PL1 modes.

0b1 Tracing is allowed in PL1 modes.
When SelfHostedTraceEnabled() == FALSE, this field is ignored.
On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

0b0 Tracing is prohibited at EL0.

0b1 Tracing is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current security state and HCR.TGE == 1.

On a Warm reset, this field resets to 0.

Accessing the TRFCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c2, 1	000	001	0001	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 0 \ \&\& \ MDCR_EL2.TTRF == 1$, then accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ MDCR_EL2.TTRF == 1$, then accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HDCR.TTRF == 1$, then Accesses to this register from EL1 generate a Hyp Trap exception.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \ HSTR.T1 == 1$, then Accesses to this register from EL1 generate a Hyp Trap exception.
- If $\text{IsUsingAArch64}(EL3) \ \&\& \ MDCR_EL3.TTRF == 1$, then accesses at EL1 or EL2 are trapped to EL3.
- If $\text{IsUsingAArch32}(EL3) \ \&\& \ SDCR.TTRF == 1$, then Accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.4 Performance Monitors registers

This section lists the Performance Monitors registers in AArch32.

G8.4.1 PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR](#), increments.

Configurations

AArch32 System register PMCCFILTR[31:0] is architecturally mapped to AArch64 System register [PMCCFILTR_EL0](#)[31:0].

AArch32 System register PMCCFILTR[31:0] is architecturally mapped to External register [PMCCFILTR_EL0](#)[31:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCCFILTR is a 32-bit register.

Field descriptions

The PMCCFILTR bit assignments are:

P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

- 0b0 Count cycles in EL1.
- 0b1 Do not count cycles in EL1.

On a Warm reset, this field resets to 0.

U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

- 0b0 Count cycles in EL0.
- 0b1 Do not count cycles in EL0.

On a Warm reset, this field resets to 0.

NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

On a Warm reset, this field resets to 0.

NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

On a Warm reset, this field resets to 0.

NSH, bit [27]

Non-secure EL2 (Hyp mode) filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0b0 Do not count cycles in EL2.

0b1 Count cycles in EL2.

On a Warm reset, this field resets to 0.

Bits [26:0]

Reserved, RES0.

Accessing the PMCCFILTR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c15, 7	000	111	1110	1111	1111

PMCCFILTR can also be accessed by using [PMXEVTYPER](#) with [PMSELR.SEL](#) set to 0b11111.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.2 PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See [Time as measured by the Performance Monitors cycle counter on page D6-2539](#) for more information.

[PMCCFILTR](#) determines the modes and states in which the PMCCNTR can increment.

Configurations

AArch32 System register PMCCNTR[63:0] is architecturally mapped to AArch64 System register [PMCCNTR_EL0](#)[63:0].

AArch32 System register PMCCNTR[63:0] is architecturally mapped to External register [PMCCNTR_EL0](#)[63:0].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

Field descriptions

The PMCCNTR bit assignments are:

When accessing as a 32-bit register:

CCNT, bits [31:0]

Cycle count. Depending on the values of [PMCR](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR.C](#) sets this field to 0.

When accessing as a 64-bit register:

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.

- Every 64th processor clock cycle.
- Writing 1 to `PMCR.C` sets this field to 0.
 This field resets to an architecturally UNKNOWN value.

Accessing the PMCCNTR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c13, 0	000	000	1001	1111	1101

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 0, <Rt>, <Rt2>, c9	0000	1111	1001

Accessibility

The register is accessible as follows:

<syntax>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
p15, 0, <Rt>, c9, c13, 0	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
p15, 0, <Rt>, c9, c13, 0	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
p15, 0, <Rt>, c9, c13, 0	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

<syntax>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
PMCCNTR	SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
PMCCNTR	HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
PMCCNTR	HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.CR == 0 && PMUSERENR.EN == 0`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.CR == 0 && PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.CR == 0 && PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `PMUSERENR.EN == 0`, then write accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then write accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.3 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

Note

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D6-2557](#).

Configurations

AArch32 System register PMCEID0[31:0] is architecturally mapped to AArch64 System register [PMCEID0_EL0\[31:0\]](#).

AArch32 System register PMCEID0[31:0] is architecturally mapped to External register [PMCEID0\[31:0\]](#).

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

The PMCEID0 bit assignments are:

ID<n>, bit [n], for n = 0 to 31

ID[n] corresponds to common event n.

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 6	000	110	1001	1111	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure read accesses to this register from EL0 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.4 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0020 to 0x003F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

Note

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D6-2557](#).

Configurations

AArch32 System register PMCEID1[31:0] is architecturally mapped to AArch64 System register [PMCEID1_EL0](#)[31:0].

AArch32 System register PMCEID1[31:0] is architecturally mapped to External register [PMCEID1](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

The PMCEID1 bit assignments are:

ID<n>, bit [n], for n = 0 to 31

ID[n] corresponds to common event (0x0020 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 7	000	111	1001	1111	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure read accesses to this register from EL0 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.5 PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

Note

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D6-2557](#).

Configurations

AArch32 System register PMCEID2[31:0] is architecturally mapped to AArch64 System register [PMCEID0_EL0\[63:32\]](#).

AArch32 System register PMCEID2[31:0] is architecturally mapped to External register [PMCEID2\[63:32\]](#).

This register is present only from ARMv8.1. Otherwise, direct accesses to PMCEID2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

The PMCEID2 bit assignments are:

IDhi<n>, bit [n], for n = 0 to 31

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID2

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 4	000	100	1001	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0`, then read accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure read accesses to this register from EL0 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.6 PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

Note

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D6-2557](#).

Configurations

AArch32 System register PMCEID3[31:0] is architecturally mapped to AArch64 System register [PMCEID1_EL0\[63:32\]](#).

AArch32 System register PMCEID3[31:0] is architecturally mapped to External register [PMCEID3\[63:32\]](#).

This register is present only from ARMv8.1. Otherwise, direct accesses to PMCEID3 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions

The PMCEID3 bit assignments are:

IDhi<n>, bit [n], for n = 0 to 31

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID3

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 5	000	101	1001	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0`, then read accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then read accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then read accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure read accesses to this register from EL0 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then read accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.7 PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the [PMCNTENSET](#) register.

Configurations

AArch32 System register PMCNTENCLR[31:0] is architecturally mapped to AArch64 System register [PMCNTENCLR_EL0](#)[31:0].

AArch32 System register PMCNTENCLR[31:0] is architecturally mapped to External register [PMCNTENCLR_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCNTENCLR is a 32-bit register.

Field descriptions

The PMCNTENCLR bit assignments are:

C, bit [31]

[PMCCNTR](#) disable bit. Disables the cycle counter register. Possible values are:

0b0 When read, means the cycle counter is disabled. When written, has no effect.

0b1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter disable bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

Possible values of each bit are:

0b0 When read, means that [PMEVCNTR<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>](#) is enabled. When written, disables [PMEVCNTR<n>](#).

This field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENCLR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 2	000	010	1001	1111	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of [HDCR.HPMN](#) or [MDCR_EL2.HPMN](#) can change the behavior of accesses to [PMCNTENCLR](#). See the description of the P<n> bit.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If [PMUSERENR.EN](#) == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If [PMUSERENR_EL0.EN](#) == 0 && ([HCR_EL2.TGE](#) == 0 || ([SCR_EL3.NS](#) == 0 && [SCR_EL3.EEL2](#) == 0)), then accesses at EL0 are trapped to EL1.
- If [PMUSERENR_EL0.EN](#) == 0 && [HCR_EL2.TGE](#) == 1 && ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1), then accesses at EL0 are trapped to EL2.
- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H](#) == 0 && [HSTR_EL2.T9](#) == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [MDCR_EL2.TPM](#) == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H](#) == 1 && [HCR_EL2.TGE](#) == 0 && [HSTR_EL2.T9](#) == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If [SCR_EL3.NS](#) == 1 && [IsUsingAArch32\(EL2\)](#) && [HDCR.TPM](#) == 1, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If [SCR_EL3.NS](#) == 1 && [IsUsingAArch32\(EL2\)](#) && [HSTR.T9](#) == 1, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If [IsUsingAArch64\(EL3\)](#) && [MDCR_EL3.TPM](#) == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.8 PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENSET is used in conjunction with the [PMCNTENCLR](#) register.

Configurations

AArch32 System register PMCNTENSET[31:0] is architecturally mapped to AArch64 System register [PMCNTENSET_EL0](#)[31:0].

AArch32 System register PMCNTENSET[31:0] is architecturally mapped to External register [PMCNTENSET_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCNTENSET is a 32-bit register.

Field descriptions

The PMCNTENSET bit assignments are:

C, bit [31]

[PMCCNTR](#) enable bit. Enables the cycle counter register. Possible values are:

0b0 When read, means the cycle counter is disabled. When written, has no effect.

0b1 When read, means the cycle counter is enabled. When written, enables the cycle counter.

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter enable bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

Possible values of each bit are:

0b0 When read, means that [PMEVCNTR<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>](#) event counter is enabled. When written, enables [PMEVCNTR<n>](#).

This field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENSET

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 1	000	001	1001	1111	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of [HDCR.HPMN](#) can change the behavior of accesses to [PMCNTENSET](#). See the description of the P<n> bit.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If [PMUSERENR.EN](#) == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If [PMUSERENR_EL0.EN](#) == 0 && ([HCR_EL2.TGE](#) == 0 || ([SCR_EL3.NS](#) == 0 && [SCR_EL3.EEL2](#) == 0)), then accesses at EL0 are trapped to EL1.
- If [PMUSERENR_EL0.EN](#) == 0 && [HCR_EL2.TGE](#) == 1 && ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1), then accesses at EL0 are trapped to EL2.
- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H](#) == 0 && [HSTR_EL2.T9](#) == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [MDCR_EL2.TPM](#) == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If ([SCR_EL3.NS](#) == 1 || [SCR_EL3.EEL2](#) == 1) && [IsUsingAArch64\(EL2\)](#) && [HCR_EL2.E2H](#) == 1 && [HCR_EL2.TGE](#) == 0 && [HSTR_EL2.T9](#) == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If [SCR_EL3.NS](#) == 1 && [IsUsingAArch32\(EL2\)](#) && [HDCR.TPM](#) == 1, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If [SCR_EL3.NS](#) == 1 && [IsUsingAArch32\(EL2\)](#) && [HSTR.T9](#) == 1, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If [IsUsingAArch64\(EL3\)](#) && [MDCR_EL3.TPM](#) == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.9 PMCR, Performance Monitors Control Register

The PMCR characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configurations

AArch32 System register PMCR[31:0] is architecturally mapped to AArch64 System register [PMCR_ELO](#)[31:0].

AArch32 System register PMCR[6:0] is architecturally mapped to External register [PMCR_ELO](#)[6:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMCR is a 32-bit register.

Field descriptions

The PMCR bit assignments are:

31	24 23	16 15	11 10	7 6 5 4 3 2 1 0
IMP	IDCODE	N	RES0	LCDP X D C P E

IMP, bits [31:24]

Implementer code. This field is RO with an IMPLEMENTATION DEFINED value.

The implementer codes are allocated by ARM. Values have the same interpretation as bits [31:24] of the [MIDR](#).

IDCODE, bits [23:16]

Identification code. This field is RO with an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that is specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

N, bits [15:11]

An RO field that indicates the number of event counters implemented. This value is in the range of 0b00000-0b11111. If the value is 0b00000 then only [PMCCNTR_ELO](#) is implemented. If the value is 0b11111 [PMCCNTR_ELO](#) and 31 event counters are implemented.

In an implementation that includes EL2:

- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of [HDCR.HPMN](#).
- If EL2 is enabled in the current Security state and is using AArch64, reads of this field from EL1 and EL0 return the value of [MDCR_EL2.HPMN](#).

Access to this field is RO.

Bits [10:7]

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

- 0b0 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR](#)[31:0].
- 0b1 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR](#)[63:0].

ARM deprecates use of [PMCR](#).LC = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

- 0b0 [PMCCNTR](#), if enabled, counts when event counting is prohibited.
- 0b1 [PMCCNTR](#) does not count when event counting is prohibited.

Counting events is never prohibited in Non-secure state. However, there are some restrictions on counting events in Secure state. For more information about the interaction between the Performance Monitors and EL3, see [Interaction with EL3 on page D6-2545](#)

When EL3 is not implemented, this field is RES0:

- When [ARMv8.1-PMU](#) is not implemented.
- When [ARMv8.1-PMU](#) is implemented, only if EL2 is not implemented.

Otherwise this field is RW.

On a Warm reset, this field resets to 0.

X, bit [4]

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:

- 0b0 Do not export events.
- 0b1 Export events where not prohibited.

This field enables the exporting of events over an event bus to another device, for example to an OPTIONAL PE trace unit. If the implementation does not include such an event bus then this field is RAZ/WI, otherwise it is an RW field.

In an implementation that includes an event bus, no events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to 0.

D, bit [3]

Clock divider. The possible values of this bit are:

- 0b0 When enabled, [PMCCNTR](#) counts every clock cycle.
- 0b1 When enabled, [PMCCNTR](#) counts once every 64 clock cycles.

This bit is RW.

If [PMCR](#).LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of [PMCR](#).D = 1.

On a Warm reset, this field resets to 0.

C, bit [2]

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

- 0b0 No action.
- 0b1 Reset [PMCCNTR](#) to zero.

This bit is always RAZ.

Resetting **PMCCNTR** does not clear the **PMCCNTR** overflow bit to 0.

P, bit [1]

Event counter reset. This bit is WO. The effects of writing to this bit are:

0b0 No action.

0b1 Reset all event counters accessible in the current EL, not including **PMCCNTR**, to zero.

This bit is always RAZ.

In Non-secure EL0 and EL1, if EL2 is implemented, a write of 1 to this bit does not reset event counters that **HDCR.HPMN** or **MDCR_EL2.HPMN** reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Resetting the event counters does not clear any overflow bits to 0.

E, bit [0]

Enable. The possible values of this bit are:

0b0 All counters that are accessible at Non-secure EL1, including **PMCCNTR**, are disabled.

0b1 All counters that are accessible at Non-secure EL1 are enabled by **PMCNTENSET**.

This bit is RW.

If EL2 is implemented, this bit does not affect the operation of event counters that **HDCR.HPMN** or **MDCR_EL2.HPMN** reserves for EL2 use.

On a Warm reset, this field resets to 0.

Accessing the PMCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 0	000	000	1001	1111	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPMCR == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPMCR == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.10 PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configurations

AArch32 System register PMEVCNTR<n>[31:0] is architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0](#)[31:0].

AArch32 System register PMEVCNTR<n>[31:0] is architecturally mapped to External register [PMEVCNTR<n>_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMEVCNTR<n> is a 32-bit register.

Field descriptions

The PMEVCNTR<n> bit assignments are:

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

This field resets to an architecturally UNKNOWN value.

Accessing the PMEVCNTR<n>

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, <CRm>, <opc2>	000	n<2:0>	1110	1111	10:n<4:3>

- <opc2> is in the range 0 - 7.
- <CRm> is in the range c8 - c11.

PMEVCNTR<n> can also be accessed by using [PMXEVCNTR](#) with [PMSELR](#).SEL set to the value of <n>.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- For an access from EL1 or a permitted access from EL0, if n is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from EL0 are permitted when:
 - EL1 is using AArch32 and the value of [PMUSERENR.EN](#) is 1.
 - EL1 is using AArch64 and the value of [PMUSERENR_EL0.EN](#) is 1.

————— Note —————

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible counters.
- If EL2 is using AArch64, [MDCR_EL2.HPMN](#) identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0 && PMUSERENR.ER == 0`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR.EN == 0`, then write accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.ER == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.ER == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then write accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.11 PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configurations

AArch32 System register PMEVTYPER<n>[31:0] is architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0](#)[31:0].

AArch32 System register PMEVTYPER<n>[31:0] is architecturally mapped to External register [PMEVTYPER<n>_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMEVTYPER<n> is a 32-bit register.

Field descriptions

The PMEVTYPER<n> bit assignments are:

P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

- 0b0 Count events in EL1.
- 0b1 Do not count events in EL1.

This field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

- 0b0 Count events in EL0.
- 0b1 Do not count events in EL0.

This field resets to an architecturally UNKNOWN value.

NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

This field resets to an architecturally UNKNOWN value.

NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

This field resets to an architecturally UNKNOWN value.

NSH, bit [27]

Non-secure EL2 (Hyp mode) filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0b0 Do not count events in EL2.

0b1 Count events in EL2.

This field resets to an architecturally UNKNOWN value.

Bit [26]

Reserved, RES0.

MT, bit [25]

Multithreading. When the implementation is multi-threaded, the valid values for this bit are:

0b0 Count events only on controlling PE.

0b1 Count events from any PE with the same affinity at level 1 and above as this PE.

When the implementation is not multi-threaded, this bit is RES0.

———— **Note** —————

- When the lowest level of [affinity](#) consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent. On such an implementation, when read at the highest implemented Exception level, the value of MPIDR_EL1.MT is 1.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

This field resets to an architecturally UNKNOWN value.

Bits [24:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

From ARMv8.1:

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>](#).

Software must program this field with an event that is supported by the PE being programmed.

There are three types of event:

- Common architectural and microarchitectural events.
- ARM recommended common architectural and microarchitectural events.
- IMPLEMENTATION DEFINED events.

The ranges of event numbers allocated to each type of event are shown in [Table D6-6 on page D6-2557](#).

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the event type:

- For the range 0x000 to 0x03F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

This field resets to an architecturally UNKNOWN value.

Accessing the PMEVTYPER<n>

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, <CRm>, <opc2>	000	n<2:0>	1110	1111	11:n<4:3>

- <opc2> is in the range 0 - 7.
- <CRm> is in the range c12 - c15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	n/a
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	n/a
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	n/a

This register is accessible at EL0 when [PMUSERENR.EN](#) is set to 1.

PMEVTYPER<n> can also be accessed by using [PMXEVTYPER](#) with [PMSELR.SEL](#) set to n.

If <n> is greater or equal to the number of accessible counters, reads and writes of PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.

- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- For an access from EL1 or a permitted access from EL0, if n is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from EL0 are permitted when:
 - EL1 is using AArch32 and the value of `PMUSERENR.EN` is 1.
 - EL1 is using AArch64 and the value of `PMUSERENR_EL0.EN` is 1.

———— **Note** —————

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, `HDCR.HPMN` identifies the number of accessible counters.
- If EL2 is using AArch64, `MDCR_EL2.HPMN` identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN` == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN` == 0 && (`HCR_EL2.TGE` == 0 || (`SCR_EL3.NS` == 0 && `SCR_EL3.EEL2` == 0)), then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN` == 0 && `HCR_EL2.TGE` == 1 && (`SCR_EL3.NS` == 1 || `SCR_EL3.EEL2` == 1), then accesses at EL0 are trapped to EL2.
- If (`SCR_EL3.NS` == 1 || `SCR_EL3.EEL2` == 1) && `IsUsingAArch64(EL2)` && `MDCR_EL2.TPM` == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS` == 1 && `IsUsingAArch32(EL2)` && `HDCR.TPM` == 1, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3)` && `MDCR_EL3.TPM` == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.12 PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the [PMINTENSET](#) register.

Configurations

AArch32 System register PMINTENCLR[31:0] is architecturally mapped to AArch64 System register [PMINTENCLR_EL1](#)[31:0].

AArch32 System register PMINTENCLR[31:0] is architecturally mapped to External register [PMINTENCLR_EL1](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMINTENCLR is a 32-bit register.

Field descriptions

The PMINTENCLR bit assignments are:

C, bit [31]

[PMCCNTR](#) overflow interrupt request disable bit. Possible values are:

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

Possible values are:

- 0b0 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is disabled. When written, has no effect.
- 0b1 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is enabled. When written, disables the [PMEVCNTR<n>](#) interrupt request.

This field resets to an architecturally UNKNOWN value.

Accessing the PMINTENCLR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 2	000	010	1001	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of `HDCR.HPMN` can change the behavior of accesses to `PMINTENCLR`. See the description of the `P<n>` bit.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL1 or EL2 are trapped to EL3.

G8.4.13 PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENSET is used in conjunction with the [PMINTENCLR](#) register.

Configurations

AArch32 System register PMINTENSET[31:0] is architecturally mapped to AArch64 System register [PMINTENSET_EL1](#)[31:0].

AArch32 System register PMINTENSET[31:0] is architecturally mapped to External register [PMINTENSET_EL1](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMINTENSET is a 32-bit register.

Field descriptions

The PMINTENSET bit assignments are:

C, bit [31]

[PMCCNTR](#) overflow interrupt request enable bit. Possible values are:

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>](#).

When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

Bits [30:N] are RAZ/WI.

Possible values are:

- 0b0 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is disabled. When written, has no effect.
- 0b1 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is enabled. When written, enables the [PMEVCNTR<n>](#) interrupt request.

This field resets to an architecturally UNKNOWN value.

Accessing the PMINTENSET

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 1	000	001	1001	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of `HDCR.HPMN` can change the behavior of accesses to `PMINTENSET`. See the description of the `P<n>` bit.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL1 or EL2 are trapped to EL3.

G8.4.14 PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configurations

AArch32 System register PMOVSR[31:0] is architecturally mapped to AArch64 System register [PMOVSLR_EL0](#)[31:0].

AArch32 System register PMOVSR[31:0] is architecturally mapped to External register [PMOVSLR_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMOVSR is a 32-bit register.

Field descriptions

The PMOVSR bit assignments are:

C, bit [31]

Cycle counter overflow clear bit. Possible values are:

- 0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
- 0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow clear bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

Possible values of each bit are:

- 0b0 When read, means that [PMEVCNTR<n>](#) has not overflowed since this bit was last cleared. When written, has no effect.
- 0b1 When read, means that [PMEVCNTR<n>](#) has overflowed since this bit was last cleared. When written, clears the [PMEVCNTR<n>](#) overflow bit to 0.

This field resets to an architecturally UNKNOWN value.

Accessing the PMOVSR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 3	000	011	1001	1111	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243* for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191* for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.15 PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Configurations

AArch32 System register PMOVSSET[31:0] is architecturally mapped to AArch64 System register [PMOVSSET_EL0](#)[31:0].

AArch32 System register PMOVSSET[31:0] is architecturally mapped to External register [PMOVSSET_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMOVSSET is a 32-bit register.

Field descriptions

The PMOVSSET bit assignments are:

C, bit [31]

Cycle counter overflow set bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

This field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow set bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

0b0 When read, means that [PMEVCNTR<n>](#) has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>](#) has overflowed since this bit was last. When written, sets the [PMEVCNTR<n>](#) overflow bit to 1.

This field resets to an architecturally UNKNOWN value.

Accessing the PMOVSSET

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 3	000	011	1001	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.16 PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

Selects the current event counter [PMEVCNTR<n>](#) or the cycle counter, CCNT.

PMSELR is used in conjunction with [PMXEVTYPER](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXVCNTR](#), to determine the value of a selected event counter.

Configurations

AArch32 System register PMSELR[31:0] is architecturally mapped to AArch64 System register [PMSELR_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSELR is a 32-bit register.

Field descriptions

The PMSELR bit assignments are:

Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER](#) or [PMXVCNTR](#) occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR.SEL is 0b11111, it selects the cycle counter and:

- A read of the [PMXEVTYPER](#) returns the value of [PMCCFILTR](#).
- A write of the [PMXEVTYPER](#) writes to [PMCCFILTR](#).
- A read or write of [PMXVCNTR](#) has CONSTRAINED UNPREDICTABLE effects, that can be one of the following:
 - Access to [PMXVCNTR](#) is UNDEFINED.
 - Access to [PMXVCNTR](#) behaves as a NOP.
 - Access to [PMXVCNTR](#) behaves as if the register is RAZ/WI.
 - Access to [PMXVCNTR](#) behaves as if the PMSELR.SEL field contains an UNKNOWN value.

If this field is set to a value greater than or equal to the number of implemented counters, but not equal to 31:

- Direct reads of this field return an UNKNOWN value.

- The results of access to [PMXEVTYPER](#) or [PMXEVCNTR](#) are CONSTRAINED UNPREDICTABLE, and can be one of the following:
 - Access to [PMXEVTYPER](#) or [PMXEVCNTR](#) is UNDEFINED.
 - Access to [PMXEVTYPER](#) or [PMXEVCNTR](#) behaves as a NOP.
 - Access to [PMXEVTYPER](#) or [PMXEVCNTR](#) behaves as if the register is RAZ/WI.
 - Access to [PMXEVTYPER](#) or [PMXEVCNTR](#) behaves as if the PMSELR.SEL field contains an UNKNOWN value.
 - Access to [PMXEVTYPER](#) behaves as if the PMSELR.SEL field contains 0b11111.

This field resets to an architecturally UNKNOWN value.

Accessing the PMSELR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 5	000	101	1001	1111	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0 && PMUSERENR.ER == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.ER == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.ER == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.17 PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see [SW_INCR](#).

Configurations

AArch32 System register PMSWINC[31:0] is architecturally mapped to AArch64 System register [PMSWINC_ELO](#)[31:0].

AArch32 System register PMSWINC[31:0] is architecturally mapped to External register [PMSWINC_ELO](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSWINC is a 32-bit register.

Field descriptions

The PMSWINC bit assignments are:

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 0 to 30

Event counter software increment bit for [PMEVCNTR<n>](#).

Bits [30:N] are WI.

When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

The effects of writing to this bit are:

0b0 No action. The write to this bit is ignored.

0b1 If [PMEVCNTR<n>](#) is enabled and configured to count the software increment event, increments [PMEVCNTR<n>](#) by 1. If [PMEVCNTR<n>](#) is disabled, or not configured to count the software increment event, the write to this bit is ignored.

Accessing the PMSWINC

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 4	000	100	1001	1111	1100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	WO	WO	n/a	WO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	WO	WO	WO	WO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	WO	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0 && PMUSERENR.SW == 0`, then write accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.SW == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then write accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.SW == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then write accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure write accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure write accesses to this register from EL0 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then write accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.18 PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

Purpose

Enables or disables User mode access to the Performance Monitors.

Configurations

AArch32 System register PMUSERENR[31:0] is architecturally mapped to AArch64 System register [PMUSERENR_ELO](#)[31:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMUSERENR is a 32-bit register.

Field descriptions

The PMUSERENR bit assignments are:

Bits [31:4]

Reserved, RES0.

ER, bit [3]

Event counter read trap control:

0b0 EL0 reads of the [PMXVCNTR](#) and [PMEVCNTR<n>](#), and EL0 RW access to the [PMSELR](#), are trapped to Undefined mode if PMUSERENR.EN is also 0.

0b1 Overrides PMUSERENR.EN and enables RO access to [PMXVCNTR](#) and [PMEVCNTR<n>](#), and RW access to [PMSELR](#).

On a Warm reset, this field resets to 0.

CR, bit [2]

Cycle counter read trap control:

0b0 EL0 reads of the [PMCCNTR](#) are trapped to Undefined mode if PMUSERENR.EN is also 0.

0b1 Overrides PMUSERENR.EN and enables access to [PMCCNTR](#).

On a Warm reset, this field resets to 0.

SW, bit [1]

Software increment write trap control:

0b0 EL0 writes to the [PMSWINC](#) are trapped to Undefined mode if PMUSERENR.EN is also 0.

0b1 Overrides PMUSERENR.EN and enables access to [PMSWINC](#).

On a Warm reset, this field resets to 0.

EN, bit [0]

Traps EL0 accesses to the Performance Monitors registers to Undefined mode:

0b0 While at EL0, PMUSERENR is always RO. Accesses to the other Performance Monitors registers are trapped to Undefined mode, unless enabled by one of PMUSERENR.{ER, CR, SW}.

0b1 While at EL0, software can access all PMU registers except [PMINTENSET](#) and [PMINTENCLR](#).

On a Warm reset, this field resets to 0.

Accessing the PMUSERENR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 0	000	000	1001	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 0 \ \&\& \text{HSTR_EL2.T9} == 1$, then read accesses at EL0 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 0 \ \&\& \text{HSTR_EL2.T9} == 1$, then accesses at EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{MDCR_EL2.TPM} == 1$, then accesses at EL0 or EL1 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 1 \ \&\& \text{HCR_EL2.TGE} == 0 \ \&\& \text{HSTR_EL2.T9} == 1$, then read accesses at EL0 are trapped to EL2.
- If $(SCR_EL3.NS == 1 \parallel SCR_EL3.EEL2 == 1) \ \&\& \text{IsUsingAArch64}(EL2) \ \&\& \text{HCR_EL2.E2H} == 1 \ \&\& \text{HCR_EL2.TGE} == 0 \ \&\& \text{HSTR_EL2.T9} == 1$, then accesses at EL1 are trapped to EL2.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \text{HDCR.TPM} == 1$, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \text{HSTR.T9} == 1$, then Non-secure read accesses to this register from EL0 are trapped to Hyp mode.
- If $SCR_EL3.NS == 1 \ \&\& \text{IsUsingAArch32}(EL2) \ \&\& \text{HSTR.T9} == 1$, then Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- If $\text{IsUsingAArch64}(EL3) \ \&\& \text{MDCR_EL3.TPM} == 1$, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.19 PMXEVNTR, Performance Monitors Selected Event Count Register

The PMXEVNTR characteristics are:

Purpose

Reads or writes the value of the selected event counter, [PMXEVNTR<n>](#). [PMSELR.SEL](#) determines which event counter is selected.

Configurations

AArch32 System register PMXEVNTR[31:0] is architecturally mapped to AArch64 System register [PMXEVNTR_EL0](#)[31:0].

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMXEVNTR is a 32-bit register.

Field descriptions

The PMXEVNTR bit assignments are:

PMXEVNTR<n>, bits [31:0]

Value of the selected event counter, [PMXEVNTR<n>](#), where n is the value stored in [PMSELR.SEL](#). This field resets to an architecturally UNKNOWN value.

Accessing the PMXEVNTR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c13, 2	000	010	1001	1111	1101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

If [PMSELR.SEL](#) is greater than or equal to the number of accessible counters then reads and writes of [PMXVCNTR](#) are CONstrained UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- In Non-secure state, for an access from EL1 or a permitted access from EL0, if [PMSELR.SEL](#), or [PMSELR_EL0.SEL](#) if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from EL0 are permitted when:
 - EL1 is using AArch32 and the value of [PMUSERENR.EN](#) is 1.
 - EL1 is using AArch64 and the value of [PMUSERENR_EL0.EN](#) is 1.

———— **Note** —————

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible counters.
- If EL2 is using AArch64, [MDCR_EL2.HPMN](#) identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0 && PMUSERENR.ER == 0`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR.EN == 0`, then write accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.ER == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then read accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && PMUSERENR_EL0.ER == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then read accesses at EL0 are trapped to EL2.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then write accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then write accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.4.20 PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When [PMSELR.SEL](#) selects an event counter, this accesses a [PMEVTYPER<n>](#) register. When [PMSELR.SEL](#) selects the cycle counter, this accesses [PMCCFILTR](#).

Configurations

AArch32 System register PMXEVTYPER[31:0] is architecturally mapped to AArch64 System register [PMXEVTYPER_ELO](#)[31:0].

When the value of [PMSELR.SEL](#) is 31, to select the cycle counter, RW fields in this register have defined reset values that apply only when the PE resets into an Exception level that is using AArch32. See [PMCCFILTR](#) for the reset values.

Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN. This applies whenever [PMSELR.SEL](#) selects an event counter.

Attributes

PMXEVTYPER is a 32-bit register.

Field descriptions

The PMXEVTYPER bit assignments are:

Bits [31:0]

Event type register or [PMCCFILTR](#).

When [PMSELR.SEL](#) == 31, this register accesses [PMCCFILTR](#).

Otherwise, this register accesses [PMEVTYPER<n>](#) where n is the value in [PMSELR.SEL](#).

Accessing the PMXEVTYPER

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c13, 1	000	001	1001	1111	1101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	RW	RW

If **PMSELR.SEL** is not 31, and is greater than or equal to the number of accessible counters then reads and writes of **PMXEVTYPER** are CONstrained UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if **PMSELR.SEL** has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if **PMSELR.SEL** is 31.
- In Non-secure state, for an access from EL1 or a permitted access from EL0, if **PMSELR.SEL**, or **PMSELR_EL0.SEL** if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from EL0 are permitted when:
 - EL1 is using AArch32 and the value of **PMUSERENR.EN** is 1.
 - EL1 is using AArch64 and the value of **PMUSERENR_EL0.EN** is 1.

Note

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, **HDCR.HPMN** identifies the number of accessible counters.
- If EL2 is using AArch64, **MDCR_EL2.HPMN** identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `PMUSERENR.EN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `PMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0))`, then accesses at EL0 are trapped to EL1.
- If `PMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && MDCR_EL2.TPM == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && HSTR_EL2.T9 == 1`, then accesses at EL0 or EL1 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HDCR.TPM == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T9 == 1`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- If `IsUsingAArch64(EL3) && MDCR_EL3.TPM == 1`, then accesses at EL0 EL1 or EL2 are trapped to EL3.

G8.5 Activity Monitors registers

This section lists the Activity Monitoring registers in AArch32.

G8.5.1 AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch32 System register AMCFGR[31:0] is architecturally mapped to AArch64 System register [AMCFGR_EL0](#)[31:0].

AArch32 System register AMCFGR[31:0] is architecturally mapped to External register [AMCFGR](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

The AMCFGR bit assignments are:

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is defined as $[AMCFGR.NCG + 1]$.

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of $0b0000$. Otherwise, this field has a value of $0b0001$.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

In ARMv8, this feature must be supported, and so this bit is $0b1$.

$0b0$ [AMCR.HDBG](#) is RES0.

$0b1$ [AMCR.HDBG](#) is read/write.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as $[AMCFGR.SIZE + 1]$.

In ARMv8, the counters are 64-bit, and so this field is 0b1111111.

———— **Note** —————

Software also uses this field to determine the spacing of counters in the memory-map. In ARMv8, the counters are at doubleword-aligned addresses.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as $[AMCFGR.N + 1]$.

Accessing the AMCFGR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c2, 1	000	001	1101	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If IsUsingAArch32(EL1) && AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

G8.5.2 AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configurations

AArch32 System register AMCGCR[31:0] is architecturally mapped to AArch64 System register [AMCGCR_ELO](#)[31:0].

AArch32 System register AMCGCR[31:0] is architecturally mapped to External register [AMCGCR](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCGCR is a 32-bit register.

Field descriptions

The AMCGCR bit assignments are:

31	16 15	8 7	0
RES0	CG1NC	CG0NC	

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group. In AMUv1, the permitted range of values is 0 to 16.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group. In AMUv1, the value of this field is 4.

Accessing the AMCGCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c2, 2	000	010	1101	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If IsUsingAArch32(EL1) && AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

G8.5.3 AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configurations

AArch32 System register AMCNTENCLR0[31:0] is architecturally mapped to AArch64 System register [AMCNTENCLR0_ELO](#)[31:0].

AArch32 System register AMCNTENCLR0[31:0] is architecturally mapped to External register [AMCNTENCLR0](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

The AMCNTENCLR0 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR.CG0NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR0<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR0<n>](#) is enabled. When written, disables [AMEVCNTR0<n>](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR0

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c2, 4	000	100	1101	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If IsUsingAArch32(EL1) && AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

G8.5.4 AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configurations

AArch32 System register AMCNTENCLR1[31:0] is architecturally mapped to AArch64 System register [AMCNTENCLR1_ELO](#)[31:0].

AArch32 System register AMCNTENCLR1[31:0] is architecturally mapped to External register [AMCNTENCLR1](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

The AMCNTENCLR1 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR_ELO.CG1NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR1<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR1<n>](#) is enabled. When written, disables [AMEVCNTR1<n>](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR1

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c3, 0	000	000	1101	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— Note ————

The number of auxiliary activity monitor event counters implemented is zero exactly when `AMCFGR.NCG == 0b0000`.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If IsUsingAArch32(EL1) && AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

G8.5.5 AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configurations

AArch32 System register AMCNTENSET0[31:0] is architecturally mapped to AArch64 System register [AMCNTENSET0_EL0](#)[31:0].

AArch32 System register AMCNTENSET0[31:0] is architecturally mapped to External register [AMCNTENSET0](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

The AMCNTENSET0 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter enable bit for [AMEVCNTR0<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR.CG0NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR0<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR0<n>](#) is enabled. When written, enables [AMEVCNTR0<n>](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENSET0

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c2, 5	000	101	1101	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If IsUsingAArch32(EL1) && AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

G8.5.6 AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configurations

AArch32 System register AMCNTENSET1[31:0] is architecturally mapped to AArch64 System register [AMCNTENSET1_EL0](#)[31:0].

AArch32 System register AMCNTENSET1[31:0] is architecturally mapped to External register [AMCNTENSET1](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions

The AMCNTENSET1 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter enable bit for [AMEVCNTR1<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR1<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR1<n>](#) is enabled. When written, enables [AMEVCNTR1<n>](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENSET1

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c3, 1	000	001	1101	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— Note ————

The number of auxiliary activity monitor counters implemented is zero when `AMCFGR.NCG == 0b0000`.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If IsUsingAArch32(EL1) && AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

G8.5.7 AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch32 System register AMCR[31:0] is architecturally mapped to AArch64 System register [AMCR_EL0](#)[31:0].

AArch32 System register AMCR[31:0] is architecturally mapped to External register [AMCR](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMCR is a 32-bit register.

Field descriptions

The AMCR bit assignments are:

Bits [31:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

0b0 Activity monitors do not halt counting when the PE is halted in Debug state.

0b1 Activity monitors halt counting when the PE is halted in Debug state.

Bits [9:0]

Reserved, RAZ/WI.

Accessing the AMCR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c2, 0	000	000	1101	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If IsUsingAArch32(EL1) && AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

G8.5.8 AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configurations

AArch32 System register AMEVCNTR0<n>[63:0] is architecturally mapped to AArch64 System register [AMEVCNTR0<n>_EL0](#)[63:0].

AArch32 System register AMEVCNTR0<n>[63:0] is architecturally mapped to External register [AMEVCNTR0<n>](#)[63:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMEVCNTR0<n> is a 64-bit register.

Field descriptions

The AMEVCNTR0<n> bit assignments are:

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

Accessing the AMEVCNTR0<n>

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, <opc1>, <Rt>, <Rt2>, <CRm>	n<2:0>	1111	000:n<3>

- <opc1> is in the range 0 - 7.
- <CRm> is in the range c0 - c1.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— Note ————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && n <= 7 && HSTR_EL2.T0 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && n <= 7 && HSTR.T0 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If AMUSERENR_EL0.EN == 0, then accesses at EL0 are trapped to EL1.

G8.5.9 AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configurations

AArch32 System register AMEVCNTR1<n>[63:0] is architecturally mapped to AArch64 System register [AMEVCNTR1<n>_EL0](#)[63:0].

AArch32 System register AMEVCNTR1<n>[63:0] is architecturally mapped to External register [AMEVCNTR1<n>](#)[63:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are UNDEFINED.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions

The AMEVCNTR1<n> bit assignments are:

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

Accessing the AMEVCNTR1<n>

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, <opc1>, <Rt>, <Rt2>, <CRm>	n<2:0>	1111	010:n<3>

- <opc1> is in the range 0 - 7.
- <CRm> is in the range c4 - c5.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— Note ————

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && n > 7 && HSTR_EL2.T5 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && n > 7 && HSTR.T5 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If AMUSERENR_EL0.EN == 0, then accesses at EL0 are trapped to EL1.

G8.5.10 AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 15

The AMEVTYPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>](#) counts.

Configurations

AArch32 System register AMEVTYPER0<n>[31:0] is architecturally mapped to AArch64 System register [AMEVTYPER0<n>_EL0](#)[31:0].

AArch32 System register AMEVTYPER0<n>[31:0] is architecturally mapped to External register [AMEVTYPER0<n>](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMEVTYPER0<n> is a 32-bit register.

Field descriptions

The AMEVTYPER0<n> bit assignments are:

31	25 24	16 15	0
RAZ	RES0	evtCount	

Bits [31:25]

Reserved, RAZ.

Bits [24:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

0x0011 **When n == 0** Processor frequency cycles

0x4004 **When n == 1** Constant frequency cycles

0x0008 **When n == 2** Instructions retired

0x4005 **When n == 3** Memory stall cycles

Accessing the AMEVTYPER0<n>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, <CRm>, <opc2>	000	n<2:0>	1101	1111	011:n<3>

- <opc2> is in the range 0 - 7.
- <CRm> is in the range c6 - c7.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPEPER0<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— **Note** —————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If IsUsingAArch32(EL1) && AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

G8.5.11 AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>](#) counts.

Configurations

AArch32 System register AMEVTYPER1<n>[31:0] is architecturally mapped to AArch64 System register [AMEVTYPER1<n>_EL0](#)[31:0].

AArch32 System register AMEVTYPER1<n>[31:0] is architecturally mapped to External register [AMEVTYPER1<n>](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions

The AMEVTYPER1<n> bit assignments are:

Bits [31:25]

Reserved, RAZ.

Bits [24:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by [AMEVCNTR1<n>](#) might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter [AMEVCNTR1<n>](#) is enabled, writes to this register have UNPREDICTABLE results.

Accessing the AMEVTYPER1<n>

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, <CRm>, <opc2>	000	n<2:0>	1101	1111	111:n<3>

- <opc2> is in the range 0 - 7.
- <CRm> is in the range c14 - c15.

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

———— **Note** —————

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch64(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If IsUsingAArch32(EL1) && AMUSERENR.EN == 0, then accesses to this register from EL0 are trapped to Undefined mode.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && (HCR_EL2.TGE == 0 || (SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0)), then accesses at EL0 are trapped to EL1.
- If IsUsingAArch64(EL1) && AMUSERENR_EL0.EN == 0 && HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1), then accesses at EL0 are trapped to EL2.

G8.5.12 AMUSERENR, Activity Monitors User Enable Register

The AMUSERENR characteristics are:

Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch32 System register AMUSERENR[31:0] is architecturally mapped to AArch64 System register [AMUSERENR_EL0](#)[31:0].

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

AMUSERENR is a 32-bit register.

Field descriptions

The AMUSERENR bit assignments are:

Bits [31:4]

Reserved, RES0.

Bits [3:1]

Reserved, RAZ/WI.

EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1.

0b0 EL0 accesses to the activity monitors registers are trapped to EL1.

0b1 This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

Note

- AMUSERENR can always be read at EL0 and is not governed by this bit.

Accessing the AMUSERENR

This register can be written using MCR with the following syntax:

```
MCR <syntax>
```

This register can be read using MRC with the following syntax:

```
MRC <syntax>
```

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c2, 3	000	011	1101	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL3) && IsUsingAArch32(EL3) && CPTR_EL3.TAM == 1, then accesses at EL0 EL1 or EL2 are trapped to EL3.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && (HCR_EL2.E2H == 0 || (HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0)) && HSTR_EL2.T13 == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && CPTR_EL2.TAM == 1, then accesses at EL0 or EL1 are trapped to EL2.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HCPTR.TAM == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.
- If HaveEL(EL2) && IsUsingAArch32(EL2) && HSTR.T13 == 1, then accesses to this register from Non-secure EL0 and EL1 are trapped to Hyp mode.

G8.6 RAS registers

This section lists the [RAS Extension](#) registers in AArch32.

G8.6.1 DISR, Deferred Interrupt Status Register

The DISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configurations

AArch32 System register DISR[31:0] is architecturally mapped to AArch64 System register [DISR_EL1](#)[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when RAS is implemented. Otherwise, direct accesses to DISR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DISR is a 32-bit register.

Field descriptions

The DISR bit assignments are:

When the ESB instruction is executed at EL2:

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bits [30:12]

Reserved, RES0.

AET, bits [11:10]

Asynchronous Error Type. See the description of [HSR.AET](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External Abort Type. See the description of [HSR.EA](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

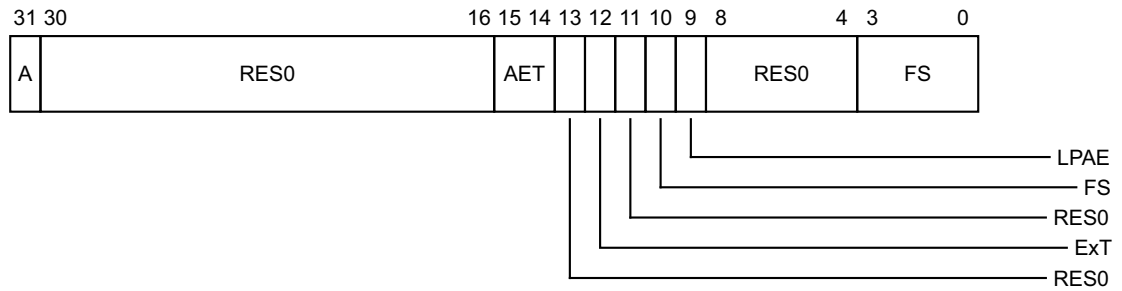

Reserved, RES0.

DFSC, bits [5:0]

Fault Status Code. See the description of [HSR.DFSC](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

When the ESB instruction is executed at EL0 or EL1 and where *TTBCR.EAE == 0*:

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of [DFSR.AET](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External Abort Type. See the description of [DFSR.ExT](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bit [10]

Fault Status Code. See the description of [DFSR.FS](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format. The possible values of this bit are:

0b0 Using the Short-descriptor translation table format.

0b1 Using the Long-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

Bits [8:4]

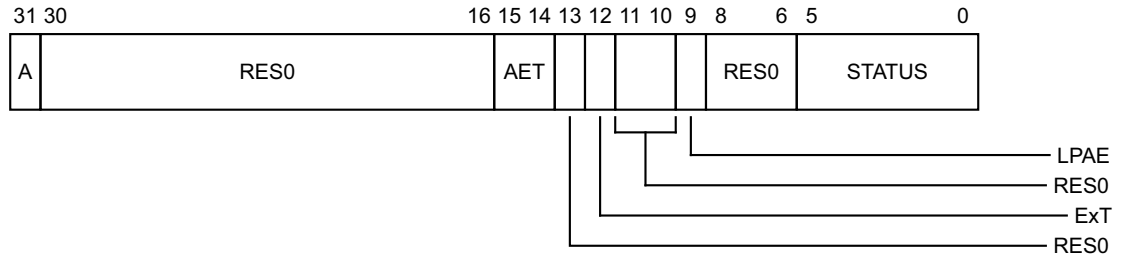

Reserved, RES0.

FS, bits [3:0]

Fault Status Code. See the description of [DFSR.FS](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 1:

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous Error interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of [DFSR.AET](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External Abort Type. See the description of [DFSR.ExT](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format. The possible values of this bit are:

0b0 Using the Short-descriptor translation table format.

0b1 Using the Long-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault Status Code. See the description of [DFSR.DFSC](#) for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

Accessing the DISR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c1, 1	000	001	1100	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HCR.AMO == 1	-	VDISR	RW	RW
(SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR.AMO == 1	-	VDISR_EL2	-	-
(SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0) HCR_EL2.AMO == 0	-	RW	RW	RW

An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

DISR is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, and any of the following apply:

- EL3 is using AArch64, [SCR_EL3.EA == 1](#), and any of the following apply:
 - The PE is executing at EL2.
 - The PE is executing at EL1 and (([SCR_EL3.NS == 0](#) && [SCR_EL3.EEL2 == 0](#)) || [HCR_EL2.AMO == 0](#)).
- EL3 is using AArch32, [SCR.EA == 1](#), and any of the following apply:
 - The PE is executing at EL2.
 - The PE is executing at EL1 and ([SCR.NS == 0](#) || [HCR.AMO == 0](#)).

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL2) && ([SCR_EL3.NS == 1](#) || [SCR_EL3.EEL2 == 1](#)) && IsUsingAArch64(EL2) && [HSTR_EL2.T12 == 1](#), then accesses at EL1 are trapped to EL2.
- If HaveEL(EL2) && ([SCR_EL3.NS == 1](#) || [SCR_EL3.EEL2 == 1](#)) && IsUsingAArch32(EL2) && [HSTR.T12 == 1](#), then accesses at EL1 are trapped to EL2.

G8.6.2 ERRIDR, Error Record ID Register

The ERRIDR characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configurations

AArch32 System register ERRIDR[31:0] is architecturally mapped to AArch64 System register [ERRIDR_EL1](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRIDR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERRIDR is a 32-bit register.

Field descriptions

The ERRIDR bit assignments are:

Bits [31:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

Accessing the ERRIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c3, 0	000	000	0101	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1, then read accesses at EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1, then read accesses at EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1, then read accesses at EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1, then read accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1, then read accesses at EL1 or EL2 are trapped to EL3.
- If HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.3 ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configurations

AArch32 System register ERRSELR[31:0] is architecturally mapped to AArch64 System register [ERRSELR_EL1](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRSELR are UNDEFINED.

If [ERRIDR](#) indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR is UNDEFINED or RES0.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERRSELR is a 32-bit register.

Field descriptions

The ERRSELR bit assignments are:

Bits [31:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

If ERRSELR.SEL is set to a value greater than or equal to [ERRIDR.NUM](#), then all of the following apply:

- The value read back from ERRSELR.SEL is UNKNOWN.
- One of the following occurs:
 - An UNKNOWN error record is selected.
 - The ERX* registers are RAZ/WI.
 - ERX* register reads and writes are NOPs.
 - ERX* register reads and writes are UNDEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the ERRSELR

This register can be written using MCR with the following syntax:

```
MCR <syntax>
```

This register can be read using MRC with the following syntax:

```
MRC <syntax>
```

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c3, 1	000	001	0101	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1, then accesses at EL1 or EL2 are trapped to EL3.
- If HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.4 ERXADDR, Selected Error Record Address Register

The ERXADDR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>ADDR for the error record selected by [ERRSELR.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXADDR[31:0] is architecturally mapped to AArch64 System register [ERXADDR_EL1](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXADDR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXADDR is a 32-bit register.

Field descriptions

The ERXADDR bit assignments are:

Bits [31:0]

ERXADDR accesses bits [31:0] of ERR<n>ADDR, where n is the value in [ERRSELR.SEL](#).

Accessing the ERXADDR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c4, 3	000	011	0101	1111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXADDR` is RAZ/WI.
- Direct reads and writes of `ERXADDR` are NOPs.
- Direct reads and writes of `ERXADDR` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.5 ERXADDR2, Selected Error Record Address Register 2

The ERXADDR2 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>ADDR for the error record selected by [ERRSELR.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXADDR2[31:0] is architecturally mapped to AArch64 System register [ERXADDR_EL1](#)[63:32].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXADDR2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXADDR2 is a 32-bit register.

Field descriptions

The ERXADDR2 bit assignments are:

Bits [31:0]

ERXADDR2 accesses bits [63:32] of ERR<n>ADDR, where n is the value in [ERRSELR.SEL](#).

Accessing the ERXADDR2

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c4, 7	000	111	0101	1111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXADDR2` is RAZ/WI.
- Direct reads and writes of `ERXADDR2` are NOPs.
- Direct reads and writes of `ERXADDR2` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.6 ERXCTLR, Selected Error Record Control Register

The ERXCTLR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>CTLR for the error record selected by [ERRSEL.RSEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXCTLR[31:0] is architecturally mapped to AArch64 System register [ERXCTLR_EL1](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXCTLR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXCTLR is a 32-bit register.

Field descriptions

The ERXCTLR bit assignments are:

Bits [31:0]

ERXCTLR accesses bits [31:0] of ERR<n>CTLR, where n is the value in [ERRSEL.RSEL](#).

Accessing the ERXCTLR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c4, 1	000	001	0101	1111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXCTLR` is RAZ/WI.
- Direct reads and writes of `ERXCTLR` are NOPs.
- Direct reads and writes of `ERXCTLR` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.7 ERXCTLR2, Selected Error Record Control Register 2

The ERXCTLR2 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>CTLR for the error record selected by [ERRSELR.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXCTLR2[31:0] is architecturally mapped to AArch64 System register [ERXCTLR_EL1](#)[63:32].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXCTLR2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXCTLR2 is a 32-bit register.

Field descriptions

The ERXCTLR2 bit assignments are:

Bits [31:0]

ERXCTLR2 accesses bits [63:32] of ERR<n>CTLR, where n is the value in [ERRSELR.SEL](#).

Accessing the ERXCTLR2

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c4, 5	000	101	0101	1111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXCTLR2` is RAZ/WI.
- Direct reads and writes of `ERXCTLR2` are NOPs.
- Direct reads and writes of `ERXCTLR2` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.8 ERXFR, Selected Error Record Feature Register

The ERXFR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>FR for the error record selected by [ERRSEL.R.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXFR[31:0] is architecturally mapped to AArch64 System register [ERXFR_EL1](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXFR are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXFR is a 32-bit register.

Field descriptions

The ERXFR bit assignments are:

Bits [31:0]

ERXFR accesses bits [31:0] of ERR<n>FR, where n is the value in [ERRSEL.R.SEL](#).

Accessing the ERXFR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c4, 0	000	000	0101	1111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXFR` is RAZ/WI.
- Direct reads of `ERXFR` are NOPs.
- Direct reads of `ERXFR` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then read accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then read accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then read accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then read accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then read accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.9 ERXFR2, Selected Error Record Feature Register 2

The ERXFR2 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>FR for the error record selected by [ERRSELR.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXFR2[31:0] is architecturally mapped to AArch64 System register [ERXFR_EL1](#)[63:32].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXFR2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXFR2 is a 32-bit register.

Field descriptions

The ERXFR2 bit assignments are:

Bits [31:0]

ERXFR2 accesses bits [63:32] of ERR<n>FR, where n is the value in [ERRSELR.SEL](#).

Accessing the ERXFR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c4, 4	000	100	0101	1111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RO	RO

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXFR2` is RAZ/WI.
- Direct reads of `ERXFR2` are NOPs.
- Direct reads of `ERXFR2` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then read accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then read accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then read accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then read accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then read accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.10 ERXMISC0, Selected Error Record Miscellaneous Register 0

The ERXMISC0 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC0 for the error record selected by [ERRSELR.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC0[31:0] is architecturally mapped to AArch64 System register [ERXMISC0_EL1](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXMISC0 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC0 is a 32-bit register.

Field descriptions

The ERXMISC0 bit assignments are:

Bits [31:0]

ERXMISC0 accesses bits [31:0] of ERR<n>MISC0, where n is the value in [ERRSELR.SEL](#).

Accessing the ERXMISC0

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c5, 0	000	000	0101	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXMISC0` is RAZ/WI.
- Direct reads and writes of `ERXMISC0` are NOPs.
- Direct reads and writes of `ERXMISC0` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.11 ERXMISC1, Selected Error Record Miscellaneous Register 1

The ERXMISC1 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC0 for the error record selected by [ERRSEL.R.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC1[31:0] is architecturally mapped to AArch64 System register [ERXMISC0_EL1](#)[63:32].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXMISC1 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC1 is a 32-bit register.

Field descriptions

The ERXMISC1 bit assignments are:

Bits [31:0]

ERXMISC1 accesses bits [63:32] of ERR<n>MISC0, where n is the value in [ERRSEL.R.SEL](#).

Accessing the ERXMISC1

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c5, 1	000	001	0101	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXMISC1` is RAZ/WI.
- Direct reads and writes of `ERXMISC1` are NOPs.
- Direct reads and writes of `ERXMISC1` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.12 ERXMISC2, Selected Error Record Miscellaneous Register 2

The ERXMISC2 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC1 for the error record selected by [ERRSELR.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC2[31:0] is architecturally mapped to AArch64 System register [ERXMISC1_EL1](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXMISC2 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC2 is a 32-bit register.

Field descriptions

The ERXMISC2 bit assignments are:

Bits [31:0]

ERXMISC2 accesses bits [31:0] of ERR<n>MISC1, where n is the value in [ERRSELR.SEL](#).

Accessing the ERXMISC2

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c5, 4	000	100	0101	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXMISC2` is RAZ/WI.
- Direct reads and writes of `ERXMISC2` are NOPs.
- Direct reads and writes of `ERXMISC2` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.13 ERXMISC3, Selected Error Record Miscellaneous Register 3

The ERXMISC3 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC1 for the error record selected by [ERRSEL.R.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC3[31:0] is architecturally mapped to AArch64 System register [ERXMISC1_EL1](#)[63:32].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXMISC3 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC3 is a 32-bit register.

Field descriptions

The ERXMISC3 bit assignments are:

Bits [31:0]

ERXMISC3 accesses bits [63:32] of ERR<n>MISC1, where n is the value in [ERRSEL.R.SEL](#).

Accessing the ERXMISC3

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c5, 5	000	101	0101	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXMISC3` is RAZ/WI.
- Direct reads and writes of `ERXMISC3` are NOPs.
- Direct reads and writes of `ERXMISC3` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.14 ERXMISC4, Selected Error Record Miscellaneous Register 4

The ERXMISC4 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC2 for the error record selected by [ERRSELR.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC4[31:0] is architecturally mapped to AArch64 System register [ERXMISC2_EL1](#)[31:0].

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXMISC4 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC4 is a 32-bit register.

Field descriptions

The ERXMISC4 bit assignments are:

Bits [31:0]

ERXMISC4 accesses bits [31:0] of ERR<n>MISC2, where n is the value in [ERRSELR.SEL](#).

Accessing the ERXMISC4

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c5, 2	000	010	0101	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXMISC4` is RAZ/WI.
- Direct reads and writes of `ERXMISC4` are NOPs.
- Direct reads and writes of `ERXMISC4` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.15 ERXMISC5, Selected Error Record Miscellaneous Register 5

The ERXMISC5 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC2 for the error record selected by [ERRSEL.R.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC5[31:0] is architecturally mapped to AArch64 System register [ERXMISC2_EL1](#)[63:32].

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXMISC5 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC5 is a 32-bit register.

Field descriptions

The ERXMISC5 bit assignments are:

Bits [31:0]

ERXMISC5 accesses bits [63:32] of ERR<n>MISC2, where n is the value in [ERRSEL.R.SEL](#).

Accessing the ERXMISC5

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c5, 3	000	011	0101	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXMISC5` is RAZ/WI.
- Direct reads and writes of `ERXMISC5` are NOPs.
- Direct reads and writes of `ERXMISC5` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.16 ERXMISC6, Selected Error Record Miscellaneous Register 6

The ERXMISC6 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC3 for the error record selected by [ERRSELR.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC6[31:0] is architecturally mapped to AArch64 System register [ERXMISC3_EL1](#)[31:0].

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXMISC6 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC6 is a 32-bit register.

Field descriptions

The ERXMISC6 bit assignments are:

Bits [31:0]

ERXMISC6 accesses bits [31:0] of ERR<n>MISC3, where n is the value in [ERRSELR.SEL](#).

Accessing the ERXMISC6

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c5, 6	000	110	0101	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXMISC6` is RAZ/WI.
- Direct reads and writes of `ERXMISC6` are NOPs.
- Direct reads and writes of `ERXMISC6` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.17 ERXMISC7, Selected Error Record Miscellaneous Register 7

The ERXMISC7 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC3 for the error record selected by [ERRSEL.R.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC7[31:0] is architecturally mapped to AArch64 System register [ERXMISC3_EL1](#)[63:32].

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXMISC7 are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXMISC7 is a 32-bit register.

Field descriptions

The ERXMISC7 bit assignments are:

Bits [31:0]

ERXMISC7 accesses bits [63:32] of ERR<n>MISC3, where n is the value in [ERRSEL.R.SEL](#).

Accessing the ERXMISC7

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c5, 7	000	111	0101	1111	0101

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXMISC7` is RAZ/WI.
- Direct reads and writes of `ERXMISC7` are NOPs.
- Direct reads and writes of `ERXMISC7` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.18 ERXSTATUS, Selected Error Record Primary Status Register

The ERXSTATUS characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>STATUS for the error record selected by [ERRSELR.SEL](#).

For details of this, see the *ARM® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

Configurations

AArch32 System register ERXSTATUS[31:0] is architecturally mapped to AArch64 System register [ERXSTATUS_EL1](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXSTATUS are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

ERXSTATUS is a 32-bit register.

Field descriptions

The ERXSTATUS bit assignments are:

Bits [31:0]

ERXSTATUS accesses bits [31:0] of ERR<n>STATUS, where n is the value in [ERRSELR.SEL](#).

Accessing the ERXSTATUS

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c4, 2	000	010	0101	1111	0100

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

If `ERRIDR.NUM == 0` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN record is selected.
- `ERXSTATUS` is RAZ/WI.
- Direct reads and writes of `ERXSTATUS` are NOPs.
- Direct reads and writes of `ERXSTATUS` are UNDEFINED.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HCR2.TERR == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch32(EL2) && HSTR.T5 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL3) && IsUsingAArch64(EL3) && SCR_EL3.TERR == 1`, then accesses at EL1 or EL2 are trapped to EL3.
- If `HaveEL(EL3) && IsUsingAArch32(EL3) && SCR.TERR == 1`, then accesses to this register in modes other than Monitor mode generate a Monitor Trap exception.

G8.6.19 VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When a virtual SError interrupt is taken, the syndrome value is reported in [DFSR](#).{AET, ExT} and the remainder of the [DFSR](#) is set as defined by VMSAv8-32. For more information, see [Chapter G5 The AArch32 Virtual Memory System Architecture](#).

If the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to [VDISR](#).

Configurations

AArch32 System register VDFSR[31:0] is architecturally mapped to AArch64 System register [VSESr_EL2](#)[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when [SCR.NS](#) == 1.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VDFSR is a 32-bit register.

Field descriptions

The VDFSR bit assignments are:

Bits [31:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[15:4] is set to VDFSR.AET.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[15:4] is set to VDFSR.AET.

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[12] is set to VDFSR.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[12] is set to VDFSR.ExT.

This field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing the VDFSR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c5, c2, 3	100	011	0101	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If HaveEL(EL2) && SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HSTR_EL2.T5 == 1, then accesses at EL1 are trapped to EL2.
- If HaveEL(EL2) && SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T5 == 1, then accesses at EL1 are trapped to EL2.

G8.6.20 VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configurations

AArch32 System register VDISR[31:0] is architecturally mapped to AArch64 System register [VDISR_EL2](#)[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VDISR is a 32-bit register.

Field descriptions

The VDISR bit assignments are:

When TTBCR.EAE == 0:

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VDFSR.AET](#).

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VDFSR.ExT](#).

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bit [10]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt. The possible values of this field are:

0b10110 Asynchronous SError interrupt.

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to [TTBCR.EAE](#) when an ESB instruction defers a virtual SError interrupt.

0b0 Using the Short-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

FS, bits [3:0]

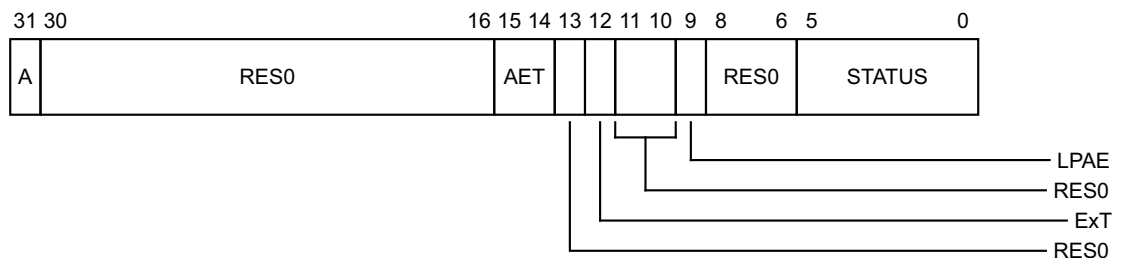

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt. The possible values of this field are:

0b10110 Asynchronous SError interrupt.

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

When [TTBCR.EAE](#) == 1:

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VDFSR.AET](#).

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VDFSR.ExT](#).

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to **TTBCR.EAE** when an ESB instruction defers a virtual SError interrupt.

0b1 Using the Long-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt. The possible values of this field are:

0b010001 Asynchronous SError interrupt.

All other values are reserved. Reserved values might be defined in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

Accessing the VDISR

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c12, c1, 1	100	001	1100	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of **DISR** occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when `SCR.NS == 1`.

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HaveEL(EL2) && SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HSTR_EL2.T12 == 1`, then accesses at EL1 are trapped to EL2.
- If `HaveEL(EL2) && SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && HSTR.T12 == 1`, then accesses at EL1 are trapped to EL2.

G8.7 Generic Timer registers

This section lists the Generic Timer registers in AArch32.

G8.7.1 CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configurations

AArch32 System register CNTFRQ[31:0] is architecturally mapped to AArch64 System register [CNTFRQ_EL0](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

The CNTFRQ bit assignments are:

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTFRQ

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c0, 0	000	000	1110	1111	0000

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
HighestEL(EL1)	RO	RW	n/a	n/a
HCR_EL2.TGE == 0 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RW	n/a
HCR_EL2.TGE == 1 && HighestEL(EL2) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RW	n/a
HighestEL(EL3) && SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RW
HCR_EL2.TGE == 0 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RW
HCR_EL2.TGE == 1 && HighestEL(EL3) && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RW

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0 && CNTKCTL_EL1.EL0PCTEN == 0 && CNTKCTL_EL1.EL0VCTEN == 0`, then read accesses at EL0 are trapped to EL1.
- If `HCR_EL2.E2H == 0 && CNTKCTL.PL0PCTEN == 0 && CNTKCTL.PL0VCTEN == 0`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0PCTEN == 0 && CNTKCTL_EL1.EL0VCTEN == 0`, then read accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL.PL0PCTEN == 0 && CNTKCTL.PL0VCTEN == 0`, then Non-secure read accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PCTEN == 0 && CNTHCTL_EL2.EL0VCTEN == 0`, then read accesses at EL0 are trapped to EL2.

G8.7.2 CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

Configurations

AArch32 System register CNTHCTL[31:0] is architecturally mapped to AArch64 System register [CNTHCTL_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHCTL is a 32-bit register.

Field descriptions

The CNTHCTL bit assignments are:

Bits [31:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register [CNTPCT](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0b0 A 0 to 1 transition of the trigger bit triggers an event.

0b1 A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT](#):

0b0 Disables the event stream.

0b1 Enables the event stream.

This field resets to an architecturally UNKNOWN value.

PL1PCEN, bit [1]

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

0b0 Non-secure EL0 and EL1 accesses to the **CNTP_CTL**, **CNTP_CVAL**, and **CNTP_TVAL** are trapped to Hyp mode, unless the it is trapped by **CNTKCTL.PL0PTEN**.

0b1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally UNKNOWN value.

PL1PCTEN, bit [0]

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

0b0 Non-secure EL0 and EL1 accesses to the **CNTPCT** are trapped to Hyp mode, unless it is trapped by **CNTKCTL.PL0PCTEN**.

0b1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHCTL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c14, c1, 0	100	000	1110	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

G8.7.3 CNTHP_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP_CTL characteristics are:

Purpose

Control register for the Hyp mode physical timer.

Configurations

AArch32 System register CNTHP_CTL[31:0] is architecturally mapped to AArch64 System register [CNTHP_CTL_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHP_CTL is a 32-bit register.

Field descriptions

The CNTHP_CTL bit assignments are:

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers](#) on page D10-2653 and [Operation of the TimerValue views of the timers](#) on page D10-2653.

This bit is read-only.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing the CNTHP_CTL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c14, c2, 1	100	001	1110	1111	0010
p15, 0, <Rt>, c14, c2, 1	000	001	1110	1111	0010

Accessibility

The register is accessible as follows:

<syntax>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
p15, 4, <Rt>, c14, c2, 1	SCR_EL3.NS == 0	-	-	n/a	-
p15, 4, <Rt>, c14, c2, 1	HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
p15, 4, <Rt>, c14, c2, 1	HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW
p15, 0, <Rt>, c14, c2, 1	SCR_EL3.NS == 0	CNTP_CTL	CNTP_CTL	n/a	CNTP_CTL
p15, 0, <Rt>, c14, c2, 1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && SCR_EL3.NS == 1	CNTP_CTL	CNTP_CTL	CNTP_CTL	CNTP_CTL

<syntax>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
p15, 0, <Rt>, c14, c2, 1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && SCR_EL3.NS == 1	CNTP_CTL	n/a	CNTP_CTL	CNTP_CTL
p15, 0, <Rt>, c14, c2, 1	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && SCR_EL3.NS == 1	CNTP_CTL	CNTP_CTL	n/a	n/a
p15, 0, <Rt>, c14, c2, 1	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && SCR_EL3.NS == 1	RW	n/a	n/a	n/a

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PTEN == 0`, then accesses at EL0 are trapped to EL2.

G8.7.4 CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

Purpose

Holds the compare value for the Hyp mode physical timer.

Configurations

AArch32 System register CNTHP_CVAL[63:0] is architecturally mapped to AArch64 System register CNTHP_CVAL_EL2[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHP_CVAL is a 64-bit register.

Field descriptions

The CNTHP_CVAL bit assignments are:

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHP_CVAL

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 6, <Rt>, <Rt2>, c14	0110	1111	1110
p15, 2, <Rt>, <Rt2>, c14	0010	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW
SCR_EL3.NS == 0	CNTP_CVAL	CNTP_CVAL	n/a	CNTP_CVAL
HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && SCR_EL3.NS == 1	CNTP_CVAL	CNTP_CVAL	CNTP_CVAL	CNTP_CVAL
HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && SCR_EL3.NS == 1	CNTP_CVAL	n/a	CNTP_CVAL	CNTP_CVAL
HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && SCR_EL3.NS == 1	CNTP_CVAL	CNTP_CVAL	n/a	n/a
HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && SCR_EL3.NS == 1	RW	n/a	n/a	n/a

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.ELOPTEN == 0`, then accesses at EL0 are trapped to EL2.

G8.7.5 CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP_TVAL characteristics are:

Purpose

Holds the timer value for the Hyp mode physical timer.

Configurations

AArch32 System register CNTHP_TVAL[31:0] is architecturally mapped to AArch64 System register CNTHP_TVAL_EL2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHP_TVAL is a 32-bit register.

Field descriptions

The CNTHP_TVAL bit assignments are:

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL.ENABLE is 1, the value returned is (CNTHP_CVAL - CNTPCT).

On a write of this register, CNTHP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTHP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHP_TVAL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c14, c2, 0	100	000	1110	1111	0010
p15, 0, <Rt>, c14, c2, 0	000	000	1110	1111	0010

Accessibility

The register is accessible as follows:

<syntax>	Configuration	Accessibility			
		EL0	EL1	EL2	EL3
p15, 4, <Rt>, c14, c2, 0	SCR_EL3.NS == 0	-	-	n/a	-
p15, 4, <Rt>, c14, c2, 0	HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
p15, 4, <Rt>, c14, c2, 0	HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW
p15, 0, <Rt>, c14, c2, 0	SCR_EL3.NS == 0	CNTP_TVAL	CNTP_TVAL	n/a	CNTP_TVAL
p15, 0, <Rt>, c14, c2, 0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && SCR_EL3.NS == 1	CNTP_TVAL	CNTP_TVAL	CNTP_TVAL	CNTP_TVAL
p15, 0, <Rt>, c14, c2, 0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && SCR_EL3.NS == 1	CNTP_TVAL	n/a	CNTP_TVAL	CNTP_TVAL
p15, 0, <Rt>, c14, c2, 0	HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && SCR_EL3.NS == 1	CNTP_TVAL	CNTP_TVAL	n/a	n/a
p15, 0, <Rt>, c14, c2, 0	HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && SCR_EL3.NS == 1	RW	n/a	n/a	n/a

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `SCR_EL3.NS == 1 && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PTEN == 0`, then accesses at EL0 are trapped to EL2.

G8.7.6 CNTHPS_CTL, Counter-timer Secure Physical Timer Control Register (EL2)

The CNTHPS_CTL characteristics are:

Purpose

Provides AArch32 access to the Secure EL2 physical timer.

Configurations

AArch32 System register CNTHPS_CTL[31:0] is architecturally mapped to AArch64 System register CNTHPS_CTL_EL2[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL are UNDEFINED.

This register is introduced in ARMv8.4.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHPS_CTL is a 32-bit register.

Field descriptions

The CNTHPS_CTL bit assignments are:

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

0b0 Timer condition is not met.

0b1 Timer condition is met.

When the value of the CNTHPS_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers](#) on page D10-2653 and [Operation of the TimerValue views of the timers](#) on page D10-2653.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

0b0 Timer interrupt is not masked by the IMASK bit.

0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

0b0 Timer disabled.

0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHPS_TVAL_EL2](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

—————
This field resets to an architecturally UNKNOWN value.

Accessing the CNTHPS_CTL

For information about accessing this register, refer to [CNTHP_CTL](#).

G8.7.7 CNTHPS_CVAL, Counter-timer Secure Physical Timer CompareValue Register (EL2)

The CNTHPS_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the Secure EL2 physical timer.

Configurations

AArch32 System register CNTHPS_CVAL[63:0] is architecturally mapped to AArch64 System register [CNTHPS_CVAL_EL2](#)[63:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL are UNDEFINED.

This register is introduced in ARMv8.4.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHPS_CVAL is a 64-bit register.

Field descriptions

The CNTHPS_CVAL bit assignments are:

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHPS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHPS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHPS_CVAL

For information about accessing this register, refer to [CNTHPS_CVAL](#).

G8.7.8 CNTHPS_TVAL, Counter-timer Secure Physical Timer TimerValue Register (EL2)

The CNTHPS_TVAL characteristics are:

Purpose

Provides AArch32 access to the timer value for the Secure EL2 physical timer.

Configurations

AArch32 System register CNTHPS_TVAL[31:0] is architecturally mapped to AArch64 System register [CNTHPS_TVAL_EL2](#)[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL are UNDEFINED.

This register is introduced in ARMv8.4.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHPS_TVAL is a 32-bit register.

Field descriptions

The CNTHPS_TVAL bit assignments are:

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHPS_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHPS_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHPS_CVAL_EL2](#) - [CNTPCT_EL0](#)).

On a write of this register, [CNTHPS_CVAL_EL2](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHPS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - [CNTHPS_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHPS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHPS_TVAL

For information about accessing this register, refer to [CNTHPS_TVAL](#).

G8.7.9 CNTHV_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL characteristics are:

Purpose

Provides AArch32 access to the control register for the EL2 virtual timer.

———— **Note** ————

The EL2 virtual timer is implemented by [ARMv8.1-VHE](#). It is only accessible from AArch32 state when EL0 is using AArch32, EL2 is using AArch64, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}.

Configurations

AArch32 System register CNTHV_CTL[31:0] is architecturally mapped to AArch64 System register [CNTHV_CTL_EL2](#)[31:0].

This register is present only from ARMv8.1. Otherwise, direct accesses to CNTHV_CTL are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

CNTHV_CTL is a 32-bit register.

Field descriptions

The CNTHV_CTL bit assignments are:

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

0b0 Timer condition is not met.

0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers](#) on page D10-2653 and [Operation of the TimerValue views of the timers](#) on page D10-2653.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

0b0 Timer interrupt is not masked by the IMASK bit.

0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

ENABLE, bit [0]

Enables the timer. Permitted values are:

0b0 Timer disabled.

0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

Accessing the CNTHV_CTL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c3, 1	000	001	1110	1111	0011

This register is accessed using the encoding for [CNTV_CTL](#).

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	CNTV_CTL	CNTV_CTL	n/a	CNTV_CTL
HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CTL	CNTV_CTL	CNTV_CTL	CNTV_CTL
HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CTL	n/a	CNTV_CTL	CNTV_CTL
HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CTL	CNTV_CTL	n/a	n/a
HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	n/a	n/a

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1) \ \&\& \ \text{IsUsingAArch64(EL2)} \ \&\& \ \text{HCR_EL2.E2H} == 1 \ \&\& \ \text{HCR_EL2.TGE} == 1 \ \&\& \ \text{CNTHCTL_EL2.ELOVTEN} == 0$, then accesses at EL0 are trapped to EL2.

G8.7.10 CNTHV_CVAL, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the EL2 virtual timer.

Note

The EL2 virtual timer is implemented by [ARMv8.1-VHE](#). It is only accessible from AArch32 state when EL0 is using AArch32, EL2 is using AArch64, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}.

Configurations

AArch32 System register CNTHV_CVAL[63:0] is architecturally mapped to AArch64 System register [CNTHV_CVAL_EL2](#)[63:0].

This register is present only from ARMv8.1. Otherwise, direct accesses to CNTHV_CVAL are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

CNTHV_CVAL is a 64-bit register.

Field descriptions

The CNTHV_CVAL bit assignments are:

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHV_CTL](#).ENABLE is 1, the timer condition is met when $(\text{CNTVCT} - \text{CompareValue})$ is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHV_CTL](#).ISTATUS is set to 1.
- If [CNTHV_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTHV_CTL](#).ENABLE is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

Accessing the CNTHV_CVAL

This register can be read using MRRC with the following syntax:

```
MRRC <syntax>
```

This register can be written using MCRR with the following syntax:

```
MCRR <syntax>
```

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 3, <Rt>, <Rt2>, c14	0011	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	CNTV_CVAL	CNTV_CVAL	n/a	CNTV_CVAL
HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CVAL	CNTV_CVAL	CNTV_CVAL	CNTV_CVAL
HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CVAL	n/a	CNTV_CVAL	CNTV_CVAL
HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_CVAL	CNTV_CVAL	n/a	n/a
HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	n/a	n/a

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.ELOVTEN == 0, then accesses at EL0 are trapped to EL2.

G8.7.11 CNTHV_TVAL, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV_TVAL characteristics are:

Purpose

Provides AArch32 access to the timer value for the EL2 virtual timer.

Note

The EL2 virtual timer is implemented by [ARMv8.1-VHE](#). It is only accessible from AArch32 state when EL0 is using AArch32, EL2 is using AArch64, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}.

Configurations

AArch32 System register CNTHV_TVAL[31:0] is architecturally mapped to AArch64 System register [CNTHV_TVAL_EL2](#)[31:0].

This register is present only from ARMv8.1. Otherwise, direct accesses to CNTHV_TVAL are UNDEFINED.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

Attributes

CNTHV_TVAL is a 32-bit register.

Field descriptions

The CNTHV_TVAL bit assignments are:

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV_CTL](#).ENABLE is 0, the value returned is UNKNOWN.
- If [CNTHV_CTL](#).ENABLE is 1, the value returned is ([CNTHV_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTHV_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV_CTL](#).ENABLE is 1, the timer condition is met when ([CNTVCT](#) - [CNTHV_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- [CNTHV_CTL](#).ISTATUS is set to 1.
- If [CNTHV_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTHV_CTL](#).ENABLE is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

Accessing the CNTHV_TVAL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c3, 0	000	000	1110	1111	0011

This register is accessed using the encoding for [CNTV_TVAL](#).

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	CNTV_TVAL	CNTV_TVAL	n/a	CNTV_TVAL
HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_TVAL	CNTV_TVAL	CNTV_TVAL	CNTV_TVAL
HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_TVAL	n/a	CNTV_TVAL	CNTV_TVAL
HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	CNTV_TVAL	CNTV_TVAL	n/a	n/a
HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RW	n/a	n/a	n/a

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If (SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0VTEN == 0, then accesses at EL0 are trapped to EL2.

G8.7.12 CNTHVS_CTL, Counter-timer Secure Virtual Timer Control Register (EL2)

The CNTHVS_CTL characteristics are:

Purpose

Provides AArch32 access to the Secure EL2 virtual timer.

Configurations

AArch32 System register CNTHVS_CTL[31:0] is architecturally mapped to AArch64 System register CNTHVS_CTL_EL2[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL are UNDEFINED.

This register is introduced in ARMv8.4.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHVS_CTL is a 32-bit register.

Field descriptions

The CNTHVS_CTL bit assignments are:

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

0b0 Timer condition is not met.

0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D10-2653](#) and [Operation of the TimerValue views of the timers on page D10-2653](#).

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

0b0 Timer interrupt is not masked by the IMASK bit.

0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

ENABLE, bit [0]

Enables the timer. Permitted values are:

0b0 Timer disabled.

0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHVS_TVAL](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

Accessing the CNTHVS_CTL

For information about accessing this register, refer to [CNTHV_CTL](#).

G8.7.13 CNTHVS_CVAL, Counter-timer Secure Virtual Timer CompareValue Register (EL2)

The CNTHVS_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the Secure EL2 virtual timer.

Configurations

AArch32 System register CNTHVS_CVAL[63:0] is architecturally mapped to AArch64 System register CNTHVS_CVAL_EL2[63:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL are UNDEFINED.

This register is introduced in ARMv8.4.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHVS_CVAL is a 64-bit register.

Field descriptions

The CNTHVS_CVAL bit assignments are:

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

Accessing the CNTHVS_CVAL

For information about accessing this register, refer to CNTHV_CVAL.

G8.7.14 CNTHVS_TVAL, Counter-timer Secure Virtual Timer TimerValue Register (EL2)

The CNTHVS_TVAL characteristics are:

Purpose

Provides AArch32 access to the timer value for the Secure EL2 virtual timer.

Configurations

AArch32 System register CNTHVS_TVAL[31:0] is architecturally mapped to AArch64 System register [CNTHVS_TVAL_EL2](#)[31:0].

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL are UNDEFINED.

This register is introduced in ARMv8.4.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTHVS_TVAL is a 32-bit register.

Field descriptions

The CNTHVS_TVAL bit assignments are:

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHVS_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHVS_CTL.ENABLE](#) is 1, the value returned is ([CNTHVS_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTHVS_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHVS_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - [CNTHVS_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHVS_CTL.ISTATUS](#) is set to 1.
- If [CNTHVS_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

Accessing the CNTHVS_TVAL

For information about accessing this register, refer to [CNTHV_TVAL](#).

G8.7.15 CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

Purpose

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

Configurations

AArch32 System register CNTKCTL[31:0] is architecturally mapped to AArch64 System register [CNTKCTL_EL1](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTKCTL is a 32-bit register.

Field descriptions

The CNTKCTL bit assignments are:

Bits [31:10]

Reserved, RES0.

PLOPTEN, bit [9]

Traps PL0 accesses to the physical timer registers to Undefined mode.

0b0 PL0 accesses to the [CNTP_CTL](#), [CNTP_CVAL](#), and [CNTP_TVAL](#) registers are trapped to Undefined mode.

0b1 This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

PLOVTEN, bit [8]

Traps PL0 accesses to the virtual timer registers to Undefined mode.

0b0 PL0 accesses to the [CNTV_CTL](#), [CNTV_CVAL](#), and [CNTV_TVAL](#) registers are trapped to Undefined mode.

0b1 This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register [CNTVCT](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register **CNTVCT** trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

- 0b0 A 0 to 1 transition of the trigger bit triggers an event.
- 0b1 A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register **CNTVCT**:

- 0b0 Disables the event stream.
- 0b1 Enables the event stream.

This field resets to an architecturally UNKNOWN value.

PL0VCTEN, bit [1]

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

- 0b0 PL0 accesses to the **CNTVCT** are trapped to Undefined mode.
PL0 accesses to the **CNTFRQ** register are trapped to Undefined mode, if **CNTKCTL.PL0PCTEN** is also 0.
- 0b1 This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

PL0PCTEN, bit [0]

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

- 0b0 PL0 accesses to the **CNTPCT** are trapped to Undefined mode.
PL0 accesses to the **CNTFRQ** register are trapped to Undefined mode, if **CNTKCTL.PL0VCTEN** is also 0.
- 0b1 This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTKCTL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c1, 0	000	000	1110	1111	0001

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	-	RW	n/a	RW
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	RW	RW	RW
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	-	n/a	RW	RW

G8.7.16 CNTP_CTL, Counter-timer Physical Timer Control register

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configurations

AArch32 System register CNTP_CTL[31:0] is architecturally mapped to AArch64 System register CNTP_CTL_ELO[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

The CNTP_CTL bit assignments are:

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D10-2653](#) and [Operation of the TimerValue views of the timers on page D10-2653](#).

This bit is read-only.

This field resets to an architecturally UNKNOWN value.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to 0.

Accessing the CNTP_CTL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c2, 1	000	001	1110	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && !HaveEL(EL3) && SCR_EL3.EEL2 == 0	RW	RW	n/a	n/a	CNTP_CTL

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0` && `CNTKCTL_EL1.ELOPTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `HCR_EL2.E2H == 0` && `CNTKCTL.PLOPTEN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 0` && `CNTHCTL_EL2.EL1PCEN == 0` && `CNTKCTL_EL1.ELOPTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTHCTL_EL2.EL1PTEN == 0` && `CNTKCTL_EL1.ELOPTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTKCTL_EL1.ELOPTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 0` && `CNTKCTL.PLOPTEN == 0`, then Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1)` && `IsUsingAArch64(EL2)` && `HCR_EL2.E2H == 1` && `HCR_EL2.TGE == 1` && `CNTHCTL_EL2.ELOPTEN == 0`, then accesses at EL0 are trapped to EL2.
- If `SCR_EL3.NS == 1` && `IsUsingAArch32(EL2)` && `CNTHCTL.PL1PCEN == 0`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

G8.7.17 CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configurations

AArch32 System register CNTP_CVAL[63:0] is architecturally mapped to AArch64 System register CNTP_CVAL_ELO[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

The CNTP_CVAL bit assignments are:

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CVAL

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 2, <Rt>, <Rt2>, c14	0010	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && IsUsingAArch32(EL3)	RW	n/a	n/a	RW	CNTP_CVAL_s

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0 && CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `HCR_EL2.E2H == 0 && CNTKCTL.PL0PTEN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && CNTHCTL_EL2.EL1PCEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && CNTHCTL_EL2.EL1PCEN == 0 && CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTHCTL_EL2.EL1PTEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTHCTL_EL2.EL1PTEN == 0 && CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL.PL0PTEN == 0`, then Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PTEN == 0`, then accesses at EL0 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && CNTHCTL.PL1PCEN == 0`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

G8.7.18 CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configurations

AArch32 System register CNTP_TVAL[31:0] is architecturally mapped to AArch64 System register [CNTP_TVAL_ELO](#)[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

The CNTP_TVAL bit assignments are:

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP_CTL.ENABLE](#) is 1, the value returned is ([CNTP_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTP_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTP_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_TVAL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c2, 0	000	000	1110	1111	0010

Accessibility

The register is accessible as follows:

Configuration	Accessibility				Instance
	EL0	EL1	EL2	EL3	
SCR_EL3.NS == 0 && !HaveEL(EL3) && SCR_EL3.EEL2 == 0	RW	RW	n/a	n/a	CNTP_TVAL

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0 && CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `HCR_EL2.E2H == 0 && CNTKCTL.PL0PTEN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && CNTHCTL_EL2.EL1PCEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 0 && CNTHCTL_EL2.EL1PCEN == 0 && CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTHCTL_EL2.EL1PTEN == 0`, then accesses at EL1 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTHCTL_EL2.EL1PTEN == 0 && CNTKCTL_EL1.EL0PTEN == 1`, then accesses at EL0 are trapped to EL2.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0PTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL.PL0PTEN == 0`, then Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PTEN == 0`, then accesses at EL0 are trapped to EL2.
- If `SCR_EL3.NS == 1 && IsUsingAArch32(EL2) && CNTHCTL.PL1PCEN == 0`, then Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

G8.7.19 CNTPCT, Counter-timer Physical Count register

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configurations

AArch32 System register CNTPCT[63:0] is architecturally mapped to AArch64 System register [CNTPCT_EL0](#)[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNPCT is a 64-bit register.

Field descriptions

The CNTPCT bit assignments are:

Bits [63:0]

Physical count value.

Accessing the CNTPCT

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 0, <Rt>, <Rt2>, c14	0000	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $\text{HCR_EL2.E2H} == 0$ && $\text{CNTKCTL_EL1.EL0PCTEN} == 0$, then read accesses at EL0 are trapped to EL1.
- If $\text{HCR_EL2.E2H} == 0$ && $\text{CNTKCTL.PL0PCTEN} == 0$, then read accesses to this register from EL0 are trapped to Undefined mode.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64(EL2)}$ && $\text{HCR_EL2.E2H} == 0$ && $\text{CNTHCTL_EL2.EL1PCTEN} == 0$, then read accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64(EL2)}$ && $\text{HCR_EL2.E2H} == 0$ && $\text{CNTHCTL_EL2.EL1PCTEN} == 0$ && $\text{CNTKCTL_EL1.EL0PCTEN} == 1$, then read accesses at EL0 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64(EL2)}$ && $\text{HCR_EL2.E2H} == 1$ && $\text{HCR_EL2.TGE} == 0$ && $\text{CNTHCTL_EL2.EL1PCTEN} == 0$, then read accesses at EL1 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64(EL2)}$ && $\text{HCR_EL2.E2H} == 1$ && $\text{HCR_EL2.TGE} == 0$ && $\text{CNTHCTL_EL2.EL1PCTEN} == 0$ && $\text{CNTKCTL_EL1.EL0PCTEN} == 1$, then read accesses at EL0 are trapped to EL2.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64(EL2)}$ && $\text{HCR_EL2.E2H} == 1$ && $\text{HCR_EL2.TGE} == 0$ && $\text{CNTKCTL_EL1.EL0PCTEN} == 0$, then read accesses at EL0 are trapped to EL1.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64(EL2)}$ && $\text{HCR_EL2.E2H} == 1$ && $\text{HCR_EL2.TGE} == 0$ && $\text{CNTKCTL.PL0PCTEN} == 0$, then Non-secure read accesses to this register from EL0 are trapped to Undefined mode.
- If $(\text{SCR_EL3.NS} == 1 \parallel \text{SCR_EL3.EEL2} == 1)$ && $\text{IsUsingAArch64(EL2)}$ && $\text{HCR_EL2.E2H} == 1$ && $\text{HCR_EL2.TGE} == 1$ && $\text{CNTHCTL_EL2.EL0PCTEN} == 0$, then read accesses at EL0 are trapped to EL2.
- If $\text{SCR_EL3.NS} == 1$ && $\text{IsUsingAArch32(EL2)}$ && $\text{CNTHCTL.PL1PCTEN} == 0$, then Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.

G8.7.20 CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configurations

AArch32 System register CNTV_CTL[31:0] is architecturally mapped to AArch64 System register CNTV_CTL_EL0[31:0].

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

The CNTV_CTL bit assignments are:

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D10-2653](#) and [Operation of the TimerValue views of the timers on page D10-2653](#).

This bit is read-only.

This field resets to an architecturally UNKNOWN value.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL](#) continues to count down.

———— Note ————

Disabling the output signal might be a power-saving option.

This field resets to 0.

Accessing the CNTV_CTL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c3, 1	000	001	1110	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
SCR_EL3.NS == 0 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && SCR_EL3.EEL2 == 1	RW	RW	RW	RW
SCR_EL3.NS == 0 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && SCR_EL3.EEL2 == 1	RW	n/a	RW	RW
SCR_EL3.NS == 0 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && SCR_EL3.EEL2 == 1	RW	RW	n/a	n/a
SCR_EL3.NS == 0 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && SCR_EL3.EEL2 == 1	CNTHVS_CTL	n/a	n/a	n/a
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0	RW	RW	RW	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0	RW	n/a	RW	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1	RW	RW	n/a	n/a
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1	CNTHV_CTL	n/a	n/a	n/a

Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-5243 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64 state* on page D1-2191 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If $HCR_EL2.E2H == 0 \ \&\& \ CNTKCTL_EL1.EL0VTEN == 0$, then accesses at EL0 are trapped to EL1.
- If $HCR_EL2.E2H == 0 \ \&\& \ CNTKCTL.PLOVTEN == 0$, then accesses to this register from EL0 are trapped to Undefined mode.
- If $(SCR_EL3.NS == 1 \ || \ SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ CNTKCTL_EL1.EL0VTEN == 0$, then accesses at EL0 are trapped to EL1.
- If $(SCR_EL3.NS == 1 \ || \ SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 0 \ \&\& \ CNTKCTL.PLOVTEN == 0$, then Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- If $(SCR_EL3.NS == 1 \ || \ SCR_EL3.EEL2 == 1) \ \&\& \ IsUsingAArch64(EL2) \ \&\& \ HCR_EL2.E2H == 1 \ \&\& \ HCR_EL2.TGE == 1 \ \&\& \ CNTHCTL_EL2.EL0VTEN == 0$, then accesses at EL0 are trapped to EL2.

G8.7.21 CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configurations

AArch32 System register CNTV_CVAL[63:0] is architecturally mapped to AArch64 System register [CNTV_CVAL_EL0](#)[63:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

The CNTV_CVAL bit assignments are:

CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When [CNTV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- If [CNTV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CVAL

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 3, <Rt>, <Rt2>, c14	0011	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
SCR_EL3.NS == 0 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && SCR_EL3.EEL2 == 1	RW	RW	RW	RW
SCR_EL3.NS == 0 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && SCR_EL3.EEL2 == 1	RW	n/a	RW	RW
SCR_EL3.NS == 0 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && SCR_EL3.EEL2 == 1	RW	RW	n/a	n/a
SCR_EL3.NS == 0 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && SCR_EL3.EEL2 == 1	CNTHVS_CVAL	n/a	n/a	n/a
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0	RW	RW	RW	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0	RW	n/a	RW	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1	RW	RW	n/a	n/a
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1	CNTHV_CVAL	n/a	n/a	n/a

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0 && CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `HCR_EL2.E2H == 0 && CNTKCTL.PL0VTEN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL.PL0VTEN == 0`, then Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0VTEN == 0`, then accesses at EL0 are trapped to EL2.

G8.7.22 CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configurations

AArch32 System register CNTV_TVAL[31:0] is architecturally mapped to AArch64 System register CNTV_TVAL_EL0[31:0].

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

The CNTV_TVAL bit assignments are:

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CNTV_CVAL - CNTVCT).

On a write of this register, CNTV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_TVAL

This register can be written using MCR with the following syntax:

MCR <syntax>

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c3, 0	000	000	1110	1111	0011

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RW	RW	n/a	RW
SCR_EL3.NS == 0 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0 && SCR_EL3.EEL2 == 1	RW	RW	RW	RW
SCR_EL3.NS == 0 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0 && SCR_EL3.EEL2 == 1	RW	n/a	RW	RW
SCR_EL3.NS == 0 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1 && SCR_EL3.EEL2 == 1	RW	RW	n/a	n/a
SCR_EL3.NS == 0 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1 && SCR_EL3.EEL2 == 1	CNTHVS_TVAL	n/a	n/a	n/a
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 0	RW	RW	RW	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 0	RW	n/a	RW	RW
SCR_EL3.NS == 1 && HCR_EL2.TGE == 0 && HCR_EL2.E2H == 1	RW	RW	n/a	n/a
SCR_EL3.NS == 1 && HCR_EL2.TGE == 1 && HCR_EL2.E2H == 1	CNTHV_TVAL	n/a	n/a	n/a

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0 && CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `HCR_EL2.E2H == 0 && CNTKCTL.PL0VTEN == 0`, then accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0VTEN == 0`, then accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL.PL0VTEN == 0`, then Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0VTEN == 0`, then accesses at EL0 are trapped to EL2.

G8.7.23 CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in [CNTPCT](#) minus the virtual offset visible in [CNTVOFF](#).

Configurations

AArch32 System register CNTVCT[63:0] is architecturally mapped to AArch64 System register [CNTVCT_EL0](#)[63:0].

The value of this register is the same as the value of [CNTPCT](#) in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented and is using AArch64, [HCR_EL2](#).{E2H, TGE} is {1, 1}, and this register is read from Non-secure EL0.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

The CNTVCT bit assignments are:

Bits [63:0]

Virtual count value.

Accessing the CNTVCT

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 1, <Rt>, <Rt2>, c14	0001	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0	RO	RO	n/a	RO
HCR_EL2.TGE == 0 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	RO	RO	RO
HCR_EL2.TGE == 1 && (SCR_EL3.NS == 1 SCR_EL3.EEL2 == 1)	RO	n/a	RO	RO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-5243](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If `HCR_EL2.E2H == 0 && CNTKCTL.PLOVCTEN == 0`, then read accesses to this register from EL0 are trapped to Undefined mode.
- If `HCR_EL2.E2H == 0 && CNTKCTL_EL1.EL0VCTEN == 0`, then read accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL.PLOVCTEN == 0`, then Non-secure read accesses to this register from EL0 are trapped to Undefined mode.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 0 && CNTKCTL_EL1.EL0VCTEN == 0`, then read accesses at EL0 are trapped to EL1.
- If `(SCR_EL3.NS == 1 || SCR_EL3.EEL2 == 1) && IsUsingAArch64(EL2) && HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1 && CNTHCTL_EL2.EL0PCTEN == 0`, then read accesses at EL0 are trapped to EL2.

G8.7.24 CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in [CNTPCT](#) and the virtual count value visible in [CNTVCT](#).

Configurations

AArch32 System register CNTVOFF[63:0] is architecturally mapped to AArch64 System register [CNTVOFF_EL2](#)[63:0].

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

———— Note —————

When EL2 is implemented and is using AArch64, if [HCR_EL2](#).{E2H, TGE} is {1, 1}, the virtual counter uses a fixed virtual offset of zero when [CNTVCT](#) is read from Non-secure EL0.

When EL2 is implemented and can use AArch32, on a reset into an Exception level that is using AArch32 this register resets to an IMPLEMENTATION DEFINED value that might be UNKNOWN.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

The CNTVOFF bit assignments are:

Bits [63:0]

Virtual offset.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTVOFF

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 4, <Rt>, <Rt2>, c14	0100	1111	1110

Accessibility

The register is accessible as follows:

Configuration	Accessibility			
	EL0	EL1	EL2	EL3
SCR_EL3.NS == 0	-	-	n/a	-
HCR_EL2.TGE == 0 && SCR_EL3.NS == 1	-	-	RW	RW
HCR_EL2.TGE == 1 && SCR_EL3.NS == 1	-	n/a	RW	RW

Part H

External Debug

Chapter H1

About External Debug

This chapter gives an overview of ARMv8 external debug, and specifies the required debug authentication. It contains the following sections:

- [Introduction to external debug](#) on page H1-6412.
- [External debug](#) on page H1-6413.
- [Required debug authentication](#) on page H1-6414.

———— **Note** —————

For information about self-hosted debug, see [Chapter D2 AArch64 Self-hosted Debug](#) and [Chapter G2 AArch32 Self-hosted Debug](#).

H1.1 Introduction to external debug

ARMv8 supports both:

Self-hosted debug

The PE itself hosts a debugger. That is, developers developing software to run on the PE use debugger software running on the same PE.

External debug

The debugger is external to the PE. The debugging might be either on-chip, for example in a second PE, or off-chip, for example a JTAG debugger that accesses the chip through a Debug Access Port.

External debug is particularly useful for:

- Hardware bring-up. That is, debugging during development when a system is first powered up and not all of the software functionality is available.
- PEs that are deeply embedded inside systems.

To support external debug, the ARM architecture defines required features that are called *external debug features*.

————— Note —————

An external debugger has a potentially high level of control over and visibility into the PE. The system sets this level using debug authentication. See [Required debug authentication on page H1-6414](#).

If the debug authentication level is set too low, agents may be able to bypass elements of the security and privilege models. This includes both off-chip agents and on-chip agents such as unprivileged or Non-secure software.

H1.1.1 Definition and constraints of a debugger in the context of external debug

When the description of external debug in this Part of the manual describes a *debugger* as controlling external debug this debugger might be a second on-chip PE or an off-chip device such as a JTAG debugger using a Debug Access Port (DAP).

If a Debug Access Port is implemented:

- When debug is prohibited at the Debug Access Port, the port must not generate accesses to the external debug interface of the PE.
- When Secure debug is prohibited at the Debug Access Port, the port must not generate Secure accesses to the external debug interface of the PE.
- When Secure accesses are allowed at the Debug Access Port, the port must be able to generate Secure accesses.

If [ARMv8.4-Debug](#) is not implemented, accesses to the PE are controlled by the external authentication interface functions, [ExternalInvasiveDebugEnabled\(\)](#), [ExternalNoninvasiveDebugEnabled\(\)](#), [ExternalSecureNoninvasiveDebugEnabled\(\)](#) and [ExternalSecureInvasiveDebugEnabled\(\)](#). The external authentication interface functions override MDCR_EL3.{EPMAD, EDAD}.

If [ARMv8.4-Debug](#) is implemented, the bus master, which may be the Debug Access Port, controls the accesses it makes to the PE and MDCR_EL3.{EPMAD, EDAD} control Non-secure access to registers.

The Debug Access Port is not required to use the same authentication interface as the PE.

ARM recommends the following authentication interface:

- When `ExternalSecureInvasiveDebugEnabled()==FALSE` at the PE, Secure debug is disabled at the DAP.
- When `ExternalInvasiveDebugEnabled()==FALSE` at the PE, all debug is prohibited at the DAP.

H1.2 External debug

Debug events allow an external debugger to halt the PE. ARMv8 provides the following debug events:

- [Halting Step debug events on page H3-6458](#):
 - The debugger can use this resource to make the PE step through code one line at a time.
- [Halt Instruction debug event on page H3-6468](#):
 - This might occur when software executes the Halting breakpoint instruction, HLT.
- [Exception Catch debug event on page H3-6469](#):
 - This can be programmed to occur on all entries to a given Exception level.
- [External Debug Request debug event on page H3-6473](#):
 - An embedded cross-trigger can signal this debug event.
- [OS Unlock Catch debug event on page H3-6474](#):
 - This might occur when the state of the OS Lock changes from locked to unlocked.
- [Reset Catch debug events on page H3-6475](#):
 - This might occur when the PE exits reset state.
- [Software Access debug event on page H3-6476](#):
 - This can be programmed to occur when software tries to access the Breakpoint Value registers, the Breakpoint Control registers, the Watchpoint value registers, or the Watchpoint Control registers. It caused a trap to Debug state.

Breakpoints and watchpoints can also halt the PE.

When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state:
 - The ITR contains a single register, EDITR, and associated flow-control flags.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger:
 - The DCC includes the data transfer registers, DTRRX and DTRTX, and associated flow-control flags.
 - Although the DCC is an essential part of Debug state operation, it can also be used in Non-debug state.
- The PE cannot service any interrupts in Debug state.

[Chapter H2 Debug State](#) describes Debug state in more detail.

H1.3 Required debug authentication

Any implementation must provide the debug authentication defined in this section, that controls:

- Whether the PE can halt.
- Whether non-invasive debug is permitted.
- Some legacy aspects of the AArch32 self-hosted debug model.

The pseudocode functions shown in [Table H1-1](#), and the conditions that follow that table, define the architectural requirements for debug authentication.

Table H1-1 Debug authentication functions

Pseudocode function	Description
ExternalSecureNoninvasiveDebugEnabled()	Returns TRUE if Secure non-invasive debug is enabled.
AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()	Returns TRUE if Secure invasive self-hosted debug is enabled in AArch32 state.
ExternalSecureInvasiveDebugEnabled()	Returns TRUE if Secure invasive debug is enabled.
ExternalNoninvasiveDebugEnabled()	Returns TRUE if Non-secure non-invasive debug is enabled.
ExternalInvasiveDebugEnabled()	Returns TRUE if Non-secure invasive debug is enabled.

The following conditions always apply:

- if [ExternalInvasiveDebugEnabled\(\)](#) is FALSE then [ExternalSecureInvasiveDebugEnabled\(\)](#) is FALSE.
- if [ExternalNoninvasiveDebugEnabled\(\)](#) is FALSE then [ExternalSecureNoninvasiveDebugEnabled\(\)](#) is FALSE.
- if [ExternalInvasiveDebugEnabled\(\)](#) is TRUE then [ExternalNoninvasiveDebugEnabled\(\)](#) is TRUE.
- if [ExternalSecureInvasiveDebugEnabled\(\)](#) is TRUE then [ExternalSecureNoninvasiveDebugEnabled\(\)](#) is TRUE.

If [ARMv8.4-Debug](#) is implemented:

- [ExternalNoninvasiveDebugEnabled\(\)](#) always returns TRUE.
- [ExternalSecureNoninvasiveDebugEnabled\(\)](#) returns the same as [ExternalSecureInvasiveDebugEnabled\(\)](#).

ARM recommends the use of the interface described in [Recommended authentication interface on page K2-7239](#) to provide this debug authentication. The pseudocode functions in [Chapter J1 ARMv8 Pseudocode](#), that are linked to by the entries in the [Pseudocode function](#) column of [Table H1-1](#), assume that this interface is implemented.

Chapter H2

Debug State

This chapter describes Debug state. It contains the following sections:

- [About Debug state on page H2-6416.](#)
- [Halting the PE on debug events on page H2-6417.](#)
- [Entering Debug state on page H2-6424.](#)
- [Behavior in Debug state on page H2-6427.](#)
- [Exiting Debug state on page H2-6452.](#)

———— **Note** —————

[Table K13-1 on page K13-7394](#) disambiguates the general register references used in this chapter.

H2.1 About Debug state

In external debug, debug events allow an external debugger to halt the PE. The PE then enters Debug state. When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger.

The PE cannot service any interrupts in Debug state.

H2.2 Halting the PE on debug events

For details of debug events, see [Introduction to Halting debug events](#) on page H3-6456 and [Breakpoint and Watchpoint debug events](#) on page H2-6418.

On a debug event, the PE must do one of the following:

- Enter Debug state.
- Pend the debug event.
- Generate a debug exception.
- Ignore the debug event.

This behavior depends on both:

- Whether halting is allowed by the current state of the debug authentication interface. See [Halting allowed and halting prohibited](#).
- The type of debug event and the programming of the debug control registers.
 - See [Halting debug events](#) for all Halting debug events.
 - See [Breakpoint and Watchpoint debug events](#) on page H2-6418 for Breakpoint and Watchpoint debug events.

See also [Other debug exceptions](#) on page H2-6419.

This means that behavior can be CONSTRAINED UNPREDICTABLE if the conditions change. See [Synchronization and Halting debug events](#) on page H3-6477.

[Summary of debug events and possible outcomes](#) on page H3-6456 summarizes the possible outcomes of each type of debug event.

H2.2.1 Halting allowed and halting prohibited

Halting can be either allowed or prohibited:

- Halting is always prohibited in Debug state.
- Halting is always prohibited when `DoubleLockStatus() == TRUE`.
 - This means that OS Double Lock is implemented and locked.
- Halting is also controlled by the IMPLEMENTATION DEFINED authentication interface, and is prohibited when either:
 - The PE is in Non-secure state and `ExternalInvasiveDebugEnabled() == FALSE`.
 - The PE is in Secure state and `ExternalSecureInvasiveDebugEnabled() == FALSE`.

———— **Note** —————

See [Appendix K2 Recommended External Debug Interface](#) for more information on these functions.

- Otherwise, halting is allowed.

For more information see:

- [Pseudocode description of Halting on debug events](#) on page H2-6423
- [Required debug authentication](#) on page H1-6414.

H2.2.2 Halting debug events

The Halting debug events are described in [Chapter H3 Halting Debug Events](#).

When a Halting debug event is generated, it causes entry to Debug state if all of:

- Halting is allowed. See [Halting allowed and halting prohibited](#).

- The Halting debug event is one of:
 - A Halt Instruction debug event and `EDSCR.HDE == 1`.
 - A Software Access debug event and `OSLSR_EL1.OSLK == 0`, meaning that the OS Lock is unlocked.
 - Neither a Halt Instruction debug event nor a Software Access debug event.

———— **Note** —————

- A Halt Instruction debug event is the only Halting debug event that relies on `EDSCR.HDE == 1`.
- Halting on Breakpoint and Watchpoint debug events is also controlled by `EDSCR.HDE`. See [Breakpoint and Watchpoint debug events](#).
- `EDSCR.HDE` can be written by software when the OS Lock is locked. Privileged code can use `SDCR.TDOSA` and `HDCR.TDOSA` to trap writes to these registers.

If a Halting debug event does not generate entry to Debug state because the conditions listed in this section do not hold, then:

- If the Halting debug event is a Halt Instruction debug event, the instruction that generated the Halting debug event is treated as UNDEFINED.
- If the Halting debug event is an Exception Catch debug event or a Software Access debug event, it is ignored.

In all other cases the Halting debug event is pended, see [Pending Halting debug events on page H3-6477](#).

[Summary of actions from debug events on page H2-6421](#) summarizes the possible outcome for each type of Debug event.

———— **Note** —————

Halting debug events never generate debug exceptions.

H2.2.3 Breakpoint and Watchpoint debug events

A breakpoint or watchpoint generates an entry to Debug state if all of the following conditions hold:

- Halting debug is enabled, that is `EDSCR.HDE == 1`.
- Halting is allowed. See [Halting allowed and halting prohibited on page H2-6417](#).
- The OS Lock is unlocked, that is `OSLSR.OSLK == 0`.

The Address Mismatch breakpoint type is reserved when all of these conditions are met.

`MDSCR_EL1.MDE` or `DBGDSCRExt.MDBGen` is ignored when determining whether to enter Debug state. A breakpoint or watchpoint that generates entry to Debug state is a Breakpoint or Watchpoint debug event and does not generate a debug exception.

A breakpoint or watchpoint that does not generate an entry to Debug state either:

- Generates a Breakpoint or Watchpoint exception.
- Is ignored.

———— **Note** —————

`EDSCR.HDE` is ignored when determining whether to generate a debug exception. The debug exception is suppressed only if the PE enters Debug state. This means that the use of Halting debug mode in Non-secure state does not affect the Exception model in Secure state.

See [Chapter D2 AArch64 Self-hosted Debug](#), [Chapter G2 AArch32 Self-hosted Debug](#), and the Note in [Other debug exceptions on page H2-6419](#).

H2.2.4 Other debug exceptions

The following events never generate entry to Debug state:

- Breakpoint Instruction exceptions.
- Software Step exceptions.
- Vector Catch exceptions.

The behavior of these events is unchanged when Halting debug mode is enabled, that is when `EDSCR.HDE == 1`. This means that these events can do one of the following:

- They can generate a debug exception.
- They can be ignored.

For additional information, see [Chapter D2 AArch64 Self-hosted Debug](#) and [Chapter G2 AArch32 Self-hosted Debug](#).

H2.2.5 Debug state entry and debug event prioritization

The following are synchronous debug events:

- Breakpoint debug event.
- Watchpoint debug event.
- Halting Step debug event.
- Halt Instruction debug event.
- Exception Catch debug event.
- Software Access debug event.
- Reset Catch debug event.

Each of these synchronous debug events are treated as a synchronous exception generated by an instruction, or by the taking of an exception or reset. That is, if halting is allowed, the synchronous debug event must be taken before any subsequent instructions are executed. Reset Catch debug events must be taken before the PE executes the instruction at the reset vector.

Note

- Reset Catch and Exception Catch debug events might be generated asynchronously, because they can result from an asynchronous exception. However, if halting is allowed after the reset or asynchronous exception has been processed, the Reset Catch or Exception Catch debug event is taken synchronously.
- The Halting Step debug event is generated by the instruction after the stepped instruction. Therefore, if the stepped instruction generates any other synchronous exceptions or debug events these are taken first.

If halting is prohibited then Halting Step debug events and Reset Catch debug events might be pended and taken asynchronously. OS Unlock Catch debug events are always pended and taken asynchronously. See [Pending Halting debug events on page H3-6477](#).

The architecture does not define when asynchronous debug events are taken, and therefore the prioritization of asynchronous debug events is IMPLEMENTATION DEFINED. See [Synchronization and Halting debug events on page H3-6477](#).

The following list shows how the synchronous debug events are prioritized, with 1 being the highest priority.

Note

The priority numbering is the same as the numbering for AArch64 synchronous exception priorities listed in [Synchronous exception types, routing and priorities on page D1-2190](#), and in particular [Prioritization and recognition of interrupts on page D1-2206](#). This numbering correlates with the equivalent AArch32 list in [Exception prioritization for exceptions taken to AArch32 state on page G1-5242](#).

The priority for synchronous debug events is as follows:

- 1 Reset Catch debug event. See [Reset Catch debug events on page H3-6475](#).

- This debug event has a higher priority than the synchronous exceptions listed in [Synchronous exception types, routing and priorities on page D1-2190](#).
- 2 Exception Catch debug event. See [Exception Catch debug event on page H3-6469](#).
This debug event can be assigned one of two priorities. When it has a priority of 2, it has a higher priority than the synchronous exceptions listed in the Exception model. See [Exception Catch debug event on page H3-6469](#).
- 3 Halting Step debug event. See [Halting Step debug events on page H3-6458](#).
This debug event has a higher priority than the synchronous exceptions listed in the Exception model.
- 4 These events are not debug events.
- 5 Exception Catch debug event. See [Exception Catch debug event on page H3-6469](#).
This debug event can be assigned one of two priorities, 0 or 5. See [Exception Catch debug event on page H3-6469](#).
- 6 - 7 These events are not debug events.
- 8 Breakpoint exception or debug event or Address Matching Vector Catch exception. See [Breakpoint exceptions on page D2-2296](#), and [Vector Catch exceptions on page G2-5405](#).
These two debug events have the same priority.
- 9 - 10 These events are not debug events.
- 11 Halt Instruction debug event. See [Halt Instruction debug event on page H3-6468](#).
- 12 - 24 These events are not debug events.
- 25 Software Access debug event. See [Software Access debug event on page H3-6476](#).
- 26 - 27 These events are not debug events.
- 28 Watchpoint exception or debug event. See [Watchpoint exceptions on page D2-2314](#) for exceptions taken from AArch64 state, or [Watchpoint exceptions on page G2-5391](#) for exceptions taken from AArch32 state.
- 29 This event is not a debug event.

For Reset Catch debug events and Halting Step debug events the priorities listed in this section only apply when halting is allowed at the time the event is generated. This means that the event is taken synchronously and not pended.

For more information on the prioritization of exceptions see:

- [Synchronous exception types, routing and priorities on page D1-2190](#).
- [Prioritization and recognition of interrupts on page D1-2206](#).
- [Exception prioritization for exceptions taken to AArch32 state on page G1-5242](#). This section covers synchronous and asynchronous exceptions.

Breakpoint debug events and Vector Catch exception

An Address Matching Vector Catch exception has the same priority as a Breakpoint debug event. See [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2191](#).

The prioritization of these events is unchanged even if the breakpoint generates entry to Debug state instead of a Breakpoint exception. This means that if a single instruction generates both an Address Matching Vector Catch exception and a Breakpoint debug event, there is a CONSTRAINED UNPREDICTABLE choice of:

- The PE entering Debug state due to the Breakpoint debug event.
- A Vector Catch exception.

This only applies if all of the following are true:

- Halting debug is enabled.
- Halting is allowed.
- The OS Lock is unlocked.

An Exception Trapping Vector Catch exception must be generated immediately following the exception that generated it. This means that it does not appear in the priority table.

H2.2.6 Imprecise entry to Debug state

Entry to Debug state is normally precise, meaning that the PE cannot enter Debug state if it can neither complete nor abandon all currently executing instructions and leave the PE in a precise state.

A debugger can write a value of 1 to [EDRCCR.CBRRQ](#) to allow imprecise entry to Debug state. An External Debug Request debug event must be pending before writing 1 to this bit. Support for this feature is `OPTIONAL` and it is `IMPLEMENTATION DEFINED` when it is effective at forcing entry to Debug state.

The PE ignores writes to this bit if either:

- External debugging is not enabled, meaning `ExternalInvasiveDebugEnabled() == FALSE`.
- Secure external debugging is not enabled, meaning `ExternalSecureInvasiveDebugEnabled() == FALSE`, and either:
 - EL3 is not implemented and the implemented Security state is Secure state.
 - EL3 is implemented.

[Example H2-1](#) shows how entry to Debug state can be forced.

Example H2-1 Forcing entry to Debug state

The debugger pends an External Debug Request debug event through the CTI to halt a program that has stopped responding. However, the memory system is not responding and a memory access instruction cannot complete. This means that Debug state cannot be entered precisely. The debugger writes a value of 1 to [EDRCCR.CBRRQ](#). The PE cancels all outstanding memory accesses and enters Debug state. As some instructions might not have completed correctly, entry to Debug state is imprecise.

When Debug state is entered imprecisely, all memory access instructions executed through the ITR have UNPREDICTABLE behavior. The value of all registers is UNKNOWN, but might be useful for diagnostic purposes.

H2.2.7 Summary of actions from debug events

[Table H2-1 on page H2-6422](#) shows the Software and Halting debug events. In [Table H2-1 on page H2-6422](#) the columns have the following meaning:

Debug event type

This means the type of debug event where:

Other software

Means one of:

- [Software Step exceptions on page D2-2329](#).
- [Breakpoint Instruction exceptions on page D2-2294](#).
- [Vector Catch exceptions on page D2-2328](#) for AArch64 state or [Vector Catch exceptions on page G2-5405](#) for AArch32 state.

Other Halting

Means one of the following:

- [Halting Step debug events on page H3-6458](#).
- [External Debug Request debug event on page H3-6473](#).
- [Reset Catch debug events on page H3-6475](#).

- [OS Unlock Catch debug event on page H3-6474.](#)

Other debug events are referred to explicitly.

Authentication

This means halting is allowed by the IMPLEMENTATION DEFINED external authentication interface. It is the result of one of the following pseudocode functions:

In Secure state ExternalSecureInvasiveDebugEnabled().

In Non-secure state ExternalInvasiveDebugEnabled().

DLK This indicates whether the OS Double Lock is implemented and locked, DoubleLockStatus() == TRUE.

OSLK This is the value of OSLSR.OSLK. It indicates whether the OS Lock is locked.

HDE This is the value of EDSCR.HDE. It indicates whether Halting debug is enabled.

The letter X in [Table H2-1](#) indicates that the value can be either 0 or 1.

Table H2-1 Debug authentication for external debug

Debug event type	Authentication	DLK	OSLK	HDE	Behavior
Other software	X	X	X	X	Handled by the Exception model
Breakpoint or Watchpoint debug event	X	TRUE	X	X	Handled by the Exception model (ignored)
	X	FALSE	1	X	Handled by the Exception model (ignored)
	FALSE	FALSE	0	X	Handled by the Exception model
	TRUE	FALSE	0	0	Handled by the Exception model
	TRUE	FALSE	0	1	Entry to Debug state
Halt Instruction debug event	FALSE	X	X	X	undefined
	TRUE	TRUE	X	X	undefined
	TRUE	FALSE	X	0	undefined
	TRUE	FALSE	X	1	Entry to Debug state
Exception Catch debug event	FALSE	X	X	X	Ignored
	TRUE	TRUE	X	X	Ignored
	TRUE	FALSE	X	X	Entry to Debug state
Software Access debug event	FALSE	X	X	X	Ignored
	TRUE	TRUE	X	X	Ignored
	TRUE	FALSE	1	X	Ignored
	TRUE	FALSE	0	X	Entry to Debug state
Other Halting	FALSE	X	X	X	Debug event is pended
	TRUE	TRUE	X	X	Debug event is pended
	TRUE	FALSE	X	X	Entry to Debug state

H2.2.8 Pseudocode description of Halting on debug events

The `Halted()`, `Restarting()`, `HaltingAllowed()`, and `HaltOnBreakpointOrWatchpoint()` functions are described in the ARMv8 pseudocode.

H2.3 Entering Debug state

On entry to Debug state, the preferred restart address and **PSTATE** are saved in **DLR** and **DSPSR**. The PE remains in the mode and security state from which it entered Debug state.

If **EDRCR.CBRRQ** has a value of 0, entry to Debug state is precise. If **EDRCR.CBRRQ** has a value of 1, then imprecise entry to Debug state is permitted.

If a Watchpoint debug event causes an entry to Debug state, the address of the access that generated the Watchpoint debug event is recorded in **EDWAR**.

For more information see:

- [Determining the memory location that caused a Watchpoint exception on page D2-2322](#) for a debug event taken from AArch64 state.
- [Determining the memory location that caused a Watchpoint exception on page G2-5398](#) for a debug event taken from AArch32 state.

Other than the effect on **PSTATE** and **EDSCR**, entry to Debug state is not a *Context synchronization event*. The effects of entry to Debug state on **PSTATE** and **EDSCR** are synchronized.

H2.3.1 Entering Debug state from AArch32 state

When entering Debug state from AArch32 state, the PE remains in AArch32 state. In AArch32 Debug state the PE executes T32 instructions, regardless of the value of **PSTATE.T** before entering Debug state.

To allow the debugger to determine the state of the PE, the current Execution state for all four Exception levels can be read from **EDSCR.RW**, and the current Exception level can be read from **EDSCR.EL**.

The current endianness state, **PSTATE.E**, is unchanged on entry to Debug state.

———— **Note** —————

- If EL1 is using AArch32 state, the current endianness state can differ from that indicated by **SCTLR.EE**.
- If EL2 is using AArch32 state, the current endianness state can differ from that indicated by **HSCTLR.EE**.
- On entry to Debug state from AArch32 state, **PSTATE.SS** is copied to **DSPSR.SS**, even though the PE remains in AArch32 state.

See also [Effect of entering Debug state on PSTATE on page H2-6425](#).

H2.3.2 Effect of Debug state entry on DLR and DSPSR

DLR is set to the preferred restart address for the debug event, that depends on the event type. The value of **PSTATE** is saved in **DSPSR**. For entry to Debug state from AArch32 state, the values saved in **DSPSR.IT** are always correct for the preferred restart address.

For synchronous Halting debug events, the preferred restart address is the address of the instruction that generated the debug event.

For asynchronous Halting debug events, including pending Halting debug events taken asynchronously, the preferred restart address is the address of the first instruction that must be executed on exit from Debug state.

This means that:

- For Breakpoint and Watchpoint debug events, the preferred restart address is the same as the preferred return address for a debug exception, as described in [Chapter D2 AArch64 Self-hosted Debug](#) and [Chapter G2 AArch32 Self-hosted Debug](#).
- For Halt Instruction debug events **DLR** is set to the address of the HLT instruction and **DSPSR.IT** is correct for the HLT instruction.

- For Software Access debug events, **DLR** is set to the address of the accessing instruction and **DSPSR.IT** is correct for this instruction.
 - For Halting Step debug events taken synchronously, **DLR** and **DSPSR** are set as the ELR and SPSR would be set for a Software Step exception. This is usually the address of, and **PSTATE** for, the instruction after the one that was stepped.
 - For Exception Catch debug events:
 - If the debug event is generated on taking an exception to a trapped Exception level, the **DLR** is set to the address of the exception vector the PE would have started fetching from. This is UNKNOWN if the **VBAR** for the Exception level has never been initialized. The **DSPSR** records the value of **PSTATE** after taking the exception. The Exception Catch occurs after the **SPSR** and the Link register are set, and the debugger can use these registers to determine where in the application program the exception occurred.
- **Note** —————
- Depending on the target Exception level and Execution state for the exception, the Link register is one of **ELR_EL1**, **ELR_EL2**, **ELR_EL3**, **ELR_hyp**, or LR (R14).
- If the debug event is generated on an exception return to a trapped Exception level, the **DLR** is set to the target address of the exception return and the **DSPSR** records the value of **PSTATE** after the exception return.
 - Reset Catch debug events taken synchronously behave like Exception Catch debug events.
 - For Reset Catch debug events and Exception Catch debug events generated on reset to a trapped Exception level, the **DLR** is set to is set to the reset address and the **DSPSR** records the reset value of **PSTATE**.
 - For pending Halting debug events and External Debug Request debug events, **DLR** is set to the address of the first instruction that must be executed on exit from Debug state and **DSPSR.IT** is correct for this instruction. See *Pending Halting debug events on page H3-6477*.

Normally **DLR** is aligned according to the instruction set state indicated in **DSPSR**. However, a debug event might be taken at a point where the PC is not aligned.

H2.3.3 Effect of Debug state entry on System registers, the Event register, and Exclusives monitors

Entering Debug state has no effect on System registers other than **DLR** and **DSPSR**. In particular, ESRs, FARs, and FSRs are not updated on entering Debug state. **SCR** is unchanged, even when entering Debug state from EL3.

Entering Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors.

———— **Note** —————

Entry to Debug state might set the Event Register or clear the Exclusives monitors, or both. However, this is not a requirement, and debuggers must not rely on any implementation specific behavior.

Unless otherwise described in this reference manual, instructions executed in Debug state have their architecturally-defined effects on the System registers, the Event register, and Exclusives monitors.

H2.3.4 Effect of entering Debug state on PSTATE

The effect of an entry to Debug state on **PSTATE** is described in *Entering Debug state on page H2-6424* and *Entering Debug state from AArch32 state on page H2-6424*. On entry to Debug state:

- **PSTATE**. {E, M, nRW, EL, SP, DIT} are unchanged.
- **PSTATE.IL** is cleared to 0, after being saved in **DSPSR_EL0.IL**.
- **PSTATE.PAN** is saved in **DSPSR_EL0.PAN**.
- **PSTATE.UAO** is saved in **DSPSR_EL0.UAO**.

The other `PSTATE` fields are ignored and not observable in Debug state:

- `PSTATE`.{N, Z, C, V, Q, GE} are unchanged.
- `PSTATE`.{IT, T, SS, D, A, I, F} are set to UNKNOWN values, after being saved in `DSPSR_EL0`.

For more information see *Process state (PSTATE) in Debug state* on page H2-6427.

H2.3.5 Entering Debug state during loads and stores

The PE can enter Debug state during instructions that perform a sequence of memory accesses, as opposed to a single single-copy atomic access, because of a Watchpoint debug event. The effect of entering Debug state on such an instruction is the same as taking a Data Abort exception during such an instruction.

In addition, when executing in AArch64 state, the PE can enter Debug state during instructions that perform a sequence of memory accesses because of an External Debug Request debug event. The effect of entering Debug state on such an instruction is the same as taking an interrupt exception during such an instruction.

This applies to all memory types.

H2.3.6 Entering Debug state and Software Step

When Software Step is active, a debug event that causes entry to Debug state behaves like an exception taken to an Exception level above the debug target Exception level. That is:

- If the instruction that is stepped generates a synchronous debug event that causes entry to Debug state, or an asynchronous debug event is taken before the step completes, the PE enters Debug state with `DSPSR.SS` set to 1.
- A pending Halting debug event or an asynchronous debug event can be taken after the step has completed. In this case the PE enters Debug state with `DSPSR.SS` set to 0.

In addition:

- If the instruction that is stepped generates an exception trapped by an Exception Catch debug event, the PE enters Debug state at the exception vector with `DSPSR.SS` set to 0. This is because `PSTATE.SS` is set to 0 by taking the exception.
- If the PE is reset, `PSTATE.SS` is reset to 0. If the following debug events are enabled, the PE enters Debug state with `DSPSR.SS` set to 0:
 - Reset Catch debug event at the reset Exception level.
 - Exception Catch debug event at the reset Exception level.
 - Halting Step debug event.
- If Halting Step is also active, then Halting Step and Software Step operate in parallel and can both become active-pending. In this case Halting step has a higher priority than Software step. This means that the PE enters Debug state and `DSPSR.SS` is set to 0.

H2.3.7 Pseudocode description of entering Debug state

The `DebugHalt` constants are described in *shared/debug/halting/DebugHalt* on page J1-7096 in the ARMv8 pseudocode. The `UpdateEDSFields()` and `Halt()` functions are described in *Chapter J1 ARMv8 Pseudocode*.

H2.4 Behavior in Debug state

Instructions are executed in Debug state from the Instruction Transfer Register, ITR. The debugger controls which instructions are executed in Debug state by writing the instructions to the External Debug Instruction Transfer register, [EDITR](#). The Execution state of the PE determines which instruction set is executed:

- If the PE is in AArch64 state it executes A64 instructions.
- If the PE is in AArch32 state it executes T32 instructions:
 - For a 32-bit T32 instruction, [EDITR\[15:0\]](#) specifies the first halfword and [EDITR\[31:16\]](#) specifies the second halfword.
 - For a 16-bit T32 instruction, [EDITR\[15:0\]](#) contains the instruction and [EDITR\[31:16\]](#) is ignored. All 16-bit T32 instructions are UNPREDICTABLE in Debug state.

The PE does not execute A32 instructions in Debug state.

Some instructions are available only in Debug state. See [Debug state operations, DCPS, DRPS, MRS, MSR](#) on page H2-6443. In Non-debug state these instructions are UNDEFINED.

The following sections describe behavior in Debug state:

- [Process state \(PSTATE\) in Debug state.](#)
- [Executing instructions in Debug state](#) on page H2-6428.
- [Decode tables](#) on page H2-6438.
- [Security in Debug state](#) on page H2-6442.
- [Privilege in Debug state](#) on page H2-6443.
- [Debug state operations, DCPS, DRPS, MRS, MSR](#) on page H2-6443.
- [Exceptions in Debug state](#) on page H2-6446.
- [Accessing registers in Debug state](#) on page H2-6448.
- [Accessing memory in Debug state](#) on page H2-6451.

This section specifies the CONSTRAINED UNPREDICTABLE behaviors that apply in Debug state, but see [Changing the value of EDECR.SS when not in Debug state](#) on page H3-6465 for a change in Non-debug state that causes CONSTRAINED UNPREDICTABLE behavior.

H2.4.1 Process state (PSTATE) in Debug state

[PSTATE](#).{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F} are all ignored in Debug state:

- There are no conditional instructions in Debug state.
- In AArch32 state, the PE only executes T32 instructions and [PSTATE.IT](#) is ignored.
- Asynchronous exceptions and debug events are ignored.
- Software step is inactive.

Instructions executed in Debug state indirectly read [PSTATE](#).{UAO, PAN, IL, E, M, nRW, EL, SP} as they would in Non-debug state.

————— Note —————

[PSTATE.DIT](#) is not guaranteed to have any effect in Debug state.

In Debug state:

- [PSTATE.PAN](#) is set to 1 by:
 - A DCPS instruction to EL1 using AArch64 if [SCTLR_EL1.SPAN](#) == 0.
 - A DCPS instruction to EL2 using AArch64 if [SCTLR_EL2.SPAN](#) == 0.
- [PSTATE.UAO](#) is set to 0 by a DCPS instruction to AArch64.
- [PSTATE](#) can also be changed by taking exceptions in Debug state, and by the execution of DCPS and DRPS instructions.

H2.4.2 Executing instructions in Debug state

The instructions executed in Debug state must be either A64 instructions or T32 instructions, depending on the current Execution state.

Each instruction falls into one of the following groups:

- Debug state instructions. These are instructions that are changed in Debug state. See *A64 instructions that are changed in Debug state* and *T32 instructions that are changed in Debug state* on page H2-6433.
- Instructions that are unchanged in Debug state. See *A64 instructions that are unchanged in Debug state* and *T32 instructions that are unchanged in Debug state* on page H2-6434.
- Instructions that are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state. See *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-6430 and *T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-6436.

All T32 instructions are treated as unconditional, regardless of PSTATE.IT. See *Process state (PSTATE) in Debug state* on page H2-6427.

If EDSCR.SDD == 1 then an instruction executed in Non-secure state cannot cause entry into Secure state. See *Security in Debug state* on page H2-6442

Executing A64 instructions in Debug state

The following sections describe the behavior of the A64 instructions in Debug state:

- *A64 instructions that are changed in Debug state.*
- *A64 instructions that are unchanged in Debug state.*
- *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-6430.

A64 instructions that are changed in Debug state

The following A64 instructions are defined in Debug state, but are undefined in Non-debug state:

- DCPS.

———— **Note** —————

DCPS can be UNDEFINED in certain conditions in Debug state. See *DCPS<n>* on page H2-6443.

- DRPS.
- MRS (DLR_EL0), MRS (DSPSR_EL0), MSR (DLR_EL0), MSR (DSPSR_EL0)

For more information see *Debug state operations, DCPS, DRPS, MRS, MSR* on page H2-6443.

A64 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state:

Any instruction that is UNDEFINED in Non-debug state

This list of instructions excludes:

- Any instruction listed in *A64 instructions that are changed in Debug state.*
- Any instruction listed in *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-6430 that is UNDEFINED because an enable or disable bit is not RES0 or RES1

Instructions that move System or Special-purpose registers to or from a general-purpose register

This list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes PSTATE access instructions.

These instructions are:

- MRS <special_reg>, MSR <special_reg>.

————— **Note** —————

This does not include NZCV, DAIF, DAIFSet, DAIFClr, SPSel, and CurrentEL.

- MRS <system_reg>, MSR <system_reg>.

Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- FMOV (between a general-purpose register and a half-precision register).
- FMOV (between a general-purpose register and a single-precision register).
- FMOV (between a general-purpose register and a double-precision register).
- FMOV (between a general-purpose register and a SIMD element).

SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- INS (from a general-purpose register to a SIMD element).
- UMOV (from a SIMD element to a general-purpose register).

Barriers

These instructions are:

- DMB.
- DSB.
- ESB, when the [RAS Extension](#) is implemented.
- ISB.
- PSB, when the [Statistical Profiling Extension](#) is implemented.

Memory access instructions at various access sizes

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
 - Unscaled (9-bit signed) immediate offset.
 - Immediate (9-bit signed) post-indexed.
 - Immediate (9-bit signed) pre-indexed.
 - Unprivileged (9-bit signed).
- Not literal.
- One of the following types:
 - (Single) register.
 - Exclusive.
 - Exclusive pair.
 - Acquire/Release.
 - Acquire/Release Exclusive.
 - Acquire/Release Exclusive pair.
- 32-bit and 64-bit target register variants.

These instructions are:

- LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW (immediate, not literal).
- LDUR, LDURB, LDURH, LDURSB, LDURSH, LDURSW (immediate).
- LDTR, LDTRB, LDTRH, LDTRSB, LDTRSH, LDTRSW (immediate).
- LDAR, LDARB, LDARH, LDXR, LDXRB, LDXRH, LDAXR, LDAXRB, LDAXRH.
- LDXP, LDAXP.
- STR, STRB, STRH (immediate).
- STUR, STURB, STURH (immediate).

- STTR, STTRB, STTRH (immediate).
- STLR, STLRB, STLRH, STXR, STXRB, STXRH, STLXR, STLXRB, STLXRH.
- STXP, STLXP.
- LDLAR, LDLARB, LDLARH - ARMv8.1 instructions.
- STLLR, STLLRB, STLLRH - ARMv8.1 instructions.
- CAS, CASB, CASH, CASP - ARMv8.1 instructions.
- SWP, SWPB, SWPH - ARMv8.1 instructions.
- LDADD, LDADDB, LDADDH - ARMv8.1 instructions.
- LDCLR, LDCLB, LDCLR - ARMv8.1 instructions.
- LDEOR, LDEORB, LDEORH - ARMv8.1 instructions.
- LDSET, LDSETB, LDSETH - ARMv8.1 instructions.
- LDSMAX, LDSMAXB, LDSMAXH - ARMv8.1 instructions.
- LDSMIN, LDSMINB, LDSMINH - ARMv8.1 instructions.
- LDUMAX, LDUMAXB, LDUMAXH - ARMv8.1 instructions.
- LDUMIN, LDUMINB, LDUMINH - ARMv8.1 instructions.
- STADD, STADDB, STADDH - ARMv8.1 instructions.
- STCLR, STCLB, STCLR - ARMv8.1 instructions.
- STEOR, STEORB, STEORH - ARMv8.1 instructions.
- STSET, STSETB, STSETH - ARMv8.1 instructions.
- STSMAX, STSMAXB, STSMAXH - ARMv8.1 instructions.
- STSMIN, STSMINB, STSMINH - ARMv8.1 instructions.
- STUMAX, STUMAXB, STUMAXH - ARMv8.1 instructions.
- STUMIN, STUMINB, STUMINH - ARMv8.1 instructions.
- LDAPR, LDAPRB, LDAPRH - ARMv8.3 instructions.
- LDAPURH, LDAPURSH, LDAPUR, LDAPURSW, LDAPURSB, LDAPURB - ARMv8.4 instructions.
- STLUR, STLURH, STLURB - ARMv8.4 instructions.

Move immediate to general-purpose register

These instructions are:

- MOVZ, MOVN, MOVK (immediate).
- MOV (between a general-purpose register and the stack pointer).

System instructions, Send Event, NOP, and Clear Exclusive

In this context, the System instructions are the Cache maintenance instructions, TLB maintenance instructions, and the Address translation instructions.

These instructions are:

- IC.
- DC.
- TLBI.
- AT.
- SEV, SEVL.
- NOP.
- CLREX.

A64 instructions that are CONstrained UNpredictable in Debug state

This subsection describes all instruction not listed in either:

- [A64 instructions that are changed in Debug state on page H2-6428.](#)
- [A64 instructions that are unchanged in Debug state on page H2-6428.](#)

These instructions are CONstrained UNPREDICTABLE in Debug state. In general, the permissible behaviors are:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- If the instruction reads the PC or [PSTATE](#), it uses an UNKNOWN value.
- If the instruction modifies the PC or [PSTATE](#), other than by advancing the PC to the sequentially next instruction, it sets [DLR_EL0](#) and [DSPSR_EL0](#) to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for A64 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed. An example of this is CCMP.

Exception-generating instructions

These instructions are:

- SVC.
- HVC.
- SMC.
- BRK.
- HLT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.
- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception that the instruction would generate in Non-debug state. The exception is taken as described in [Exceptions in Debug state on page H2-6446](#)

Note

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSCR.SDD is set to 1.

Instructions that explicitly write to the PC (branches)

These instructions are:

- B, B. cond, BL, BLR, BR, CBZ, CBNZ, RET, TBZ, TBNZ.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set [DSPSR_EL0](#) and [DLR_EL0](#) to UNKNOWN values.

Exception return and related instructions

These instructions are:

- ERET.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.

- They execute as in Non-debug state without branching. They set **DSPSR_EL0** and **DLR_EL0** to UNKNOWN values, and either:
 - Execute the DRPS operation instead of performing an exception return, using UNKNOWN SPSR values.
 - Not change the Exception level.

Instructions that request entry to a low-power state

These instructions are:

- WFE, WFI.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See [Configurable instruction enables and disables, and trap controls on page D1-2208](#).
- A WFE instruction clears the Event register if it is set.

———— Note —————

This means that these instructions must not suspend execution.

Instructions that read the PC

These instructions are:

- LDR (literal), LDRSW (literal).
- ADR, ADRP.
- PRFM (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, using an UNKNOWN value for the PC operand.

Instructions that explicitly modify **PSTATE**, other than DCPS and DRPS

These instructions are:

- ADDS, SUBS, ADCS, SBCS, ANDS, BICS, CCMN, CCMP.
- FCMP, FCMP, FCCMP, FCCMPE.
- MSR DAIFSet (immediate), MSR DAIFClr (immediate), MSR SPSe1 (immediate).
- MSR NZCV (register), MSR DAIF (register), MSR SPSe1 (register).
- When **ARMv8.1-PAN** is implemented, MSR PAN (immediate) and MSR PAN (register).
- When **ARMv8.2-UAO** is implemented, MSR UAO (immediate) and MSR UAO (register).
- When **ARMv8.4-CondM** is implemented, CFINV, RMIF, SETF8, SETF16.
- When **ARMv8.4-DIT** is implemented, MSR DIT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting **DSPSR_EL0** and **DLR_EL0** to UNKNOWN values.

Instructions that read **PSTATE**.{N, Z, C, V} or other **PSTATE** fields

These instructions are:

- CSEL, CSINC, CSINV, CSNEG, CCMN, CCMP, FCSEL, FCCMP, FCCMPE.
- ADC, ADCS, SBC, SBCS.
- CFINV.
- MRS NZCV, MRS DAIF, MRS SPSe1, MRS CurrentEL.

- When [ARMv8.1-PAN](#) is implemented, MRS PAN.
- When [ARMv8.2-UAO](#) is implemented, MRS UAO.
- When [ARMv8.4-CondM](#) is implemented, CFINV.
- When [ARMv8.4-DIT](#) is implemented, MRS DIT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
 - For the conditional operations and those using the [PSTATE.C](#) flag as an input, these instructions use an UNKNOWN value for the Condition flag.
 - For the MRS instruction, they return an UNKNOWN value.

All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They have the same behavior as in Non-debug state.

———— Note —————

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state.

Executing T32 instructions in Debug state

The following sections describe the behavior of the T32 instructions in Debug state:

- [T32 instructions that are changed in Debug state.](#)
- [T32 instructions that are unchanged in Debug state on page H2-6434.](#)
- [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-6436.](#)

T32 instructions that are changed in Debug state

The following T32 instructions are defined in Debug state, but are undefined in Non-debug state:

- DCPS

———— Note —————

DCPS can be UNDEFINED in certain conditions in Debug state. See [DCPS<n> on page H2-6443.](#)

- MRC p15, 3, <Rt>, c4, c5, 0 (DSPSR).
- MCR p15, 3, <Rt>, c4, c5, 0 (DSPSR).
- MRC p15, 3, <Rt>, c4, c5, 1 (DLR).
- MCR p15, 3, <Rt>, c4, c5, 1 (DLR).

In addition, ERET executes the DRPS operation in Debug state.

For more information see [Debug state operations, DCPS, DRPS, MRS, MSR on page H2-6443.](#)

T32 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state. Any T32 instruction that uses the PC or APSR. {N, Z, C, V} as the source or destination register is not included in the list. Moreover, the list only includes the 32-bit T32 encodings.

Any instruction that is UNDEFINED in Non-debug state

The list of instructions:

- Excludes any instruction listed in [T32 instructions that are changed in Debug state on page H2-6433](#).
- Excludes any instruction listed in [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-6436](#) that is UNDEFINED because an enable or disable bit is not RES0 or RES1

Instructions that move System or Special-purpose registers to or from a general-purpose register

The list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes APSR and CPSR access instructions.
- Excludes instructions for accessing banked registers for the current mode.

These instructions are:

- MRS <banked_reg>, MSR <banked_reg>.

———— **Note** —————

This does not apply to cases which are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state in the current mode.

- MRC, MCR.

———— **Note** —————

This includes all allocated System registers in the (coproc==0b111x) encoding space other than an MRC move to APSR_nzcv.

- MRS SPSR, MSR SPSR.
- VMRS <vfp_system_reg>, VMSR <vfp_system_reg>.

———— **Note** —————

This includes all allocated Advanced SIMD and floating-point System registers, other than an a VMRS move to APSR_nzcv.

Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a single-precision register).
- VMOV (between a general-purpose register and a doubleword floating-point register).

SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a scalar).

Barriers

These instructions are:

- DMB.
- DSB.
- ESB, when the [RAS Extension](#) is implemented.
- ISB.

Memory access instructions at various access sizes

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
 - Immediate (8-bit or 12-bit) offset.
 - Immediate (8-bit) post-indexed.
 - Immediate (8-bit) pre-indexed.
 - Unprivileged (8-bit).
- Not literal.
- One of the following types:
 - (Single) register.
 - Dual.
 - Exclusive.
 - Exclusive doubleword.
 - Acquire/Release.
 - Acquire/Release Exclusive.
 - Acquire/Release Exclusive doubleword.

These instructions are:

- LDR.W, LDRB.W, LDRH.W, LDRD, LDRSB.W, LDRSH.W (immediate, not literal).
- LDRT, LDRBT, LDRHT, LDRSBT, LDRSHT (immediate).
- LDREX, LDREXB, LDREXH, LDA, LDAB, LDAH, LDAEX, LDAEXB, LDAEXH.
- LDREXD, LDAEXD.
- STR.W, STRB.W, STRH.W, STRD (immediate).
- STRT, STRBT, STRHT (immediate).
- STREX, STREXB, STREXH, STL, STLB, STLH, STLEX, STLEXB, STLEXH.
- STREXD, STLEXD.

Move to general-purpose register

These instructions are:

- MOVW, MOVT (immediate).

System instructions, Send Event, NOP, and Clear Exclusive

The System instructions are Cache maintenance instructions, TLB maintenance instructions, and Address translation instructions. These are encoded in the (coproc==0b1111) System register encoding space.

These instructions are:

- [ICIALLU](#), [ICIALLUIS](#), [ICIMVAU](#).
- [DCCIMVAC](#), [DCCISW](#), [DCCMVAC](#), [DCCMVAU](#), [DCCSW](#), [DCIMVAC](#), [DCISW](#).
- [TLBIALL](#), [TLBIALLH](#), [TLBIALLHIS](#), [TLBIALLIS](#), [TLBIALLNSNH](#), [TLBIALLNSNHIS](#), [TLBIASID](#), [TLBIASIDIS](#), [TLBIIPAS2](#), [TLBIIPAS2IS](#), [TLBIIPAS2L](#), [TLBIIPAS2LIS](#), [TLBIMVA](#), [TLBIMVAA](#), [TLBIMVAAIS](#), [TLBIMVAAL](#), [TLBIMVAALIS](#), [TLBIMVAH](#), [TLBIMVAHIS](#), [TLBIMVAIS](#), [TLBIMVAL](#), [TLBIMVALH](#), [TLBIMVALHIS](#), [TLBIMVALIS](#).
- [ATS12NSOPR](#), [ATS12NSOPW](#), [ATS12NSOUR](#), [ATS12NSOUW](#), [ATS1CPR](#), [ATS1CPW](#), [ATS1CUR](#), [ATS1CUW](#), [ATS1HR](#), [ATS1HW](#).
- [BPIALL](#), [BPIALLIS](#), [BPIMVA](#).
- [SEV.W](#), [SEVL.W](#).
- [NOP.W](#).
- [CLREX](#).

T32 instructions that are CONstrained UNPREDICTABLE in Debug state

This subsection describes all instruction not listed in either:

- [T32 instructions that are changed in Debug state on page H2-6433](#).
- [T32 instructions that are unchanged in Debug state on page H2-6434](#).

These instructions are CONstrained UNPREDICTABLE in Debug state. In general, the permissible behaviors are:

- The instruction generates an Undefined Instruction exception.
- The instruction executes as a NOP.
- If the instruction reads the PC or [PSTATE](#), it uses an UNKNOWN value.
- If the instruction modifies the PC or [PSTATE](#), other than by advancing the PC to the sequentially next instruction, it sets [DLR](#) and [DSPSR](#) to unknown values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for T32 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed.

Exception-generating instructions

These instructions are:

- SVC.
- HVC.
- SMC.
- UDF.
- BKPT.
- HLT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.
- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception the instruction would generate in Non-debug state. The exception is taken as described in [Exceptions in Debug state on page H2-6446](#)

Note

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSCR.SDD is set to 1.

Instructions that explicitly write to the PC (branches)

These instructions are:

- B, B (conditional), CBZ, CBNZ BL.
- BX, BLX (register or immediate).
- BXJ, TBB, TBH.
- MOV pc and related instructions.
- LDR pc, LDM (with a register list includes the PC), POP (with a register list that includes the PC).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.

- They execute as in Non-debug state without branching and set **DSPSR** and **DLR** to UNKNOWN values.

Exception return and related instructions, other than ERET

These instructions are:

- SRS, RFE, SUBS pc, 1r, and related instructions.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching, setting **DLR** and **DSPSR** to UNKNOWN values, and either:
 - Execute the DRPS operation instead of performing an exception return, using UNKNOWN SPSR values.
 - Not changing Exception level or PE mode.

Instructions that request entry to a low-power state

These instructions are:

- WFE, WFI.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See [Configurable instruction enables and disables, and trap controls on page G1-5314](#).
- A WFE instruction is permitted to clear the Event register if it is set.

Note

This means that these instructions must not suspend execution.

Instructions that read the PC

These instructions are:

- LDR (literal), LDRB (literal), LDRH (literal), LDRSB (literal), LDRSH (literal).
- ADR, ADRL, ADRH.
- PLD (literal), PLI (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state using an UNKNOWN value for the PC operand.

Instructions that explicitly modify **PSTATE**, other than DCPS and ERET

These instructions are:

- CMP, TST, TEQ, CMN.
- <opc>S.
- MRC p14, 0, APSR_nzcv, c0, c1, 0 (accessing DBGDSCRint).
- CPS, SETEND, IT.
- MSR CPSR (immediate), MSR CPSR (register), MSR APSR (immediate), MSR APSR (register).
- VMRS APSR_nzcv, FPSCR.
- QADD, QDADD, QSUB, QDSUB.
- SMLABB, SMLABT, SMLATB, SMLATT, SMLAD, SMLAWB, SMLAWT, SMLSD, SMUAD.
- SSAT, SSAT16, USAT, USAT16.

- SADD, SADD8, SADD16, SASX, SSAX, SSUB, SSUB8, SSUB16.
- UADD, UADD8, UADD16, UASX, USAX, USAUB, USUN8, USUB16.
- When [ARMv8.1-PAN](#) is implemented, SETPAN.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting [DSPSR_ELO](#) and [DLR_ELO](#) to UNKNOWN values.

Instructions that read [PSTATE](#).{N, Z, C, V} or other [PSTATE](#) fields

These instructions are:

- SEL, VSEL.
- ADC, SBC, all instructions with an RRX shift.
- MRS CPSR.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
 - For the conditional operations and those using the [PSTATE.C](#) flag as an input, these instructions use an UNKNOWN value for the Condition flag.
 - For the MRS instruction, they return an UNKNOWN value

All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They have the same behavior as in Non-debug state.

———— Note —————

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are CONSTRAINED UNPREDICTABLE in Debug state. This includes some T32 instructions that specify R15 as a destination or source register.

[Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#) describes the CONSTRAINED UNPREDICTABLE behavior for these instructions. In Debug state these CONSTRAINED UNPREDICTABLE choices are further restricted:

- Instructions that specify R15 as a destination register:
 - Are not permitted to branch, because the architecture does not define a branch operation in Debug state.
 - Might set [DLR](#) and [DSPSR](#) to UNKNOWN values.
 - Might have any of the other permitted behaviors.
- Instructions that specify R15 as a source operand:
 - Cannot use PC + offset, because there is no architecturally-defined PC in Debug state.
 - Might have any of the other permitted behaviors, including using an UNKNOWN value.

H2.4.3 Decode tables

The syntax in the tables is defined as follows:

- | | |
|----------|---------------------------------|
| 1 | The bit has a fixed value of 1. |
| 0 | The bit has a fixed value of 0. |

!= The field has any value other than the value or values specified. The field might be an encoding field in the instruction whose value is supplied by the debugger.

Note

The instruction encodings in [Chapter C6 A64 Base Instruction Descriptions](#) and [Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions](#) might show these bits as (0) or (1). A debugger must set these bits to 0 or 1, as appropriate.

Any other value indicates an encoding field in the instruction whose value is supplied by the debugger. Some values might be reserved or undefined, in which case the instruction is UNDEFINED or CONSTRAINED UNPREDICTABLE in Debug state, as it is in Non-debug state.

For more information about the instruction encodings, see:

- [Chapter C6 A64 Base Instruction Descriptions](#).
- [Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions](#).

For information about the syntax used in [Table H2-2](#), [Table H2-3](#), [Table H2-4](#), and [Table H2-5](#) on page H2-6440, see:

- [Common syntax terms](#) on page C1-151.
- [Assembler symbols](#) on page F2-3651.

[Table H2-2](#) shows the A64 instructions that are modified in Debug state. For details of how these are packed in the [EDITR](#) see the register description.

H2.4.4 Security in Debug state

If EL3 is implemented or the implemented Security state is Secure state, security in Debug state is governed by the Secure debug disabled flag, [EDSCR.SDD](#).

On entry to Debug state

If entering in Secure state, [EDSCR.SDD](#) is set to 0. Otherwise [EDSCR.SDD](#) is set to the inverse of `ExternalSecureInvasiveDebugEnabled()`. That is:

- If `ExternalSecureInvasiveDebugEnabled() == TRUE`, [EDSCR.SDD](#) is set to 0.
- If `ExternalSecureInvasiveDebugEnabled() == FALSE`, [EDSCR.SDD](#) is set to 1.

Note

Normally, if `ExternalSecureInvasiveDebugEnabled() == FALSE` then halting is prohibited and it is not possible to enter Debug state from Secure state. However, because changes to the authentication signals require a *Context synchronization event* to guarantee their effect, there is a period during which the PE might halt even though the authentication signals prohibit halting.

In Debug state

The value of [EDSCR.SDD](#) does not change, even if `ExternalSecureInvasiveDebugEnabled()` changes.

Note

- [DBGAUTHSTATUS_EL1](#).{SNID, SID, NSNID, NSID} are not frozen in Debug state.
 - If [EDSCR.SDD](#) set to 1 in Debug state, then there is no means to enter Secure state from Non-secure state. In this case it is impossible for the PE to be in Secure state. This is a general principle of behavior in Debug state.
-

In Non-debug state

[EDSCR.SDD](#) returns the inverse of `ExternalSecureInvasiveDebugEnabled()`. If the authentication signals that control `ExternalSecureInvasiveDebugEnabled()` change, a *Context synchronization event* is required to guarantee their effect.

Note

- In Non-debug state, [EDSCR.SDD](#) is unaffected by the Security state of the PE.
 - A *Context synchronization event* is also required to guarantee that changes in the authentication signals are visible in [DBGAUTHSTATUS_EL1](#).{SNID, SID, NSNID, NSID}.
-

If EL3 is not implemented and the implemented Security state is Non-Secure state, [EDSCR.SDD](#) is RES1.

H2.4.5 Privilege in Debug state

The only additional privileges offered to Debug state are:

- The privilege to execute *Debug state operations, DCPS, DRPS, MRS, MSR*.
- The privilege to execute DTR access instructions regardless of the Exception level and traps.

The DTR access instructions can be executed at any Exception level, including EL0, regardless of any control register settings that might force these instructions to be undefined or trapped in Non-debug state. These instructions are:

- The MRS and MSR instructions that access `DBGDTR_EL0`, `DBGDTRTX_EL0`, and `DBGDTRRX_EL0` in AArch64 state.
- The MRC and MCR instructions that access `DBGDTRTXint` and `DBGDTRRXint` in AArch32 state.

All other instructions operate with the privilege determined by the current Exception level and security state. This applies to all Special-purpose and System registers accesses, memory accesses, and undefined instructions, and includes generating exceptions when the System registers trap or disable an instruction.

H2.4.6 Debug state operations, DCPS, DRPS, MRS, MSR

ARMv8 defines operations to change between Exception levels in Debug state. These operations can also change the mode at the current Exception level.

DCPS<n>

Executing a DCPS<n> instruction in Debug state moves the PE to a higher Exception level or to a specific mode at the current Exception level.

If the DCPS<n> instruction is executed in AArch32 state and the target Exception level is using AArch64:

- The current instruction set switches from T32 to A64.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for system calls in Non-debug state. See *Execution state on page D1-2149*.

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- In AArch64 state the current endianness is determined by the value of `SCTLR_ELx.EE` for the target Exception level.
- In AArch32 state the current endianness is determined by the value of `SCTLR.EE` or `HSCTLR.EE` for the target Exception level.

The DCPS<n> instructions are:

In AArch64 state

- `DCPS1`
- `DCPS2`
- `DCPS3`

In AArch32 state, in the T32 instruction set only

- `DCPS1 variant`
- `DCPS2 variant`
- `DCPS3 variant`

The DCPS instructions are undefined in Non-debug state.

Table H2-6 shows the target of the instruction. In Table H2-6 the entries have the following meaning:

EL1h/Svc	This means that the target is: <ul style="list-style-type: none"> EL1h if EL1 is using AArch64. EL1 and Supervisor mode if EL1 is using AArch32.
EL2h/Hyp	This means that the target is: <ul style="list-style-type: none"> EL2h if EL2 is using AArch64. EL2 and Hyp mode if EL2 is using AArch32.
EL3h/Monitor	This means that the target is: <ul style="list-style-type: none"> EL3h if EL3 is using AArch64. EL3 and Monitor mode if EL3 is using AArch32.
Svc	Secure Supervisor mode, in EL3 using AArch32.
Monitor	Secure Monitor mode, in EL3 using AArch32.

Table H2-6 Target for DCPS instructions in Debug state

Instruction	Target when DCPS instruction executed at stated Exception level:				
	EL0	EL1	EL2	EL3 (AArch64)	EL3 (AArch32)
DCPS1	EL1h/Svc	EL1h/Svc	EL2h/Hyp	EL3h	Svc, clears SCR.NS to 0
DCPS2	EL2h/Hyp	EL2h/Hyp	EL2h/Hyp	EL3h	UNDEFINED
DCPS3	EL3h/Monitor	EL3h/Monitor	EL3h/Monitor	EL3h	Monitor, clears SCR.NS to 0

In AArch32 Monitor mode, DCPS1 and DCPS3 clear SCR.NS to 0.

Note

In AArch64 state, at EL3, DCPS<n> does not change SCR_EL3.NS.

However:

- DCPS1 is undefined at EL0 if either:
 - EL2 is implemented and enabled in the current Security state, and is using AArch64 and HCR_EL2.TGE == 1.
 - In Non-secure state, EL2 is implemented and using AArch32 and HCR.TGE == 1.
- DCPS2 is undefined at all Exception levels if EL2 is not implemented.
- DCPS2 is undefined at the following Exception levels if EL2 is implemented:
 - At EL0 and EL1 in Secure state if EL2 is disabled in the current Security state.
 - At EL3 if EL3 is using AArch32.
- DCPS3 is undefined at all Exception levels if either:
 - EDSCR.SDD == 1.
 - EL3 is not implemented.

———— **Note** ————

The references to [DCPS1](#), [DCPS2](#), and [DCPS3](#) in this section link to the descriptions of the instructions in the A64 instruction set. The DCPS<n> instructions are also defined in the T32 instruction set, see [DCPS1](#), [DCPS2](#), [DCPS3](#) on page F5-3916. These instructions are not defined in the A32 instruction set, because A32 instructions cannot be executed in Debug state.

On executing a DCPS instruction:

- If the target Exception level is using AArch64:
 - [ELR_ELx](#) of the target Exception level becomes UNKNOWN.
 - [SPSR_ELx](#) of the target Exception level becomes UNKNOWN.
 - [ESR_ELx](#) of the target Exception level becomes UNKNOWN.
 - [DLR_EL0](#) and [DSPSR_EL0](#) become UNKNOWN.
- If the target Exception level is using AArch32 [DLR](#) and [DSPSR](#) become UNKNOWN and:
 - If the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.
 - If the target Exception level is EL2, then [ELR_hyp](#), [SPSR_hyp](#), and [HSR](#) become UNKNOWN.

If the target Exception level is using AArch32, and the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become unknown.

The [DCPSInstruction\(\)](#) function is described in [Chapter J1 ARMv8 Pseudocode](#).

DRPS

Executing the DRPS operation in Debug state moves the PE to a lower Exception level, or to another PE mode at the current Exception level, by copying the current SPSR to [PSTATE](#).

If [DRPS](#) is executed in AArch64 state and the target Exception level is using AArch32:

- The current instruction set switches from A64 to T32.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for exception returns in Non-debug state. See [Execution state](#) on page D1-2149.

Otherwise the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- If targeting an Exception level using AArch64, current endianness is set according to [SCTLR_ELx.EE](#), or [SCTLR_EL1.E0E](#) for the target Exception level.
- If targeting an Exception level using AArch32, current endianness is set by [SPSR.E](#) as appropriate.

The DRPS instructions are:

In AArch64 state

- [DRPS](#)

In AArch32 state, in the T32 instruction set only

- [ERET](#)

If the SPSR specifies an illegal exception return, then [PSTATE](#).{M, nRW, EL, SP} are unchanged and [PSTATE](#).IL is set to 1. For further information on illegal exception returns, see [Illegal return events from AArch64 state](#) on page D1-2180.

[PSTATE](#).{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F} are ignored in Debug state. This means that the effect of the DRPS operation on these fields is to set them to an UNKNOWN value that might be the value from the SPSR. For more information see [Process state \(PSTATE\) in Debug state](#) on page H2-6427.

All other [PSTATE](#) fields are copied from SPSR.

[DRPS](#) is undefined at EL0 and in Non-debug state.

———— **Note** —————

Unlike an exception return, the DRPS operation has no architecturally-defined effect on the Event Register and Exclusives monitors. DRPS might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

On executing a DRPS instruction:

- If the target Exception level is using AArch64:
 - [DLR_EL0](#) and [DSPSR_EL0](#) become UNKNOWN.
- If the target Exception level is using AArch32:
 - [DLR](#) and [DSPSR](#) become UNKNOWN.

The [DRPSInstruction\(\)](#) function is described in [Chapter J1 ARMv8 Pseudocode](#).

MRS and MSR

The other Debug state instructions are used to read or write [DLR_EL0](#) and [DSPSR_EL0](#).

These instructions are:

In AArch64 state

- [MRS](#)
- [MSR \(register\)](#)

In AArch32 state

- [MRC](#)
- [MCR](#)

```
MRS <Xt>, DLR_EL0      ; Copy DLR_EL0 to <Xt>
MRS <Xt>, DSPSR_EL0    ; Copy DSPSR_EL0 to <Xt>
MSR DLR_EL0, <Xt>      ; Copy <Xt> to DLR_EL0
MSR DSPSR_EL0, <Xt>    ; Copy <Xt> to DSPSR_EL0
```

These instructions can be executed at any Exception level when in Debug state, including EL0. They are undefined in Non-debug state.

H2.4.7 Exceptions in Debug state

The following sections describe how exceptions are handled in Debug state:

- [Generating exceptions when in Debug state](#).
- [Taking exceptions when in Debug state on page H2-6447](#).
- [Reset in Debug state on page H2-6448](#).

Generating exceptions when in Debug state

In Debug state:

- Instruction Abort exceptions cannot happen because instructions are not fetched from memory.
- Interrupts, including SError and virtual interrupts are ignored and remain pending:
 - The pending interrupt remains visible in [ISR](#).
- Debug exceptions and debug events are ignored.
- [SCR.EA](#) is treated as if it were set to 0, regardless of its actual state, other than for the purpose of reading the bit.

- Any attempt to execute an instruction bit pattern that is an allocated instruction at the current Exception level, but is listed in [Executing instructions in Debug state on page H2-6428](#) as undefined in Debug state, generates an exception, that is taken to the current Exception level, or to EL1 if executing at EL0.

———— **Note** —————

If the exception is taken to an Exception level that is using AArch32 then it is taken as an Undefined Instruction exception.

The priority and syndrome for these exceptions is the same as for executing an encoding that does not have an allocated instruction.

- Instructions executed at EL2, EL1 and EL0 that are configured by EL3 control registers to trap to EL3:
 - When the value of `EDSCR.SDD` is 0, generate the appropriate trap exception that is taken to EL3.
 - When the value of `EDSCR.SDD` is 1, are treated as UNDEFINED and generate an exception that is taken to the current Exception level, or to EL1 if the instruction is executed at EL0. If the exception is taken to an Exception level that is using AArch32 it is taken as an Undefined Instruction exception.
If the exception is taken to an Exception level using AArch64 or to AArch32 Hyp mode, then it is reported with an EC value of `0x00`.

Otherwise configurable traps, enables, and disables for instructions are unaffected by Debug state, and executing an affected instruction generates the appropriate exception.

Otherwise, synchronous exceptions, including Data Aborts, are generated as they would be in Non-debug state and taken to the appropriate Exception level in Debug state.

———— **Note** —————

If `EDSCR.SDD` = 1 then an exception from Non-secure state is never taken to Secure state. See [Security in Debug state on page H2-6442](#).

Taking exceptions when in Debug state

When the PE is in Debug state, all exceptions are synchronous. When an exception is generated, it is taken to Debug state. This means that:

- The target Exception level is as defined for the exception in Non-debug state.
- If the target Exception level is using AArch32 then the target PE mode is as defined for the exception in Non-debug state.
- The exception syndrome is reported as defined for the exception in Non-debug state, except for the case described in [Data Aborts in Memory access mode on page H4-6486](#) for which the reporting requirements are relaxed.

The exception syndrome is reported using the syndrome register or registers for the target Exception level. In AArch64 state, these are `ESR_ELx`, and `FAR_ELx`. In AArch32 state, these are `DFSR`, `DFAR`, `HSR`, `HDFAR`, and `HPFAR`. For example:

- If a Data Abort exception is taken to Abort mode at EL1 or EL3 and the exception is taken from AArch32 state and using the Short-descriptor translation table format, the `DFSR` reports the exception using the Short-descriptor format fault encoding. For exceptions other than Data Abort exceptions taken to Abort mode, `DFSR` is not updated.
- If an instruction is trapped to an Exception level using AArch64 due to a configurable trap, disable, or enable, the exception code reported is the same as it would be in Non-debug state.

The effect on auxiliary syndrome registers, such as `AFSR`, is IMPLEMENTATION DEFINED.

———— **Note** —————

Generally, the AArch32 Fault Address Registers (FARs) and Fault Status Registers (FSRs) are not described as *syndrome registers*, although the term is appropriate to their function.

- The PE remains in Debug state and changes to the target mode.
- If EL3 is using AArch32 and the exception is taken from Monitor mode, `SCR.NS` is cleared to 0.
- If the exception is taken to an Exception level using AArch32, the PE continues to execute T32 instructions, regardless of the TE bit in the System register for the target Exception level.
- The endianness switches to that indicated by the EE bit of the System register for the target Exception level.
- The SPSR for the target Exception level or mode is corrupted and becomes UNKNOWN.
- If the target Exception level is using AArch64, `ELR_ELx` for the target Exception level becomes unknown.
- If the target Exception level is EL2 using AArch32, `ELR_hyp` becomes unknown.
- If the target Exception level is EL1 or EL3 using AArch32, `LR_<mode>` for the target mode becomes unknown.
- `DLR` and `DSPSR` become UNKNOWN.
- The cumulative error flag, `EDSCR.ERR`, is set to 1. See *Cumulative error flag* on page H4-6490.
- `PSTATE.IL` is cleared to 0.
- `PSTATE`. {IT, T, SS, D, A, I, F} are set to UNKNOWN values, and `PSTATE`. {N, Z, C, V, Q, GE} are unchanged. However, these fields are ignored and are not observable in Debug state. For more information see *Process state (PSTATE) in Debug state* on page H2-6427.

The debugger must save any state that can be corrupted by an exception before executing an instruction that might generate another exception.

Pseudocode description of taking exceptions in Debug state

The pseudocode function `AArch64.TakeException()` shows the behavior when the PE takes an exception to an Exception level using AArch64 in Non-debug state. In Debug state, this is replaced with the function `AArch64.TakeExceptionInDebugState()`.

The pseudocode functions `AArch32.EnterMode()`, `AArch32.EnterHypMode()`, and `AArch32.EnterMonitorMode()` show the behavior when the PE takes an exception to an Exception level using AArch32 in Non-debug state. In Debug state:

- `AArch32.EnterMode()` is replaced with the function `AArch32.EnterModeInDebugState()`.
- `AArch32.EnterHypMode()` is replaced with the function `AArch32.EnterHypModeInDebugState()`.
- `AArch32.EnterMonitorMode()` is replaced with `AArch32.EnterMonitorModeInDebugState()`.

Reset in Debug state

If the PE is reset when in Debug state, it exits Debug state and enters Non-debug reset state. When the PE is in reset state, `EDSCR.STATUS == 0b000010` and writes to `EDITR` are ignored.

————— Note —————

If `EDECR.RCE == 1`, meaning that a Reset Catch debug event is programmed, and if halting is allowed on exiting reset state, then on exiting reset state the PE halts and re-enters Debug state. See *Reset Catch debug events* on page H3-6475. All PE registers have taken their reset values, which might be UNKNOWN.

H2.4.8 Accessing registers in Debug state

Register accesses are unchanged in Debug state. The view of each register is determined by either the current Exception level or the mode, or both, and accesses might be disabled or trapped by controls at a higher Exception level.

General-purpose register access, other than AArch64 state SP access

A single general-purpose register can be read by issuing an MSR instruction through the ITR to write `DBGDTR_EL0` in AArch64 state, or an MCR instruction through the ITR to write `DBGDTRXint` in AArch32 state. The debugger can then read the DTR register or registers through the external debug interface. The reverse sequence writes to a general-purpose register.

Figure H2-1 shows the reading and writing of general-purpose registers, other than SP, in Debug state in AArch64 state.

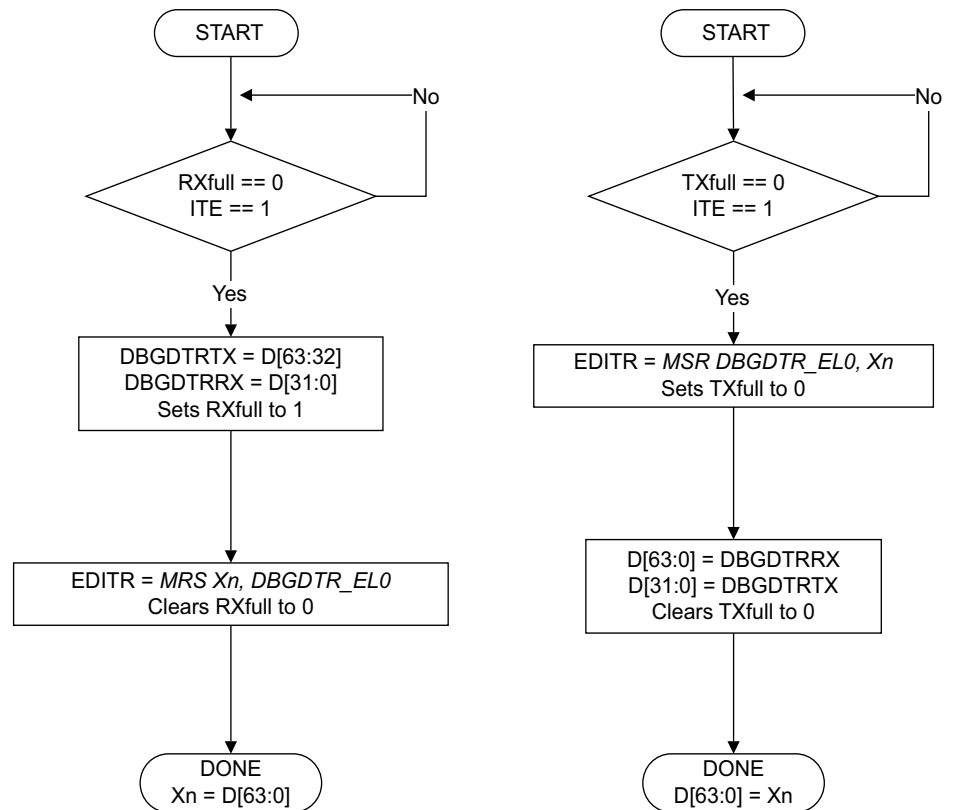

Figure H2-1 Reading and writing general-purpose registers, other than SP, in Debug state in AArch64 state

Figure H2-2 on page H2-6450 shows the reading and writing of general-purpose registers in Debug state in AArch32 state.

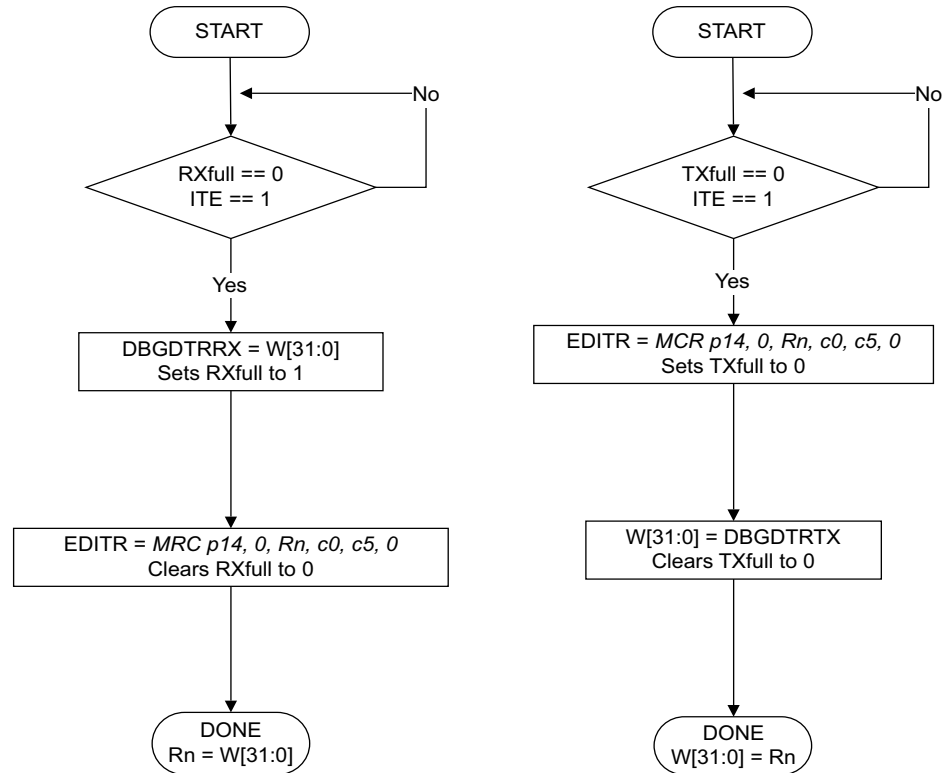

Figure H2-2 Reading and writing general-purpose registers in Debug state in AArch32 state

SIMD and floating-point register, System register, and AArch64 state SP accesses

To read a SIMD and floating-point register or a System register, the debugger must first copy the value into a general-purpose register using:

- An FMOV instruction in AArch64 state or a VMOV instruction in AArch32 state for floating-point transfers to SIMD and FP registers.
- A UMOV instruction in AArch64 state or a VMOV instruction in AArch32 state for SIMD transfers to SIMD and FP registers.
- An MRS instruction in AArch64 state or an MRC instruction in AArch32 state for System registers.
- A MOV Xd, SP instruction for the SP register in AArch64 state.

The debugger can then read out the particular general-purpose register. The reverse sequence writes a register.

PC and PSTATE access

The debugger reads the program counter and **PSTATE** of the process being debugged through the **DLR_EL0** and **DSPSR_EL0** System registers. The actual values of PC and **PSTATE** cannot be directly observed in Debug state:

- Instructions that are used for direct reads and writes of PC and **PSTATE** in Non-debug state are UNDEFINED in Debug state.
- On taking an exception, **ELR_ELx** and **SPSR_ELx** at the target Exception level are UNKNOWN. They do not record the PC and **PSTATE**.

PSTATE. {IL, E, M, nRW, EL, SP} are indirectly read by instructions executed in Debug state, but all other **PSTATE** fields are ignored and cannot be observed. See also:

- [Process state \(PSTATE\) in Debug state on page H2-6427.](#)
- [Executing instructions in Debug state on page H2-6428.](#)
- [Exceptions in Debug state on page H2-6446.](#)

H2.4.9 Accessing memory in Debug state

How the PE accesses memory is unchanged in Debug state. This includes:

- The operation of the MMU, including address translation, tagged address handling, access permissions, memory attribute determination, and the operation of any TLBs.
- The operation of any caches and coherency mechanisms.
- Alignment support.
- Endianness support.
- The Memory order model.

Simple memory transfers

Simple memory accesses can be performed in Debug state by issuing memory access instructions through the ITR and passing data through the DTR registers. [Executing instructions in Debug state on page H2-6428](#) lists the memory access instructions that are supported in Debug state.

Bulk memory transfers

Memory access mode can accelerate bulk memory transfers in Debug state. See [DCC and ITR access modes on page H4-6484](#).

H2.5 Exiting Debug state

The PE exits Debug state when it receives a Restart request trigger event. If `EDSCR.ITE == 0` the behavior of any instruction issued through the ITR in Normal access mode or an operation issued by a DTR access in memory access mode that has not completed execution is *CONSTRAINED UNPREDICTABLE*, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state after the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an *UNKNOWN* state.

Note

- Implementations can set `EDSCR.ITE` to 1 to indicate that further instructions can be accepted by ITR before the previous instructions have completed. If any previous instruction has not completed and `EDSCR.ITE == 1`, then the PE must complete these instructions in Debug state before executing the restart sequence. `EDSCR.ITE == 0` indicates that the PE is not ready to restart.
- A debugger must observe that any instructions issued through `EDITR` that might generate a synchronous exception, as complete, before issuing a restart request. It can do this by observing the completion of a later instruction, as synchronous exceptions must occur in program order. For example, a debugger can observe that an instruction that reads or writes a DTR register is complete because of its effect on the `EDSCR.{TXfull, RXfull}` flags.

On exiting Debug state, the PE sets the program counter to the address in `DLR`, where:

- If exiting to AArch32 state:
 - Bits[31:1] of the PC are set to the value of bits[31:1] of `DLR`.
 - Bit[0] of the PC is set to a *CONSTRAINED UNPREDICTABLE* choice of 0 or the value of bit[0] in `DLR`.
- If exiting to AArch64 state:
 - Bits[63:56] of `DLR_ELO` might be ignored as part of tagged address handling. See *Address tagging in AArch64 state* on page D5-2386.
 - Otherwise the PC is set from `DLR_ELO`.

Note

Bits[63:32] of `DLR_ELO` are ignored when exiting to AArch32 state.

Exit from Debug state can give rise to a PC alignment fault exception when the program counter is used. Unlike an exception return, this might also happen when returning to AArch32 state. For more information, see *PC alignment checking* on page D1-2164.

On exiting Debug state, `PSTATE` is set from `DSPSR` in the same way that an exception return sets `PSTATE` from `SPSR_ELx`:

- The same illegal exception return checks that apply to an exception return also apply to exiting Debug state. If the return from Debug state is an illegal exception return then the effect on `PSTATE` and the PC is the same as for any other illegal exception return. See *Exception return* on page D1-2179 and *Exception return to an Exception level using AArch32* on page G1-5261.
- The checks on the `PSTATE.IT` bits that apply to exiting Debug state into AArch32 state are the same as those that apply to an exception return. See *Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors*.
- `PSTATE.SS` is copied from `DSPSR.SS` if all of the following hold:
 - `MDSCR_EL1.SS == 1`.
 - The debug target Exception level is using AArch64.
 - Software step exceptions from the restart Exception level are enabled.

Otherwise `PSTATE.SS` is set to 0.

Note

Unlike a return using ERET, [PSTATE.SS](#) must be restored from [DSPSR.SS](#) because otherwise it is UNKNOWN.

However, if [OSDLR.DLK](#) == 1 and [DBGPRCR.CORENPDRQ](#) == 0, meaning the OS Double Lock is implemented and locked in Non-debug state and therefore Software Step exceptions are disabled, but otherwise Software Step exceptions would be enabled from the restart Exception level, it is CONSTRAINED UNPREDICTABLE whether [PSTATE.SS](#) is copied from [DSPSR.SS](#).

- If [ARMv8.1-PAN](#) is implemented, [PSTATE.PAN](#) is copied from [DSPSR_EL0.PAN](#).
- If [ARMv8.2-UAO](#) is implemented, [PSTATE.UAO](#) is copied from [DSPSR_EL0.UAO](#).
- If [ARMv8.4-DIT](#) is implemented, on exit from Debug state to AArch64 state, [DSPSR_EL0.DIT](#) is copied to [PSTATE.DIT](#).
- If [ARMv8.4-DIT](#) is implemented, on exit from Debug state to AArch32 state, [DSPSR.DIT](#) is copied to [CPSR.DIT](#).

Note

- One important difference between Debug state exit and an exception return is that the PE can exit Debug state at EL0. Despite this, the behavior of an exit from Debug state is similar to an exception return. For example, [PSTATE.{D, A, I, F}](#) is updated regardless of the value of [SCTLR_EL1.UMA](#).
- Exit from Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors. An exit from Debug state might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

The [ExitDebugState\(\)](#) function is described in [Chapter J1 ARMv8 Pseudocode](#).

H2 Debug State
H2.5 Exiting Debug state

Chapter H3

Halting Debug Events

This chapter describes a particular class of debug events. It contains the following sections:

- *Introduction to Halting debug events* on page H3-6456.
- *Halting Step debug events* on page H3-6458.
- *Halt Instruction debug event* on page H3-6468.
- *Exception Catch debug event* on page H3-6469.
- *External Debug Request debug event* on page H3-6473.
- *OS Unlock Catch debug event* on page H3-6474.
- *Reset Catch debug events* on page H3-6475.
- *Software Access debug event* on page H3-6476.
- *Synchronization and Halting debug events* on page H3-6477.

Note

[Table K13-1 on page K13-7394](#) disambiguates the general register references used in this chapter.

H3.1 Introduction to Halting debug events

External debug defines Halting debug events. The following Halting debug events are available in ARMv8:

- [Halting Step debug events on page H3-6458](#).
- [Halt Instruction debug event on page H3-6468](#).
- [Exception Catch debug event on page H3-6469](#).
- [External Debug Request debug event on page H3-6473](#).
- [OS Unlock Catch debug event on page H3-6474](#).
- [Reset Catch debug events on page H3-6475](#).
- [Software Access debug event on page H3-6476](#).

If halting is allowed, a Halting debug event halts the PE. The PE enters Debug state.

In addition, breakpoints and watchpoints might halt the PE if halting is allowed. See [Breakpoint and Watchpoint debug events on page H2-6418](#). Because breakpoints and watchpoints can generate an exception or halt the PE, Breakpoint and Watchpoint debug events are not classified as Halting debug events.

For a definition of Debug state, see [Chapter H2 Debug State](#). For a definition of halting allowed, see [Halting allowed and halting prohibited on page H2-6417](#).

[Debug state entry and debug event prioritization on page H2-6419](#) describes the behavior when multiple debug events are generated by an instruction.

See also [Synchronization and Halting debug events on page H3-6477](#).

[Table H3-1](#) shows the behavior of Breakpoint, Watchpoint, and Halting debug events.

Table H3-1 Summary of debug events and possible outcomes

Debug event type	PE behavior when halting is:	
	Allowed	Prohibited
Breakpoint and Watchpoint debug events on page H2-6418	Halt	See Table D2-1 on page D2-2284 and Table G2-1 on page G2-5353
Halt Instruction debug event on page H3-6468	Halt	UNDEFINED
Software Access debug event on page H3-6476	Halt	Ignored
Exception Catch debug event on page H3-6469	Halt	Ignored
Halting Step debug events on page H3-6458	Halt	Pended
External Debug Request debug event on page H3-6473	Halt	Pended
Reset Catch debug events on page H3-6475	Halt	Pended
OS Unlock Catch debug event on page H3-6474	Pended	Pended

[Table H3-2](#) shows where the pseudocode for each Halting debug event type is located.

Table H3-2 Pseudocode description of Halting debug events

Halting debug event type	Pseudocode
Halt Instruction debug event on page H3-6468	HLT on page C6-835 for AArch64 and HLT on page F5-3937 for AArch32
Software Access debug event on page H3-6476	Pseudocode description of Software Access debug event on page H3-6476
Exception Catch debug event on page H3-6469	Pseudocode description of Exception Catch debug events on page H3-6472
Halting Step debug events on page H3-6458	Pseudocode description of Halting Step debug events on page H3-6467

Table H3-2 Pseudocode description of Halting debug events (continued)

Halting debug event type	Pseudocode
<i>External Debug Request debug event on page H3-6473</i>	<i>Pseudocode description of External Debug Request debug events on page H3-6473</i>
<i>Reset Catch debug events on page H3-6475</i>	<i>Pseudocode description of Reset Catch debug event on page H3-6475</i>
<i>OS Unlock Catch debug event on page H3-6474</i>	<i>Pseudocode description of OS Unlock Catch debug event on page H3-6474</i>

H3.2 Halting Step debug events

Halting Step is a debug resource that a debugger can use to make the PE step through code one instruction at a time. This section describes the Halting Step debug events. It is divided into the following sections:

- [Overview of a Halting Step debug event.](#)
- [The Halting Step state machine.](#)
- [Using Halting Step on page H3-6461.](#)
- [Detailed Halting Step state machine behavior on page H3-6461.](#)
- [Synchronization and the Halting Step state machine on page H3-6464.](#)
- [Stepping T32 IT instructions on page H3-6465.](#)
- [Disabling interrupts while stepping on page H3-6466.](#)
- [Syndrome information on Halting Step on page H3-6466.](#)
- [Pseudocode description of Halting Step debug events on page H3-6467.](#)

The architecture describes the behavior as a simple Halting Step state machine. See [The Halting Step state machine.](#)

H3.2.1 Overview of a Halting Step debug event

The behavior of Halting Step is defined by a state machine, shown in [Figure H3-1 on page H3-6460](#). A Halting Step debug event executes a single instruction and then returns control to the debugger. When the debugger software wants to execute a Halting Step:

1. With the PE in Debug state, the debugger activates Halting Step.
2. The debugger signals the PE to exit Debug state and return to the instruction that is to be stepped.
3. The PE executes that single instruction.
4. The PE enters Debug state before executing the next instruction.

However, an exception might be generated while the instruction is being stepped. That is either:

- A synchronous exception generated by the instruction being stepped.
- An asynchronous exception taken before or after the instruction being stepped.

Halting Step has its own enable control bit, [EDECR.SS](#) and [EDES.R.SS](#).

———— Note ————

Because the Halting Step state machine states occur as a result of normal PE operation, the states can be described as both:

- PE states.
- Halting Step states.

H3.2.2 The Halting Step state machine

The state machine states are:

- Inactive** Halting Step is inactive. No Halting Step debug events can be generated, therefore execution is not affected by Halting Step. The PE is in this state whenever either of the following is true:
- Halting Step is disabled. That is, [EDECR.SS](#) is set to 0 and [EDES.R.SS](#) is set to 0.
 - Halting is prohibited. See [Halting the PE on debug events on page H2-6417](#). In this state, if [EDECR.SS](#) is set to 1 then a Halting Step debug event is pending.

In [Figure H3-1 on page H3-6460](#) this state is shown in red.

Active-not-pending

Halting Step is enabled and active. This is the state in which the PE steps an instruction. [EDECR.SS](#) == 1 and [EDES.R.SS](#) == 0. Software must not set [EDECR.SS](#) to 1 unless the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE, as described in [Changing the value of EDECR.SS when not in Debug state on page H3-6465](#).

In [Figure H3-1 on page H3-6460](#) this state is shown in green.

Active-pending

Halting Step is enabled and active. The step has completed, and the PE enters Debug state.
`EDESR.SS == 1`.

In [Figure H3-1 on page H3-6460](#) this state is shown in green.

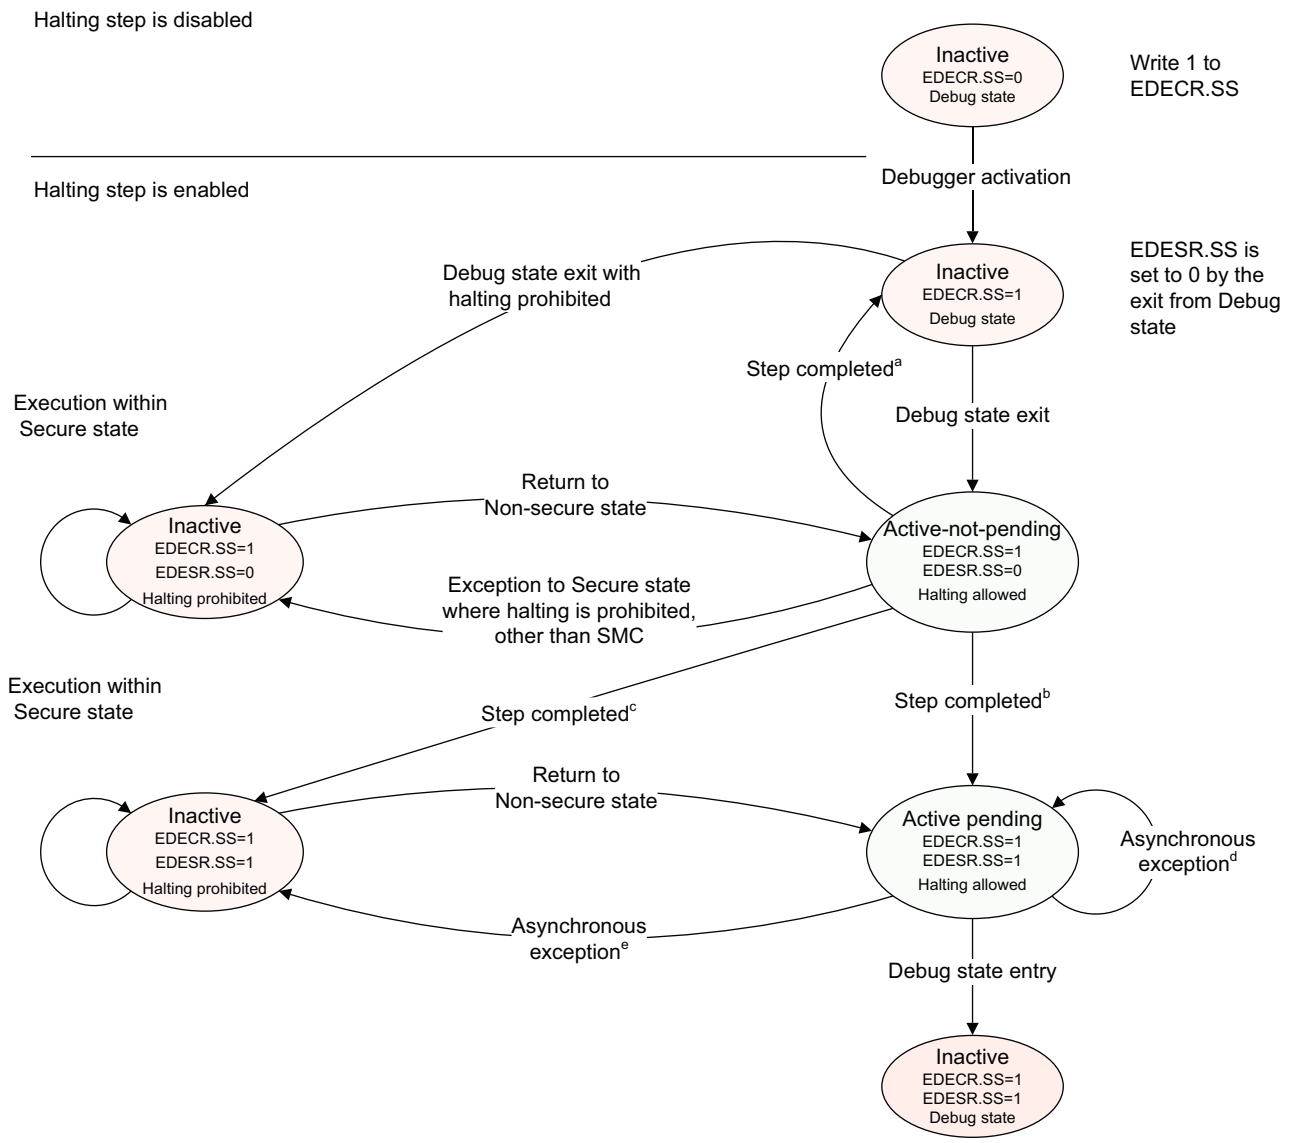

Whenever Halting Step is enabled and active, whether the state machine is in the active-not-pending state or in the active-pending state depends on `EDESR.SS`. [Halting Step state machine states on page H3-6461](#) shows this.

In the simple sequential execution of the program the PE executes the Halting Step state machine, as follows:

1. Initially, Halting Step is inactive.
2. After exiting Debug state, Halting Step is active-not-pending.
3. The PE executes an instruction and Halting Step is active-pending.
4. The pending Debug state entry is taken on the next instruction and the step is complete.

Exceptions and other changes to the PE context can interrupt this sequence.

[Figure H3-1 on page H3-6460](#) shows a Halting Step state machine.

- a. Step completed occurs when:
- A debug event, other than a Halting Step debug event, causes entry into Debug state.
- b. Step completed occurs when:
- An instruction is executed without taking an exception.
 - An exception is taken to a state where halting is allowed.
 - A reset.
- c. Step completed occurs when:
- An SMC exception is taken to Secure state where halting is prohibited.
- d. An asynchronous exception taken to a state where halting is allowed.
- e. An asynchronous exception taken to Secure state where halting is prohibited.

Figure H3-1 Halting Step state machine

———— **Note** ————

Figure H3-1 on page H3-6460 only describes state transitions to and from the inactive state by exit from Debug state, executing an exception return, or taking an exception. Other changes to the PE context, including writes to registers such as [EDECRCR](#) and [OSDLR](#) and changes to the authentication interface can also cause changes to the Halting Step state machine. These can lead to UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior. See [Synchronization and the Halting Step state machine on page H3-6464](#).

The following bits control the state machine, as shown in [Table H3-3](#):

- [EDECRCR.SS](#). This is the Halting Step enable bit.

———— **Note** ————

- The [EDECRCR](#) value is preserved over powerdown, meaning that the step active state is maintained over a powerdown event.
- A debugger must only change the value of [EDECRCR.SS](#) when the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE as described in [Changing the value of EDECRCR.SS when not in Debug state on page H3-6465](#).

- [EDESRCR.SS](#). This is the Halting Step debug event pending bit.

[Table H3-3](#) shows the Halting Step state machine states. The letter X in a register column means that the relevant bit can be set to either zero or one.

Table H3-3 Halting Step state machine states

Halting	EDECRCR.SS	EDESRCR.SS	Halting Step state
Prohibited	X	X	Inactive (Halting Step debug even not pending)
Prohibited	X	1	Inactive (Halting Step debug event pending).
Allowed	0	0	Inactive
Allowed	1	0	Active-not-pending
Allowed	X	1	Active-pending

H3.2.3 Using Halting Step

To step a single instruction the PE must be in Debug state:

1. The debugger sets [EDECRCR.SS](#) to 1 to enable Halting step.
2. The debugger signals the PE to exit Debug state with [DLR](#) set to the address of the instruction being stepped. The PE clears [EDESRCR.SS](#) to 0 and the Halting Step state machine enter the active-not-pending state.
3. The PE executes the instruction being stepped.
If an exception is taken to a state where halting is prohibited, then [EDESRCR.SS](#) is always correct for the preferred return address of the exception.
4. The PE enters Debug state before executing the next instruction and the step is complete.

H3.2.4 Detailed Halting Step state machine behavior

The behavior of the Halting Step state machine is described in the following sections:

- [Entering the active-not-pending state on page H3-6462](#).
- [PE behavior in the active-not-pending state on page H3-6462](#).
- [Entering the active-pending state on page H3-6463](#).
- [PE behavior in the active-pending state on page H3-6463](#).
- [PE behavior in the inactive state when in Non-debug state on page H3-6464](#).
- [PE behavior in Debug state on page H3-6464](#).

Entering the active-not-pending state

The PE enters the active-not-pending state:

- By exiting Debug state with `EDECR.SS == 1`.
- By an exception return from a state where halting is prohibited to a state where halting is allowed with `EDECR.SS == 1` and `EDES.R.SS == 0`.
- As described in *Synchronization and the Halting Step state machine* on page H3-6464.

PE behavior in the active-not-pending state

When the PE is in the active-not-pending state it does one of the following:

- It executes one instruction and does one of the following:
 - Completes it without generating a synchronous exception.
 - Generates a synchronous exception.
 - Generates a debug event that causes entry to Debug state.
- It takes an asynchronous exception without executing any instruction.
- It takes an asynchronous debug event into Debug state.

If no exception or debug event is generated

If no exception or debug event is generated the PE sets `EDES.R.SS` to 1. This means that the Halting Step state machine advances to the active-pending state.

If an exception or debug event is generated

The PE sets `EDES.R.SS` according to all of the following:

- The type of exception.
- The target Exception level of the exception.
- If the exception is taken to Secure state, whether halting is prohibited in Secure state.
 - This is determined by the result of `ExternalSecureInvasiveDebugEnabled()`.

If an exception or debug event is generated, the PE sets `EDES.R.SS` to 1 if one of the following applies:

- A synchronous exception is generated by the instruction and one of the following applies:
 - The exception is taken to EL1 or EL2.
 - The exception is taken to EL3, it is not an SMC exception, and `ExternalSecureInvasiveDebugEnabled() == TRUE`.
 - The exception is an SMC exception.
- An asynchronous exception is generated before executing an instruction and this is either:
 - Taken to EL1 or EL2.
 - Taken to EL3 and `ExternalSecureInvasiveDebugEnabled() == TRUE`.
- A PE reset occurs.

Otherwise `EDES.R.SS` is unchanged. This happens when:

- No instruction is executed because either:
 - An asynchronous exception is taken to EL3 and `ExternalSecureInvasiveDebugEnabled() == FALSE`.
 - An asynchronous debug event causes entry to Debug state.
- An instruction is executed and either:
 - Generates a synchronous exception other than an SMC exception which is taken to EL3, and `ExternalSecureInvasiveDebugEnabled() == FALSE`.
 - Generates a synchronous debug event and causes entry to Debug state.

If halting is prohibited after taking the exception or debug event, then the Halting Step state machine advances to the inactive state. Otherwise the Halting Step state machine advances to the active-pending state.

———— **Note** —————

The underlying criteria for the value of `EDES.R.SS` on an exception are:

- Whether halting is allowed at the target of the exception. If halting is allowed, the PE must step into the exception. If halting is prohibited, the PE must step over the exception.
- Whether the preferred return address of the exception is the instruction itself or the next instruction, if the PE steps over the exception.

Table H3-4 shows the behavior of the active-not-pending state. The letter X indicates that `ExternalSecureInvasiveDebugEnabled()` can be either TRUE or FALSE.

Table H3-4 Summary of active-not-pending state behavior

Event	Target Exception level	<code>ExternalSecureInvasiveDebugEnabled()</code>	Value written to <code>EDES.R.SS</code>
No exception or debug event	Not applicable	X	1
SMC exception	EL3	X	1
Reset	Highest	X	1
Exception, other than SMC exception	EL1	X	1
	EL2	X	1
	EL3	TRUE	1
		FALSE	Unchanged
Debug event	Debug state	X	Unchanged

Entering the active-pending state

The PE enters the active-pending state by one of the following:

- From the active-not-pending state by:
 - Executing an instruction without taking an exception.
 - Taking an exception so that the PE remains in a state where halting is allowed.
- An exception return from a state where halting is prohibited when `EDES.R.SS == 1`.

———— **Note** —————

That is, an exception return from Secure state with `ExternalSecureInvasiveDebugEnabled() == FALSE` to Non-secure state with `ExternalInvasiveDebugEnabled() == TRUE`.

- A reset when the value of `EDEC.R.SS == 1`, regardless of the state the PE was in before the reset occurred.
- From the active-pending state by taking an asynchronous exception to a state where halting is allowed.
- Following the description in *Synchronization and the Halting Step state machine* on page H3-6464.

PE behavior in the active-pending state

When the PE is in the active-pending state, it enters Debug state before executing an instruction.

The entry into Debug state has higher priority than all other types of synchronous debug event and synchronous exception. However, the architecture does not define the prioritization of this Debug state entry with respect to any unmasked pending asynchronous exception. If an asynchronous exception is prioritized over the entry to Debug state, then EDESR.SS is unchanged.

For more information on the prioritization of debug events, see [Debug state entry and debug event prioritization on page H2-6419](#).

PE behavior in the inactive state when in Non-debug state

EDESR.SS is not updated by the execution of an instruction or the taking of an exception when Halting Step is inactive. This means that EDESR.SS is not changed by an exception handled in a state where halting is prohibited.

On return to a state where halting is allowed, the Halting Step state machine is restored either to the active-pending state or the active-not-pending state, depending on the value of EDESR.SS. The return to a state where halting is allowed is normally by an exception return, which is a [Context synchronization event](#).

See also [Synchronization and the Halting Step state machine](#).

PE behavior in Debug state

Halting Step is inactive in Debug state because halting is prohibited, see [Halting allowed and halting prohibited on page H2-6417](#).

Entry to Debug state does not change EDESR.SS.

EDESR.SS is cleared to 0 on exiting Debug state as the result of a restart request. If EDECR.SS == 1, Halting Step enters the active-not-pending state.

———— Note —————

This means that EDESR.SS is never cleared to 0 by the execution of an instruction in Debug state, or by taking an exception when in Debug state as described in [PE behavior in the active-not-pending state on page H3-6462](#), because the Halting Step state machine is not in the active-not-pending state. EDESR.SS can be cleared by a write to EDESR, see the register description.

However, if the PE exits Debug state as the result of a PE reset and EDECR.SS == 1, then Halting Step immediately enters the active-pending state, as EDESR.SS is set to the value of EDECR.SS.

H3.2.5 Synchronization and the Halting Step state machine

The Halting Step state machine also changes state if:

- Halting becomes allowed or prohibited other than by exit from Debug state, an exception return, or taking an exception. This means that halting becomes allowed or prohibited because:
 - The security state changes without an exception return. See [State and mode changes without explicit context synchronization events on page G2-5412](#).
 - The external authentication interface changes.
 - The OS Double Lock is implemented and the status, DoubleLockStatus(), changes.
- A write to EDECR when the PE is in Non-debug state changes the value of EDECR.SS.

———— Note —————

Behavior is CONSTRAINED UNPREDICTABLE if the value of EDECR.SS is changed when the PE is in Non-debug state, see [Changing the value of EDECR.SS when not in Debug state on page H3-6465](#).

- A write to EDESR when the PE is in Non-debug state clears EDESR.SS to 0.

These operations are guaranteed to take effect only after a [Context synchronization event](#). If the instruction being stepped generates a [Context synchronization event](#), then the PE might use the old or new state.

The PE must perform the required behavior of the new state before or immediately following the next *Context synchronization event*, but it is not required to do so immediately. This means that the PE can perform the required behavior of the old state before the next *Context synchronization event*. This is illustrated in [Example H3-1](#) and [Example H3-2](#).

Example H3-1 Synchronization requirements 1

EDECR.SS is set to 1 in Debug state, requesting the active-not-pending state on exit from Debug state. On exit from Debug state the PE immediately takes an exception to Secure state. ExternalSecureInvasiveDebugEnabled() == FALSE, meaning that halting is prohibited in Secure state. The PE does not step any instructions but executes the software in Secure state as normal. EDESR.SS remains set to 0. If ExternalSecureInvasiveDebugEnabled() subsequently becomes TRUE, meaning that halting is now allowed, the PE must perform the required behavior of the active-not-pending state before or immediately following the next *Context synchronization event*, but it is not required to do so immediately.

Example H3-2 Synchronization requirements 2

EDECR.SS is set to 1 in Debug state. On exit from Debug the PE executes an MSR instruction that sets OSDLR_EL1.DLK to 1 and DoubleLockStatus() becomes TRUE. This change requires a *Context synchronization event* to guarantee its effect, meaning it is CONSTRAINED UNPREDICTABLE whether:

- Halting is allowed:
 - The PE enters Debug state on the next instruction.
- Halting is prohibited:
 - The PE does not enter Debug state.

The value in EDESR.SS depends on whether halting was allowed or prohibited when the write to OSDLR_EL1.DLK completed, and so it might be 0 or 1. If a second MSR instruction clears OSDLR_EL1.DLK to 0, the PE must perform the required behavior of the state indicated by EDESR.SS before or immediately following the next *Context synchronization event*, but it is not required to do so immediately.

See also [Synchronization and Halting debug events on page H3-6477](#).

Changing the value of EDECR.SS when not in Debug state

If software changes the value of EDECR.SS when the PE is not in Debug state then behavior is CONSTRAINED UNPREDICTABLE, and one or more of the following behaviors occurs:

- The value of EDECR.SS becomes UNKNOWN.
- The state of the Halting Step state machine becomes UNKNOWN.
- On a reset of the PE, the value of EDECR.SS and the state of the Halting Step state machine are UNKNOWN.

H3.2.6 Stepping T32 IT instructions

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and another 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

For the purpose of stepping an item, it is IMPLEMENTATION DEFINED whether:

- The PE considers such a pair of instructions to be one instruction.
- The PE considers such a pair of instructions be two instructions.

It is IMPLEMENTATION DEFINED whether this behavior depends on the value of the applicable ITD bit. For example:

- The debug logic might consider such a pair of instructions as one instruction, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as two instructions, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as one instruction when the value of the applicable ITD field is 1, and as two instructions when the value of the ITD field is 0.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

The ITD control fields are:

HSTCLR.ITD Applies to execution at EL2 when EL2 is using AArch32.

SCTLR.ITD Applies to execution at EL0 or EL1 when EL1 is using AArch32.

SCTLR_EL1.ITD

Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

H3.2.7 Disabling interrupts while stepping

When using Halting Step, the sequence of entering Debug state, interacting with the debugger, and then exiting Debug state for each instruction reduces the rate at which the PE executes instructions. However, the rate at which certain interrupts, such as timer interrupts, are generated might be fixed by the system. This means it might be necessary to disable interrupts while using Halting Step by setting **EDSCR.INTdis**, to allow the code being debugged to make forward progress.

H3.2.8 Syndrome information on Halting Step

Three **EDSCR.STATUS** encodings record different scenarios for entering Debug state on a Halting Step debug event:

Halting Step, normal

An instruction other than a Load-Exclusive instruction was stepped.

Halting Step, exclusive

A Load-Exclusive instruction was stepped.

Halting Step, no syndrome

The syndrome data is not available.

If the PE enters Debug state due to a Halting Step debug event immediately after stepping an instruction in the active-not-pending state, **EDSCR.STATUS** is set to either:

- Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

If the stepped instruction was a conditional Load-Exclusive instruction that failed its Condition code check, **EDSCR.STATUS** is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, normal, or Halting Step, exclusive.

Otherwise the PE enters Debug state without stepping an instruction. This means that the Halting Step state machine enters the active-pending state directly from the inactive state, without going through active-not-pending state. In this case, **EDSCR.STATUS** is set to Halting Step, no syndrome. This happens when:

- The PE enters directly into the active-pending state on an exception return to Non-secure state from EL3 when Halting is prohibited in Secure state.
- The active-pending state is entered for other reasons. See [Synchronization and the Halting Step state machine on page H3-6464](#)

In addition, `EDSCR.STATUS` is set to one of a CONSTRAINED UNPREDICTABLE choice if:

- The instruction being stepped generated a synchronous exception, or a pending asynchronous exception was taken before the instruction was executed.

In this case `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of:

- Halting Step, no syndrome, or Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
 - Halting Step, no syndrome, or Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.
- The instruction that was stepped was an exception return instruction or an ISB. As these instructions are not in the Load-Exclusive instructions, `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.
 - The PE enters directly into the active-pending state on reset because `EDECR.SS` is set to 1. `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.

In all cases, if `EDSCR.STATUS` is not set to Halting Step, no syndrome, then it must indicate whether the stepped instruction was a Load-Exclusive instruction by setting `EDSCR.STATUS` to Halting Step, normal or Halting Step, exclusive.

———— **Note** —————

In an implementation that always sets `EDSCR.STATUS` to Halting Step, no syndrome is not compliant.

H3.2.9 Pseudocode description of Halting Step debug events

There are two pseudocode functions for Halting Step debug events:

- `RunHaltingStep()`. This is called after an instruction has executed and any exception generated by the instruction is taken. It is also called after taking a reset before executing any instructions. That is, reset is treated like an asynchronous exception, even if `EDECR.RCE == 1`. `RunHaltingStep()` affects the next instruction.
- `CheckHaltingStep()`. This is called before the next instruction is executed. If a step is pending, it generates the debug event.

H3.3 Halt Instruction debug event

A Halt Instruction debug event is generated when `EDSCR.HDE == 1`, halting is allowed, and the PE executes the Halt instruction, HLT.

The pseudocode for Halt Instruction debug events is described in [HLT on page C6-835](#) for A64 and [HLT on page F5-3937](#) for A32 and T32.

HLT never generates a debug exception. It is treated as UNDEFINED if `EDSCR.HDE == 0`, or if halting is prohibited.

———— Note —————

A debugger can replace a program instruction with a Halt instruction to generate a Halt Instruction debug event. Debuggers that use the HLT instruction must be aware of the ARMv8-A rules for concurrent modification of executable code, CMOIDX. The rules for concurrent modification and execution of instructions do not allow one thread of execution or an external debugger to replace an instruction with an HLT instruction when these same instructions are being executed by a different thread of execution. See [Concurrent modification and execution of instructions on page B2-94](#).

The T32 HLT instruction is unconditionally executed inside an IT block, even when it is treated as undefined. The A32 HLT instruction is CONSTRAINED UNPREDICTABLE if the Condition code field is not `0b1110`, with the set of behaviors the same as for BKPT. See [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

———— Note —————

The HLT instruction is part of the external debug solution for ARMv8-A. As such, the presence of the HLT instruction is not indicated in the ID registers. In particular, the AArch32 System register `ID_ISAR0`. Debug does not indicate the presence of the HLT instruction.

H3.3.1 HLT instructions as the first instruction in a T32 IT block

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and certain other 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

The T32 HLT instruction cannot be combined with an IT instruction in this way. In an implementation that supports the ITD control, if the first instruction in an IT block is an HLT instruction, then the behavior of the instruction depends on the value of the applicable ITD field:

- If the value of the ITD field is 1, then the combination is treated as undefined and an Undefined Instruction exception is generated either by the IT instruction or by the HLT instruction.
- If the value of the ITD field is 0, then the HLT instruction unconditionally executed.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

To set an Halt Instruction debug event on the first instruction of an IT block, debuggers must replace the IT instruction with an HLT instruction to ensure consistent behavior.

The ITD control fields are:

HSCTLR.ITD Applies to execution at EL2 when EL2 is using AArch32.

SCTLR.ITD Applies to execution at EL0 or EL1 when EL1 is using AArch32.

SCTLR_EL1.ITD

Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

———— Note —————

An HLT instruction is always unconditional, even within an IT block.

H3.4 Exception Catch debug event

Exception Catch debug events:

- Are generated when the corresponding bit in the Exception Catch Control Register, [EDECCCR](#), is set to 1 on all entries to a given Exception level. This means:
 - Exceptions taken to the Exception level.
 - Exception returns to the Exception level.
- Are taken synchronously, after entry to the Exception level.
- Ignore the Execution state of the target Exception level.
- Are ignored if halting is prohibited.

From ARMv8.2 the definition is extended to include generation of Exception Catch debug events on reset entry, see [Exception Catch debug events from ARMv8.2 on page H3-6471](#).

The [EDECCCR](#) contains two sets of fields:

- One set for Non-secure state.
- One set for Secure state.

Each set of fields control generation of Exception Catch debug events:

- On exception entry and, from ARMv8.2, on reset entry.
- On exception return.

Each field within each set contains one bit for each Exception level in that state. Bits corresponding to Exception levels that are not implemented are RES0. For more information see the [EDECCCR](#) description.

————— Note —————

- [EDECCCR](#) does not replace [DBGVCR](#):
 - [DBGVCR](#) is retained in AArch32 state for backwards compatibility.
 - [DBGVCR](#) is ignored in AArch64 state and never generates entries to Debug state.
 - [DBGVCR](#) cannot be accessed by the external debug interface.
- [EDECCCR](#) is only visible as [OSECCR_EL1](#) by System register instructions in AArch64 state, and as [DBGOSECCR](#) by System register access instructions in AArch32 state, when the OS Lock is locked to allow software to save and restore it over a powerdown.
- Exception Catch debug events are not disabled when the OS Lock is locked.

For an Exception Catch debug event generated after taking an exception to a trapped Exception level:

- The PE must not fetch instructions from the vector address before entering Debug state, if address translation is disabled in the translation regime at the target Exception level.
- On entering Debug state:
 - The current Exception level is the target Exception level of the exception.
 - The ELR, SPSR, ESR, and other syndrome registers contain information about the exception.
 - [DLR](#) contains the exception vector address or, from ARMv8.2, the reset address.

H3.4.1 Prioritization of Exception Catch debug events

The following rules define the prioritization of Exception Catch debug events:

- It is IMPLEMENTATION DEFINED whether Exception Catch debug events are higher or lower priority than each of [Software Step exceptions](#) and [Halting Step debug events](#).

- Exception Catch debug events are higher priority than all synchronous exceptions other than [Software Step exceptions](#).
- Exception Catch debug events are lower priority than [Reset Catch debug events](#).

Note

As described in [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2191, an exception trapping form of a Vector Catch debug event might generate a second debug exception as part of the exception entry, before the Exception Catch debug event is taken. See [Vector Catch exceptions](#) on page D2-2328 or [Vector Catch exceptions](#) on page G2-5405.

A second unmasked asynchronous exception can be taken before the PE enters Debug state. If this second exception does not generate an Exception Catch debug event, the exception handler executed at the higher Exception level later returns to the trapped Exception level, causing the Exception Catch debug event to be generated again.

See also [Debug state entry and debug event prioritization](#) on page H2-6419.

From ARMv8.2, when an Exception Catch debug event is generated on exception entry, the PE must enter Debug state as part of the exception entry:

- After the exception entry has updated the program counter, [PSTATE](#) and syndrome registers for the exception.
- Before the first instruction at the handler is executed.
- Before any asynchronous or lower priority synchronous exception or debug event is taken at the first instruction in the exception handler.

From ARMv8.2, when an Exception Catch debug event is generated on exception return, the PE must enter Debug state:

- After the exception return has updated the program counter and [PSTATE](#).
- Before the execution of the first instruction at the return address is completed.

Note

From ARMv8.2, there is no prioritization between asynchronous exceptions, asynchronous debug events, and an Exception Catch debug event generated on an exception return.

H3.4.2 CONSTRAINED UNPREDICTABLE generation of Exception Catch debug events

When [ARMv8.2-Debug](#) is not implemented, the PE is executing code at a given Exception level, and the corresponding [EDECCR](#) bit is 1, it is CONSTRAINED UNPREDICTABLE whether an Exception Catch debug event is generated.

Note

It is possible to generate Exception Catch debug events:

- As a trap on all instruction fetches from the trapped Exception level as part of an instruction fetch.
- On entry to the Exception level, as described in [Detailed Halting Step state machine behavior](#) on page H3-6461.

This is similar to the implementation options allowed for Vector Catch debug events. The architecture does not require that the event is generated following an ISB operation executed at the Exception level.

Examples of this are:

- If the debugger writes to [EDECCR](#) so that the current Exception level is trapped.
- If the OS restore code writes to [OSECCR](#) so that the current Exception level is trapped.

- If the code executing in AArch32 state changes the Exception level or security state other than by an exception return, and the target Exception level is trapped. See *State and mode changes without explicit context synchronization events* on page G2-5412.

When [ARMv8.2-Debug](#) is implemented, there are no CONSTRAINED UNPREDICTABLE cases that are permitted to generate Exception Catch debug events.

H3.4.3 Exception Catch debug events from ARMv8.2

From ARMv8.2, the definition of Exception Catch debug events is extended so that Exception Catch debug events can be generated from:

- Exception entry.
- Reset entry.
- Exception return.

It is IMPLEMENTATION DEFINED whether a reset into an Exception level generates an Exception Catch debug event.

Exception catch debug events are taken synchronously, after the exception or reset entry or the exception return has been processed by the PE.

For exception returns, the final Exception level of the exception return determines whether an Exception Catch debug event is generated. On an illegal exception return an Exception Catch debug event is generated only if EDECCR is programmed to generate an Exception Catch debug event for an exception return to the current Exception level.

The NSR and SR fields in [EDECCR](#) determine whether Exception Catch debug events can be generated from reset entry. [Table H3-5](#) shows how exception entry and exception return Exception Catch debug events are enabled by a combination of the fields NSR, SR, NSE and SE in [EDECCR](#).

Table H3-5 Summary of Exception Catch debug event control

(N)SR<n>	(N)SE<n>	Behavior on exception return to ELn	Behavior on exception taken to ELn
0	0	No action.	No action.
0	1	Halt if allowed.	Halt if allowed.
1	0	Halt if allowed.	No action.
1	1	No action.	Halt if allowed.

H3.4.4 Examples of Exception Catch debug events

If [EDECCR](#) == 0x20, meaning that the Exception Catch debug event is enabled for Non-secure EL1, then the following exceptions generate Exception Catch debug events:

- An exception taken from Non-secure EL0 to Non-secure EL1.
- An exception return from EL2 to Non-secure EL1.
- An exception return from EL3 to Non-secure EL1.

For example, on taking a Data Abort exception from Non-secure EL0 to Non-secure EL1, using AArch64:

- [ELR_EL1](#) and [SPSR_EL1](#) are written with the preferred return address and PE state for a return to EL0.
- [ESR_EL1](#) and [FAR_EL1](#) are written with the syndrome information for the exception.
- [DLR_EL0](#) is set to [VBAR_EL1](#) + 0x400, the synchronous exception vector.
- [DSPSR_EL0](#) is written with the PE state for an exit to EL1.

The following do not generate Exception Catch debug events:

- An exception taken from EL0 to EL2, if enabled in the current Security state, or EL3.

- An exception return from EL2, if enabled in the current Security state, to EL0.
- An exception taken from Secure EL0 to Secure EL1.
- An exception return from EL3 to Secure EL1.

H3.4.5 Pseudocode description of Exception Catch debug events

The pseudocode function [CheckExceptionCatch\(\)](#) is described in [Chapter J1 ARMv8 Pseudocode](#).

H3.5 External Debug Request debug event

External Debug Request debug events are asynchronous debug events.

An External Debug Request debug event is generated when signaled by the embedded cross-trigger. See [Chapter H5 The Embedded Cross-Trigger Interface](#).

———— **Note** —————

ARMv8-A requires the implementation of an embedded cross-trigger.

An implementation might also support IMPLEMENTATION DEFINED ways of generating an External Debug Request debug event.

H3.5.1 Synchronization and External Debug Request debug events

An External Debug Request debug event that is asserted before a *Context synchronization event* is taken and the PE enters Debug state before the first instruction following the *Context synchronization event* completes its execution, provided that halting is allowed after completion of the *Context synchronization event*.

An External Debug Request debug event that is being asserted when the PE comes out of reset is taken, and the PE enters Debug state before the first instruction after the reset completes its execution, provided that halting is allowed when the PE exits reset state.

If the first instruction after the *Context synchronization event* or after coming out of reset generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

Otherwise, when halting is allowed, External Debug Request debug events must be taken in finite time, without requiring the synchronization of any necessary change to the external authentication interface.

———— **Note** —————

These rules are based on the rules that apply when taking asynchronous exceptions. See [Asynchronous exception types, routing, masking and priorities](#) on page D1-2198.

If an unmasked External Debug Request debug event was pending but is changed to not pending before it is taken, then the architecture permits the External Debug Request debug event to be taken, but does not require this to happen. If the External Debug Request debug event is taken then it must be taken before the first *Context synchronization event* after the External Debug Request debug event was changed to not pending.

[Example H3-3](#) shows an example of the synchronization requirements.

Example H3-3 Synchronization requirements

Secure software locks up in a tight loop, so it executes indefinitely without any synchronization operations. An External debug request must be able to break the PE out of that loop. This is a requirement even if **DBGEN** or **SPIDEN** or both are LOW on entry to the loop, meaning that halting is prohibited, and are only asserted HIGH later.

H3.5.2 Pseudocode description of External Debug Request debug events

The `ExternalDebugRequest()` function is described in [Chapter J1 ARMv8 Pseudocode](#).

H3.6 OS Unlock Catch debug event

An OS Unlock Catch debug event is generated when `EDECR.OSUCE == 1` and the state of the OS Lock changes from locked to unlocked.

When the OS Lock is unlocked, the PE sets `EDESR.OSUC` to 1 if `EDECR.OSUCE` is set to 1 and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. However, this is an indirect write to `EDESR.OSUC`, meaning the OS Unlock Catch debug event is not guaranteed to be taken before a subsequent context synchronization event. If the PE enters Debug state or `EDECR.OSUCE` is cleared to 0 before `EDESR.OSUC` becomes set to 1, then `EDESR.OSUC` might not be set.

OS Unlock Catch debug events are not generated if the OS Lock is unlocked when the PE is in Debug state. See also:

- [Synchronization and Halting debug events on page H3-6477](#).
- The `EDECR` and `EDESR` register descriptions.

`EDESR.OSUC` is cleared to 0 on a Warm reset and on exiting Debug state.

H3.6.1 Using the OS Unlock Catch debug event

If the debugger attempts to access a debug register when the Core power down domain is completely off or in a low-power state in which the core power domain registers cannot be accessed, and that access returns an error, then the debugger must retry the access. However, if the Core power domain is regularly powered down, this can lead to unreliable debugger behavior.

The debugger can program a Reset Catch debug event to halt the PE when it has powered up, and can program the debug registers from Debug state. However, if the PE boot software restores the debug registers, as described in [Debug OS Save and Restore sequences on page H6-6525](#), then newly written values are overwritten by the restore sequence.

The debugger can program an OS Unlock Catch debug event to halt the PE after the restore sequence has completed, and program the debug registers from Debug state.

H3.6.2 Pseudocode description of OS Unlock Catch debug event

The `CheckOSUnlockCatch()` function is called when the OS Lock is unlocked.

The `CheckPendingOSUnlockCatch()` function is called before an instruction is executed. If an OS Unlock Catch is pending, it generates the debug event.

H3.7 Reset Catch debug events

A Reset Catch debug event is generated when `EDECR.RCE == 1` and the PE exits reset state. When the Reset Catch debug event is generated, it is recorded by setting `EDESR.RC` to 1.

If halting is allowed when the event is generated, the Reset Catch debug event is taken immediately and synchronously. On entering Debug state, `DLR` has the address of the reset vector. The PE must not fetch any instructions from memory.

Otherwise, the Reset Catch debug event is pended and taken when halting is allowed. See also:

- [Synchronization and Halting debug events on page H3-6477](#).
- The `EDECR` and `EDESR` register descriptions.

This means that `EDESR.RC` is set to the value of `EDECR.RCE` on a Warm reset. `EDESR.RC` is cleared to 0 on exiting Debug state.

H3.7.1 Pseudocode description of Reset Catch debug event

The `CheckResetCatch()` function is called after reset before executing any instruction.

The `CheckPendingResetCatch()` function is called before an instruction is executed. If a Reset Catch is pending, it generates the Reset Catch debug event.

H3.8 Software Access debug event

When the value of `EDSCR.TDA` is 1, software access to the following AArch64 and AArch32 debug System registers generate a Software Access debug event:

- The Breakpoint Value Registers, [DBGBVR](#).
- The Breakpoint Control Registers, [DBGBCR](#).
- The Watchpoint Value Registers, [DBGWVR](#).
- The Watchpoint Control Registers, [DBGWCR](#).

However, `EDSCR.TDA` is ignored if any of the following applies:

- The value of `OSLSR.OSLK` == 1, meaning that the OS Lock is locked.
- Halting is prohibited. See [Halting allowed and halting prohibited on page H2-6417](#).
- The register access generates an exception.

———— **Note** —————

- The only accesses to the specified registers that generate a Software Access debug event are:
 - Accesses to System registers in AArch64 state.
 - Accesses to System registers in the (coproc==0b1110) encoding space in AArch32 state.
- Accesses by a PE using the external debug interface never generate a Software Access debug event.

H3.8.1 Pseudocode description of Software Access debug event

The [CheckSoftwareAccessToDebugRegisters\(\)](#) function is described in [Chapter J1 ARMv8 Pseudocode](#).

H3.9 Synchronization and Halting debug events

The behavior of external debug depends on:

- Indirect reads of:
 - External debug registers.
 - System registers, including system debug registers.
 - Special-purpose registers.
- The state of the external authentication interface.

For some registers, all read and write accesses that update the register occur in program order, without any additional synchronization, but others require an explicit *Context synchronization event*. For more information on the synchronization of register updates see:

- *Synchronization requirements for AArch64 System registers* on page D12-2675.
- *Synchronization of changes to the external debug registers* on page H8-6538.
- *State and mode changes without explicit context synchronization events* on page G2-5412.

Changes to the external authentication interface do not require explicit synchronization to affect External Debug Request debug events. See *Synchronization and External Debug Request debug events* on page H3-6473.

For changes that require explicit synchronization, it is CONSTRAINED UNPREDICTABLE whether instructions between the change and the *Context synchronization event* observe the old state or the new state.

This means that any change to these registers or the external authentication interface requires explicit synchronization by a *Context synchronization event* before the change takes effect. This ensures that for instructions appearing in program order after the change, the change affects the following:

- The generation and behavior of Breakpoint and Watchpoint debug events. See *Synchronization and debug exceptions* on page D2-2342 for exceptions taken from AArch64 state, or *Synchronization and debug exceptions* on page G2-5412 for exceptions taken from AArch32 state.
- The generation of all Halting debug events by instructions.
- Taking a pending Halting debug event or other asynchronous Debug event. See:
 - *Pending Halting debug events*.
 - *Synchronization and External Debug Request debug events* on page H3-6473.
- The behavior of the Halting Step state machine. See *Synchronization and the Halting Step state machine* on page H3-6464.

H3.9.1 Pending Halting debug events

A Halting debug event might be pending:

1. If Halting Step of an instruction sets **EDES.RC** to 1, and halting is prohibited following the step, then the Halting Step state machine is inactive but a Halting Step debug event is pending.
2. If a Reset Catch debug event sets **EDES.RC** to 1, and halting is prohibited following reset, then a Reset Catch debug event is pending.
3. If an OS Unlock Catch debug event sets **EDES.OSUC** to 1, then an OS Unlock Catch debug event is pending.

Pending Halting debug events are taken asynchronously when halting is allowed.

Pending Halting debug events are discarded by a Cold reset. The debugger can also force a pending event to be dropped by writing to **EDES**.

Any Halting debug event that is observed as pending in the **EDES** before a *Context synchronization event* is taken and the PE enters Debug state before the first instruction following the *Context synchronization event* completes its execution. This is only possible if halting is allowed after completion of the *Context synchronization event*.

If the first instruction after the *Context synchronization event* generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken, unless both:

- A Halting Step debug event is pending. `EDESR.SS == 1`.
- The *Context synchronization event* is an exception return from a state where halting is prohibited to a state where halting is allowed.

———— **Note** —————

This applies to an exception return from Secure state with `ExternalSecureInvasiveDebugEnabled() == FALSE` to Non-secure state with `ExternalInvasiveDebugEnabled() == TRUE`.

In this case the order in which the debug events are handled is specified to avoid a double-step. See *Entering the active-pending state* on page H3-6463.

If an asynchronous exception is also pending after the *Context synchronization event* then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

———— **Note** —————

These rules are based on the rules that apply to taking asynchronous exceptions. See *Asynchronous exception types, routing, masking and priorities* on page D1-2198.

Chapter H4

The Debug Communication Channel and Instruction Transfer Register

This chapter describes communication between a debugger and the implemented debug logic, using the *Debug Communications Channel* (DCC) and the *Instruction Transfer Register* (ITR), and associated control flags. It contains the following sections:

- [Introduction](#) on page H4-6480.
- [DCC and ITR registers](#) on page H4-6481.
- [DCC and ITR access modes](#) on page H4-6484.
- [Flow control of the DCC and ITR registers](#) on page H4-6488.
- [Synchronization of DCC and ITR accesses](#) on page H4-6492.
- [Interrupt-driven use of the DCC](#) on page H4-6498.
- [Pseudocode description of the operation of the DCC and ITR registers](#) on page H4-6499.

Note

Where necessary [Table K13-1](#) on page K13-7394 disambiguates the general register references used in this chapter.

H4.1 Introduction

The *Debug Communications Channel*, DCC, is a channel for passing data between the PE and an external agent, such as a debugger. The DCC provides a communications channel between:

- An external debugger, described as the *debug host*.
- The debug implementation on the PE, described as the *debug target*.

The DCC can be used:

- As a 32-bit full-duplex channel.
- As a 64-bit half-duplex channel.

The DCC is an essential part of Debug state operation and can also be used in Non-debug state.

The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.

The PE includes flow-control mechanisms for both the DCC and ITR.

H4.2 DCC and ITR registers

The DCC comprises *data transfer registers*, the DTRs, and associated flow-control flags. The data transfer registers are DTRRX and DTRTX.

The ITR comprises a single register, [EDITR](#), and associated flow-control flags.

In AArch64 state, software can access the data transfer registers as:

- A receive and transmit pair for 32-bit full duplex operation:
 - The write-only [DBGDTRTX_EL0](#) register to transmit data.
 - The read-only [DBGDTRRX_EL0](#) register to receive data.
- A single 64-bit read/write register, [DBGDTR_EL0](#), for 64-bit half-duplex operation.
- The read/write [OSDTRTX_EL1](#) and [OSDTRRX_EL1](#) registers for save and restore.

In AArch32 state, software can only access the data transfer registers as:

- A receive and transmit pair, for 32-bit full duplex operation:
 - The write-only [DBGDTRTXint](#) register to transmit data.
 - The read-only [DBGDTRRXint](#) register to receive data.
- The read/write [DBGDTRTXext](#) and [DBGDTRRXext](#) registers for save and restore.

The data transfer registers are also accessible by the external debug interface as a pair of 32-bit registers, [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#). Both registers are read/write, allowing both 32-bit full-duplex and 64-bit half-duplex operation.

The DCC flow-control flags are [EDSCR](#). {RXfull, TXfull, RXO, TXU}:

- The RXfull and TXfull ready flags are used for flow-control and are visible to software in the Debug system registers in [DCCSR](#).
- The RX overrun flag, RXO, and the TX underrun flag, TXU, report flow-control errors.
- The flow-control flags are also accessible by software as simple read/write bits for saving and restoring over a powerdown when the OS Lock is locked in [DSCR](#).
- The flow-control flags are accessible from the external debug interface in [EDSCR](#).

[Figure H4-1 on page H4-6482](#) shows the System register and external debug interface views of the [EDSCR](#) and DTR registers in both AArch64 state and AArch32 state. These figures do not include the save and restore views.

Figure H4-1 System register and external debug interface views of EDSCR and DTR registers, Normal access mode

EDITR and the ITR flow-control flags, EDSCR.{ITE, ITO} are accessible only by the external debug interface:

- The EDITR specifies an instruction to execute in Debug state.
- The ITR empty flag, ITE, is used for flow-control.
- The ITR overrun flag, ITO, reports flow-control errors.

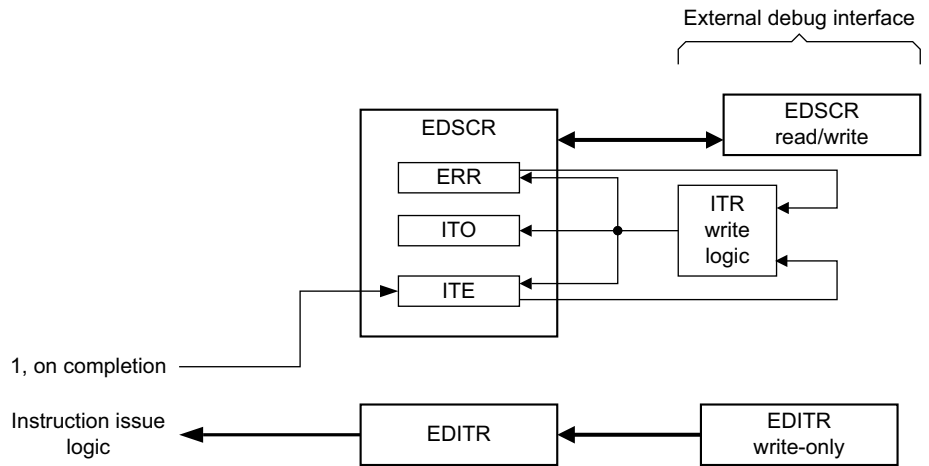

Figure H4-2 External debug interface views of EDSCR and EDITR registers, Normal access mode

The sticky overflow flag, EDSCR.ERR, is used by both the DCC and ITR to report flow-control errors.

To save and restore the DCC registers for an external debugger over powerdown, software uses:

- The MDSCR_EL1, OSDTRTX_EL1, and OSDTRRX_EL1 registers in AArch64 state.

- The `DBGDSCRext`, `DBGDTRTXext`, and `DBGDTRRXext` registers in AArch32 state.

———— **Note** ————

There is no save and restore mechanism for the ITR registers as the ITR is only used in Debug state.

Figure H4-3 System register views of EDSCR and DTR registers for save and restore

H4.3 DCC and ITR access modes

The DCC and ITR support two access modes:

DCC and ITR access mode, links to description	Applies when:
Normal access mode	EDSCR.MA == 0 or the PE is in Non-debug state
Memory access mode on page H4-6485	EDSCR.MA == 1 and the PE is in Debug state

H4.3.1 Normal access mode

The Normal access mode allows use of the DCC as a communications channel between target and host. It also allows the use of the ITR for issuing instructions to the PE in Debug state.

In Normal access mode, if there is no overrun or underrun, the following occurs:

For accesses by software:

- Direct writes to [DBGDTRTX](#) update the value in DTRTX and indirectly write 1 to TXfull.
- Direct reads from [DBGDTRRX](#) return the value in DTRRX and indirectly write 0 to RXfull.
- In AArch64 state, direct writes to [DBGDTR_EL0](#) update both DTRTX and DTRRX, indirectly write 1 to TXfull, and do not change RXfull:
 - DTRTX is set from bits[31:0] of the transfer register.
 - DTRRX is set from bits[63:32] of the transfer register.
- In AArch64 state, direct reads from [DBGDTR_EL0](#) return the concatenation of DTRRX and DTRTX, indirectly write 0 to RXfull, and do not change TXfull:
 - Bits[31:0] of the transfer register are set from DTRRX.
 - Bits[63:32] of the transfer register are set from DTRTX.

Note

For [DBGDTR_EL0](#), the word order is reversed for reads with respect to writes.

Software reads TXfull and RXfull using [DCCSR](#).

For accesses by the external debug interface:

- Writes to [EDITR](#) trigger the instruction to be executed if the PE is in Debug state:
 - If the PE is in AArch64 state, this is an A64 instruction.
 - If the PE is in AArch32 state, this is a T32 instruction. The T32 instruction is a pair of halfwords where the first halfword is taken from the lower 16-bits, and the second halfword is taken from the upper 16-bits.
- Reads of [DBGDTRTX_EL0](#) return the value in DTRTX and indirectly write 0 to TXfull.
- Writes to [DBGDTRTX_EL0](#) update the value in DTRTX and do not change TXfull.
- Reads of [DBGDTRRX_EL0](#) return the value in DTRRX and do not change RXfull.
- Writes to [DBGDTRRX_EL0](#) update the value in DTRRX and indirectly write 1 to RXfull.

TXfull and RXfull are visible to the external debug interface in [EDSCR](#).

The PE detects overrun and underrun by the external debug interface, and records errors in [EDSCR](#). {TXU, RXO, ITO, ERR}. See [Flow control of the DCC and ITR registers on page H4-6488](#).

See also [Synchronization of DCC and ITR accesses on page H4-6492](#).

H4.3.2 Memory access mode

When the PE is in Debug state, *Memory access mode* can be selected to accelerate word-aligned block reads or writes of memory by an external debugger. Memory access mode can only be enabled in Debug state, and no instructions can be issued directly by the debugger when in Memory access mode.

If there is no overrun or underrun when in Memory access mode, an access by the external debug interface results in the following:

- External reads from [DBGDTRTX_ELO](#) cause:
 1. The existing value in DTRTX to be returned. This clears [EDSCR.TXfull](#) to 0.
 2. The equivalent of `LDR W1, [X0], #4`, if in AArch64 state, or `LDR R1, [R0], #4`, if in AArch32 state, to be executed.
 3. The equivalent of the `MSR DBGDTRTX_ELO, X1` instruction, if in AArch64 state, or the `MCR p14, 0, R1, c0, c5, 0` instruction, if in AArch32 state, to be executed.
 4. [EDSCR.{TXfull, ITE}](#) to be set to {1,1}, and X1 or R1 to be set to an UNKNOWN value.
- External writes to [DBGDTRRX_ELO](#) cause:
 1. The value in DTRRX to be updated. This sets [EDSCR.RXfull](#) to 1.
 2. The equivalent of the instruction `MRS X1, DBGDTRRX_ELO`, if in AArch64 state, or `MRC p14, 0, R1, c0, c5, 0` if in AArch32 state, to be executed.
 3. The equivalent of the instruction `STR W1, [X0], #4`, if in AArch64 state, or `STR R1, [R0], #4`, if in AArch32 state, to be executed.
 4. [EDSCR.{RXfull, ITE}](#) to be set to {0,1}, and X1 or R1 to be set to an UNKNOWN value.
- External reads from [DBGDTRRX_ELO](#) return the last value written to DTRRX.
- External writes to [EDITR](#) generate an overrun error.

During these accesses, [EDSCR.{TXfull, RXfull, ITE}](#) are used for flow control.

———— Note ————

An overrun or underrun might result in [EDSCR.ERR](#) being set to 1 asynchronously to the sequence of operations that are outlined in this section. As this is timing-dependent, it is UNPREDICTABLE when the [EDSCR.ERR](#) flag affects the instructions and therefore whether neither instruction, only the first instruction, or both instructions are executed. If the second instruction is executed, then the first instruction must have been executed. However, in each case X1 or R1 is set to an UNKNOWN value. This means that:

- In both cases, if the memory access instruction is not executed, then the base register X0 or R0 is not updated, meaning the debugger can determine the last accessed location.
- In the list describing External reads from [DBGDTRTX_ELO](#), DTRTX and [EDSCR.TXfull](#) get set to UNKNOWN values. If the load was executed, then the value that was read by the PE is lost. This means the operation might need to be repeated by the debugger, and it is not advisable to use Memory access mode to read from read-sensitive locations using the underrun and overrun detection for flow control.
- In the list describing External writes to [DBGDTRRX_ELO](#), [EDSCR.RXfull](#) is set to an UNKNOWN value.

A Data Abort from the memory access can also set [EDSCR.ERR](#) to 1. See *Data Aborts in Memory access mode on page H4-6486*.

The architecture does not require precisely when these flags are set or cleared by the sequence of operations outlined in this section. For example, in the case of an external write to [DBGDTRRX_ELO](#), in AArch64 state, [RXfull](#) might be cleared after step 2, or it might not be cleared until after step 3, as an implementation is free to fuse these steps into a single operation. The architecture does require that the flags are set as at step 4 when the PE is ready to accept a further read or write without causing an overrun error or an underrun error.

The process outlined in this section represents a simple sequential execution model of Memory access mode. An implementation is free to pipeline, buffer, and re-order instructions and transactions, as long as the following remain true:

- Data items are transferred into and out of the DTR in order and without loss of data, other than as a result of an overrun or an underrun.

- Data Aborts occur in order.
- The constraints of the memory type are met.
- In the list describing [External reads from DBGDTRTX_ELO on page H4-6485](#):
 - The MSR equivalent operation at step 3 of the sequence reads the value loaded by step 2.
 - If the list is performed in a loop, for all but the first iteration of this list, the value read by step 1 returns the values written by the MSR equivalent operation at the previous iteration of step 3.
- In the list describing [External writes to DBGDTRRX_ELO on page H4-6485](#):
 - The MRS equivalent operation at step 2 of the sequence returns the value written at step 1.
 - The STR equivalent at step 3 of the sequence writes the value read at step 2.
- If the PE cannot accept a read or write, as applicable, during the sequence, then the flags are updated to indicate an overrun or underrun.

See [Flow control of the DCC and ITR registers on page H4-6488](#) for more information on overrun and underrun.

Ordering, access sizes and effect on Exclusives monitors

For the purposes of memory ordering, access sizes, and effect on the Exclusives monitor, accesses in Memory access mode are consistent with Load/Store word instructions executed by the PE.

The simple sequential access model of Memory-access mode, as stated in [Memory access mode on page H4-6485](#), must also be ordered with respect to instructions executed as a result of explicit writes to EDITR in Normal mode both before and after accesses to the DTR registers in Memory-access mode.

Data Aborts in Memory access mode

If a memory access generates a Data Abort, then:

- The Data Abort exception is taken. See [Exceptions in Debug state on page H2-6446](#):
 - This means EDSCR.ERR is set to 1, see [Cumulative error flag on page H4-6490](#).
 - If the Data Abort occurs on stage 2 of an address translation, then the values returned in the ISV field and in bits[23:14] of the ISS are UNKNOWN.
If this Data Abort is taken to EL2 using AArch64, the ISS is returned by [ESR_EL2. ISS encoding for an exception from a Data Abort on page D12-2792](#) describes the usual encoding of this ISS.
If EL2 is using AArch32 and this Data Abort is taken to Hyp mode, the ISS is returned by [HSR. ISS encoding for an exception from a Data Abort on page G8-5838](#) describes the usual encoding of this ISS.
- Register R0 retains the address that generated the abort.
- Register R1 is set to an UNKNOWN value.
- [EDSCR.TXfull](#), for a load, or [EDSCR.RXfull](#), for a store, is set to an UNKNOWN value.
- DTRTX, for a load, or DTRRX, for a store, is set to an UNKNOWN value.
- [EDSCR.ITE](#) is set to 1.

Illegal Execution state exception

If PSTATE.IL is set to 1 when [EDSCR.MA](#) == 1, then on an external write access to [DBGDTRRX_ELO](#) or an external read from [DBGDTRTX_ELO](#), it is CONSTRAINED UNPREDICTABLE whether the PE:

- Takes an Illegal Execution state exception without performing any operations. In this case:
 - [EDSCR.ERR](#) is set to 1, see [Cumulative error flag on page H4-6490](#).
 - Register R0 is unchanged.
 - Register R1 is set to an UNKNOWN value.

- `EDSCR.TXfull` or `EDSCR.RXfull`, as applicable, is set to an UNKNOWN value.
- `DTRTX` or `DTRRX`, as applicable, is set an UNKNOWN value.
- `EDSCR.ITE` is set to 1.

See also [Exceptions in Debug state on page H2-6446](#).

- Ignores `PSTATE.IL`.

———— **Note** —————

The typical usage model for Memory access mode involves executing instructions in Normal access mode to set up X0 before setting `EDSCR.MA` to 1. These instructions generate an Illegal state exception if `PSTATE.IL` is set to 1.

Alignment constraints

If the address in R0 is not aligned to a multiple of four, the behavior is as follows:

- For each external DTR access a CONSTRAINED UNPREDICTABLE choice of:
 1. The PE makes an unaligned memory access to R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
 2. The PE makes a memory access to `Align(X[0], 4)` in AArch64 state, or `Align(R[0], 4)` in AArch32 state.
 3. The PE generates an Alignment fault, regardless of whether alignment checking is enabled.
 4. The PE does nothing.
- Following each memory access, if there is no Data Abort, R0 is updated with an UNKNOWN value.
- For external writes to `DBGDTRRX_EL0`, if the PE writes to memory, an UNKNOWN value is written.
- For external reads of `DBGDTRTX_EL0` an UNKNOWN value is returned.
- The `RXfull` and `TXfull` flags are left in an UNKNOWN state, meaning that a `DBGDTRTX_EL0` read can trigger a TX underrun, and a `DBGDTRTX_EL0` write can trigger an RX overrun.

H4.3.3 Memory-mapped accesses to the DCC and ITR

Writes to the flags in `EDSCR` by external debug interface accesses to the DCC and the ITR registers are indirect writes, because they are a side-effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see [Register access permissions for memory-mapped accesses on page H8-6542](#).

H4.4 Flow control of the DCC and ITR registers

- [Ready flags](#).
- [Buffering writes to EDITR](#).
- [Overrun and underrun flags](#).
- [Cumulative error flag on page H4-6490](#).

H4.4.1 Ready flags

In Normal access mode:

- For the DTR registers there are two ready flags:
 - `EDSCR.RXfull == 1` indicates that `DBGDTRRX_ELO` contains a valid value that has been written by the external debugger and not yet read by software running on the target.
 - `EDSCR.TXfull == 1` indicates that `DBGDTRTX_ELO` contains a valid value that has been written by software running on the target and not yet read by an external debugger.
- For the ITR register there is a single ready flag:
 - `EDSCR.ITE == 1` indicates that the PE is ready to accept an instruction to the ITR.

————— **Note** —————

The architecture permits a PE to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, as long as those instructions are discarded if `EDSCR.ERR` is set, either by an underrun or overrun or by any of the other error conditions described in this architecture, such as an instruction generating an abort.

In Memory access mode:

- `EDSCR.{RXfull, ITE} == {0,1}` indicates that `DBGDTRRX_ELO` is empty and the PE is ready to accept a word external write to `DBGDTRRX_ELO`.
- `EDSCR.{TXfull, ITE} == {1,1}` indicates that `DBGDTRTX_ELO` is full and the PE is ready to accept a word external read from `DBGDTRTX_ELO`.

All other values indicate that the PE is not ready, and result in a DTR overrun or underrun error, an ITR overrun error, or both, as defined in [Overrun and underrun flags](#).

`EDSCR.{ITE, RXfull, TXfull}` shows the status of the ITR and DCC registers. It ignores the question of whether a read or write cannot be accepted because, for example, `EDSCR.ERR` is set or the OPTIONAL Software Lock is locked for memory-mapped accesses (`EDLSR.SLK == 1`).

H4.4.2 Buffering writes to EDITR

The architecture permits a processor to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, provided that:

- Those instructions are discarded if `EDSCR.ERR` is set to 1, either by an underrun or an overrun, or by any other error conditions described in this architecture, such as an instruction generating an abort.
- The PE maintains the simple sequential execution model with the order of instructions determined by the order in which the PE accepts the EDITR writes. In particular, the buffered instructions must be executed in the Execution state consistent with a simple sequential execution of the instructions, even if one of the previous instructions is a state changing operation, such as DCPS or DRPS.

H4.4.3 Overrun and underrun flags

Each of the ready flags has a corresponding overrun or a corresponding underrun flag. These are sticky status flags that are set if the register is accessed using the external debug interface when the corresponding ready flag is not in the ready state.

If the PE is in Debug state and Memory access mode, the corresponding error flag is also set if the PE is not ready to accept an operation because a previous load or store is still in progress. The sticky status flag remains set until cleared by writing 1 to [EDRCR.CSE](#).

———— **Note** ————

The architecture permits a PE to continue to accept and buffer data to write to memory in Memory access mode.

[Table H4-1](#) shows DCC and ITR ready flags and the overrun and underrun flags associated with them.

Table H4-1 DCC and ITR ready flags and the associated overrun/underrun flags

External debug interface access	Overrun/Underrun condition	EDSCR flag
Write DBGDTRRX_EL0	$\text{EDSCR.RXfull} == '1' \ \ (\text{Halted}() \ \&\& \ \text{EDSCR.MA} == '1' \ \&\& \ \text{EDSCR.ITE} == '0')$	RXO
Read DBGDTRTX_EL0	$\text{EDSCR.TXfull} == '0' \ \ (\text{Halted}() \ \&\& \ \text{EDSCR.MA} == '1' \ \&\& \ \text{EDSCR.ITE} == '0')$	TXU
Write EDITR	$\text{Halted}() \ \&\& \ (\text{EDSCR.ITE} == '0' \ \ \text{EDSCR.MA} == '1')$	ITO

When an overrun or underrun flag is set to 1, the cumulative error flag, [EDSCR.ERR](#), described in *Cumulative error flag* on page H4-6490, is also set to 1.

In the event of an external write to [DBGDTRRX_EL0](#) or [EDITR](#) generating an overrun, or an external read from [DBGDTRTX_EL0](#) generating an underrun:

- For a write, the written value is ignored.
- For a read, an UNKNOWN value is returned.
- [EDSCR.TXfull](#), [EDSCR.RXfull](#) or [EDSCR.ITE](#), as applicable, are not updated.

There is no overrun or underrun detection on external reads of [DBGDTRRX_EL0](#) or external writes of [DBGDTRTX_EL0](#).

There is no overrun or underrun detection of direct reads and direct writes of the DTR System registers by software:

- If $\text{RXfull} == 0$, a direct read of [DBGDTRRX](#) or [DBGDTR_EL0](#) returns UNKNOWN.
- If $\text{TXfull} == 1$, a direct write of:
 - [DBGDTRTX](#) sets [DTRTX](#) to UNKNOWN.
 - [DBGDTR_EL0](#) sets [DTRRX](#) and [DTRTX](#) to UNKNOWN.

See *DCC accesses in Non-debug state* on page H4-6493 for more information.

Accessing 64-bit data

In AArch64 state, a software access to the [DBGDTR_EL0](#) register and an external debugger access to both [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#) can perform a 64-bit half-duplex operation.

However, there is only overrun and underrun detection on one of the external debug registers. That is:

- If software directly writes a 64-bit value to [DBGDTR_EL0](#), only TXfull is set to 1, meaning:
 - A subsequent external write to [DBGDTRRX_EL0](#) would not be detected as an overrun.
 - If the external debugger reads [DBGDTRTX_EL0](#) first, software might observe [MDCCSR_EL0.TXfull](#) == 0 and send a second value before the external debugger reads [DBGDTRRX_EL0](#), leading to an undetected overrun.
- On external writes to both [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#) only RXfull is set to 1, meaning:
 - A subsequent direct write of [DBGDTRTX_EL0](#) would not be detected as an overrun.

- If the external debugger writes to `DBGDTRRX_EL0` first, software might observe `MDCCSR_EL0.RXfull == 1` and read a full 64-bit value, before the external debugger writes to `DBGDTRTX_EL0`, leading to an undetected underrun.

To avoid this, debuggers need to be aware of the data size used by software for transfers and ensure that 64-bit data is read or written in the correct order. If the PE is in Non-debug state, this order is as follows:

- The external debugger must check `EDSCR.{RXfull, TXfull}` before each transfer.
- To receive a 64-bit value from the target, the external debugger must read `DBGDTRRX_EL0` before reading `DBGDTRTX_EL0`.
- To send a 64-bit value to the target, the external debugger must write to `DBGDTRTX_EL0` before writing `DBGDTRRX_EL0`.

Because three accesses are required to transfer 64 bits of data, 64-bit transfers are not recommended for regular communication between host and target. The use of underrun and overrun detection means that only one access is required for 32 bits of data when using 32-bit transfers.

In Debug state, the debugger controls the instructions executed by the PE, so these limitations do not apply. 64-bit transfers provide a means to transfer a 64-bit general register between the host and the target in Debug state.

H4.4.4 Cumulative error flag

The cumulative error flag, `EDSCR.ERR`, is set to 1:

- On taking an exception from Debug state.
- On any signalled overrun or underrun in the DCC or ITR.

When `EDSCR.ERR == 1`:

- External reads of `DBGDTRTX_EL0` do not have any side-effects.
- External writes to `DBGDTRRX_EL0` are ignored.
- External writes to `EDITR` are ignored.
- No further instructions can be issued in Debug state. This includes any instructions previously accepted as external writes to `EDITR` that occur in program order after the instruction or access that caused the error.

This allows a debugger to stream data, or, in Debug state, instructions, to the target without having to:

- Check `EDSCR.{RXfull, TXfull, ITE}` before each access.
- Check `EDSCR.{ITO, RXO, TXU}` following each access, for overrun or underrun.
- Check `PSTATE` or other syndrome registers, or both, for an exception following each instruction executed in Debug state that might generate a synchronous exception.

The cumulative error flag remains set until cleared to 0 by writing 1 to `EDRCR.CSE`. However, the effect of writing 1 to `EDRCR.CSE` to clear `EDSCR.ERR` is **CONSTRAINED UNPREDICTABLE** when both of the following apply:

- The PE is in Debug state.
- The value of `EDSCR.ITE` is 0.

When these conditions apply and a value of 1 is written to `EDRCR.CSE`, either or both of the following might occur:

- `EDSCR.ERR` is not cleared to 0.
- Any instructions in `EDITR` that have not been executed might be executed subsequently, rather than being ignored.

————— **Note** —————

This means that a debugger must poll `EDSCR.ITE` until it has the value 1, indicating that `EDITR` is empty, before writing to `EDRCR.CSE` to clear the `EDSCR.ERR` flag to 0.

For overruns and underruns, `EDSCR.{ITO, RXO, TXU}` record the error type.

Pseudocode description of clearing the error flag

The `ClearStickyErrors()` pseudocode function is described in [Chapter J1 ARMv8 Pseudocode](#).

H4.5 Synchronization of DCC and ITR accesses

In addition to the standard synchronization requirements for register accesses, the following subsections describe additional requirements that apply for the DCC and ITR registers:

- [Summary of System register accesses to the DCC.](#)
- [DCC accesses in Non-debug state on page H4-6493.](#)
- [Synchronization of DCC interrupt request signals on page H4-6496.](#)
- [DCC and ITR access in Debug state on page H4-6496.](#)

In these sections, accesses by the external debug interface are referred to as external reads and external writes. Accesses to System registers are referred to as direct reads, direct writes, indirect reads, and indirect writes.

———— Note —————

In [Synchronization requirements for AArch64 System registers on page D12-2675](#) external reads and external writes are described as forms of indirect access. This whole section uses more explicit terminology.

The DTR registers and the DCC flags, TXfull and RXfull, form a communication channel, with one end operating asynchronously to the other. Implementations must respect the ordering of accesses to these registers in order to maintain the correct behavior of the channel.

External reads of, and external writes to [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#) are asynchronous to direct reads of, and direct writes to, [DBGDTRRX](#), [DBGDTRTX](#), and in AArch64 state [DBGDTR_EL0](#), made by software using System register access instructions. The direct reads and direct writes indirectly write to the DCC flags. The external reads and external writes indirectly read the DCC flags to check for underrun and overrun.

Throughout this section:

- DCC flags** Means any or all of the following:
- The [EDSCR](#).{RXfull.TXfull} ready flags.
 - The [EDSCR](#).RXO overrun flag.
 - The [EDSCR](#).TXU underrun flag.
 - The [EDSCR](#).ERR cumulative error flag.
- ITR flags** Means any or all of the following:
- The [EDSCR](#).ITE ready flag.
 - The [EDSCR](#).ITO overrun flag.
 - The [EDSCR](#).ERR cumulative error flag.

H4.5.1 Summary of System register accesses to the DCC

System register accesses to the DTR registers are direct reads and writes of those registers, as shown in [Table H4-2 on page H4-6493](#). Several of these instructions access the same registers using different encodings.

With the exception of the read and write bits, [DBGDTRRX](#) and [DBGDTRTX](#) are the same encoding, with exception of the read/write bits, but use different registers. The Armv8 architecture governs the order of these instructions, as described in [Synchronization requirements for AArch64 System registers on page D12-2675](#). For more details, see the description of the individual register in the relevant chapter, [Chapter D12 AArch64 System Register Descriptions](#) or [Chapter G8 AArch32 System Register Descriptions](#).

Table H4-2 shows a summary of System register accesses to the DCC.

Table H4-2 Summary of System register accesses to the DCC

Operation	OS Lock	AArch64 (MRS/MSR)	AArch32 (MRC/MCR)	Description
Read	-	DBGDTRRX_EL0	DBGDTRRXint	Direct read of DTRRX Indirect write to the DCC flags An STC instruction that reads DBGDTRRXint makes an indirect write to DBGDSCRint.RXfull
Write	-	DBGDTRTX_EL0	DBGDTRTXint	Direct read of DTRTX Indirect write to the DCC flags An LDC instruction that writes to DBGDTRTXint using a value read from memory is a direct write to DBGDTRTXint
Read/write	-	DBGDTR_EL0	-	Direct read/write of both DTRRX and DTRTX Indirect write to the DCC flags
Read	-	MDCCSR_EL0	DBGDSCRint	Direct read of the DCC flags
Read/write	-	OSDTRRX_EL1	DBGDTRRXext	Direct read/write of DTRRX
Read/write	-	OSDTRTX_EL1	DBGDTRTXext	Direct read/write of DTRTX
Read	Unlocked	MDSCR_EL1	DBGDSCRext	Direct read of DCC flags
Read/write	Locked	MDSCR_EL1	DBGDSCRext	Direct read/write of DCC flags

H4.5.2 DCC accesses in Non-debug state

In Non-debug state DCC accesses are as described in *Normal access mode* on page H4-6484:

- If a direct read of **DCCSR** returns $RXfull == 1$, then a following direct read of **DBGDTRRX**, or in AArch64 state of **DBGDTR_EL0**, returns valid data and indirectly writes 0 to **DCCSR.RXfull** as a side-effect.
- If a direct read of **DCCSR** returns $TXfull == 0$, then a following direct write to **DBGDTRTX**, or in AArch64 state to **DBGDTR_EL0**, writes the intended value, and indirectly writes 1 to **DCCSR.TXfull** as a side-effect.

No *Context synchronization event* is required between these two instructions. Overrun and underrun detection prevents intervening external reads and external writes affecting the outcome of the second instruction.

The indirect write to the **DCC flags** as part of the DTR access instruction is made atomically with the DTR access.

Because a direct read of **DBGDTRRX** is an indirect write to **DCCSR.RXfull**, it must occur in program order with respect to the direct read of **DCCSR**, meaning it must not return a speculative value for DTRRX that predates the **RXfull** flag returned by the read of **DCCSR**. The direct write to **DBGDTRTX** must not be executed speculatively.

Direct reads of **DBGDTRRX**, or in AArch64 state **DBGDTR_EL0**, and **DCCSR**, must occur in program order with respect to other direct reads of the same register using the same encoding.

The following accesses have an implied order within the atomic access:

- In the simple sequential execution of the program the indirect write of the **DCC flags** occurs immediately after the direct DTR access.

———— **Note** ————

For an access to **DBGDTR_EL0**, this means the indirect write happens after both **DBGDTRRX_EL0** and **DBGDTRTX_EL0** have been accessed.

- In the simple sequential execution model, for an external read of `DBGDTRTX_EL0` or an external write of `DBGDTRRX_EL0`:
 - The check of the **DCC flags** for overrun or underrun occurs immediately before the access.
 - If there is no underrun or overrun, the update of the **DCC flags** occurs immediately after the access.
 - If there is underrun or overrun, the update of the DCC underrun or overrun flags occurs immediately after the access.

All observers must observe the same order for accesses.

———— **Note** —————

These requirements do not create order where order does not otherwise exist. It applies only for ordered accesses.

Without explicit synchronization following external writes and external reads:

- The value written by the external write to `DBGDTRRX_EL0` that does not overrun, must be observable to direct reads of `DBGDTRRX` and `DBGDTR_EL0` in finite time.
- The **DCC flags** that are updated as a side-effect of the external write or external read must be observable:
 - To subsequent external reads of `EDSCR`.
 - To subsequent external reads of `DBGDTRRX_EL0` when checking for underrun.
 - To subsequent external writes to `DBGDTRTX_EL0` when checking for overrun.
 - To direct reads of `DCCSR` in finite time.

However, explicit synchronization is required to guarantee that a direct read of `DCCSR` returns up-to-date **DCC flags**. This means that if a signal is received from another agent that indicates that `DCCSR` must be read, an ISB is required to ensure that the direct read of `DCCSR` occurs after the signal has been received. This also synchronizes the value in `DBGDTRRX`, if applicable. However, if that signal is an interrupt exception triggered by `COMMIRQ`, `COMMTX`, or `COMMRX`, the exception entry is sufficient synchronization. See *Synchronization of DCC interrupt request signals* on page H4-6496.

Explicit synchronization is required following a direct read or direct write:

- To ensure that a value directly written to `DBGDTRTX` is observable to external reads of `DBGDTRTX_EL0`.
- To ensure that a value directly written to `DBGDTR_EL0` is observable to external reads of `DBGDTRTX_EL0` and `DBGDTRRX_EL0`.
- To guarantee that the indirect writes to the **DCC flags** that were a side-effect of the direct read or direct write have occurred, and therefore that the updated values are:
 - Observable to external reads of `EDSCR`.
 - Observable to external reads of `DBGDTRRX_EL0` when checking for underrun.
 - Observable to external writes of `DBGDTRTX_EL0` when checking for overrun.
 - Returned by a following direct read of `DCCSR`.

See also *Memory-mapped accesses to the DCC and ITR* on page H4-6487 and *Synchronization of changes to the external debug registers* on page H8-6538.

———— **Note** —————

These ordering rules mean that software:

- Must not read `DBGDTRRX` without first checking `DCCSR.RXfull` or if the previously-read value of `DCCSR.RXfull` is 0.
It is not sufficient to read both registers and then later decide whether to discard the read value, as there might be an intervening write from the external debug interface.
- Must not write `DBGDTRTX` without first checking `DCCSR.TXfull` or if the previously-read value of `DCCSR.TXfull` is 1.
The write to `DBGDTRTX` overwrites the value in `DTRTX`, and the external debugger might or might not have read this value.

- Must ensure there is an explicit *Context synchronization event* following a DTR access, even if not immediately returning to read **DCCSR** again. This synchronization operation can be an exception return.
-

Derived requirements

The rules for DCC accesses in Non-debug state are as follows:

- Following a direct read of **DBGDTRRX** when **RXfull** is 1:
 - If an external write to **DBGDTRRX** checks the **RXfull** flag for overrun and observes that the value of **RXfull** is 0, the value returned by the previous direct read must not be affected by the external write.
 - If an external read of **EDSCR** returns a **RXfull** value of 0, then the value returned by the previous direct read must not be affected by a following external write to **DBGDTRRX**, and the following external write does not overrun.
- Following a direct read of **DBGDTR_EL0**, when **RXfull** is 1:
 - If an external write to **DBGDTRRX** checks the **RXfull** flag for overrun and observes that the value of **RXfull** is 0, the value returned by the previous direct read must not be affected by the external write nor by a following direct write to **DBGDTRTX**.
 - If an external read of **EDSCR** returns a **RXfull** value of 0, then the value returned by the previous direct read must not be affected by subsequent external writes to **DBGDTRRX** and **DBGDTRTX** in any order, and the following external write of **DBGDTRRX** will not overrun.
- Following a direct write to **DBGDTRTX**, when **TXfull** is 0:
 - If an external read of **DBGDTRTX** checks the **TXfull** flag for underrun and observes that the value of **TXfull** is 1, the value returned by the external read must be the value written by the previous direct write.
 - If an external read of **EDSCR** returns a **TXfull** value of 1, then the value returned by a following external read of **DBGDTRRX** must be the value written by the previous direct read, and the subsequent external read will not underrun.
- Following a direct write to **DBGDTR_EL0**, when **TXfull** is 0:
 - If an external read of **DBGDTRTX** checks the **TXfull** flag for underrun and observes that the value of **TXfull** is 1, the values returned by the external read and by a subsequent external read of **DBGDTRRX** must be the value written by the previous direct write.
 - If an external read of **EDSCR** returns a **TXfull** value of 1, then the value returned by subsequent external reads of **DBGDTRRX** and **DBGDTRTX**, in any order, must be the value written by the previous direct read, and the subsequent external read of **DBGDTRTX** does not underrun.
- Following an external read of **DBGDTRTX** that does not underrun, if a direct read of **DCCSR** returns a **TXfull** value of 0, then the value returned by the external read must not be affected by a following direct write to **DBGDTRTX**.
- Following a first external read **DBGDTRRX** and a following second external read of **DBGDTRTX** that does not underrun, if a direct read of **DCCSR** returns a **TXfull** value of 0, then the values returned by the external reads must not be affected by a following direct write to **DBGDTR_EL0**.
- Following an external write to **DBGDTRRX** that does not overrun, if a direct read of **DCCSR** returns an **RXfull** value of 1, then the value returned by a following direct read of **DBGDTRRX** or **DBGDTR_EL0** must be the value written by the previous external write.
- Following a first external write to **DBGDTRTX** and a following second external write to **DBGDTRRX** that does not overrun, if a direct read of **DCCSR** returns an **RXfull** value of 1, then the value returned by a subsequent direct read of **DBGDTR_EL0** must return the values written by the previous external writes.

H4.5.3 Synchronization of DCC interrupt request signals

Following an external read or external write access to the DTR registers, the interrupt request signals, **COMMIRQ**, **COMMTX**, and **COMMRX**, must be updated in finite time without explicit synchronization.

The updated values must be observable to a direct read of **DCCSR** or **DBGDTRRX**, or a direct write of **DBGDTRTX** executed after taking an interrupt exception generated by the interrupt request. The updated values must also be observable to a direct write of **DBGDTRTX** executed after taking an interrupt exception generated by the interrupt request.

———— **Note** —————

The requirement that indirect writes to registers are observable to direct reads in finite time does not imply that all observers will observe the indirect write at the same time. For more information, see *Synchronization requirements for AArch64 System registers* on page D12-2675 and *Synchronization of changes to AArch32 System registers* on page G8-5632.

Following a direct read of **DBGDTRRX** or a direct write to **DBGDTRRX**, software must execute a *Context synchronization event* to guarantee the interrupt request signals have been updated in finite time. This synchronization operation can be an exception return.

H4.5.4 DCC and ITR access in Debug state

In Debug state, stricter observability rules apply for instructions issued through the ITR, to maintain communication between a debugger and the PE, without requiring excessive explicit synchronization.

In Normal access mode, without explicit synchronization:

- A direct read or direct write of the DTR registers by an instruction written to **EDITR** must be observable to an external write or an external read in finite time:
 - A direct read of **DBGDTRRX** must be observable to an external write of **DBGDTRRX_EL0**.
 - A direct read of **DBGDTR_EL0** must be observable to an external write of **DBGDTRRX_EL0** and **DBGDTRTX_EL0**.
 - A direct write of **DBGDTRTX** must be observable to an external read of **DBGDTRTX_EL0**.
 - A direct write of **DBGDTR_EL0** must be observable to an external read of **DBGDTRRX_EL0** and **DBGDTRTX_EL0**.

This includes the indirect write to the **DCC flags** that occurs atomically with the access as described in *DCC accesses in Non-debug state* on page H4-6493.

The subsequent external write or external read must observe either the old or the new values of both the DTR contents and **DCC flags**. If the old values are observed, this typically results in overrun or underrun, assuming the old values of the **DCC flags** indicate an overrun or underrun condition, as would normally be the case.

This means the debugger can observe the direct read or direct write without explicit synchronization and without explicitly testing the **DCC flags** in **EDSCR**, because it can rely on overrun and underrun tests.

- External reads of **DBGDTRTX_EL0** that do not underrun and external writes to **DBGDTRRX_EL0** that do not overrun must be observable to an instruction subsequently written to **EDITR** on completion of the first external access. This includes the indirect write to the **DCC flags**.

This means that without explicit synchronization and without the need to first check the **DCC flags** in **DCCSR**:

- If the instruction is a direct read of **DBGDTRRX**, it observes the external write.
- If the instruction is a direct write of **DBGDTRTX**, it observes the external read.
- Writes to **EDITR** that do not overrun commit an instruction for execution immediately. The instruction must complete execution in finite time without requiring any further operation by the debugger.
- After an external write to the **EDITR**, the **ITR flags** that are updated as a side effect of that write must be observable by:
 - An external read of the **EDSCR** that follows the external write to the **EDITR**.
 - When checking for overrun, another external write to the **EDITR** that follows the original external write to the **EDITR**.

In Memory access mode, these requirements shift to the instructions implicitly executed by external reads and external writes of the DTR registers, as described in [Memory access mode](#) on page H4-6485.

H4.6 Interrupt-driven use of the DCC

Arm recommends implementations provide a level-sensitive DCC interrupt request through the IMPLEMENTATION DEFINED interrupt controller as a private peripheral interrupt for the originating PE.

———— **Note** —————

- In addition to connection to the interrupt controller Arm also recommends **COMMIRQ**, **COMMTX**, and **COMMRX** signals that might be implemented for use by any legacy system peripherals.
- GICv3 reserves a private peripheral interrupt number for the **COMMIRQ** interrupt.

The **DCCINT** register provides a first level of interrupt masking within the PE, meaning only a single interrupt source, **COMMIRQ**, is needed at the interrupt controller.

See also [Synchronization of DCC interrupt request signals on page H4-6496](#).

H4.7 Pseudocode description of the operation of the DCC and ITR registers

The basic operation of the DCC and ITR registers is shown by the following pseudocode functions. These functions do not cover the behavior when `OSLSR.OSLK == 1`, meaning that the OS Lock is locked:

- `DBGDTR_EL0[]`.
- `DBGDTRRX_EL0[]`.
- `DBGDTRTX_EL0[]`.
- `EDITR[]`.
- `CheckForDCCInterrupts()`.

For the definition of the DTR Registers, see [shared/debug/dccanditr/DTR](#) on page J1-7093.

Chapter H5

The Embedded Cross-Trigger Interface

This chapter describes the embedded cross-trigger interface. It contains the following sections:

- *About the Embedded Cross-Trigger (ECT) on page H5-6502.*
- *Basic operation on the ECT on page H5-6504.*
- *Cross-triggers on a PE in an ARMv8 implementation on page H5-6508.*
- *Description and allocation of CTI triggers on page H5-6509.*
- *CTI registers programmers' model on page H5-6513.*
- *Examples on page H5-6514.*

H5.1 About the Embedded Cross-Trigger (ECT)

The *Embedded Cross-Trigger*, ECT, allows a debugger to:

- Send trigger events to a PE. For example, this might be done to halt the PE.
- Send a trigger event to one or more PEs, or other system components, when a trigger event occurs on another PE or system component. For example, this might be done to halt all PEs when one individual PE halts.

Figure H5-1 shows the logical structure of an ECT.

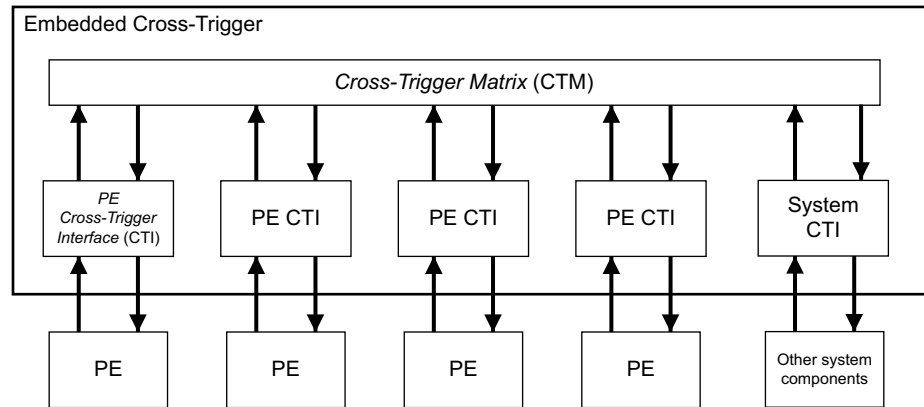

Figure H5-1 Structure of an embedded cross-trigger

The ECT can deliver many types of trigger events, which are described in the following sections:

- [Debug request trigger event on page H5-6509.](#)
- [Restart request trigger event on page H5-6510.](#)
- [Cross-halt trigger event on page H5-6510.](#)
- [Performance Monitors overflow trigger event on page H5-6510.](#)
- [Generic trace external input trigger events on page H5-6511.](#)
- [Generic trace external output trigger events on page H5-6511.](#)
- [Generic CTI interrupt trigger event on page H5-6511.](#)

An ARMv8-A implementation must:

- Include a cross-trigger interface, CTI.
- Implement at least the input and output triggers defined in this architecture.

In addition, see [Cross-triggers on a PE in an ARMv8 implementation on page H5-6508.](#)

ARM recommends that this cross-trigger interface includes:

- The ability to route trigger events between Trace Units, which typically have advanced event triggering logic.
- An output trigger to the interrupt controller.

Also, ARM recommends that the Embedded Cross-Trigger includes the capability to send and receive IMPLEMENTATION DEFINED system trigger events to and from other system components, including a system counter, using a system CTI. See [Halt-on-debug on page 12-6724.](#)

———— **Note** —————

The ECT and CTI must only signal trigger events for external debugging. They must not route software events, such as interrupts. For example, the Performance Monitors overflow input trigger is provided to allow entry to Debug state on a counter overflow, and the output trigger to the interrupt controller is provided to generally allow events from the external debug sub-system to be routed to a software agent. However, the combination of the two must not be used as a mechanism to route Performance Monitors overflows to an interrupt controller.

H5.1.1 Implementation with a CoreSight CTI

For details of the recommended connections in an ARMv8-A implementation, see [Appendix K2 Recommended External Debug Interface](#). See also *CoreSight™ SoC Technical Reference Manual*.

H5.2 Basic operation on the ECT

The ECT comprises a Cross-Trigger Matrix, CTM, and one Cross-Trigger Interface, CTI, for each PE. The ECT might also include other CTIs for other system components. The CTM passes events between the CTI blocks over channels. The CTM can have a maximum of 32 channels.

The main interfaces of the cross-trigger interface, CTI, are:

- The input triggers:
 - These are trigger event inputs from the PE to the CTI.
- The output triggers:
 - These are trigger event outputs from the CTI to the PE.
- The input channels:
 - These are channel event inputs from the cross-trigger matrix, CTM, to the CTI.
- The output channels:
 - These are channel event outputs from the CTI to the CTM.

Each CTI block has:

- Up to 32 input triggers that come from the PE:
 - The input triggers are numbered 0-31.
- Up to 32 output triggers that go to the PE:
 - The output triggers are numbered 0-31.

[Figure H5-2 on page H5-6505](#) shows the logical internal structure of a CTI.

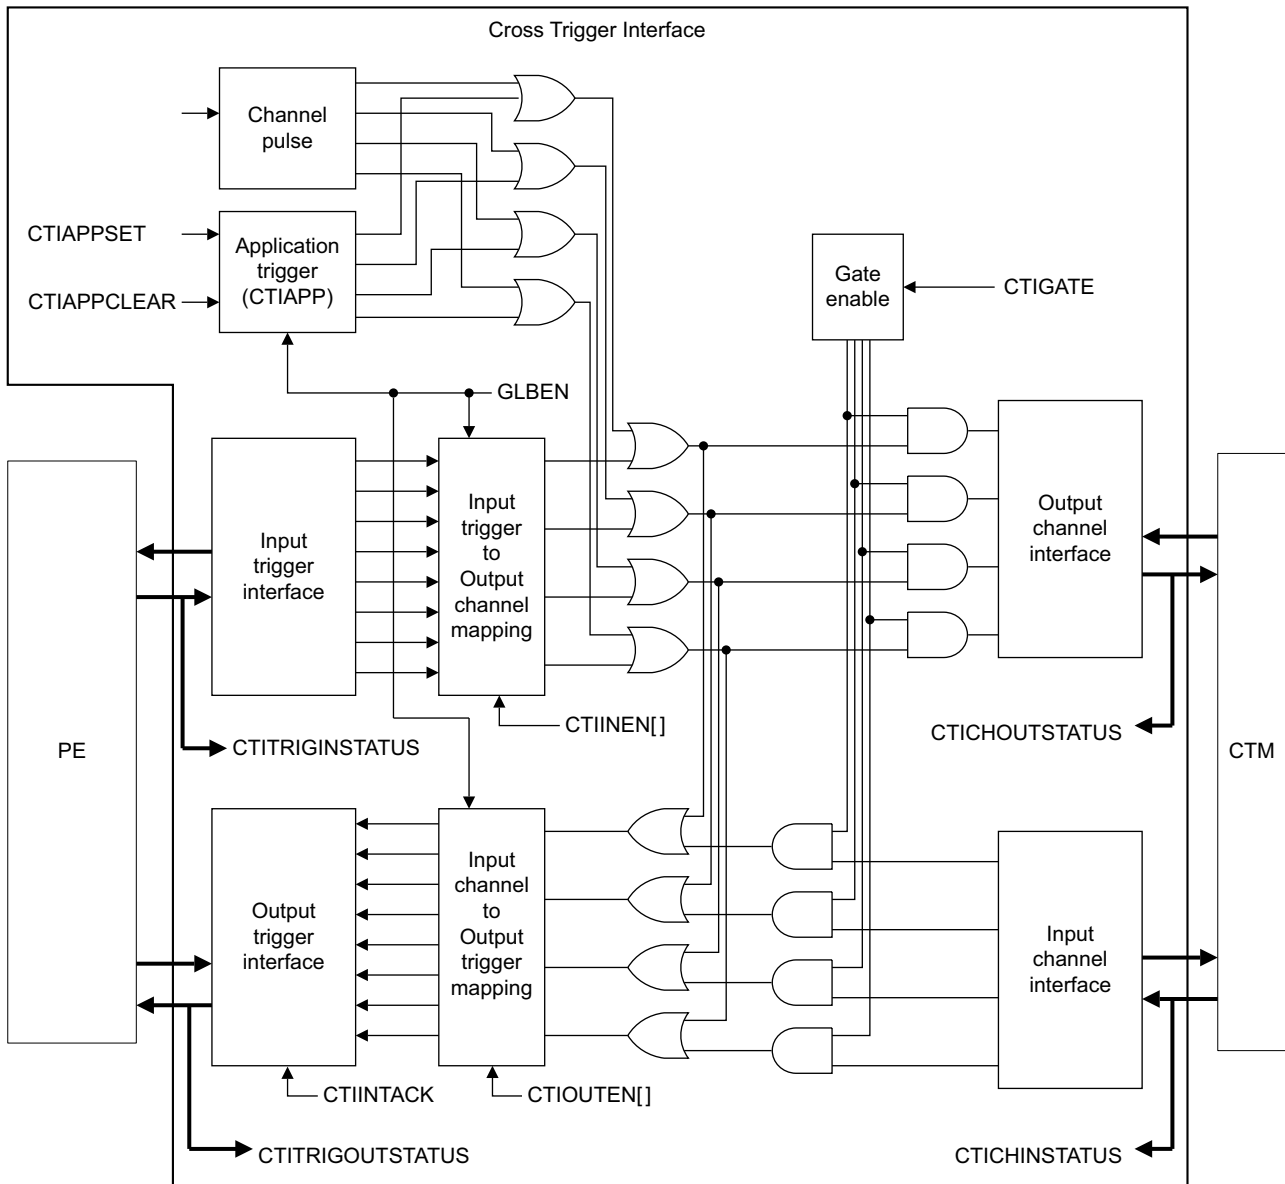

Figure H5-2 Structure of a cross-trigger interface

Note

- The number of triggers is IMPLEMENTATION DEFINED. Figure H5-2 shows eight input and eight output triggers.
- The number of channels is IMPLEMENTATION DEFINED. Figure H5-2 shows four channels.
- In Figure H5-2 the input channel gate function is a CTIv2 feature.

When the CTI receives an input trigger event, this generates channel events on one or more internal channels, according to the *mapping function* defined by the *Input trigger→output channel mapping registers*, CTIINEN<n>.

The CTI also contains an *application trigger* and *channel pulse* to allow a debugger to create channel events directly on internal channels by writing to the CTI control registers.

Channel events on each internal channel are passed to a corresponding output channel that is controlled by a *channel gate*. The channel gate can block propagation of channel events from an internal channel to an output channel.

The output channels from a CTI are combined, using a logical OR function, with the output channels from all other CTIs to form the input channels on other CTIs. The input channels of this CTI are the logical OR of the output channels on all other CTIs. This is the *cross-trigger matrix*, CTM. Therefore, the number of input channels must equal the number of output channels.

———— **Note** —————

The number of input triggers and output triggers is not required to be the same.

The internal channels form an internal cross-trigger matrix within the CTI. This delivers events directly from the input triggers to the output triggers. Therefore the number of internal channels is the same as the number of input and output channels on the external CTM, and there is a direct mapping between the two.

Channel events received on each input channel are passed to the corresponding internal channel. It is IMPLEMENTATION DEFINED whether the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

When the CTI receives a channel event on an internal channel this generates trigger events on one or more output triggers, according to the mapping function defined by the *Input channel* → *output trigger mapping registers*, `CTIOUTEN<n>`.

The CTI contains the input and output trigger interfaces to the PE and the interface of the cross-trigger matrix. The architecture does not define the signal protocol used on the trigger interfaces, and:

- It is IMPLEMENTATION DEFINED whether the CTI supports multicycle input trigger events.
- It is IMPLEMENTATION DEFINED whether the CTM supports multicycle channel events.

See *Multicycle events*.

However, an output trigger is asserted until acknowledged. The output trigger can be:

- Self-acknowledging. This means that no further action is required from the debugger.
- Acknowledged by the debugger writing 1 to the corresponding bit of `CTIINTACK`.

The time taken to propagate a trigger event from the first PE, through its CTI, across the CTM to another CTI, and thereby to a second PE is IMPLEMENTATION DEFINED.

———— **Note** —————

ARM recommends that this path is not longer than the shortest software communication path between those PEs. This is because if the first PE halts, the Cross-halt trigger event can propagate through the ECT and halt the second PE without causing software on the second PE to malfunction because the first PE is in Debug state and is not responding.

H5.2.1 Multicycle events

A multicycle event is one with a continuous state that might persist over many cycles, as opposed to a discrete event. A typical implementation of a multicycle event is a level-based signal interface, whereas a discrete event might be implemented as a pulse signal or message.

CTI support for multicycle trigger events is IMPLEMENTATION DEFINED. Use of multicycle trigger events is deprecated. Of the architecturally defined input trigger events, the Performance Monitors overflow trigger event and Generic trace external output trigger events can be multicycle input triggers.

CTM support for multicycle channel events is IMPLEMENTATION DEFINED. A CTM that does not support multicycle channel events cannot propagate a multicycle trigger event between CTIs.

———— **Note** —————

A full ECT might comprise a mix of CTIs, some of which can support multicycle trigger events. In bridging these components, multicycle channel events become single channel events at the boundary between the CTIs.

An ECT that supports multicycle trigger events

When an ECT supports multicycle trigger events, an input trigger event to the CTI continuously asserts channel events on all output channels mapped to it until either:

- The input trigger event is removed.
- The channel mapping function is disabled.

This means that an input trigger that is asserted for multiple cycles causes any channels that are mapped to it to become active for multiple cycles. Consequently, any output triggers mapped from that channel are asserted for multiple cycles.

———— Note —————

The output trigger remains asserted for at least as long as the channel remains active. This means that even if the output trigger is acknowledged, it remains asserted until the channel deactivates.

The CTI does not guarantee that these events have precisely the same duration, as the triggers and channels can cross between clock domains.

[CTIAPPSET](#) and [CTIAPPCLEAR](#) can set a channel active for multiple cycles. [CTIAPPULSE](#) generates a single channel event. [CTICHINSTATUS](#) and [CTICHOUTSTATUS](#) can report whether a channel is active.

An ECT that does not support multicycle trigger events

When an ECT does not support multicycle trigger events, an input trigger event to the CTI generates a single channel event on all output channels mapped to it, regardless of how long the input trigger event is asserted.

This means that an input trigger event that is asserted for multiple cycles generates a single channel event on any channels mapped to it. Consequently any self-acknowledging output triggers mapped from those channels are single trigger events.

———— Note —————

A single event is typically a single cycle, but there is no guarantee that this is always the case.

[CTIAPPSET](#) and [CTIAPPCLEAR](#) can only generate a single channel event. [CTIAPPULSE](#) generates a single channel event. If the ECT does not support multicycle channel events, use of [CTIAPPSET](#) and [CTIAPPCLEAR](#) is deprecated, and the debugger must only use [CTIAPPULSE](#). [CTICHINSTATUS](#) and [CTICHOUTSTATUS](#) must be treated as UNKNOWN.

H5.3 Cross-triggers on a PE in an ARMv8 implementation

An Armv8 PE must include a cross-trigger interface, and the implementation must include at least the input and output triggers defined in this architecture. The number of channels in the cross-trigger matrix is IMPLEMENTATION DEFINED, but there must be a minimum of three. Software can read CTIDEVID.NUMCHAN to discover the number of implemented channels.

The CTM must connect to all PEs in the same Inner Shareability domain as the Armv8-A PE, but can also connect to additional PEs. ARM strongly recommends that the CTM connects all PEs implementing a CTI in the system. This includes ARMv7-A PEs and other PEs that can be connected using a CoreSight CTI module.

———— **Note** —————

In a uniprocessor system the CTM is OPTIONAL. The CTM might be connected other CTI modules for non-PEs, such as triggers for system visibility components. ARM recommends that the CTM is implemented.

Any CTI connected to a PE that is not an ARMv8-A PE must implement at least:

- The Debug request trigger event.
- The Restart trigger event.
- The Cross-halt trigger event.

For more information about the CTI, see the *CoreSight™ SoC Technical Reference Manual*. Armv8-A refines the generic CTI by defining roles for each of the implemented input and output triggers.

H5.4 Description and allocation of CTI triggers

Table H5-1 shows the output trigger events defined by the architecture and the related trigger numbers.

Table H5-1 Allocation of CTI output trigger events

Number	Source	Destination	Event description
0	CTI	PE	<i>Debug request trigger event</i>
1	CTI	PE	<i>Restart request trigger event on page H5-6510</i>
2	CTI	IRQ controller	<i>Generic CTI interrupt trigger event on page H5-6511</i>
3	-	-	Reserved
4 - 7	CTI	PE Trace Unit	OPTIONAL <i>Generic trace external input trigger events on page H5-6511</i>

———— **Note** —————

Output triggers from the CTI are inputs to other blocks.

Table H5-2 shows the input trigger events defined by the architecture and the related trigger numbers.

Table H5-2 Allocation of CTI input trigger events

Number	Source	Destination	Event description
0	PE	CTI	<i>Cross-halt trigger event on page H5-6510</i>
1	PE	CTI	<i>Performance Monitors overflow trigger event on page H5-6510</i>
2	PE	CTI	<i>Statistical Profiling Extension sample trigger event on page H5-6511</i>
3	-	-	Reserved
4 - 7	PE Trace Unit	CTI	OPTIONAL <i>Generic trace external output trigger events on page H5-6511</i>

———— **Note** —————

Input triggers to the CTI are outputs from other blocks.

Table H5-1 and Table H5-2 show the minimum set of trigger events defined by the architecture. However:

- The Generic trace external input and output trigger events are only required if the OPTIONAL PE Trace Unit is implemented. If the OPTIONAL PE Trace Unit is not implemented, these trigger events are reserved.
- Support for the generic CTI interrupt trigger event is IMPLEMENTATION DEFINED because details of interrupt handling in the system, including any interrupt controllers, are IMPLEMENTATION DEFINED. Details regarding how the CTI interrupt is connected to an interrupt controller and its allocated interrupt number lie outside the scope of the architecture. ARM strongly recommends that implementations provide a means to generate interrupts based on external debug events.
- The other trigger events are required by the architecture.

An Armv8-A implementation can extend the CTI with additional triggers. These start with the number eight.

H5.4.1 Debug request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to force the PE into Debug state. The trigger event is asserted until acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to `CTIINTACK[0]`.

Note

A debugger must poll `CTITRIGOUTSTATUS[0]` until it reads as 0, to confirm that the output trigger has been deasserted before generating any event that must be ordered after the write to `CTIINTACK`, such as a write to `CTIAPPULSE` to activate another trigger.

If the PE is already in Debug state, the PE ignores the trigger event, but the CTI continues to assert it until it is removed by the debugger. See also [External Debug Request debug event on page H3-6473](#).

H5.4.2 Restart request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to request the PE to exit Debug state. If the PE is in Non-debug state, the request is ignored by the PE.

If a Restart request trigger event is received at or about the same time as the PE enters Debug state, it is CONstrained UNPREDICTABLE whether:

- The request is ignored by the PE. In this case the PE enters Debug state and remains in Debug state.
- The PE enters Debug state and then immediately restarts.

Debuggers must program the CTI to send Restart request trigger events only to PEs that are halted. To enable the PE to disambiguate discrete Restart request trigger events, after sending a Restart request trigger event, the debugger must confirm that the PE has restarted and halted before sending another Restart request trigger event. Debuggers can use `EDPRSR.{SDR, HALTED}` to determine the Execution state of the PE.

Note

Before generating a Restart request trigger event for a PE, a debugger must ensure any Debug request trigger event targeting that PE is cleared. [Debug request trigger event on page H5-6509](#) describes how to do this.

The trigger event is self-acknowledging, meaning that the debugger requires no further action to remove the trigger event. The trigger event is acknowledged even if the request is ignored by the PE. See also [Exiting Debug state on page H2-6452](#).

H5.4.3 Cross-halt trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted by a PE when it is entering Debug state.

Note

To reduce the latency of halting, ARM recommends that an implementation issues the Cross-halt trigger event early in the committed process of entering Debug state. This means that there is no requirement to wait until all aspects of entry to Debug state have completed before issuing the trigger event. Speculative emission of Cross-halt trigger events is not allowed. The Cross-halt trigger event must not be issued early enough for a subsequent Debug request trigger event, that might be derived from the Cross-halt trigger event, to be recorded in the `EDSCR.STATUS` field. This applies to Debug request trigger events that are acting as inputs to the PE.

H5.4.4 Performance Monitors overflow trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted each time the PE asserts a new Performance Monitors counter overflow interrupt request. See [Chapter D6 The Performance Monitors Extension](#).

If the CTI supports multicycle trigger events, then the trigger event remains asserted until the overflow is cleared by a write to `PMOVSCLR_EL0`. Otherwise, the trigger event is asserted when the value of `PMOVSCLR_EL0` changes from zero to a non-zero value.

Note

- This does not replace the recommended connection of Performance Monitors overflow trigger event to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI.
 - Events can be counted when `ExternalNoninvasiveDebugEnabled()==FALSE`, and, in Secure state, when `ExternalSecureNoninvasiveDebugEnabled()==FALSE`. Secure software must be aware that overflow trigger events are nevertheless visible to the CTI.
-

H5.4.5 Statistical Profiling Extension sample trigger event

If the Statistical Profiling Extension is implemented, and a sample record is written to memory, CTI input trigger 2 is asserted. This trigger might also be directly connected to other IMPLEMENTATION DEFINED debug features.

For more information see [Chapter D8 The Statistical Profiling Extension](#).

H5.4.6 Generic trace external input trigger events

These are output trigger events from the CTI, and input trigger events to the OPTIONAL PE Trace Unit, that are used in conjunction with the Generic trace external output trigger events to pass trigger events between:

- The PE and the OPTIONAL PE Trace Unit.
- The OPTIONAL PE Trace Unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external input trigger events.

The trigger events are self-acknowledging. This means that the debugger does not have to take any further action to remove the events.

H5.4.7 Generic trace external output trigger events

These are input trigger events to the CTI, and output trigger events from the OPTIONAL PE Trace Unit, used in conjunction with the Generic trace external input trigger events to pass trigger events between:

- The PE and the OPTIONAL PE Trace Unit.
- The OPTIONAL PE Trace Unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external output trigger events.

H5.4.8 Generic CTI interrupt trigger event

This is an output trigger event from the CTI, and an input to an IMPLEMENTATION DEFINED interrupt controller, and can transfer trigger events from the PE, PE Trace Units, or any other component attached to the CTI and CTM to software as an interrupt. The Generic CTI interrupt trigger event must be connected to the interrupt controller as an interrupt that can target the originating PE.

Note

- ARM recommends that the Generic CTI interrupt trigger event is a private peripheral interrupt, but implementations might instead make this trigger event available as a shared peripheral interrupt or a local peripheral interrupt.
 - GICv3 reserves a private peripheral interrupt number for this interrupt.
-

It is IMPLEMENTATION DEFINED whether this trigger event is:

- Self-acknowledging. This means that the debugger is not required to take any further action, and that the interrupt controller must treat the trigger event as a pulse or edge-sensitive interrupt.

- Acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to [CTIINTACK\[2\]](#). This means that the interrupt controller must treat the trigger event as a level-sensitive interrupt.

ARM recommends that the Generic CTI interrupt trigger event is a self-acknowledging trigger event.

H5.5 CTI registers programmers' model

The CTI registers programmers' model is described in [Chapter H8 About the External Debug Registers](#). The following sections contain information specific to the CTI:

- [External debug register resets](#) on page H8-6556.
- [External debug interface register access permissions](#) on page H8-6545.
- [Cross-trigger interface registers](#) on page H8-6554.
- The individual register descriptions in [Cross-Trigger Interface registers](#) on page H9-6666.

See also [Memory-mapped accesses to the external debug interface](#) on page H8-6542.

H5.5.1 CTI reset

An External Debug reset resets the CTI. See [External debug register resets](#) on page H8-6556 for details of CTI register resets. All CTI output triggers and output channels are deasserted on an External Debug reset.

———— **Note** —————

An indirect read of an output trigger might not observe the deasserted state until the processor is Cold reset. For more information, see [Synchronization of changes to the external debug registers](#) on page H8-6538.

H5.5.2 CTI authentication

The CTI ignores the state of the IMPLEMENTATION DEFINED authentication interface. This means that:

- [CTITRIGINSTATUS](#) shows the status of the input triggers and [CTICHINSTATUS](#) shows the status of the input channels, regardless of the value of `ExternalNoninvasiveDebugEnabled()`.

———— **Note** —————

The PE does not generate the Cross-halt trigger event and the PE Trace Unit does not generate Generic trace external output trigger events when `ExternalNoninvasiveDebugEnabled()==FALSE`. However, the PE can generate Performance Monitors overflow trigger events.

- The CTI can generate external triggers regardless of the value of `ExternalInvasiveDebugEnabled()`.

———— **Note** —————

The PE ignores Debug request and Restart request trigger events when `ExternalInvasiveDebugEnabled()==FALSE`. The PE Trace Unit ignores Generic trace external input trigger events when `ExternalNoninvasiveDebugEnabled()==FALSE`. The behavior of Generic CTI interrupt requests is part of the IMPLEMENTATION DEFINED handling of these interrupts, but it is permissible for an interrupt controller to receive these requests even when `ExternalInvasiveDebugEnabled()==FALSE`.

H5.6 Examples

The CTI is fully programmable and allows for flexible cross-triggering of events within a PE and between PEs in a multiprocessor system. For example:

- The Cross-halt trigger event and the Debug request trigger event can be used for cross-triggering in a multiprocessor system.
- The Cross-halt trigger event and the Generic interrupt trigger event can be used for event-driven debugging in a multiprocessor system.
- The Performance Monitors overflow trigger event and the Debug request trigger event can force entry to Debug state on overflow of a Performance Monitors event counter, for event-driven profiling.

———— **Note** —————

This does not replace the recommended connection of Performance Monitors overflow trigger events to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI. ARM recommends that the Performance Monitors overflow signal is directly available as a local interrupt source.

- The Generic trace external input and Generic trace external output trigger events can pass trace events into and out of the event logic of the PE Trace Unit. They can do this:
 - To pass trace events between Trace Units.
 - In conjunction with the Performance Monitors overflow trigger event, to couple the Performance Monitors to the PE Trace Unit.
 - In conjunction with the Debug request trigger event, to trigger entry to Debug state on a trace event.
 - In conjunction with other CTIs, to signal a trace trigger event onto a CoreSight trace interconnect.

The following sections describe some examples in more detail:

- [Halting a single PE.](#)
- [Halting all PEs in a group when any one PE halts on page H5-6515.](#)
- [Synchronously restarting a group of PEs on page H5-6515.](#)
- [Halting a single PE on Performance Monitors overflow on page H5-6515.](#)

Example H5-1 Halting a single PE

To halt a single PE, set:

1. `CTIGATE[0]` to 0, so that the CTI does not pass channel events on internal channel 0 to the CTM.
2. `CTIOUTEN0[0]` to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 0.

———— **Note** —————

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instance of `CTIOUTEN<n>` for which `<n>` is 0.

3. `CTIAPPULSE[0]` to 1, to generate a channel event on channel 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to `CTIINTACK[0]`, before restarting the PE.

Example H5-2 Halting all PEs in a group when any one PE halts

To program a group of PEs so that when one PE in the group halts, all of the PEs in that group halt, set the following registers for each PE in the group:

1. `CTIGATE[2]` to 1, so that each CTI passes channel events on internal channel 2 to the CTM.
2. `CTIINEN0[2]` to 1, so that each CTI generates a channel event on channel 2 in response to a Cross-halt trigger event.
3. `CTIOUTEN0[2]` to 1, so that each CTI generates a Debug request trigger event in response to a channel event on channel 2.

———— **Note** —————

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instances of `CTIINEN<n>` and `CTIOUTEN<n>` for which `<n>` is 0.

When a PE has halted, clear the Debug request trigger event by writing a value of 1 to `CTIINTACK[0]`, before restarting the PE.

Example H5-3 Synchronously restarting a group of PEs

To restart a group of PEs, for each PE in the group:

1. If the PE was halted because of a Debug request trigger event, the debugger must ensure the trigger event is deasserted. It can do this by:
 - a. Writing 1 to `CTIINTACK[0]` to clear the Debug request trigger event.
 - b. Polling `CTITRIGOUTSTATUS[0]`, until it reads as 0, to confirm that the trigger event has been deasserted.
2. Set `CTIGATE[1]` to 1, so that each CTI passes channel events on internal channel 1 to the CTM.
3. Set `CTIOUTEN1[1]` to 1, so that each CTI generates a Restart request trigger event in response to a channel event on channel 1.

———— **Note** —————

This example must use the instance of `CTIOUTEN<n>` for which `<n>` is 1.

4. Set `CTIAPPULSE[1]` to 1 on any one PE in the group, to generate a channel event on channel 1.
-

Example H5-4 Halting a single PE on Performance Monitors overflow

To halt a single PE on a Performance Monitors overflow set:

1. `CTIGATE[3]` to 0, so that the CTI does not pass channel events on internal channel 3 to the CTM.
2. `CTIINEN1[3]` to 1, so that the CTI generates a channel event on channel 3 in response to a Performance Monitors overflow trigger event.

———— **Note** —————

This step of this example must use the instance of `CTIINEN<n>` for which `<n>` is 1.

3. `CTIOUTEN0[3]` to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 3.

———— **Note** —————

This step of this example must use the instance of [CTIOUTEN<n>](#) for which <n> is 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to [CTIINTACK\[0\]](#), before restarting the PE. Clear the overflow status by writing to [PMOVSLR_ELO](#).

Chapter H6

Debug Reset and Powerdown Support

This chapter describes the reset and powerdown support in the Debug architecture. It contains the following sections:

- *About Debug over powerdown* on page H6-6518.
- *Power domains and debug* on page H6-6519.
- *Core power domain power states* on page H6-6520.
- *Emulating low-power states* on page H6-6523.
- *Debug OS Save and Restore sequences* on page H6-6525.
- *Reset and debug* on page H6-6529.

———— **Note** —————

Where necessary, [Table K13-1 on page K13-7394](#) disambiguates the general register references used in this chapter.

H6.1 About Debug over powerdown

Debug over powerdown is a facility for an operating system to save and restore the PE state on behalf of a self-hosted or external debugger or both.

For external debug over powerdown, the architecture defines the OS Lock, OS Double Lock, and the logical split of the hardware on which a PE executes into the *Core power domain* and the *Debug power domain*. See:

- [Power domains and debug on page H6-6519.](#)
- [Core power domain power states on page H6-6520.](#)

H6.2 Power domains and debug

The external debug component of ARMv8-A has two logical power domains, each with its own reset:

- The debug power domain contains the interface between the PE and the external debugger, and is powered up whenever an external debugger is connected to the SoC. It remains powered up while the external debugger is connected. Registers in this domain are reset by an external debug reset.
- The core power domain contains the rest of the PE, and is allowed to power up and power down independently of the Debug power domain.

The core power domain contains several types of registers:

- Non-debug logic refers to all registers and logic that are not associated with debug.
- Self-hosted debug logic refers to registers and logic associated solely with the self-hosted debug aspects of the architecture.
- Shared debug logic refers to registers and logic associated with both the self-hosted and external debug aspects of the architecture.
- External debug logic refers to registers and logic associated solely with the external debug aspects of the architecture.

———— **Note** ————

- The model of two logical power domains has an impact on the reset and access permission requirements of the debug programmers' model.
- The power domains are described as logical because the architecture defines the requirements but does not require two physical power domains. Any power domain split that meets the requirements of the programmers' model is a valid implementation.

Figure H6-1 shows the recommended power domain split. The signals **DBGPWRUPREQ**, **DBGNOPWRDWN**, and **DBGPWRDUP** shown in Figure H6-1 provide an interface between the power controller and the PE debug logic that is in the debug power domain. They are part of the recommended interface. See [Appendix K2 Recommended External Debug Interface](#).

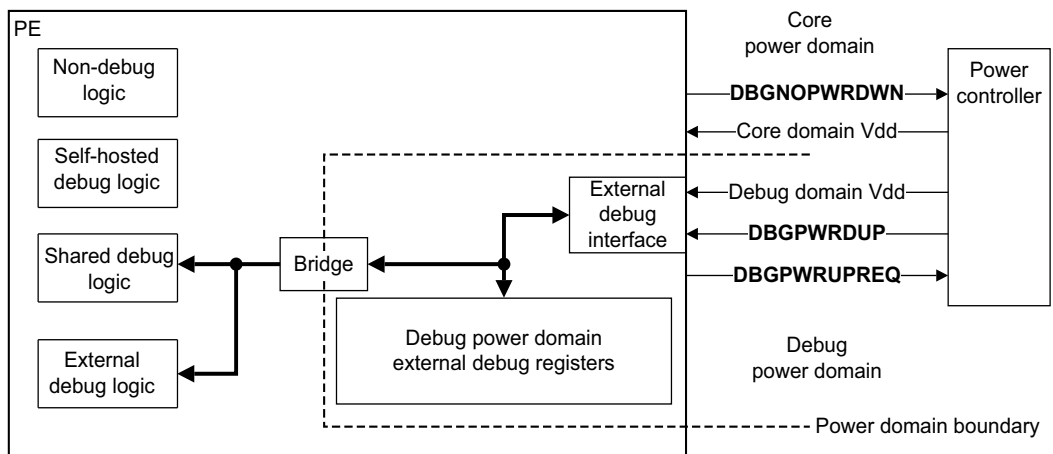

Figure H6-1 Recommended power domain split between core and debug power domains

H6.3 Core power domain power states

The ARM architecture does not define the power states of the PE as these are not normally visible to software. However, they are visible to the external debugger. The Debug architecture uses a four logical power states model for the core power domain. The four logical power states are as follows:

- Normal** The core power domain is fully powered up and the debug registers are accessible.
- Standby** The core power domain is on, but there are measures to reduce energy consumption. In a typical implementation, the PE enters standby by executing a WFI or WFE instruction, and exits on a wake-up event. There can be other IMPLEMENTATION DEFINED measures the OS can take to enter standby. The PE preserves the PE state, including the debug logic state. Changing from standby to normal operation does not involve a reset of the PE. Standby is the least invasive OS energy saving state. Standby implies only that the PE is unavailable and does not clear any debug settings. For standby, the Debug architecture requires only the following:
- An External Debug Request debug event is a wake-up event when halting is allowed. This means that the PE must exit standby to handle the debug event. If the PE executed a WFE or a WFI instruction to enter standby, then it retires that instruction,
 - If the external debug interface is accessed, the PE must respond to that access. ARM recommends that, if the PE executed a WFI or WFE instruction to enter standby, then it does not retire that instruction.
- Standby is transparent, meaning that to software and to an external debugger it is indistinguishable from normal operation.
- Retention** The OS takes some measures, including IMPLEMENTATION DEFINED code sequences and registers, to reduce energy consumption. The PE state, including debug settings, is preserved in low-power structures, allowing the core power domain to be at least partially turned off. Changing from low-power retention to normal operation does not involve a reset of the PE. The saved PE state is restored on changing from low-power retention state to normal operation. If software has to use an IMPLEMENTATION DEFINED code sequence before entering, or after leaving, a retention state, this is referred to as a *software-visible retention state*. It is IMPLEMENTATION DEFINED whether the value of `DBGPRCR.CORENPDRQ` is set to the value of `EDPRCR.COREPURQ` on leaving the software-visible retention state. External Debug Request debug events stay pending and debug registers in the core power domain cannot be accessed.
- **Note** —————
- This model of retention does not include implementations where the PE exits the state in response to a debug register access. From the Debug architecture perspective, implementations like this are forms of standby.
- Powerdown** The OS takes some measures to reduce energy consumption by turning the core power domain off. These measures must include the OS saving any PE state, including the debug settings, that must be preserved over powerdown. If [ARMv8.4-Debug](#) is implemented, it is implementation defined whether OS Double Lock is implemented and used during powerdown. Changing from powerdown to normal operation must include:
- A Cold reset of the PE after the power level has been restored.
 - The OS restoring the saved PE state.
- External Debug Request debug events stay pending and debug registers in the core power domain cannot be accessed.

An implementation might support enabling and disabling threads, either dynamically or once at reset time. Threads that are disabled in this way must appear to the external debugger as either:

- Powered off, meaning they are either:
 - In a powerdown state.
 - In a retention state.
- Held in reset state.

The Debug architecture uses a simpler two states model for the Debug power domain. The two states are:

- Off** The debug power domain is turned off.
- On** The debug power domain is turned on.

The available power states, including the cross-product of core power domain and debug power domain power states is IMPLEMENTATION DEFINED. Implementations are not required to implement all of these states and might include additional states. These additional states must appear to the debugger as one of the logical power states defined by this model. The control of power states is IMPLEMENTATION DEFINED.

———— **Note** ————

As a result, it is IMPLEMENTATION DEFINED whether it is possible for the debug power domain to be on when the core power domain is off.

H6.3.1 EDPRSR.{DLK, SPD, PU} and the Core power domain

Software interprets EDPRSR.{DLK, SPD, PU} to determine whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read.

Table H6-1 Interpretation of the EDPRSR.{DLK, SPD, PU} bits

EDPRSR		Core power domain				Notes
DLK	SPD	PU	Power	Accesses	State lost	
0	0	1	On	OK	No	-
0	1	1	On	OK	Yes	SPD is cleared to 0 following the read.
1	X	1	On	Error	Not known	OS Double Lock is locked. Software locks the OS Double Lock before removing power.
X	1	0	Off	Error	Yes	A Cold reset will be asserted on exiting powerdown state, but not on exiting low-power retention state.
X	0	0	Not known	Error	Not known	

When ARMv8.4-Debug is implemented, EDPRSR.DLK is always 0, and it is implementation defined whether the OS Double Lock is implemented.

If ARMv8.4-Debug and OS Double Lock are implemented, and DoubleLockStatus() == TRUE, the behavior of all registers and fields except EDPRSR.DLK is the same as their behavior if ARMv8.4-Debug is not implemented.

If the Core power domain is powered up and DoubleLockStatus() == TRUE, then:

- When ARMv8.2-Debug is not implemented, EDPRSR.{DLK, SPD, PU} can read either {1, UNKNOWN, 1} or {UNKNOWN, 0, 0}.
- When ARMv8.2-Debug is implemented, EDPRSR.{DLK, SPD, PU} can only read {UNKNOWN, 0, 0}.

H6.3.2 EDPRSR.SPD when the Core domain is in either retention or powerdown state

When the Core power domain is in either the retention or powerdown state, EDPRSR.SPD is not cleared following a read of EDPRSR and it is IMPLEMENTATION DEFINED whether:

- EDPRSR.SPD shows whether the state of the debug registers in the Core power domain has been lost since the last time that EDPRSR was read. This means that:
 - When the Core power domain is in the powerdown state, EDPRSR.SPD is RAO, this indicates that the state of the debug registers has been lost.
 - When the Core power domain is in the retention state, EDPRSR.SPD indicates whether the state of the debug registers was lost before the Core power domain entered retention state.
- EDPRSR.SPD is RAZ, and:
 - On leaving the powerdown state, EDPRSR.SPD is set to 1 which indicates that the state of the debug registers has been lost.
 - On leaving the retention state, EDPRSR.SPD reverts the value it had on entering the retention state.

———— **Note** —————

ARM recommends that an implementation makes EDPRSR.SPD fixed as RAO when in the power-down state, particularly if it does not support a low-power retention state.

H6.3.3 EDPRSR.{DLK, R} and reset state

From ARMv8.2, it is IMPLEMENTATION DEFINED whether OS Double Lock is implemented.

If OS Double Lock is not implemented, EDPRSR.DLK is RES0 and DoubleLockStatus() always returns FALSE.

If OS Double Lock is implemented and enabled, the behavior of all registers and fields except EDPRSR.DLK is the same as their behavior if ARMv8.4-Debug is not implemented.

If ARMv8.4-Debug is implemented EDPRSR.DLK is always 0 and does not give any information about the OS Double Lock.

EDPRSR.R is UNKNOWN when DoubleLockStatus() == TRUE. OSDLR_EL1.DLK is cleared to 0 by a reset. If the Core power domain is powered up and entered reset state with the OS Double Lock locked, it is CONSTRAINED UNPREDICTABLE whether a read of EDPRSR while the PE is in reset state returns:

- EDPRSR.{DLK, R, PU} == {1, UNKNOWN, 1} indicating that the OS Double Lock is locked. This is not permitted from ARMv8.2.
- EDPRSR.{DLK, R, PU} == {0, 1, 1} indicating that the PE is in reset state.
- EDPRSR.{DLK, R, PU} == {UNKNOWN, UNKNOWN, 0} indicating that the registers in the Core power domain cannot be accessed because the OS Double Lock is locked.

If the PE was powered up and the OS Double Lock was unlocked when the PE was reset, then EDPRSR.{DLK, R, PU} reads as {0, 1, 1} while the PE is in reset state.

On leaving reset state, EDPRSR.{DLK, R} reads as {0, 0}.

H6.4 Emulating low-power states

The control registers [DBGPRCR.CORENPDRQ](#) and [EDPRCR.COREPURQ](#) provide an interface between the power controller and the PE. They typically map directly to signals in the recommended external debug interface. With this interface the external debugger can request the power controller to:

- Emulate states where the core power domain is completely off or in a low-power state where the core power domain registers cannot be accessed. This simplifies the requirements on software by sacrificing entirely realistic behavior.
- Restore full power to the core power domain.

[EDPRSR](#).{SPD, PU} indicates the core power domain power state. For more information see:

- The [DBGPRCR_EL1](#) and [DBGPRCR](#) System register descriptions.
- The [EDPRCR](#) and [EDPRSR](#) external debug register descriptions.
- [Appendix K2 Recommended External Debug Interface](#).

The measures to emulate powerdown are IMPLEMENTATION DEFINED. The ability of the debugger to access the state of the PE and the system might be limited as a result of the measures adopted.

In an emulated powerdown state, the debugger must be able to access all debug, PMU, CTI, and trace unit registers that are accessible on the external debug interface and are in one of:

- The debug power domain.
- The core power domain.
- When a trace unit with a separate trace unit core power domain is implemented, and the trace unit core power domain is powered on, the trace unit core power domain.

That is, the debugger must be able to read and write to such registers without receiving errors. This allows an external debugger to debug the powerup sequence.

ARM recommends that any IMPLEMENTATION DEFINED registers that are on the external debug interface and in either the core power domain or the debug power domain are also accessible in an emulated powerdown state.

If the OS Double Lock is implemented, to stop the OS Double Lock preventing access to debug registers when powerdown is being emulated, `DoubleLockStatus() == FALSE` when [DBGPRCR.CORENPDRQ](#) == 1.

Otherwise, the behavior of the PE in emulated powerdown must be similar to that in a real powerdown state. In particular, the PE must not respond to other system stimuli, such as interrupts.

[Example H6-1](#) and [Example H6-2](#) are examples of two approaches to emulating powerdown.

Example H6-1 An example of emulating powerdown

The PE is held in Standby state, isolated from any system stimuli. It is IMPLEMENTATION DEFINED whether the PE can respond to debug stimuli such as an External Debug Request debug event.

If the PE can enter Debug state, then the external debugger is able to use the ITR to execute instructions, such as loads and stores. This causes the external debugger to interact with the system. If the external debugger restarts the PE, the PE leaves Standby state and restarts fetching instructions from memory.

Example H6-2 Another example of emulating powerdown

The PE is held in Warm reset. This limits the ability of an external debugger to access the resources of the PE. For example, the PE cannot be put into Debug state.

On exit from emulated powerdown the PE is reset. However, the debug registers that are only reset by a Cold reset must not be reset. Typically this means that a Warm reset is substituted for the Cold reset. As such, the effect of accessing any register that is reset by a Warm reset while the PE is in the emulated powerdown state will have an IMPLEMENTATION DEFINED effect on that register.

Note

- Warm reset and Cold reset have different effects apart from resetting the debug registers. In particular, [RMR_ELx](#) is reset by a Cold reset and controls the reset state on a Warm reset. This means that if a Cold reset is substituted by a Warm reset, the behavior of the reset code might be different.
 - The timing effects of powering down are typically not factored in the powerdown emulation. Examples of these timing effects are clock and voltage stabilization.
 - Emulation does not model the state lost during powerdown, meaning that it might mask errors in the state storage and recovery routines.
-

H6.5 Debug OS Save and Restore sequences

In ARMv8-A, the following registers provide the OS Save and restore mechanism:

- The *OS Lock Access Register*, [OSLAR](#), locks the OS Lock to restrict access to debug registers before starting an OS Save sequence, and unlocks the OS Lock after an OS Restore sequence.
- The *OS Lock Status Register*, [OSLSR](#), shows the status of the OS Lock.
- The *External Debug Execution Control Register*, [EDECR](#), can be configured to generate a debug event when the OS Lock is unlocked.
- The *OS Double Lock Register*, [OSDLR](#), locks out an external debug interface entirely. This is only used immediately before a powerdown sequence.

See also:

- [Reset and debug on page H6-6529](#)
- [Appendix K8 Example OS Save and Restore Sequences](#)

H6.5.1 Debug registers to save over powerdown

[Table H6-2](#) shows the different requirements for self-hosted debug over powerdown and external debug over powerdown:

- The column labeled Self-hosted lists registers that software must preserve over powerdown so that it can support self-hosted debug over powerdown. This does not require use of the OS Save and Restore mechanism.
- The column labeled External lists registers that software must preserve over powerdown so that it can support external debug over powerdown. This requires use of the OS Save and Restore mechanism:
 - Some external debug registers are not normally accessible to software executing on the PE. Additional debug registers are provided that give software the required access to save and restore these external debug registers when [OSLSR.OSLK](#) is locked. These registers include [OSECCR](#), [OSDTRRX](#), and [OSDTRTX](#).
- Some registers might only present in some implementations, or might not be accessible at all Exception levels or in Non-secure state. [DBGVCR32_EL2](#) and [SDER32_EL3](#) are only required to support AArch32.

[Table H6-2](#) does not include registers for the OPTIONAL Trace and Performance Monitor extensions.

Table H6-2 Debug registers to save over powerdown

Register in AArch64 state	Register in AArch32 state	Self-hosted	External
MDSCR_EL1	DBGDSCRExt	Yes	Yes ^a
DBGBVR<n>_EL1	DBGBVR<n>	Yes	Yes
DBGBCR<n>_EL1	DBGBCR<n>	Yes	Yes
DBGWVR<n>_EL1	DBGWVR<n>	Yes	Yes
DBGWCR<n>_EL1	DBGWCR<n>	Yes	Yes
DBGVCR32_EL2	DBGVCR	Yes	-
MDCR_EL2	HDCR	Yes	-
SDER32_EL3	SDER	Yes	-
MDCR_EL3	SDCR	Yes ^b	-
MDCCINT_EL1	DBGDCCINT	-	Yes ^b

Table H6-2 Debug registers to save over powerdown (continued)

Register in AArch64 state	Register in AArch32 state	Self-hosted	External
DBGCLAIMSET_EL1 DBGCLAIMCLR_EL1	DBGCLAIMSET, DBGCLAIMCLR	-	Yes ^c
OSECCR_EL1	DBGOSECCR	-	Yes ^{ab}
OSDTRRX_EL1 OSDTRTX_EL1	DBGDTRRXext DBGDTRTXext	-	Yes

- a. The OS Lock must be locked to save and restore for external debug. When the OS Lock is locked, **DSCR** is part of the software save and restore mechanism for external debug. It provides a mechanism for an operating system to access some fields of **EDSCR** that are otherwise read-only or not visible to software. This allows the operating system to save and restore these settings over a powerdown for the external debugger.
- b. This register is new in ARMv8-A. Sequences written for ARMv7 do not preserve the register over powerdown.
- c. Read **DBGCLAIMCLR** to save, write **DBGCLAIMSET** to restore.

H6.5.2 OS Save sequence

To preserve the debug logic state over a powerdown, the state must be saved to nonvolatile storage. This means the OS Save sequence must:

1. Lock the OS Lock by:
 - Writing the key value 0xC5ACCE55 to the **DBGOSLAR** in AArch32 state.
 - Writing 1 to **OSLAR_EL1.OSLK** in AArch64 state.
2. Execute an ISB instruction.
3. Walk through the debug registers listed in *Debug registers to save over powerdown on page H6-6525* and save the values to the nonvolatile storage.

If the OS Double Lock is implemented, before removing power from the core power domain, software must:

1. Lock the OS Double Lock by writing 1 to **OSDLR_EL1.DLK**.
2. Execute a *Context synchronization event*.

H6.5.3 OS Restore sequence

After a powerdown, the OS Restore sequence must perform the following steps to restore the debug logic state from the non-volatile storage:

1. Lock the OS Lock, as described in *OS Save sequence*. The OS Lock is generally locked by the Cold reset, but this step ensures that it is locked.
2. Execute an ISB instruction.
3. To ensure that, if an external debugger clears the OS Lock before the end of this sequence, no debug exceptions are generated:
 - Write 0 to **MDSCR_EL1** if executing in AArch64 state.
 - Write 0 to **DBGDSCRext** if executing in AArch32 state.
4. Walk through the debug registers listed in *Debug registers to save over powerdown on page H6-6525*, and restore the values from the nonvolatile storage. The last register to be restored must be:
 - **MDSCR_EL1** if executing in AArch64 state.
 - **DBGDSCRext** if executing in AArch32 state.

5. Execute an ISB instruction.
6. Unlock the OS Lock by:
 - Writing any non-key value to [DBGOSLAR](#) if executing in AArch32 state.
 - Writing 0 to [OSLAR_EL1.OSLK](#) if executing in AArch64 state.
7. Execute a [Context synchronization event](#).

———— **Note** —————

The OS Restore sequence overwrites the debug registers with the values that were saved. If there are valid values in these registers immediately before the restore sequence, then those values are lost.

H6.5.4 Debug behavior when the OS Lock is locked

The main purpose of the OS Lock is to prevent updates to debug registers during an OS Save or OS Restore operation. The OS Lock is locked on a Cold reset.

When the OS Lock is locked:

- Access to debug registers through the System register interface is mainly unchanged except that:
 - Certain registers are read and written without side-effects.
 - Fields in [DSCR](#) and [OSECCR](#) that are normally read-only become read/write.
- This allows the state to be saved or restored. For more information, see the relevant register description in [Chapter H9 External Debug Register Descriptions](#).
- Access to debug registers by the external debug interface is restricted to prevent an external debugger modifying the registers that are being saved or restored. For more information see [External debug interface register access permissions summary on page H8-6547](#).
 - Debug exceptions, other than Breakpoint Instruction exceptions are not generated.
 - Breakpoint and Watchpoint debug events are not generated. The OS Lock has no effect on Breakpoint Instruction exceptions and other debug events.

H6.5.5 Debug behavior when the OS Lock is unlocked

When the OS Lock is unlocked, the PE sets [EDESRO.SUC](#) to 1 if [EDESRO.UCE](#) is set to 1 and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. See [OS Unlock Catch debug event on page H3-6474](#).

H6.5.6 Debug behavior when the OS Double Lock is locked

If the OS Double Lock is implemented, software locks the OS Double Lock immediately before a powerdown sequence.

The OS Double Lock ensures that it is safe to remove core power by forcing the debug interfaces to be quiescent.

When `DoubleLockStatus() == TRUE`:

- The external debug interface only has restricted access to the debug registers, so that it is quiescent before removing power. See [External debug interface register access permissions summary on page H8-6547](#).
- Debug exceptions, other than Breakpoint Instruction exceptions, are not generated.
- Halting is prohibited. See [Halting allowed and halting prohibited on page H2-6417](#).

———— **Note** —————

Pending Halting debug events might be lost when core power is removed.

- No asynchronous debug events are WFI or WFE wake-up events.

If the OS Double Lock is not implemented, the PE ensures these conditions are met before allowing power to be removed.

Software must synchronize the update to `OSDLR.DLK` before it indicates to the system that core power can be removed. The interface between the PE and its power controller is IMPLEMENTATION DEFINED.

Typically software indicates that core power can be removed by entering the Wait For Interrupt state. This means that software must explicitly synchronize the `OSDLR` update before issuing the WFI instruction.

`OSDLR.DLK` is ignored and `DoubleLockStatus() == FALSE` if either:

- The PE is in Debug state.
- `DBGPRCR.CORENPDRQ` is set to 1.

———— **Note** —————

It is possible to enter Debug state with `OSDLR.DLK` set to 1. This is because a *Context synchronization event* is required to ensure the OS Double Lock is locked, meaning that Debug state might be entered before the `OSDLR` update is synchronized.

Because `OSDLR.DLK` is ignored when `DBGPRCR.CORENPDRQ` is set to 1, an external debugger can write to `DBGPRCR.CORENPDRQ`, and the OS Double Lock is not always implemented, software must not rely on using the OS Double Lock to disable debug exceptions or to prohibit halting, or both. ARM deprecates use of the OS Double Lock for these purposes, and instead recommends that software:

- Uses the OS Lock to disable debug exceptions during save or restore sequences.
- Uses the debug authentication interface to prohibit halting and external debug access to debug registers at times other than immediately prior to removing power.

As the purpose of the OS Double Lock is to ensure that it is safe to remove core power, if the OS Double Lock is implemented, it is important to avoid race conditions that defeat this purpose. ARM recommends that:

- Once the write to `OSDLR.DLK` has been synchronized by a *Context synchronization event* and `DoubleLockStatus() == TRUE`, a PE must:
 - Not allow a debug event generated before the *Context synchronization event* to cause an entry to Debug state or act as a wake-up event for a WFI or WFE instruction after the *Context synchronization event* has completed.
 - Complete any external debug access started before the *Context synchronization event* by the time the *Context synchronization event* completes.

———— **Note** —————

A debug register access might be in progress when software sets `OSDLR.DLK` to 1. An implementation must not permit the synchronization of locking the OS Double Lock to stall indefinitely while waiting for that access to complete. This means that any debug register access that is in progress when software sets `OSDLR.DLK` to 1 must complete or return an error in finite time.

- If a write to `DBGPRCR` or `EDPRCR` made when `OSDLR.DLK == 1` changes `DBGPRCR.CORENPDRQ` or `EDPRCR.CORENPDRQ` from 1 to 0, meaning `DoubleLockStatus()` changes from `FALSE` to `TRUE`, then before signaling to the system that the `CORENPDRQ` field has been cleared and emulation of powerdown is no longer requested, meaning the system can remove core power, the PE must ensure that all the requirements for `DoubleLockStatus() == TRUE` listed in this section are met.

In a standard OS Save sequence, the OS Lock is locked before the OS Double Lock is locked. This means that writes to `CORENPDRQ` are ignored by the time the OS Double Lock is locked. However, if `DoubleLockStatus() == FALSE`, an external debugger can clear the OS Lock at any time, and then write to `EDPRCR`.

H6.6 Reset and debug

All registers in the Core power domain are either:

- Reset by both a Cold and a Warm reset.
- Reset only by a Cold reset and are not changed by a Warm reset.

For more information, see [Reset on page D1-2166](#).

All registers in the Debug power domain are reset by an External Debug reset.

[Figure H6-2](#) shows this reset scheme. The following three reset signals are an example implementation of the reset scheme:

- **CORERESET**, which must be asserted for a Warm reset.
- **CPUPORESET**, which must be asserted for a Cold reset.
- **PRESETDBG**, which must be asserted for an External Debug reset.

As shown in the figure, the external debug logic is split between the Debug power domain and the Core power domain.

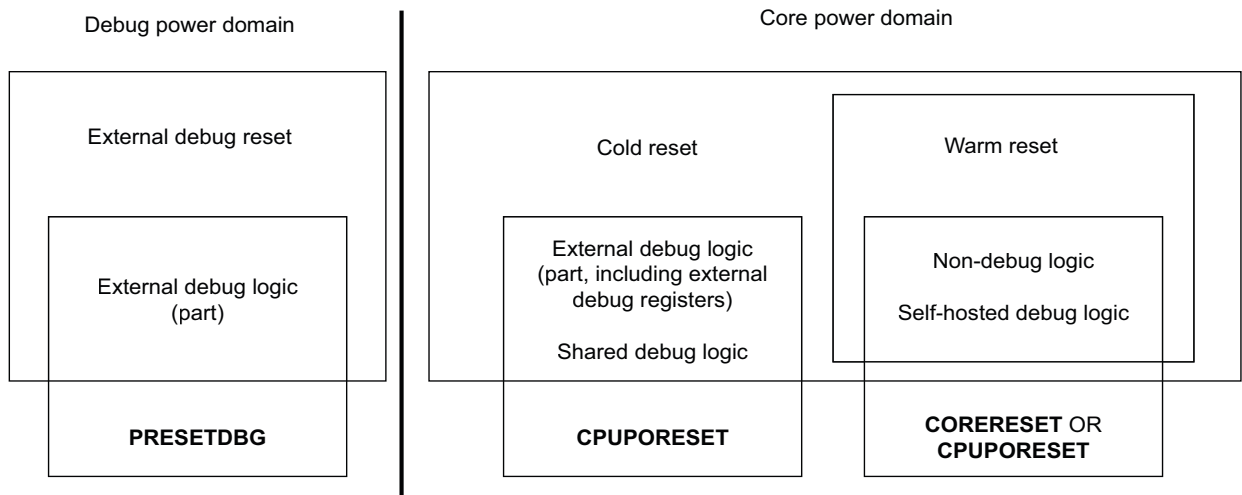

Figure H6-2 Power and reset domains

For more information about power domains and power states, see [Power domains and debug on page H6-6519](#).

When power is first applied to the Debug power domain, **PRESETDBG** must be asserted.

When power is first applied to the Core power domain, **CPUPORESET** must be asserted.

———— **Note** ————

In this scheme, logic in the Warm reset domain is reset by asserting either **CORERESET** or **CPUPORESET**. This implies a particular implementation style that permits these approaches.

CPUPORESET is not normally asserted on moving from a low-power state, where power has not been removed, to a full-power state. This can occur, for example, on exiting a low-power retention state. See also [Emulating low-power states on page H6-6523](#) and the [EDPRSR](#) register description.

H6.6.1 External debug interface accesses to registers in reset

If a reset signal is asserted and the external debug interface:

- Writes a register, or indirectly writes a register or register field as a side-effect of an access:
 - Then, if the register or register field is reset by that reset signal, it is **CONSTRAINED UNPREDICTABLE** whether the register or register field takes the reset value or the value written. The reset value might be **UNKNOWN**.
 - Otherwise the register or register field takes the value that is written.
- Reads a register, or indirectly reads a register or register field, as part of an access:
 - Then, if the register or register field is reset by that reset signal, the value returned is **UNKNOWN**.
 - Otherwise, the value of the register or register field is returned.

It is **IMPLEMENTATION DEFINED** whether any register can be accessed when External Debug reset is being asserted. The result of these accesses is **IMPLEMENTATION DEFINED**.

Chapter H7

The PC Sample-based Profiling Extension

This chapter describes the OPTIONAL PC Sample-based Profiling Extension that provides a non-invasive external debug component.

It contains the following section:

- [About the PC Sample-based Profiling Extension on page H7-6532.](#)

H7.1 About the PC Sample-based Profiling Extension

The PC Sample-based Profiling Extension is an OPTIONAL extension that provides coarse-grained, non-invasive profiling by an external debugger. See also [Non-invasive behavior on page D6-2540](#).

PC Sample-based Profiling creates samples so that tools can populate a statistical model of the performance of software executing on the PE.

———— Note —————

Data returned by periodic sampling of PC Sample-based Profiling registers is sufficient to allow tools to estimate the distribution of time spent executing software on the PE.

The delay between an instruction being executed by the PE and its address appearing in the PC Sample Register is not defined, and ARMv8 does not require that the sampled instruction was recently executed. For example, if a piece of software executes a load instruction that reads the PC Sample Register of the PE it is running on, there is no guaranteed relationship between the address of the load instruction and the value read. The PC Sample Register is intended only for use by an external agent to provide statistical information for software profiling.

It must be possible to sample references to branch targets. It is IMPLEMENTATION DEFINED whether references to other instructions can be sampled. The branch target for a conditional branch instruction that fails its condition check is the instruction that follows the conditional branch instruction. The branch target for an exception is the exception vector address.

To keep the implementation and validation cost low, a reasonable degree of inaccuracy in the sampled data is acceptable. ARM does not define *a reasonable degree of inaccuracy* but recommends the following guidelines:

- In exceptional circumstances, such as a change in Security state or other boundary condition, it is acceptable for the sample to represent an instruction that was not committed for execution.
- Under unusual non-repeating pathological cases, the sample can represent an instruction that was not committed for execution. These cases are likely to occur as a result of asynchronous exceptions, such as interrupts, where the chance of a systematic error in sampling is very unlikely.
- Under normal operating conditions, the sample must reference an instruction that was committed for execution, including its context, and must not reference instructions that are fetched but not committed for execution.

———— Note —————

In the Armv7 PC Sample-based Profiling Extension, an offset was applied to the sampled program counter value and this offset and the instruction set state indicated in bits [1:0] of the sampled value. In the Armv8 PC Sample-based Profiling Extension, the sampled value is the address of an instruction that has executed, with no offset and no indication of the instruction set state.

- [Controlling the PC Sample-based Profiling Extension](#).
- [Registers implemented by the PC Sample-based Profiling Extension on page H7-6533](#).
- [Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-6534](#).
- [Pseudocode description of PC Sample-based Profiling on page H7-6534](#).

H7.1.1 Controlling the PC Sample-based Profiling Extension

PC Sample-based Profiling is controlled by the IMPLEMENTATION DEFINED authentication interface `ExternalNonInvasiveDebugEnabled()`.

PC Sample-based Profiling is prohibited unless both:

- It is allowed by the IMPLEMENTATION DEFINED authentication interface `ExternalNonInvasiveDebugEnabled()`.
- At least one of the following applies:
 - The PE is executing in Non-secure state.
 - EL3 is not implemented.

- EL3 is implemented, the PE is executing in Secure state, and non-invasive debug is allowed by the IMPLEMENTATION DEFINED authentication interface `ExternalSecureNoninvasiveDebugEnabled()`.
- EL3 is implemented, EL3 or EL1 is using AArch32, the PE is executing at EL0 in Secure state, and the value of `SDER.SUNIDEN` is 1.

The state of the IMPLEMENTATION DEFINED authentication interface is visible through `DBGAUTHSTATUS_EL1`. See *Recommended authentication interface* on page K2-7239.

H7.1.2 Registers implemented by the PC Sample-based Profiling Extension

The options for implementing the PC Sample-based Profiling extension are:

- The extension is implemented in the external debug register space. `EDDEVID.PCSample` identifies the implemented level of profiling, and `EDDEVID1.PCSROffset` also indicates that this option is implemented. From Armv8.2 this option is not permitted.
- [ARMv8.2-PCSample](#) is implemented, meaning the PC Sample-based Profiling extension is implemented in the Performance Monitors memory-mapped register space. `PMDEVID.PCSample` identifies the implemented level of profiling.

If PC Sample-based Profiling is implemented in the external debug register space:

- The following external debug registers can be implemented:
 - `EDCIDSR`.
 - `EDPCSR`.
 - `EDVIDSR`.

See *External debug interface register map* on page H8-6549.

- If [ARMv8.1-VHE](#) is implemented, `EDSCR.SC2` controls what PC Sample-based Profiling samples.

If [ARMv8.2-PCSample](#) is implemented, the following registers can be implemented in the Performance Monitors memory-mapped register space:

- `PMCID1SR` and `PMCID2SR`.
- `PMPCSR`.
- `PMVIDSR`.

See *Performance Monitors external register views* on page I5-6742.

If the PC Sample-based Profiling Extension is implemented with [ARMv8.2-PCSample](#) but the Performance Monitors Extension is not implemented, then the PC Sample-based Profiling Extension is implemented in its own memory-mapped register space, within the area that is reserved for the Performance Monitors, see [Table H7-1](#). If CoreSight compliance is required:

- The management registers are defined as in [Table K2-3 on page K2-7241](#).
- The support for PC Sample-based profiling is defined in the following registers:
 - `PMDEVTYPE.MAJOR` has the value 0x0.
 - `PMDEVARCH.ARCHID` has the value 0x0A10.

Table H7-1 PC Sample-based Profiling register map without the Performance Monitors Extension

Offset	Description
0x200	<code>PMPCSR</code> [31:0]
0x204	<code>PMPCSR</code> [63:32]
0x208	<code>PMCID1SR</code>
0x20C	<code>PMVIDSR</code>
0x220	<code>PMPCSR</code> [31:0] (alias)

Table H7-1 PC Sample-based Profiling register map without the Performance Monitors Extension (continued)

Offset	Description
0x224	PMPCSR [63:32] (alias)
0x228	PMCID1SR (alias)
0x22C	PMCID2SR
0x600-0x6FC	IMPLEMENTATION DEFINED
0xE80-0xEFC	IMPLEMENTATION DEFINED for CoreSight compliance
0xFF0-0xFFC	Management and CoreSight compliance registers

H7.1.3 Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN

The architecture permits IMPLEMENTATION DEFINED extensions to external debug to define mechanisms that make the values of the PC Sample-based profiling registers UNKNOWN. However, it requires that any such mechanism is disabled by default. This means that powerup or a hard reset of the PE must leave the PE in a state where the PC Sample-based Profiling Extension, if implemented, exhibits its architecturally-defined behavior.

———— **Note** ————

A mechanism that, when enabled, makes the PC Sample-based profiling registers UNKNOWN might use other sample-based profiling events that are appropriate for a use that is independent of PC Sample-based Profiling.

When [EDPCSR](#) or [PMPCSR](#) are read by the PE for the first time after exiting Debug state or Reset state, [PMPCSR](#) or [EDPCSR](#) will return the value 0xFFFFFFFF. Any subsequent read of [PMPCSR](#) or [EDPCSR](#) will return sampled instruction address values.

H7.1.4 Pseudocode description of PC Sample-based Profiling

When PC Sample-based Profiling is implemented but not with [ARMv8.2-PCSample](#), the functionality is described by the pseudocode functions:

- [CreatePCSample\(\)](#), which populates a variable of type [PCSample](#).
- [EDPCSRto\[\]](#), which writes a PC sample to the [EDPCSR](#) and associated registers.

When [ARMv8.2-PCSample](#) is implemented, the functionality is described by the pseudocode functions:

- [CreatePCSample\(\)](#), which populates a variable of type [PCSample](#).
- [PMPCSR\[\]](#), which writes a PC Sample to the [PMPCSR](#) and associated registers.

Chapter H8

About the External Debug Registers

This chapter provides some additional information about the external debug registers. It contains the following sections:

- *Relationship between external debug and System registers* on page H8-6536.
- *Endianness and supported access sizes* on page H8-6537.
- *Synchronization of changes to the external debug registers* on page H8-6538.
- *Memory-mapped accesses to the external debug interface* on page H8-6542.
- *External debug interface register access permissions* on page H8-6545.
- *External debug interface registers* on page H8-6549.
- *Cross-trigger interface registers* on page H8-6554.
- *External debug register resets* on page H8-6556.

———— **Note** —————

Where necessary [Table K13-1](#) on [page K13-7394](#) disambiguates the general register references used in this chapter.

H8.1 Relationship between external debug and System registers

Table H8-1 shows the relationship between external debug registers and System registers. Where no relationship exists, the registers are not listed.

Table H8-1 Equivalence between external debug and System registers

External debug register	System register		Notes
	AArch64	AArch32	
DBGDTRRX_EL0	DBGDTRRX_EL0	DBGDTRRXint	See also <i>Summary of System register accesses to the DCC</i> on page H4-6492

EDDEVAFF1	MPIDR_EL1[63:32] ^a		

a. This is a word of a 64-bit register.

In addition:

- **EDSCR**.{TXfull, RXfull} are read-only aliases for **DCCSR**.{TXfull, RXfull}.
- **EDPRCR**.CORENPDRQ is a read/write alias for **DBGPRCR**.CORENPDRQ.
- **EDPRSR**.OSLK is a read-only alias for **OSLSR**.OSLK.
- **EDPRSR**.DLK is a read-only function of **OSDLR**.DLK.

H8.2 Endianness and supported access sizes

The debug registers, Performance Monitors registers, and CTI registers are implemented as memory-mapped peripherals. The ARM architecture requires memory-mapped peripherals to be little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the debug registers, Performance Monitors registers, and CTI registers, implementations must:

- Comply with the requirements of [Supported access sizes on page I1-6714](#).
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

———— **Note** —————

These requirements mean that a system implementing the debug registers using a 32-bit bus, such as a AMBA APB3, with a wider system interconnect must implement a bridge between the system and the debug bus that can split 64-bit accesses.

For accesses from the external debug interface, the size of an access is determined by the interface. For an access from an ADiv5-compliant Memory Access Port, MEM-AP, this is specified by the MEM-AP CSW register.

H8.3 Synchronization of changes to the external debug registers

This section describes the synchronization requirements for the external debug interface.

For more information on how these requirements affect debug, see:

- [Synchronization and debug exceptions on page D2-2342](#) for exceptions taken from AArch64 state, or [Synchronization and debug exceptions on page G2-5412](#) for exceptions taken from AArch32 state.
- [Synchronization and Halting debug events on page H3-6477](#).
- [Synchronization of DCC and ITR accesses on page H4-6492](#).

This section refers to accesses from the external debug interface as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

———— Note ————

[Synchronization requirements for AArch64 System registers on page D12-2675](#) and [Synchronization of changes to AArch32 System registers on page G8-5632](#) define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads, and external writes as indirect writes.

For general information about synchronization, access completion, ordering, and observability, see [Synchronization of memory-mapped registers on page I1-6716](#).

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. With the exception of [DBGBCR<n>_EL1](#), [DBGBVR<n>_EL1](#), [DBGWCR<n>_EL1](#), and [DBGWVR<n>_EL1](#), external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

[Synchronization of DCC and ITR accesses on page H4-6492](#) describes the synchronization requirements for the DCC and ITR.

Changes to the IMPLEMENTATION DEFINED authentication interface are external writes to the authentication status registers by the master of the authentication interface. See [Synchronization and the authentication interface on page H8-6539](#).

The external agent must be able to guarantee completion of a write. For example by:

- Marking the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- Reading back the value written.
- Some guaranteed property of the connection between the PE and the external agent.

———— Note ————

For an external Debug Access Port, access completion is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, accesses complete in order.

However, the external agent cannot force synchronization of completed writes without halting the PE. Executing an ISB instruction, either in Debug state or in Non-debug state, and exiting from Debug state forces synchronization. If the PE is in Debug state, executing an ISB instruction is guaranteed to explicitly synchronize any external reads, external writes, and changes to the authentication interface that are ordered before the external write to [EDITR](#).

For any given observer, external writes to the following register groups are guaranteed to be observable in the same order in which they complete:

- The breakpoint registers, [DBGBCR<n>_EL1](#) and [DBGBVR<n>_EL1](#).
- The watchpoint registers, [DBGWCR<n>_EL1](#) and [DBGWVR<n>_EL1](#).

This guarantee only applies to external writes to registers within one of these groups. There is no guarantee regarding the ordering of the observability of external writes within these groups with respect to external writes to registers, for example [EDSCR](#), or between breakpoints and watchpoints, including watchpoints linked to context matching breakpoints.

Note

This means that a debugger can rely on the external writes to be observed in the same order in which they complete. It does not mean that a debugger can rely on the external writes being observed in finite time.

In a simple sequential execution an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

If two or more interfaces simultaneously access a register, the behavior must be as if the accesses occurred atomically and in any order. This is described in *Examples of the synchronization of changes to the external debug registers*.

Some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means that simultaneous writes must be merged. Registers that have this property and support both external debug and System register access include `DBGCLAIMSET_EL1`, `DBGCLAIMCLR_EL1`, `PMCR_EL0`, `{C,P}`, `PMOVSSET_EL0`, `PMOVSCLR_EL0`, `PMCNTENSET_EL0`, `PMCNTENCLR_EL0`, `PMINTENSET_EL1`, `PMINTENCLR_EL1`, and `PMSWINC_EL0`. This last register is OPTIONAL and deprecated in the external debug interface.

H8.3.1 Synchronization and the authentication interface

Changes to the authentication interface are indirect writes to the state of the PE by the master of the authentication interface.

For an external debug interface read of any Authentication Status register, or an indirect read of the authentication interface made in determining the response to a subsequent external debug interface access, a change on the authentication interface must be observable following a subsequent explicit *Context synchronization event*, and:

- It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable in finite time.
- It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable following an entry to Debug state.

For a System register read of `DBGAUTHSTATUS_EL1`, a change on the authentication interface is guaranteed to be observable only after a *Context synchronization event*.

Note

- In some systems the authentication interface is fixed by configuration, or changed under the control of software. These systems can require explicit synchronization for any change to the authentication interface.
 - In other systems, the authentication interface is controlled dynamically by an external agent. In these systems, it is desirable that changes to the authentication interface do not require explicit synchronization by software executing on the PE to be observable by subsequent external debug interface accesses, and are either observable in finite time or are synchronized by entry to Debug state. Otherwise there are scenarios where a debugger is not able to halt and debug the system.
-

H8.3.2 Examples of the synchronization of changes to the external debug registers

Example H8-1, Example H8-2 on page H8-6540, and Example H8-3 on page H8-6540 show the synchronization of changes to the external debug registers.

Example H8-1 Order of synchronization of Breakpoint and Watchpoint register writes

Initially `DBGBVR<n>_EL1` is `0x8000` and `DBGBCR<n>_EL1` is `0x0181`. This means that a breakpoint is enabled on the halfword T32 instruction at address `0x8000`.

A sequence of external writes occurs in the following order:

1. `0x0000` is written to `DBGBCR<n>_EL1`, disabling the breakpoint.
2. `0x9000` is written to `DBGBVR<n>_EL1[31:0]`.

3. 0x0061 is written to `DBGBCR<n>_EL1`, enabling a breakpoint on the halfword at address 0x9002.

The external writes must be observable to indirect reads in the same order as the external writes complete. This means that at no point is there a breakpoint enabled on either of the halfwords at address 0x8002 and 0x9000.

Similarly a breakpoint or watchpoint must be disabled:

- If both halves of a 64-bit address have to be updated.
- If any of the `DBGBCR<n>_EL1` or `DBGWCR<n>_EL1` fields are modified at the same time as updating the address.

Example H8-2 Simultaneous accesses to DTR registers

Initially `EDSCR.{TXfull, TXU, ERR}` are 0. Then:

- 0x0DCCDA7A is directly written to `DBGDTRTX_EL0` by an MSR instruction.
- `DBGDTRTX_EL0` is indirectly read by the external debug interface.

These accesses might happen at the same time and in any order.

If the direct write of 0x0DCCDA7A to `DBGDTRTX_EL0` is handled first, then:

- The external debug interface read of `DBGDTRTX_EL0` clears `EDSCR.TXfull` to 0.
- `EDSCR.{TXU, ERR}` are unchanged.
- The external debug interface read returns 0x0DCCDA7A.

If the indirect read of `DBGDTRTX_EL0` by the external debug interface is handled first, then:

- The external debug interface read of `DBGDTRTX_EL0` causes an underrun and as a result `EDSCR.{TXU, ERR}` are both set to 1.
- The external debug interface returns an UNKNOWN value.
- Writing 0x0DCCDA7A to `DBGDTRTX_EL0` sets `DTRTX` to 0x0DCCDA7A and `EDSCR.TXfull` to 1.

Example H8-3 Simultaneous writes to CLAIM registers

Initially all CLAIM tag bits are 0. Then:

- 0x01 is written to `DBGCLAIMSET_EL1` by a direct write, followed by an explicit *Context synchronization event*.
- 0x02 is written to `DBGCLAIMSET_EL1` by an external write.

These events might happen at the same time and in either order.

After this:

- `DBGCLAIMCLR_EL1` is read by a direct read.
- `DBGCLAIMCLR_EL1` is read by an external read.

In this case, a direct read can return either 0x01 or 0x03, and the external read can return either 0x02 or 0x03.

The only permitted final result for the CLAIM tags is the value 0x03, because this would be the result regardless of whether 0x01 or 0x02 is written first. This is because the external write is guaranteed to be observable to a direct read in finite time. See *Synchronization requirements for AArch64 System registers* on page D12-2675.

It is not possible for a direct read to return 0x01 and the external read to return 0x02, because the writes to `DBGCLAIMCLR_EL1` are serialized.

In the following scenario, there is only one permitted result. Both observers observe the value 0x03, and then, at the same time, two writes occur:

- 0x04 is written to `DBGCLAIMSET_EL1` by a direct write, followed by an explicit *Context synchronization event*.
- 0x01 is written to `DBGCLAIMCLR_EL1` by an external write.

In this case only permitted final result for the CLAIM tags is the value 0x06.

H8.4 Memory-mapped accesses to the external debug interface

Support for memory-mapped access to the external debug interface is OPTIONAL. When memory-mapped access to the external debug interface is supported, the external debug interface is accessed as a little-endian memory-mapped peripheral.

If the external debug interface is CoreSight compliant, then an OPTIONAL Software Lock can be implemented for memory-mapped accesses to each component.

The Software Lock is OPTIONAL and deprecated. If [ARMv8.4-Debug](#) is implemented, the Software Lock is not implemented. If it is not implemented, the behavior is as if it is unlocked. The Software Locks are controlled by [EDLSR](#) and [EDLAR](#), [PMLSR](#) and [PMLAR](#), and [CTILSR](#) and [CTILAR](#). See [Management registers and CoreSight compliance on page K2-7241](#).

With the exception of these registers and the effect of the Software Lock, the behavior of the memory-mapped accesses is the same as for other accesses to the external debug interface.

———— Note —————

The recommended memory-mapped accesses to the external debug interface are not compatible with the memory-mapped interface defined in ARMv7. In particular:

- The memory map is different.
- Memory-mapped accesses do not behave differently to Debug Access Port accesses when [OSLSR.OSLK == 1](#), meaning that the OS Lock is locked.

The following sections give more information about these memory-mapped accesses:

- [Register access permissions for memory-mapped accesses](#).
- [Synchronization of memory-mapped accesses to external debug registers on page H8-6543](#).

See also [Supported access sizes on page I1-6714](#).

H8.4.1 Register access permissions for memory-mapped accesses

It is IMPLEMENTATION DEFINED whether unprivileged memory-mapped accesses are allowed. Privileged software is responsible for controlling memory-mapped accesses using the MMU.

If [ARMv8.4-Debug](#) is implemented, the Secure view of a debug component is mapped into Secure physical memory and the Non-secure view is mapped into Non-secure physical memory.

If [ARMv8.4-Debug](#) is implemented, the access permissions are different in each Security state, but Secure and Non-secure views of the debug components are identical. ARM recommends the views are located at the same address in the Secure and Non-secure physical address maps.

If memory-mapped accesses are made through an ADiv5 interface, the Debug Access Port can block the access using [DBGSWENABLE](#). This is outside the scope of the ARMv8-A architecture. See [ARM® Debug Interface Architecture Specification ADiv5.0 to ADiv5.2](#).

Effect of the OPTIONAL Software Lock on memory-mapped access

For memory-mapped accesses, if other controls permit access to a register, the OPTIONAL Software Lock is implemented, and [EDLSR.SLK](#), [PMLSR.SLK](#), or [CTILSR.SLK](#) is set to 1, meaning the Software Lock is locked, then with the exception of the LAR itself:

- If other controls permit access to a register, then writes are ignored. That is:
 - Read/write (RW) registers become read-only, writes ignored (RO/WI).
 - Write-only (WO) registers become writes ignored (WI).
- Reads and writes have no side-effects. A side-effect is where a direct read or a direct write of a register creates an indirect write of the same or another register. When the Software Lock is locked, the indirect write does not occur.

- Writes to [EDLAR](#), [PMLAR](#), and [CTILAR](#) are unaffected.

This behavior must also apply to all IMPLEMENTATION DEFINED registers.

For example, if [EDLSR.SLK](#) is set to 1:

- [EDSCR](#).{TXfull, TXU, ERR} are unchanged by a memory-mapped read from [DBGDTRTX_ELO](#).
- [EDSCR](#).{RXfull, RXO, ERR} are unchanged by a memory-mapped write to [DBGDTRRX_ELO](#) that is ignored.
- [EDSCR](#).{ITE, ITO, ERR} are unchanged by a memory-mapped write to [EDITR](#) that is ignored.
- [OSLSR.OSLK](#) is unchanged by a memory-mapped write to [OSLAR_EL1](#) that is ignored.
- [EDPCSR](#)[63:32], [EDCIDSR](#), and [EDVIDSR](#) are unchanged by a memory-mapped read from [EDPCSR](#)[31:0].

———— **Note** —————

Updating [EDVIDSR](#), [EDCIDSR](#), and [EDPCSR](#)hi are side-effects of reading [EDPCSR](#)lo, such that these registers contain the matching context for [EDPCSR](#)lo. The process that updates [EDPCSR](#)lo with PC samples is not a side-effect of the access. Reads of [EDPCSR](#)lo made when the Software Lock is locked can be used to profile software.

- [PMPCSR](#)[63:32], [PMCID1SR/PMCID2SR](#), and [PMVIDSR](#) are unchanged by a memory-mapped read from [PMPCSR](#)[31:0].

———— **Note** —————

Updating [PMVIDSR](#), [PMCID1SR/PMCID2SR](#), and [PMPCSR](#)[31:0] are side-effects of reading [PMPCSR](#)[63:32], such that these registers contain the matching context for [PMPCSR](#)[63:32]. The process that updates [PMPCSR](#)[63:32] with PC samples is not a side-effect of the access. Reads of [PMPCSR](#)[63:32] made when the Software Lock is locked can be used to profile software.

- [EDPRSR](#).{SDR, SPMAD, SDAD, SR, SPD} are unchanged by a memory-mapped read from [EDPRSR](#).
- [EDPRSR.SDAD](#) is not set if an error response is returned due to a memory-mapped read or write of any debug register as the result of the value of the [EDAD](#) field.
- The CLAIM tags are unchanged by memory-mapped writes to [DBGCLAIMSET_EL1](#) and [DBGCLAIMCLR_EL1](#) which are ignored.

Similarly, if [PMLSR.SLK](#) is set to 1, then [EDPRSR.SPMAD](#) is not set if an error response is returned to a memory-mapped read or write of any Performance Monitors register due to the value of the [EPMAD](#) field.

Behavior of a not permitted memory-mapped access

Where the architecture requires that an external debug interface access generates an error response, a memory-mapped access must also generate an error response. However, it is IMPLEMENTATION DEFINED how the error response is handled, as this depends on the system.

ARM recommends that the error is returned as either:

- A synchronous external Data Abort.
- An SError interrupt.

H8.4.2 Synchronization of memory-mapped accesses to external debug registers

The synchronization requirements for memory-mapped accesses to the external debug interface is described in [Synchronization of changes to the external debug registers on page H8-6538](#) and [Synchronization of memory-mapped registers on page H8-6716](#).

The synchronization requirements between different routes to the external debug interface, that is, between Debug Access Port accesses and memory-mapped accesses are IMPLEMENTATION DEFINED.

H8.5 External debug interface register access permissions

Some external accesses to debug registers and Performance Monitor registers are not permitted and return an error response if:

- The Core power domain is powered down or is in low-power state where the registers cannot be accessed.
- `OSLSR.OSLK == 1`. The OS Lock is locked.
- The OS Double Lock is implemented and `DoubleLockStatus() == TRUE`. The OS Double Lock is locked.
- Access by the external debug interface is disabled by the authentication interface or secure monitor.

Not all registers are affected in all of these cases. For details, see [External debug interface register access permissions summary](#) on page H8-6547.

———— **Note** —————

`OSLSR.OSLK` is visible through `EDPRSR`.

If `ARMv8.4-Debug` is not implemented, authentication is controlled by the external authentication interface functions `ExternalSecureNoninvasiveDebugEnabled()` and `ExternalSecureInvasiveDebugEnabled()`, which may override `MDCR_EL3.{EPMAD, EDAD}`.

If `ARMv8.4-Debug` is implemented, authentication is controlled by the bus master. The bus master may be a Debug Access Port. The bus master uses `MDCR_EL3.{EPMAD, EDAD}` to indicate whether Secure and Non-secure accesses are permitted.

If `ARMv8.4-Debug` is implemented, an external read of `EDPRSR.{EDAD, EPMAD}` returns the values for a Non-secure view, whether a Secure or Non-secure view is accessed.

H8.5.1 External debug over powerdown and locks

Accessing registers using the external debug interface is not possible when the Debug power domain is off. In this case all accesses return an error.

External accesses to debug and Performance Monitors registers in the Core power domain are not permitted and return an error response if:

- The Core power domain is off or in low-power state where the registers cannot be accessed.
- `OSLSR.OSLK == 1`, meaning that the OS Lock is locked. This allows software to prevent external debugger modification of the registers while it saves and restores them over powerdown.
- The OS Double Lock is implemented and `DoubleLockStatus() == TRUE`. This means that the OS Double Lock is locked. The OS Double Lock ensures that it is safe to remove Core power by forcing the debug interface to be quiescent.

It is IMPLEMENTATION DEFINED whether the ID registers that describe the PE to the debugger are in the Debug power domain or the Core power domain.

———— **Note** —————

This applies only to the `MIDR_EL1`, `EDPFR`, `EDDFR`, and `EDAA32PFR` registers. It does not include the CoreSight ID registers in the management register address range.

The OS Lock condition does not apply to the following debug registers:

- `OSLAR_EL1`. This means that an external debugger can override this lock.
- `EDES`. This means that an external debugger can program a debug event for when software unlocks the OS Lock. See [OS Unlock Catch debug event](#) on page H3-6474.
- The ID registers that describe the PE to the debugger.

See also [Debug registers to save over powerdown](#) on page H6-6525.

H8.5.2 External access disabled

Accesses are further controlled by the external authentication interface. An untrusted external debugger cannot program the breakpoint and watchpoint registers to generate spurious debug exceptions. If external invasive debugging is not enabled, these external accesses to the registers are disabled. If EL3 is implemented, then **SDCR** provides additional external access controls for those registers.

The disable applies to:

- The **DBGBVR<n>_EL1**, **DBGBCR<n>_EL1**, **DBGWVR<n>_EL1**, and **DBGWCR<n>_EL1** registers.
- From ARMv8.2, the **OSLAR_EL1** register.

In ARMv8.0 and ARMv8.1 implementations, it is IMPLEMENTATION DEFINED whether the disable applies to **OSLAR_EL1**.

If **ARMv8.4-Debug** is not implemented, the external debug interface cannot access these registers if any of the following are true:

- **ExternalInvasiveDebugEnabled()** == FALSE.
- **ExternalSecureInvasiveDebugEnabled()** == FALSE, EL3 is not implemented, and the PE behaves as if the Security state is Secure.
- **ExternalSecureInvasiveDebugEnabled()** == FALSE, EL3 is implemented and **SDCR.EDAD** == 1.

If **ARMv8.4-Debug** is implemented, Non-secure accesses to these registers are not permitted if any of the following are true:

- EL3 is not implemented and the PE behaves as if the Security state is Secure.
- EL3 is implemented and **SDCR.EDAD** == 1.

The **AllowExternalDebugAccess()** pseudocode function describes these accessibility rules.

PEs might also provide an OPTIONAL external debug interface to the Performance Monitor registers. The authentication interface and **SDCR** provide similar external access disable controls for those registers.

If **ARMv8.4-Debug** is not implemented, the external debug interface cannot access the Performance Monitor registers if any of the following are true:

- **ExternalNoninvasiveDebugEnabled()** == FALSE.
- **ExternalSecureNoninvasiveDebugEnabled()** == FALSE, EL3 is not implemented and the PE behaves as if the Security state is Secure.
- **ExternalSecureNoninvasiveDebugEnabled()** == FALSE, EL3 is implemented and **SDCR.EPMAD** == 1.

If **ARMv8.4-Debug** is implemented, Non-secure accesses to these registers are not permitted if any of the following are true:

- EL3 is not implemented and the PE behaves as if the Security state is Secure.
- EL3 is implemented and **SDCR.EDAD** == 1.

The **AllowExternalPMUAccess()** pseudocode function describes these accessibility rules.

————— **Note** —————

- ARM recommends that secure software that is not making use of debug hardware does not lock out the external debug interface.
- ARMv8-A does not provide the equivalent control over access to Trace extension registers, which means if **ARMv8.4-Debug** is implemented, the Non-secure and Secure views are identical.

H8.5.3 Behavior of a not permitted access

For an external debug interface access by a Debug Access Port, the Debug Access Port receives the error response and must signal this to the external debugger. For an ADIV5 implementation of a Debug Access Port, the error sets a sticky error flag in the Debug Access Port that the debugger can poll, and that suppresses further accesses until it is explicitly cleared.

When an error is returned because external access is disabled, and this is the highest priority error condition, a sticky error flag in `EDPRSR` is indirectly written to 1 as a side-effect of the access:

- For a debug register access when `AllowExternalPMUAccess() == FALSE`, `EDPRSR.SDAD` is indirectly written to 1.
- For Performance Monitor register access when `AllowExternalPMUAccess() == FALSE`, `EDPRSR.SPMAD` is indirectly written to 1.

The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see [Register access permissions for memory-mapped accesses on page H8-6542](#).

If no error is returned, or the error is returned because of a higher priority error condition, the flag in `EDPRSR` is unchanged.

See also [Behavior of a not permitted memory-mapped access on page H8-6543](#).

For more information, see *ARM® Debug Interface Architecture Specification*.

H8.5.4 External debug interface register access permissions summary

For accesses to:

- IMPLEMENTATION DEFINED registers, see [IMPLEMENTATION DEFINED registers](#).
- OPTIONAL registers for CoreSight compliance, see [OPTIONAL CoreSight management registers](#).
- Reserved, unallocated, or unimplemented registers, writes to read-only registers, and reads of write-only registers, see [Reserved and unallocated registers](#).

For all other external debug interface, CTI, and Performance Monitor registers, [Table H8-3 on page H8-6552](#), [Table H8-4 on page H8-6554](#) and [Table I3-1 on page I3-6734](#), show the response of the PE to accesses by the external debug interface.

If `ARMv8.4-Debug` is implemented, each debug component has a Secure and a Non-secure view. Non-secure accesses are permitted only when `AllowExternalDebugAccess() == TRUE` or `AllowExternalPMUAccess() == TRUE`.

H8.5.5 IMPLEMENTATION DEFINED registers

For debug registers, Performance Monitors registers, CTI registers, IMPLEMENTATION DEFINED register access permissions are IMPLEMENTATION DEFINED. The power domain in which these registers are implemented is also IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there are additional constraints on memory-mapped accesses to registers. These constraints must also apply to IMPLEMENTATION DEFINED registers. In particular, if the OPTIONAL Software Lock is locked, writes are ignored and accesses have no side-effects. For more information see [Register access permissions for memory-mapped accesses on page H8-6542](#).

H8.5.6 OPTIONAL CoreSight management registers

Compliance with CoreSight architecture requires additional registers in the range `0xF00 - 0xFFC` that are always accessible. See [Management registers and CoreSight compliance on page K2-7241](#).

H8.5.7 Reserved and unallocated registers

The access requirements are described in [Access requirements for reserved and unallocated registers on page I1-6718](#).

———— Note —————

Reads of WO and writes to RO refers to the default access permissions for a register. For example, when the SLK field is set, meaning that the relevant registers become RO, a memory-mapped write to a RW register is ignored, and not treated as a reserved access.

The following reserved registers are RES0 in all conditions, other than when debug power is off:

- If the implementation is CoreSight architecture compliant, all reserved registers in the range 0xF00 - 0xFFC. See [Management register access permissions on page K2-7242](#).
- All reserved CTI registers.

Otherwise, the architecture defines that:

1. If debug power is off, all register accesses, including reserved accesses, return an error.
2. For reserved debug registers and Performance Monitors registers, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0, when any of the following hold:
 - Off** The Core power domain is either completely off or in a low-power state in which the Core power domain registers cannot be accessed.
 - DLK** The OS Double Lock is implemented and `DoubleLockStatus() == TRUE`. The OS Double Lock is locked.
 - OSLK** `OSLSR.OSLK == 1`. The OS Lock is locked.
3. In addition, for reserved debug registers in the address ranges 0x400 - 0x4FC and 0x800 - 0x8FC, the response is a constrained unpredictable choice of error or RES0 when conditions 1 or 2 do not apply and:
 - EDAD** `AllowExternalDebugAccess() == FALSE`. External debug is disabled.

———— **Note** —————

See also [Behavior of a not permitted access on page H8-6546](#).
4. In addition, for reserved Performance Monitors registers in the address ranges 0x000 - 0xEFC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:
 - EPMAD** `AllowExternalPMUAccess() == FALSE`. External Performance Monitor access is disabled.

———— **Note** —————

See also [Behavior of a not permitted access on page H8-6546](#).
5. For reads of WO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a write to the location to return an error.
6. For writes of RO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a read to the location to return an error.
7. For reads and writes of locations for features that are not implemented, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires an access to the location to return an error if the feature is implemented.

H8.6 External debug interface registers

The external debug interface register map is described by:

- *Performance Monitors external register views* on page 15-6742.
- *Cross-trigger interface registers* on page H8-6554.
- *External debug interface register map*.

- a. Supported only if the OPTIONAL PC Sample-Based Profiling is implemented but ARMv8.2-PCSample is not implemented. See [Chapter H7 The PC Sample-based Profiling Extension](#).
Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented.
- b. A 64-bit register mapped to a pair of 32-bit locations. Doubleword accesses to this register are not guaranteed to be 64-bit single copy atomic. See [Endianness and supported access sizes on page H8-6537](#). Software must ensure a breakpoint or watchpoint is disabled before altering the value register.
- c. Implemented breakpoints and watchpoints only. *n* is the breakpoint or the watchpoint number.

Note

All other locations are reserved.

H8.6.1 Access permissions for the External debug interface registers

Table H8-3 on page H8-6552 shows the access permissions for the external debug interface registers in an ARMv8-A Debug implementation. The terms are defined as follows:

Domain	This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.
Conditions	This lists the conditions under which the access is attempted. To determine the access permissions for a register, read these columns from left to right, and stop at first column which lists the condition as being true. The conditions are: <ul style="list-style-type: none"> Off The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed, and <code>EDPRSR.PU</code> will read as 0. <p style="text-align: center;">Note</p> <p style="text-align: center;">If debug power is off, then all external debug interface accesses return an error.</p> <ul style="list-style-type: none"> DLK The OS Double Lock is implemented and <code>DoubleLockStatus() == TRUE</code>. The OS Double Lock is locked. OSLK <code>OSLSR.OSLK == 1</code>. The OS Lock is locked. EDAD <code>AllowExternalDebugAccess() == FALSE</code>. External debug access is disabled for the access. If ARMv8.4-Debug is implemented, this applies only for Non-secure accesses to the register. See also Behavior of a not permitted access on page H8-6546. EPMAD <code>AllowExternalPMUAccess() == FALSE</code>. Access to the external Performance Monitors is disabled for the access. If ARMv8.4-Debug is implemented, this applies only for Non-secure accesses to the register. See also Behavior of a not permitted access on page H8-6546. SLK <code>SoftwareLockStatus() == TRUE</code>. This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See Register access permissions for memory-mapped accesses on page H8-6542. For all other accesses, this column is ignored.
Default	This provides the default access permissions, if there are no conditions that prevent access to the register.

The access permissions are:

-	This means that the default access permission applies. See the Default column, or the SLK column, if applicable.
RO	This means that the register or field is read-only, and: <ul style="list-style-type: none"> • Unless the register description states otherwise, a RO field in an RW register ignores writes. • Where the SLK control makes a RW register RO, the register ignores writes.
RW	This means that the register or field is read/write. Individual fields within the register might be RO or WO. See the relevant register description for details.
RC	This means that a read of the register bit clears the field to 0.
WO	This means that the register or field is write-only. Unless the register description states otherwise, a WO field in a RW register returns an UNKNOWN value on a read of the register.
WI	This means that the register or field ignores writes.
IMP DEF	This means that the access permissions are IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there might be additional constraints on memory-mapped accesses. See [Register access permissions for memory-mapped accesses on page H8-6542](#).

- a. Implemented only if the PC Sample-based profiling Extension is implemented.
- b. In ARMv8.0 and ARMv8.1 implementations, it is IMPLEMENTATION DEFINED whether an error is returned. See [External access disabled on page H8-6546](#). If no error is returned, the access is permitted.
- c. Some control bits are in the Core power domain. These bits ignore writes when Core power domain registers cannot be accessed as shown.
- d. Some status bits are fetched from the Core power domain. These bits read UNKNOWN when Core power domain registers cannot be accessed as shown.
- e. Implemented breakpoints and watchpoints only. *n* is the breakpoint or watchpoint number.
- f. It is IMPLEMENTATION DEFINED whether an error is returned. See [External debug over powerdown and locks on page H8-6545](#). If no error is returned, the access is permitted.

For the reset values for the external debug interface registers, see [Table H8-6 on page H8-6556](#).

H8.7 Cross-trigger interface registers

The embedded Cross-trigger Interface, CTI, is located within its own block of the external debug memory map. There must be one such block for each PE.

If the CTI of a PE does not implement the [CTIDEVAFF0](#) or [CTIDEVAFF1](#) registers it must be located 64KB above the debug registers in the external debug interface.

When [ARMv8.4-Debug](#) is implemented, each debug component has a Secure and Non-secure view. The Secure view of a debug component is mapped into Secure physical memory and the Non-secure view of a debug component is mapped into Non-secure memory. Apart from access conditions, the Non-secure and Secure views of the debug components are identical.

[Table H8-4](#) shows the CTI register map.

Table H8-4 Cross-trigger interface map

Offset	Mnemonic	Location of further details

0x0A0+4×n	CTIOUTEN<n>	Debug	-	-	-	-	RW	RO	
0x130	CTITRIGINSTATUS	Debug	-	-	-	-	RO	RO	
0x134	CTITRIGOUTSTATUS	Debug	-	-	-	-	RO	RO	
0x138	CTICHINSTATUS	Debug	-	-	-	-	RO	RO	
0x13C	CTICHOUTSTATUS	Debug	-	-	-	-	RO	RO	
0x140	CTIGATE	Debug	-	-	-	-	RW	RO	
0xFC0	CTIDEVID2	Debug	-	-	-	-	RO	RO	
0xFC4	CTIDEVID1	Debug	-	-	-	-	RO	RO	
0xFC8	CTIDEVID	Debug	-	-	-	-	RO	RO	

a. Implemented triggers only (including triggers that are not connected). *n* is the trigger number.

For the reset values of the CTI registers, see [Table H8-7 on page H8-6558](#).

H8.8 External debug register resets

Each register or field has a defined reset domain:

- Registers and fields in the Warm reset domain are also reset by a Cold reset and unchanged by an External Debug reset that is not coincident with a Cold reset or a Warm reset.
- Registers and fields in the Cold reset domain are unchanged by a Warm reset or an External Debug reset that is not coincident with a Cold reset.
- Registers and fields in the External Debug reset domain are unchanged by a Cold reset or a Warm reset that is not coincident with an External Debug reset.

A reset might change the value of a register. Specific rules apply to the observability of registers in the External Debug reset domain by indirect reads from the Core power domain when an External Debug reset is asserted without a coincident Cold reset. For more information, see [Synchronization of changes to the external debug registers on page H8-6538](#).

[Table H8-6](#) and [Table H8-7 on page H8-6558](#) show the external debug register and CTI register resets. For other debug registers and Performance Monitors registers, see [Management register resets on page K2-7246](#) and [Power domains and Performance Monitors registers reset on page I3-6735](#).

———— **Note** —————

By reference to [Figure H6-2 on page H6-6529](#) the power domain can be deduced from the reset domain. [Table K2-7 on page K2-7246](#) also shows reset power domains.

[Table H8-6](#) and [Table H8-7 on page H8-6558](#) do not include:

- Read-only identification registers, such as Processor ID Registers and [PMCFGR](#), that have a fixed value from reset.
- Read-only status registers, such as [EDSCR.RW](#), that are evaluated each time the register is read and that have no meaningful reset value.
- Write-only registers, such as [EDRCR](#), that only have an effect on writes, and have no meaningful reset value.
- Read/write registers, such as breakpoint and watchpoint registers, and [EDPRCR.CORENPDRQ](#), that alias other registers. The reset values are described by the descriptions of those other registers.
- IMPLEMENTATION DEFINED registers. The reset values and reset domains of these registers are also IMPLEMENTATION DEFINED and might be UNKNOWN.

All other fields in the registers are set to an IMPLEMENTATION DEFINED value, that can be UNKNOWN. The register is in the specified reset domain.

———— **Note** —————

An IMPLEMENTATION DEFINED reset value, which can be UNKNOWN, means that hardware is not required to reset the register on the specified reset, but software must not rely on the register being preserved over reset.

Table H8-6 Summary of external debug register resets, debug registers

Register	Reset domain	Field	Value	Description
EDES _R	Warm	SS	EDECR.SS	Halting Step debug event pending
		RC	EDECR.RCE	Reset Catch debug event pending
		OSUC	0	OS Unlock Catch debug event pending

Table H8-6 Summary of external debug register resets, debug registers (continued)

Register	Reset domain	Field	Value	Description
EDECR	External debug	SS	0	Halting Step debug event enable
		RCE	0	Reset Catch debug event enable
		OSUCE	0	OS Unlock Catch debug event enable
EDWAR	Cold	-	-	All fields
EDSCR	Cold	RXfull	0	DTRRX register full
		TXfull	0	DTRTX register full
		RXO	0	DTRRX overrun
		TXU	0	DTRTX underrun
		INTdis	0	Interrupt disable
		TDA	0	Trap debug register accesses to Debug state
		MA	0	Memory access mode in Debug state
		HDE	0	Halting debug mode enable
		ERR	0	Cumulative error flag
EDECCR	Cold	NSE[2:1]	0b00	Coarse-grained Non-secure Exception Catch
		SE[3,1]	0b00	Coarse-grained Secure Exception Catch
EDPCSR	Cold	-	-	All fields
EDCIDSR	Cold	-	-	All fields
EDVIDSR	Cold	-	-	All fields
EDPRCR	External debug	COREPURQ ^a	0	Core powerup request
EDPRSR	Warm	SDR	-	Sticky debug restart
	Cold	SPMAD	0	Sticky EPMAD error
		SDAD	0	Sticky EDAD error
	Warm	SR	1	Sticky reset status
	Cold	SPD	1	Sticky powerdown status

- a. On a cold reset into AArch64 state, [DBGPRCR_EL1.CORENPRDRQ](#) resets to the value of [EDPRCR.COREPURQ](#). On a cold reset into AArch32 state, [DBGPRCR.CORENPRDRQ](#) resets to the value of [EDPRCR.COREPURQ](#). If an External Debug reset and a Cold reset coincide, both [EDPRCR.COREPURQ](#) and the [CORENPRDRQ](#) field of the appropriate System register are reset to 0.

Table H8-7 shows the reset values for the CTI registers

Table H8-7 Summary of external debug register resets, CTI registers

Register	Reset domain	Field	Value	Description
CTICONTROL	External debug	GLBEN	0	CTI global enable
CTIAPPSET	External debug	-	-	All fields
CTIINEN<n>	External debug	-	-	All fields
CTIOUTEN<n>	External debug	-	-	All fields

ASICCTL	IMPLEMENTATION DEFINED	-	IMPLEMENTATION DEFINED	All of register

Chapter H9

External Debug Register Descriptions

This chapter provides a description of the external debug registers.

It contains the following sections:

- [About the debug registers](#) on page H9-6560.
- [External debug registers](#) on page H9-6561.
- [Cross-Trigger Interface registers](#) on page H9-6666.

H9.1 About the debug registers

The following sections describe the registers that are accessible through the external debug interface:

- [External debug registers](#) on page H9-6561.
- [Cross-Trigger Interface registers](#) on page H9-6666.

H9.2 External debug registers

This section describes the debug registers that are accessible through the external debug interface and are used for external debug.

This section lists the registers that are accessible through the external debug interface.

H9.2.1 DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Usage constraints

There are no usage constraints.

Configurations

External register DBGAUTHSTATUS_EL1[31:0] is architecturally mapped to AArch64 System register [DBGAUTHSTATUS_EL1](#)[31:0].

External register DBGAUTHSTATUS_EL1[31:0] is architecturally mapped to AArch32 System register [DBGAUTHSTATUS](#)[31:0].

It is IMPLEMENTATION DEFINED whether DBGAUTHSTATUS_EL1 is implemented in the Core power domain or in the Debug power domain.

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions

The DBGAUTHSTATUS_EL1 bit assignments are:

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

When ARMv8.4-Debug is implemented:

Secure non-invasive debug.

ExternalSecureNoninvasiveDebugEnabled() == ExternalSecureInvasiveDebugEnabled().

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1.

0b10 Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1.

0b10 Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.
All other values are reserved.

NSNID, bits [3:2]

When ARMv8.4-Debug is implemented:

Non-secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.

0b11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

If the Effective value of SCR_EL3.NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.

0b10 Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.

0b10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing the DBGAUTHSTATUS_EL1:

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFB8	DBGAUTHSTATUS_EL1

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.2 DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register DBGBCR<n>_EL1[31:0] is architecturally mapped to AArch64 System register [DBGBCR<n>_EL1\[31:0\]](#).

External register DBGBCR<n>_EL1[31:0] is architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

DBGBCR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then this register is unallocated.

Attributes

DBGBCR<n>_EL1 is a 32-bit register.

Field descriptions

The DBGBCR<n>_EL1 bit assignments are:

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

- 0b0000 Unlinked instruction address match. [DBGBVR<n>_EL1](#) is the address of an instruction.
- 0b0001 As 0b0000 but linked to a Context matching breakpoint.
- 0b0010 Unlinked Context ID match. When [ARMv8.1-VHE](#) is implemented, EL2 is using AArch64, and the Effective value of [HCR_EL2.E2H](#) is 1, if either the PE is executing at EL0 with [HCR_EL2.TGE](#) set to 1 or the PE is executing at EL2, then [DBGBVR<n>_EL1.ContextID](#) must match the [CONTEXTIDR_EL2](#) value. Otherwise, [DBGBVR<n>_EL1.ContextID](#) must match the [CONTEXTIDR_EL1](#) value.
- 0b0011 As 0b0010, with linking enabled.

- 0b0100 Unlinked instruction address mismatch. [DBGBVR<n>_EL1](#) is the address of an instruction to be stepped.
- 0b0101 As 0b0100, with linking enabled.
- 0b0110 Unlinked [CONTEXTIDR_EL1](#) match. [DBGBVR<n>_EL1](#).ContextID is a Context ID compared against [CONTEXTIDR_EL1](#).
- 0b0111 As 0b0110, with linking enabled.
- 0b1000 Unlinked VMID match. [DBGBVR<n>_EL1](#).VMID is a VMID compared against [VTTBR_EL2](#).VMID.
- 0b1001 As 0b1000, with linking enabled.
- 0b1010 Unlinked VMID and Context ID match. [DBGBVR<n>_EL1](#).ContextID is a Context ID compared against [CONTEXTIDR_EL1](#), and [DBGBVR<n>_EL1](#).VMID is a VMID compared against [VTTBR_EL2](#).VMID.
- 0b1011 As 0b1010, with linking enabled.
- 0b1100 Unlinked [CONTEXTIDR_EL2](#) match. [DBGBVR<n>_EL1](#).ContextID2 is a Context ID compared against [CONTEXTIDR_EL2](#).
- 0b1101 As 0b1100, with linking enabled.
- 0b1110 Unlinked Full Context ID match. [DBGBVR<n>_EL1](#).ContextID is compared against [CONTEXTIDR_EL1](#), and [DBGBVR<n>_EL1](#).ContextID2 is compared against [CONTEXTIDR_EL2](#).
- 0b1111 As 0b1110, with linking enabled.

Constraints on breakpoint programming mean some values are reserved under certain conditions. For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2305 and [Reserved DBGBCR<n>_EL1.BT values](#) on page D2-2309.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of [DBGBCR<n>_EL1.E](#) is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see [Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values](#) on page D2-2310.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2305.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see [DBGBCR<n>_EL1.SSC](#) description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2305.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64 only implementation, this field is reserved, RES1.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved.

For more information, see [Using the BAS field in Address Match breakpoints on page G2-5379](#).

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for stepping T32 instructions
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions

For more information, see [Using the BAS field in Address Match breakpoints on page G2-5379](#).

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-2305](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint DBGBVR<n>_EL1. Possible values are:

- 0b0 Breakpoint disabled.
- 0b1 Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGBCR<n>_EL1:

DBGBCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x408 + 16n	DBGBCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

H9.2.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>_EL1](#).

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register DBGBVR<n>_EL1[63:0] is architecturally mapped to AArch64 System register [DBGBVR<n>_EL1\[63:0\]](#).

External register DBGBVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register [DBGBVR<n>\[31:0\]](#).

If the breakpoint is context-aware and EL2 is implemented then External register DBGBVR<n>_EL1[63:32] is architecturally mapped to AArch32 System register [DBGXVR<n>](#). Otherwise there is no External register access to DBGBVR<n>_EL1[63:32] from AArch32 state.

DBGBVR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then this register is unallocated.

Attributes

How this register is interpreted depends on the value of [DBGBCR<n>_EL1.BT](#).

- When [DBGBCR<n>_EL1.BT](#) is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>_EL1.BT](#) is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>_EL1.BT](#) is 0b100x, this register holds a VMID.
- When [DBGBCR<n>_EL1.BT](#) is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>_EL1.BT](#) is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>_EL1.BT](#), this register is RES0.

Field descriptions

The DBGBVR<n>_EL1 bit assignments are:

When [DBGBCR<n>_EL1.BT == 0b0x0x:](#)

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

From ARMv8.2, or if ARMv8.2-LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When **ARMv8.2-LVA** is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When *DBGBCR<n>_EL1.BT == 0b001x:*

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against **CONTEXTIDR_EL2** when **ARMv8.1-VHE** is implemented, EL2 is using AArch64, **HCR_EL2.E2H** is 1, and either:

- The PE is executing at EL2.
- **HCR_EL2.TGE** is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against **CONTEXTIDR** when the PE is executing at AArch32, or **CONTEXTIDR_EL1** when the PE is executing at AArch64.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR\langle n \rangle_EL1.BT == 0b011x$:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

From ARMv8.1, or if ARMv8.1-VHE is implemented:

Context ID value for comparison against [CONTEXTIDR_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When $DBGBCR\langle n \rangle_EL1.BT == 0b100x$ and $IsExceptionLevelImplemented(EL2)$:

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

From ARMv8.1, or if ARMv8.1-VHE is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When $DBGBCR<n>_{EL1.BT} == 0b101x$ and $IsExceptionLevelImplemented(EL2)$:

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

From ARMv8.1:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR<n>_{EL1.BT} == 0b110x$ and $IsExceptionLevelImplemented(EL2)$:

ContextID2, bits [63:32]

From ARMv8.1:

Context ID value for comparison against [CONTEXTIDR_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

When $DBGBCR<n>_{EL1.BT} == 0b111x$ and $IsExceptionLevelImplemented(EL2)$:

ContextID2, bits [63:32]

From ARMv8.1, or if ARMv8.1-VHE is implemented:

Context ID value for comparison against [CONTEXTIDR_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ContextID, bits [31:0]

From ARMv8.1, or if ARMv8.1-VHE is implemented:

Context ID value for comparison against [CONTEXTIDR_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the $DBGBVR<n>_{EL1}$:

This interface is accessible as follows:

- When $IsCorePowered()$, $!DoubleLockStatus()$, $!OSLockStatus()$, $AllowExternalDebugAccess()$ and $SoftwareLockStatus()$ access to this register is RO.
- When $IsCorePowered()$, $!DoubleLockStatus()$, $!OSLockStatus()$, $AllowExternalDebugAccess()$ and $!SoftwareLockStatus()$ access to this register is RW.
- Access to this register is ERROR.

H9.2.4 DBGCLAIMCLR_EL1, Debug Claim Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear these bits to 0.
The architecture does not define any functionality for the CLAIM tag bits.

———— Note —————

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET_EL1](#) register.

Usage constraints

There are no usage constraints.

Configurations

External register DBGCLAIMCLR_EL1[31:0] is architecturally mapped to AArch64 System register [DBGCLAIMCLR_EL1](#)[31:0].

External register DBGCLAIMCLR_EL1[31:0] is architecturally mapped to AArch32 System register [DBGCLAIMCLR](#)[31:0].

DBGCLAIMCLR_EL1 is in the Core power domain.

This register is not affected by a Warm reset, and is not affected by an External debug reset.

An implementation must include 8 CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions

The DBGCLAIMCLR_EL1 bit assignments are:

Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

Accessing the DBGCLAIMCLR_EL1:

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA4	DBGCLAIMCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

H9.2.5 DBGCLAIMSET_EL1, Debug Claim Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR_EL1](#) register.

Usage constraints

There are no usage constraints.

Configurations

External register DBGCLAIMSET_EL1[31:0] is architecturally mapped to AArch64 System register [DBGCLAIMSET_EL1](#)[31:0].

External register DBGCLAIMSET_EL1[31:0] is architecturally mapped to AArch32 System register [DBGCLAIMSET](#)[31:0].

DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include 8 CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 32-bit register.

Field descriptions

The DBGCLAIMSET_EL1 bit assignments are:

Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Set CLAIM tag bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

Accessing the DBGCLAIMSET_EL1:

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA0	DBGCLAIMSET_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

H9.2.6 DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

Usage constraints

If `EDSCR.ITE == 0` when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is `CONSTRAINED UNPREDICTABLE`, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

Configurations

External register DBGDTRRX_EL0[31:0] is architecturally mapped to AArch64 System register [DBGDTRRX_EL0](#)[31:0].

External register DBGDTRRX_EL0[31:0] is architecturally mapped to AArch32 System register [DBGDTRRXint](#)[31:0].

DBGDTRRX_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

The DBGDTRRX_EL0 bit assignments are:

Bits [31:0]

Update DTRRX.

If `RXfull` is set to 0, then writes to this register update the value in DTRRX and set `RXfull` to 1.

Reads of this register return the last value written to DTRRX and do not change `RXfull`.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRRX_EL0:

DBGDTRRX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x080	DBGDTRRX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

H9.2.7 DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

Usage constraints

If `EDSCR.ITE == 0` when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is `CONSTRAINED UNPREDICTABLE`, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

Configurations

External register DBGDTRTX_EL0[63:32] is architecturally mapped to AArch64 System register [DBGDTRTX_EL0](#)[31:0].

External register DBGDTRTX_EL0[31:0] is architecturally mapped to AArch32 System register [DBGDTRTXint](#)[31:0].

DBGDTRTX_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

The DBGDTRTX_EL0 bit assignments are:

Bits [31:0]

Return DTRTX.

If `TXfull` is set to 1, then reads of this register return the value in `DTRTX` and clear `TXfull` to 0.

Writes of this register update the value in `DTRTX` and do not change `TXfull`.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRTX_EL0:

DBGDTRTX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x08C	DBGDTRTX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

H9.2.8 DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>_EL1](#).

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register DBGWCR<n>_EL1[31:0] is architecturally mapped to AArch64 System register [DBGWCR<n>_EL1\[31:0\]](#).

External register DBGWCR<n>_EL1[31:0] is architecturally mapped to AArch32 System register [DBGWCR<n>\[31:0\]](#).

DBGWCR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then this register is unallocated.

Attributes

DBGWCR<n>_EL1 is a 32-bit register.

Field descriptions

The DBGWCR<n>_EL1 bit assignments are:

When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

0b00000 No mask.

0b00001 Reserved.

0b00010 Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

0b0 Unlinked data address match.

0b1 Linked data address match.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2316](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2316](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by `DBGWVR<n>_EL1` is being watched.

BAS	Description
xxxxxxx1	Match byte at <code>DBGWVR<n>_EL1</code>
xxxxxx1x	Match byte at <code>DBGWVR<n>_EL1 + 1</code>
xxxxx1xx	Match byte at <code>DBGWVR<n>_EL1 + 2</code>
xxxx1xxx	Match byte at <code>DBGWVR<n>_EL1 + 3</code>

In cases where `DBGWVR<n>_EL1` addresses a double-word:

BAS	Description, if <code>DBGWVR<n>_EL1[2] == 0</code>
xxx1xxxx	Match byte at <code>DBGWVR<n>_EL1 + 4</code>
xx1xxxxx	Match byte at <code>DBGWVR<n>_EL1 + 5</code>
x1xxxxxx	Match byte at <code>DBGWVR<n>_EL1 + 6</code>
1xxxxxxx	Match byte at <code>DBGWVR<n>_EL1 + 7</code>

If `DBGWVR<n>_EL1[2] == 1`, only `BAS[3:0]` is used. ARM deprecates setting `DBGWVR<n>_EL1[2] == 1`.

The valid values for `BAS` are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See [Reserved `DBGWCR<n>.BAS` values on page G2-5401](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- 0b01 Match instructions that load from a watchpointed address.
- 0b10 Match instructions that store to a watchpointed address.
- 0b11 Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint `n` is generated. This field must be interpreted along with the `SSC` and `HMC` fields.

For more information on the operation of the `SSC`, `HMC`, and `PAC` fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2316](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint `n`. Possible values are:

- 0b0 Watchpoint disabled.
- 0b1 Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the `DBGWCR<n>_EL1`:

`DBGWCR<n>_EL1` can be accessed through the external debug interface:

Component	Offset	Instance
Debug	<code>0x808 + 16n</code>	<code>DBGWCR<n>_EL1</code>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

H9.2.9 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>_EL1](#).

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register DBGWVR<n>_EL1[63:0] is architecturally mapped to AArch64 System register [DBGWVR<n>_EL1](#)[63:0].

External register DBGWVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register [DBGWVR<n>](#)[31:0].

DBGWVR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then this register is unallocated.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

The DBGWVR<n>_EL1 bit assignments are:

RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When ARMv8.2-LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When [ARMv8.2-LVA](#) is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RES0.

ARM deprecates setting `DBGWVR<n>_EL1[2] == 1`.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the DBGWVR<n>_EL1:

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalDebugAccess()` and `SoftwareLockStatus()` access to this register is RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalDebugAccess()` and `!SoftwareLockStatus()` access to this register is RW.
- Access to this register is ERROR.

H9.2.10 EDAA32PFR, External Debug AArch32 Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D12-2680](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

EDAA32PFR is only accessible in an implementation that only supports execution in AA32 state. If AArch64 state is supported at any Exception level, EDAA32PFR is RES0.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions

The EDAA32PFR bit assignments are:

Bits [63:16]

Reserved, RES0.

EL3, bits [15:12]

AArch32 EL3 Exception level handling. Defined values are:

0b0000 EL3 is not implemented.

0b0001 EL3 can be executed in AArch32 state only.

When the value of [EDPFR.EL3](#) is non-zero, this field must be 0b0000.

All other values are reserved.

Note

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

EL2, bits [11:8]

AArch32 EL2 Exception level handling. Defined values are:

0b0000 EL2 is not implemented.

0b0001 EL2 can be executed in AArch32 state only.

When the value of [EDPFR.EL2](#) is non-zero, this field must be 0b0000.

All other values are reserved.

Note

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

0b0000 PMSA not supported.

0b0100 Support for an ARMv8-R PMSAv8-32.

All other values are reserved. In ARMv8-A, the only permitted value is 0b0000.

VMSA, bits [3:0]

Indicates support for a VMSA. When the PMSA field is nonzero, determines support for a VMSA. When the PMSA field is 0b0000, VMSA is supported. Defined values are:

0b0000 VMSA not supported.

All other values are reserved. In ARMv8-A, the only permitted value is 0b0000.

Accessing the EDAA32PFR:

EDAA32PFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD60	EDAA32PFR

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() access to this register is RO.
- Access to this register is IMPDEF.

H9.2.11 EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, `OSLSR_EL1.OSLK == 1`, and when the Core is powered off.

Attributes

EDACR is a 32-bit register.

Field descriptions

The EDACR bit assignments are:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the EDACR:

EDACR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x094	EDACR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` access to this register is RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` access to this register is RW.

- Access to this register is IMPDEF.

H9.2.12 EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDCIDR0 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions

The EDCIDR0 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble. Must read as 0x0D.

Accessing the EDCIDR0:

EDCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF0	EDCIDR0

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.13 EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDCIDR1 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

The EDCIDR1 bit assignments are:

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class. Reads as 0x9, debug component.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Accessing the EDCIDR1:

EDCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF4	EDCIDR1

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.14 EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDCIDR2 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR2 is a 32-bit register.

Field descriptions

The EDCIDR2 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble. Must read as 0x05.

Accessing the EDCIDR2:

EDCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF8	EDCIDR2

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.15 EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDCIDR3 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions

The EDCIDR3 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble. Must read as 0xB1.

Accessing the EDCIDR3:

EDCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFFC	EDCIDR3

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.16 EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

Purpose

Contains the sampled value of the Context ID, captured on reading [EDPCSR](#)[31:0].

Usage constraints

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-6534.

Configurations

EDCIDSR is in the Core power domain.

Fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

———— Note ————

[ARMv8.2-PCSample](#) implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDCIDSR is a 32-bit register.

Field descriptions

The EDCIDSR bit assignments are:

When ARMv8.2-PCSample is implemented:

Bits [31:0]

Reserved, RES0.

Otherwise:

Bit [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent [EDPCSR](#) sample.

- If EL1 is using AArch64, the context is held in [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, the context is held in [CONTEXTIDR](#).
- If EL3 is using AArch32, then [CONTEXTIDR](#) is a banked register, and EDCIDSR samples the current banked copy of [CONTEXTIDR](#) for the current Security state that is associated with the most recent [EDPCSR](#) sample.

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, therefore it is CONstrained UNPREDICTABLE whether EDCIDSR is set to the original or new value of EDPCSRlo samples:

- An instruction that writes to `CONTEXTIDR_EL1`.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDCIDSR:

EDCIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A4	EDCIDSR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()` and `!OSLockStatus()` access to this register is RO.
- Access to this register is ERROR.

H9.2.17 EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDDEVAFF0 is implemented in the Core power domain or in the Debug power domain.

There are no configuration notes.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions

The EDDEVAFF0 bit assignments are:

MPIDR_EL1 low half, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the EDDEVAFF0:

EDDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA8	EDDEVAFF0

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.18 EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDDEVAFF1 is implemented in the Core power domain or in the Debug power domain.

There are no configuration notes.

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions

The EDDEVAFF1 bit assignments are:

MPIDR_EL1 high half, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the EDDEVAFF1:

EDDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFAC	EDDEVAFF1

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.19 EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDDEVARCH is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

The EDDEVARCH bit assignments are:

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is ARM Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For debug, the revision defined by ARMv8-A is 0x0.

All other values are reserved.

ARCHVER, bits [15:12]

Defines the architecture version of the component. This is the same value as [ID_AA64DFR0_EL1.DebugVer](#) and [DBGDIDR.Version](#). The defined values of this field are:

0b0110 ARMv8.0 Debug architecture.

0b0111 ARMv8.0 Debug architecture with Virtualization Host Extensions.

0b1000 ARMv8.2 Debug architecture.

0b1001 ARMv8.4 Debug architecture.

[ARMv8.4-Debug](#) adds the functionality indicated by the value 0b1001. [ARMv8.2-Debug](#) adds the functionality indicated by the value 0b1000. If [ARMv8.1-VHE](#) is not implemented, the only permitted value is 0b0110.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHVER is ARCHID[15:12].

ARCHPART, bits [11:0]

0xA15 The part number of the ARMv8-A debug component.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHPART is ARCHID[11:0].

Accessing the EDDEVARCH:

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFBC	EDDEVARCH

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.20 EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDDEVID is implemented in the Core power domain or in the Debug power domain.

There are no configuration notes.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

The EDDEVID bit assignments are:

31	28 27	24 23	4 3	0
RES0	AuxRegs	RES0	PCSample	

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Permitted values for this field are:

0b0000 None supported.

0b0001 Support for External Debug Auxiliary Control Register, [EDACR](#).

All other values are reserved.

Bits [23:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Permitted values of this field are:

0b0000 PC Sample-based Profiling Extension is not implemented in the external debug registers space.

0b0010 Only [EDPCSR](#) and [EDCIDSR](#) are implemented. This option is only permitted if EL3 and EL2 are not implemented.

0b0011 [EDPCSR](#), [EDCIDSR](#), and [EDVIDSR](#) are implemented.

All other values are reserved.

When [ARMv8.2-PCSample](#) is implemented, the only permitted value is 0b0000.

————— **Note** —————

[ARMv8.2-PCSample](#) implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID.PCSample](#).

Accessing the EDDEVID:

EDDEVID can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC8	EDDEVID

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.21 EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDDEVID1 is implemented in the Core power domain or in the Debug power domain.

There are no configuration notes.

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions

The EDDEVID1 bit assignments are:

Bits [31:4]

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of [EDPCSR](#). Permitted values of this field in ARMv8 are:

0b0000 [EDPCSR](#) not implemented.

0b0010 [EDPCSR](#) implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When [ARMv8.2-PCSample](#) is implemented, the only permitted value is 0b0000.

————— Note —————

[ARMv8.2-PCSample](#) implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID.PCSample](#).

Accessing the EDDEVID1:

EDDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC4	EDDEVID1

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.22 EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDDEVID2 is implemented in the Core power domain or in the Debug power domain.

There are no configuration notes.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

The EDDEVID2 bit assignments are:

Bits [31:0]

Reserved, RES0.

Accessing the EDDEVID2:

EDDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC0	EDDEVID2

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.23 EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's debug logic.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDDEVTYPE is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDDEVTYPE is a 32-bit register.

Field descriptions

The EDDEVTYPE bit assignments are:

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Must read as 0x1 to indicate this is a component within a PE.

MAJOR, bits [3:0]

Major type. Must read as 0x5 to indicate this is a debug logic component.

Accessing the EDDEVTYPE:

EDDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFCC	EDDEVTYPE

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.24 EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top level information about the debug system.

Note

Debuggers must use [EDDEVARCH](#) to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers](#) on page D12-2680.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

There are no configuration notes.

Attributes

EDDFR is a 64-bit register.

Field descriptions

The EDDFR bit assignments are:

Bits [63:44]

Reserved, RES0.

TraceFilt, bits [43:40]

When ARMv8.4-Trace is implemented:

ARMv8.4 Self-hosted Trace Extension version. The defined values of this field are:

0b0000 ARMv8.4 Self-hosted Trace Extension is not implemented.

0b0001 ARMv8.4 Self-hosted Trace Extension is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

UNKNOWN, bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64DFR0_EL1.CTX_CMPs](#).

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64DFR0_EL1](#).WRPs.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64DFR0_EL1](#).BRPs.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in [Alternative ID scheme used for the Performance Monitors Extension version on page D12-2682](#).

Defined values are:

- | | |
|--------|---|
| 0b0000 | Performance Monitors Extension not implemented. |
| 0b0001 | Performance Monitors Extension implemented, PMUv3. |
| 0b0100 | PMUv3 for ARMv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none">Extended 16-bit PMEVTYPER<n>_EL0.evtCount field.If EL2 is implemented, the MDCR_EL2.HPMD control bit. |
| 0b0101 | PMUv3 for ARMv8.4. As 0b0100 and also includes support for the PMMIR register. |
| 0b1111 | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations. |

[ARMv8.1-PMU](#) implements the functionality added by the value 0b0100.

[ARMv8.4-PMU](#) implements the functionality added by the value 0b0101.

All other values are reserved.

From ARMv8.1, the value 0b0001 is not permitted.

From ARMv8.4, the value 0b0100 is not permitted.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64DFR0_EL1](#).PMUVer.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented.

Defined values are:

- | | |
|--------|---|
| 0b0000 | PE trace unit System registers not implemented. |
| 0b0001 | PE trace unit System registers implemented. |

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented.

A PE trace unit might nevertheless be implemented without a System register interface.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64DFR0_EL1](#).TraceVer.

UNKNOWN, bits [3:0]

Reserved, UNKNOWN.

Accessing the EDDFR:

EDDFR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD28	EDDFR	31:0

EDDFR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD2C	EDDFR	63:32

These interfaces are accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() access to EDDFR[31:0] is RO.
- Access to EDDFR[31:0] is IMPDEF.
- When IsCorePowered() and !DoubleLockStatus() access to EDDFR[63:32] is RO.
- Access to EDDFR[63:32] is IMPDEF.

H9.2.25 EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events.

Usage constraints

There are no usage constraints.

Configurations

External register EDECCR[31:0] is architecturally mapped to AArch64 System register [OSECCR_EL1](#)[31:0].

External register EDECCR[31:0] is architecturally mapped to AArch32 System register [DBGOSECCR](#)[31:0].

EDECCR is in the Core power domain. Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Attributes

EDECCR is a 32-bit register.

Field descriptions

The EDECCR bit assignments are:

When ARMv8.2-Debug is implemented or ARMv8.4-Debug is implemented:

Bits [31:16]

Reserved, RES0.

NSR<n>, bit [12 + n], for n = 0 to 3

Controls Non-secure exception catch on exception return to EL<n> in conjunction with NSE<n>. See the [Table H3-5 on page H3-6471](#) for information.

If EL3 and EL2 are not implemented and the PE behaves as if [SCR_EL3.NS](#) is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

- 0b0 If the corresponding NSE<n> bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level <n>.
If the corresponding NSE<n> bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level <n>.
- 0b1 If the corresponding NSE<n> bit is 0, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level <n>.
If the corresponding NSE<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level <n>.

————— Note —————

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the NSR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSR field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

SR<n>, bit [8 + n], for n = 0 to 3

Controls Secure exception catch on exception return to EL<n> in conjunction with SE<n>. See the [Table H3-5 on page H3-6471](#) for information.

If EL3 is not implemented and the PE behaves as if [SCR_EL3.NS](#) is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:

- | | |
|-----|--|
| 0b0 | If the corresponding SE<n> bit is 0, then Exception Catch debug events are disabled for Secure Exception level <n>.
If the corresponding SE<n> bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level <n>. |
| 0b1 | If the corresponding SE<n> bit is 0, then Exception Catch debug events are enabled for exception returns to Secure Exception level <n>.
If the corresponding SE<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level <n>. |

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the SR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SR field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

NSE<n>, bit [4 + n], for n = 0 to 3

Coarse-grained Non-secure exception catch for EL<n>. This controls whether Exception Catch debug events are enabled for Non-secure EL<n>. This also controls:

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with NSR<n>.

If EL3 and EL2 are not implemented and the PE behaves as if [SCR_EL3.NS](#) is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

- | | |
|-----|--|
| 0b0 | If the corresponding NSR<n> bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level <n>.
If the corresponding NSR<n> bit is 1, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level <n>. |
| 0b1 | If the corresponding NSR<n> bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level <n>.
If the corresponding NSR<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level <n>. |

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

SE<n>, bit [n], for n = 0 to 3

Coarse-grained Secure exception catch for EL<n>. This field controls whether Exception Catch debug events are enabled for Secure EL<n>.

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with SR<n>.

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:

0b0 If the corresponding SR<n> bit is 0, then Exception Catch debug events are disabled for Secure Exception level <n>.

If the corresponding SR<n> bit is 1, then Exception Catch debug events are enabled for exception returns to Secure Exception level <n>.

0b1 If the corresponding SR<n> bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level <n>.

If the corresponding SR<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level <n>.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

Otherwise:

Bits [31:8]

RES0

NSE<n>, bit [4 + n], for n = 0 to 3

Coarse-grained Non-secure exception catch.

If EL3 and EL2 are not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

0b0 Exception Catch debug events are disabled for Non-secure Exception level <n>.

0b1 Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level <n>.

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is UNKNOWN.

SE<n>, bit [n], for n = 0 to 3

Coarse-grained Secure exception catch.

If EL3 is not implemented and the PE behaves as if `SCR_EL3.NS` is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:

- 0b0 Exception Catch debug events are enabled for exception returns to Secure Exception level <n>.
- 0b1 Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level <n>.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

Accessing the EDECCR:

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x098	EDECCR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` access to this register is RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` access to this register is RW.
- Access to this register is ERROR.

H9.2.26 EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDECR is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Attributes

EDECR is a 32-bit register.

Field descriptions

The EDECR bit assignments are:

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

- 0b0 Halting step debug event disabled.
- 0b1 Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in [Changing the value of EDECR.SS when not in Debug state on page H3-6465](#).

On a reset, this field resets to 0.

RCE, bit [1]

Reset Catch Enable.

- 0b0 Reset Catch debug event disabled.
- 0b1 Reset Catch debug event enabled.

On a External debug reset, this field resets to 0.

OSUCE, bit [0]

OS Unlock Catch Enable.

0b0 OS Unlock Catch debug event disabled.

0b1 OS Unlock Catch debug event enabled.

On a External debug reset, this field resets to 0.

Accessing the EDECR:

EDECR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x024	EDECR

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is RO.
- When !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

H9.2.27 EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Usage constraints

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is **CONSTRAINED UNPREDICTABLE** whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

Configurations

EDESR is in the Core power domain. Some or all RW fields of this register have defined reset values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

EDESR is a 32-bit register.

Field descriptions

The EDESR bit assignments are:

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step debug event pending. Possible values of this field are:

0b0 Reading this means that a Halting step debug event is not pending. Writing this means no action.

0b1 Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

On a Warm reset, this field resets to the value in [EDECR.SS](#).

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

0b0 Reading this means that a Reset Catch debug event is not pending. Writing this means no action.

0b1 Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

On a Warm reset, this field resets to the value in [EDECR.RCE](#).

OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

- 0b0 Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.
- 0b1 Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

On a Warm reset, this field resets to 0.

Accessing the EDESR:

EDESR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x020	EDESR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

H9.2.28 EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions

The EDITCTRL bit assignments are:

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0b0 Normal operation.

0b1 Integration mode enabled.

On a Implementation reset, this field resets to 0.

Accessing the EDITCTRL:

EDITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xF00	EDITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is IMPDEF.

H9.2.29 EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Usage constraints

If `EDSCR.ITE == 0` when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is `CONSTRAINED UNPREDICTABLE`, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an `UNKNOWN` state.

EDITR ignores writes if the PE is in Non-debug state.

Configurations

EDITR is in the Core power domain.

There are no configuration notes.

Attributes

EDITR is a 32-bit register.

Field descriptions

The EDITR bit assignments are:

When in AArch32 state:

T32Second, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information see [Behavior in Debug state on page H2-6427](#)

T32First, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

When in AArch64 state:

Bits [31:0]

A64 instruction to be executed on the PE.

Accessing the EDITR:

EDITR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x084	EDITR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() access to this register is WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() access to this register is WO.
- Access to this register is ERROR.

H9.2.30 EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDLAR is implemented in the Core power domain or in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software Lock can be implemented as part of CoreSight compliance.

EDLAR ignores writes if the Software Lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses EDLAR to set or clear the lock, and [EDLSR](#) to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

The EDLAR bit assignments are:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Accessing the EDLAR:

EDLAR can be accessed through its memory-mapped interface:

Component	Offset	Instance
Debug	0xFB0	EDLAR

This interface is accessible as follows:

- Access to this register is WO.
- Access to this register is ERROR.

H9.2.31 EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDLSR is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software Lock can be implemented as part of CoreSight compliance.

EDLSR is RAZ if the Software Lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses [EDLAR](#) to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions

The EDLSR bit assignments are:

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

- 0b0 Lock clear. Writes are permitted to this component's registers.
- 0b1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On a reset, this field resets to 1.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED.

Permitted values are:

- 0b0 Software Lock not implemented or not memory-mapped access.
- 0b1 Software Lock implemented and memory-mapped access.

Accessing the EDLSR:

EDLSR can be accessed through its memory-mapped interface:

Component	Offset	Instance
Debug	0xFB4	EDLSR

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.32 EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Usage constraints

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-6534

Configurations

EDPCSR is in the Core power domain.

Fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

———— Note ————

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDPCSR is a pair of 32-bit registers.

If ARMv8.1-VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Field descriptions

The EDPCSR bit assignments are:

When ARMv8.1-VHE is not implemented:

Bits [63:32]

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

- For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the access has no side-effects.
- In any other cases, a read of EDPCSR[31:0] has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR:
 - If the PE is in Debug state, or PC Sample-based profiling is prohibited, EDPCSRlo reads as 0xFFFFFFFF, and EDPCSRhi, EDCIDSR, and EDVIDSR become UNKNOWN.

- If the PE is in Reset state, the sampled value is UNKNOWN and EDPCRhi, EDCIDSR, and EDVIDSR become UNKNOWN.
- If no instruction has been sampled since the PE left Reset state, Debug state, or a state where PC Sample-based profiling is prohibited, the sampled value is 0xFFFFFFFF, and EDPCRhi, EDCIDSR, and EDVIDSR become UNKNOWN. Any subsequent read will return an instruction address value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ARMv8.1-VHE is implemented and EDSCR.SC2 == 0:

Bits [63:32]

When ARMv8.1-VHE is implemented:

PC Sample high word, EDPCRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCR samples can be determined from EDVIDSR.{NS,E2,E3}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:0]

When ARMv8.1-VHE is implemented:

PC Sample low word. EDPCRlo, bits[31:0] of the sampled instruction address value. The translation regime that EDPCR samples can be determined from EDVIDSR.{NS,E2,E3}.

- For a read of EDPCR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the access has no side-effects.
- In any other cases, a read of EDPCR[31:0] has the side-effect of indirectly writing to EDPCRhi, EDCIDSR, and EDVIDSR:
 - If the PE is in Debug state, or PC Sample-based profiling is prohibited, EDPCRlo reads as 0xFFFFFFFF, and EDPCRhi, EDCIDSR, and EDVIDSR become UNKNOWN.
 - If the PE is in Reset state, the sampled value is UNKNOWN and EDPCRhi, EDCIDSR, and EDVIDSR become UNKNOWN.
 - If no instruction has been retired since the PE left Reset state, Debug state, or a state where PC Sample-based profiling is prohibited, the sampled value is UNKNOWN, and EDPCRhi, EDCIDSR, and EDVIDSR become UNKNOWN.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When ARMv8.1-VHE is implemented and EDSCR.SC2 == 1:

NS, bit [63]

When ARMv8.1-VHE is implemented:

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL, bits [62:61]

When ARMv8.1-VHE is implemented:

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

0b00 Sample is from EL0.

0b01 Sample is from EL1.

0b10 Sample is from EL2.

0b11 Sample is from EL3.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [60:56]

Reserved, RES0.

Bits [55:32]

When ARMv8.1-VHE is implemented:

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:0]

When ARMv8.1-VHE is implemented:

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

- For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the access has no side-effects.
- In any other cases, a read of EDPCSR[31:0] has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR:
 - If the PE is in Debug state, or PC Sample-based profiling is prohibited, EDPCSRlo reads as 0xFFFFFFFF, and EDPCSRhi, EDCIDSR, and EDVIDSR become UNKNOWN.
 - If the PE is in Reset state, the sampled value is UNKNOWN and EDPCSRhi, EDCIDSR, and EDVIDSR become UNKNOWN.
 - If no instruction has been retired since the PE left Reset state, Debug state, or a state where PC Sample-based profiling is prohibited, the sampled value is UNKNOWN, and EDPCSRhi, EDCIDSR, and EDVIDSR become UNKNOWN.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When ARMv8.2-PCSample is implemented:

Bits [63:0]

Reserved, RES0.

Accessing the EDPCSR:

EDPCSR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x0A0	EDPCSR	31:0

EDPCSR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x0AC	EDPCSR	63:32

These interfaces are accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to EDPCSR[31:0] is RO.
- Access to EDPCSR[31:0] is ERROR.
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to EDPCSR[63:32] is RO.
- Access to EDPCSR[63:32] is ERROR.

H9.2.33 EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers on page D12-2680](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

There are no configuration notes.

Attributes

EDPFR is a 64-bit register.

Field descriptions

The EDPFR bit assignments are:

Bits [63:52]

Reserved, RES0.

UNKNOWN, bits [51:48]

Reserved, UNKNOWN.

AMU, bits [47:44]

From ARMv8.4:

Activity Monitors Extension. Defined values are:

0b0000 Activity Monitors Extension is not implemented.

0b0001 Activity Monitors Extension version 1 is implemented.

All other values are reserved.

AMUv1 implements the functionality identified by the value 0b0001.

In ARMv8.0, ARMv8.1, ARMv8.2, and ARMv8.3, the only permitted value is 0b0000.

From ARMv8.4, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

MPAM, bits [43:40]

From ARMv8.2, or if MPAM is implemented:

MPAM Extension. Defined values are:

0b0000 MPAM is not implemented.

0b0001 MPAM is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

SEL2, bits [39:36]

From ARMv8.4:

Secure EL2. Defined values are:

0b0000 Secure EL2 is not implemented.

0b0001 Secure EL2 is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

SVE, bits [35:32]

From ARMv8.2:

Scalable Vector Extension. Defined values are:

0b0000 SVE is not implemented.

0b0001 SVE is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

UNK, bits [31:28]

When the RAS Extension is implemented, this field is UNKNOWN. Otherwise, this field is RES0.

———— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

GIC, bits [27:24]

System register GIC interface support. Defined values are:

0b0000 No System register interface to the GIC is supported.

0b0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.

All other values are reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64PFR0_EL1.GIC](#).

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

0b0000 Advanced SIMD is implemented, including support for the following SISR and SIMD operations:

- Integer byte, halfword, word and doubleword element operations.
- Single-precision and double-precision floating-point arithmetic.
- Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

0b0001 As for 0b0000, and also includes support for half-precision floating-point arithmetic.

0b1111 Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support, that does not include the [ARMv8.2-FP16](#) extension.
- 0b0001 in an implementation with Advanced SIMD support, that includes the [ARMv8.2-FP16](#) extension.
- 0b1111 in an implementation without Advanced SIMD support.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64PFR0_EL1](#).AdvSIMD.

FP, bits [19:16]

Floating-point. Defined values are:

0b0000 Floating-point is implemented, and includes support for:

- Single-precision and double-precision floating-point types.
- Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

0b0001 As for 0b0000, and also includes support for half-precision floating-point arithmetic.

0b1111 Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the [ARMv8.2-FP16](#) extension.
- 0b0001 in an implementation with floating-point support, that includes the [ARMv8.2-FP16](#) extension.
- 0b1111 in an implementation without floating-point support.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64PFR0_EL1](#).FP.

EL3, bits [15:12]

AArch64 EL3 Exception level handling. Defined values are:

0b0000 EL3 is not implemented or cannot be executed in AArch64 state.

0b0001 EL3 can be executed in AArch64 state only.

0b0010 EL3 can be executed in either AArch64 or AArch32 state.

When the value of [EDAA32PFR](#).EL3 is non-zero, this field must be 0b0000.

All other values are reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64PFR0_EL1](#).EL3.

EL2, bits [11:8]

AArch64 EL2 Exception level handling. Defined values are:

0b0000 EL2 is not implemented or cannot be executed in AArch64 state.

0b0001 EL2 can be executed in AArch64 state only.

0b0010 EL2 can be executed in either AArch64 or AArch32 state.

When the value of [EDAA32PFR](#).EL2 is non-zero, this field must be 0b0000.

All other values are reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64PFR0_EL1](#).EL2.

EL1, bits [7:4]

AArch64 EL1 Exception level handling. Defined values are:

0b0000 EL1 can be executed in AArch32 state only.

0b0001 EL1 can be executed in AArch64 state only.

0b0010 EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64PFR0_EL1.EL1](#).

EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

0b0000 EL0 can be executed in AArch32 state only.

0b0001 EL0 can be executed in AArch64 state only.

0b0010 EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64PFR0_EL1.EL0](#).

Accessing the EDPFR:

EDPFR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD20	EDPFR	31:0

EDPFR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD24	EDPFR	63:32

These interfaces are accessible as follows:

- When `IsCorePowered()` and `!DoubleLockStatus()` access to EDPFR[31:0] is RO.
- Access to EDPFR[31:0] is IMPDEF.
- When `IsCorePowered()` and `!DoubleLockStatus()` access to EDPFR[63:32] is RO.
- Access to EDPFR[63:32] is IMPDEF.

H9.2.34 EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDPIDR0 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions

The EDPIDR0 bit assignments are:

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

Accessing the EDPIDR0:

EDPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE0	EDPIDR0

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.35 EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDPIDR1 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions

The EDPIDR1 bit assignments are:

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is 0b1011.

PART_1, bits [3:0]

Part number, most significant nibble.

Accessing the EDPIDR1:

EDPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE4	EDPIDR1

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.36 EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDPIDR2 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

The EDPIDR2 bit assignments are:

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is 0b011.

Accessing the EDPIDR2:

EDPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE8	EDPIDR2

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.37 EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDPIDR3 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions

The EDPIDR3 bit assignments are:

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

Accessing the EDPIDR3:

EDPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFEC	EDPIDR3

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.38 EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether EDPIDR4 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions

The EDPIDR4 bit assignments are:

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. RAZ. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is 0b0100.

Accessing the EDPIDR4:

EDPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xF00	EDPIDR4

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.39 EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

Usage constraints

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

Configurations

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

For RW fields see the field description for a description of the behavior of the field on a reset that applies to its power domain. However:

- Fields that are in the Core power domain are not affected by a warm reset and are not affected by an External debug reset.
- Fields that are in the Debug power domain reset to their defined reset values on an External debug reset, and are not affected by a Warm reset and are not affected by a Cold reset.

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

Attributes

EDPRCR is a 32-bit register.

Field descriptions

The EDPRCR bit assignments are:

Bits [31:4]

Reserved, RES0.

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 Do not request power up of the Core power domain.

0b1 Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

———— **Note** ————

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a External debug reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RW.

Bit [2]

Reserved, RES0.

CWRR, bit [1]

Warm reset request. Write-only bit that reads as zero.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

0b0 No action.

0b1 Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or SoftwareLockStatus(), access to this field is WI.
- Otherwise, access to this field is WO.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR_EL1.CORENPDRQ](#) fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state.

———— **Note** —————

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or OSLockStatus(), access to this field is UNKNOWN.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RW.

Accessing the EDPRCR:

EDPRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x310	EDPRCR

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is RO.
- When !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

H9.2.40 EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Usage constraints

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up ($\text{EDPRSR.PU} == 1$), then following a read of EDPRSR:

- If the OS Double Lock is not implemented or $\text{DoubleLockStatus()} == \text{FALSE}$, then:
 - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
 - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state ($\text{EDPRSR.R} == 0$).
- Otherwise it is CONstrained UNPREDICTABLE whether or not this clearing occurs.

If the Core power domain is powered down ($\text{EDPRSR.PU} == 0$), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

Configurations

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

Some of the fields in the Core power domain are in the Cold reset domain and others are in the Warm reset domain. See the field descriptions for more information. However:

- Fields that are in the Cold reset domain are not affected by a warm reset and are not affected by an External debug reset.
- Fields in the Warm reset domain are also reset by a Cold reset but are not affected by an External debug reset.
- Fields in the Debug power domain are not affected by a Warm reset and are not affected by a Cold reset.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

The EDPRSR bit assignments are:

Bits [31:12]

Reserved, RES0.

SDR, bit [11]

Sticky debug restart. Set to 1 when the PE exits Debug state.

Permitted values are:

- 0b0 The PE has not restarted since EDPRSR was last read.
- 0b1 The PE has restarted since EDPRSR was last read.

———— Note ————

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:

- If the OS Double Lock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If the OS Double Lock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain.

This field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RC.

SPMAD, bit [10]

When ARMv8.4-Debug is implemented:

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

Permitted values are:

- 0b0 No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.
- 0b1 At least one Non-secure external debug interface access to the external Performance Monitors register have failed because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If the OS Double Lock is not implemented or `DoubleLockStatus() == FALSE`, this bit clears to 0.
- If the OS Double Lock is implemented, and `DoubleLockStatus() == TRUE`, it is CONstrained UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is UNKNOWN.
- When `SoftwareLockStatus()`, access to this field is RO.
- Otherwise, access to this field is RC.

Otherwise:

Sticky EPMAD error.

- 0b0 No accesses to the external Performance Monitors registers have failed with an `AllowExternalPMUAccess() == FALSE` error since EDPRSR was last read.
- 0b1 At least one access to the external Performance Monitors registers returned an `AllowExternalPMUAccess() == FALSE` error since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If the OS Double Lock is not implemented or `DoubleLockStatus() == FALSE`, this bit clears to 0.
- If the OS Double Lock is implemented, and `DoubleLockStatus() == TRUE`, it is CONstrained UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `OSLockStatus()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is UNKNOWN.
- When `SoftwareLockStatus()`, access to this field is RO.
- Otherwise, access to this field is RC.

EPMAD, bit [9]

When ARMv8.4-Debug is implemented:

External Performance Monitors access disable status.

- 0b0 External Non-secure Performance Monitors access enabled.
`AllowExternalPMUAccess() == TRUE`.
- 0b1 External Non-secure Performance Monitors access disabled.
`AllowExternalPMUAccess() == FALSE`.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

Otherwise:

External Performance Monitors access disable status.

- 0b0 External Performance Monitors access enabled. `AllowExternalPMUAccess() == TRUE`.
- 0b1 External Performance Monitors access disabled. `AllowExternalPMUAccess() == FALSE`.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `OSLockStatus()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

SDAD, bit [8]

When ARMv8.4-Debug is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess() == FALSE`.

0b0 No Non-secure accesses to the external debug registers have failed with `AllowExternalDebugAccess() == FALSE` since EDPRSR was last read.

0b1 At least one Non-secure access to the external debug registers has failed with `AllowExternalDebugAccess() == FALSE` since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If the OS Double Lock is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If the OS Double Lock is implemented and `DoubleLockStatus() == TRUE`, it is CONstrained UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess() == FALSE`.

0b0 No accesses to the external debug registers have failed with `AllowExternalDebugAccess() == FALSE` since EDPRSR was last read.

0b1 At least one access to the external debug registers has failed with `AllowExternalDebugAccess() == FALSE` since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If the OS Double Lock is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If the OS Double Lock is implemented and `DoubleLockStatus() == TRUE`, it is CONstrained UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is UNKNOWN on reads if `OSLockStatus() == TRUE` and external debug writes to [OSLAR_EL1](#) do not return an error when `AllowExternalDebugAccess() == FALSE`.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

EDAD, bit [7]

When ARMv8.4-Debug is implemented:

External debug access disable status.

- 0b0 External Non-secure access to breakpoint registers, watchpoint registers, and [OSLAR_ELI](#) is enabled.
- 0b1 Non-secure access to breakpoint registers, watchpoint registers, and [OSLAR_ELI](#) from an external debugger is not permitted.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

When ARMv8.2-Debug is implemented:

External debug access disable status.

- 0b0 Access from an external debugger to breakpoint registers, watchpoint registers, and [OSLAR_ELI](#) is enabled.
- 0b1 Access from an external debugger to breakpoint registers, watchpoint registers, and [OSLAR_ELI](#) is not permitted.

This bit is not valid and reads UNKNOWN if `OSLockStatus() == TRUE` and external debug writes to [OSLAR_ELI](#) do not return an error when `AllowExternalDebugAccess() == FALSE`.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

Otherwise:

External debug access disable status.

- 0b0 Access from an external debugger to breakpoint registers, watchpoint registers is enabled.
- 0b1 Access from an external debugger to breakpoint registers, watchpoint registers is not permitted and it is IMPLEMENTATION DEFINED whether accesses to [OSLAR_ELI](#) are permitted.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, or `DoubleLockStatus()` or `EDPRSR.R == 1`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

DLK, bit [6]

When ARMv8.4-Debug is implemented:

This field is RES0.

When ARMv8.2-Debug is implemented:

From ARMv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When `IsCorePowered()` and `!DoubleLockStatus()`, access to this field is RAZ.
- Otherwise, access to this field is UNKNOWN.

Otherwise:

This field returns the result of the pseudocode function `DoubleLockStatus()`.

If the Core power domain is powered up and the OS Double Lock is implemented and `DoubleLockStatus() == TRUE`, it is IMPLEMENTATION DEFINED whether:

- `EDPRSR.PU` reads as 1, `EDPRSR.DLK` reads as 1, and `EDPRSR.SPD` is UNKNOWN.
- `EDPRSR.PU` reads as 0, `EDPRSR.DLK` is UNKNOWN, and `EDPRSR.SPD` reads as 0.

This field is in the Core power domain.

0b0 `DoubleLockStatus()` returns FALSE.

0b1 `DoubleLockStatus()` returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

OSLK, bit [5]

OS lock status bit.

A read of this bit returns the value of `OSLSR_EL1.OSLK`.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, `DoubleLockStatus()` and `EDPRSR.R == 1`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

HALTED, bit [4]

Halted status bit.

This bit is UNKNOWN on reads if `EDPRSR.PU` is 0.

Otherwise permitted values are:

0b0 PE is in Non-debug state.

0b1 PE is in Debug state.

Because the OS Double Lock is never set when the PE is in Debug state, this bit is always RAZ when `DoubleLockStatus() == TRUE`.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When `!IsCorePowered()`, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

SR, bit [3]

Sticky core reset status bit.

Permitted values are:

0b0 The non-debug logic of the PE is not in reset state and has not been reset since the last time `EDPRSR` was read.

0b1 The non-debug logic of the PE is in reset state or has been reset since the last time `EDPRSR` was read.

If `EDPRSR.PU` reads as 1 and `EDPRSR.R` reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of `EDPRSR`:

- If the OS Double Lock is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If the OS Double Lock is implemented and `DoubleLockStatus() == TRUE`, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain.

This field resets to 1.

Accessing this field has the following behavior:

- When !IsCorePowered() or DoubleLockStatus(), access to this field is UNKNOWN.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RC.

R, bit [2]

PE reset status bit.

Permitted values are:

- 0b0 The non-debug logic of the PE is not in reset state.
- 0b1 The non-debug logic of the PE is in reset state.

If the OS Double Lock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see [EDPRSR.{DLK, R} and reset state on page H6-6522](#)

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered() or DoubleLockStatus(), access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

SPD, bit [1]

Sticky Core powerdown status bit.

This bit is UNKNOWN on reads if EDPRSR.PU is 1, the OS Double Lock is implemented and DoubleLockStatus() == TRUE.

Otherwise, permitted values are:

- 0b0 If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost.
If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.
- 0b1 The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If the OS Double Lock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If the OS Double Lock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When the value of EDPRSR.PU is 0 indicating that the Core power domain is in either retention or powerdown state, EDPRSR.SPD reads as 0. For more information, see [EDPRSR.SPD when the Core domain is in either retention or powerdown state on page H6-6522](#).

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-6521](#).

This field is in the Core power domain and the Cold reset domain.

On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- When !IsCorePowered(), access to this field is RAZ.
- When IsCorePowered() and DoubleLockStatus(), access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

PU, bit [0]

When ARMv8.2-Debug is implemented:

Core powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

0b0 Either the Core power domain is in a low-power or powerdown state, or the OS Double Lock is implemented and `DoubleLockStatus() == TRUE`, meaning the debug registers in the Core power domain cannot be accessed.

0b1 The Core power domain is in a powerup state, and either the OS Double Lock is not implemented or `DoubleLockStatus() == FALSE`, meaning the debug registers in the Core power domain can be accessed.

If the OS Double Lock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see [EDPRSR.{DLK, R} and reset state on page H6-6522](#)

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-6521](#)

Access to this field is RO.

Otherwise:

Core powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and `DoubleLockStatus() == TRUE`, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

0b0 Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.

0b1 Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If the Core power domain is powered up and `DoubleLockStatus() == TRUE`, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If the PE is in reset state and entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see [EDPRSR.{DLK, R} and reset state on page H6-6522](#)

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-6521](#)

Access to this field is RO.

Accessing the EDPRSR:

EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x314	EDPRSR

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

H9.2.41 EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in [EDSCR](#).

Usage constraints

There are no usage constraints.

Configurations

EDRCR is in the Core power domain.

There are no configuration notes.

Attributes

EDRCR is a 32-bit register.

Field descriptions

The EDRCR bit assignments are:

Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

0b0 No action.

0b1 Allow imprecise entry to Debug state, for example by canceling pending bus accesses.

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the [EDSCR](#).PipeAdv bit to 0. The actions on writing to this bit are:

0b0 No action.

0b1 Clear the [EDSCR](#).PipeAdv bit to 0.

CSE, bit [2]

Clear Sticky Error. Used to clear the [EDSCR](#) cumulative error bits to 0. The actions on writing to this bit are:

0b0 No action.

0b1 Clear the [EDSCR](#).{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the [EDSCR](#).ITO bit, to 0.

Bits [1:0]

Reserved, RES0.

Accessing the EDRCR:

EDRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x090	EDRCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() access to this register is WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() access to this register is WO.
- Access to this register is ERROR.

H9.2.42 EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Usage constraints

There are no usage constraints.

Configurations

External register EDSCR[30:29] is architecturally mapped to AArch64 System register [MDCCSR_EL0\[30:29\]](#).

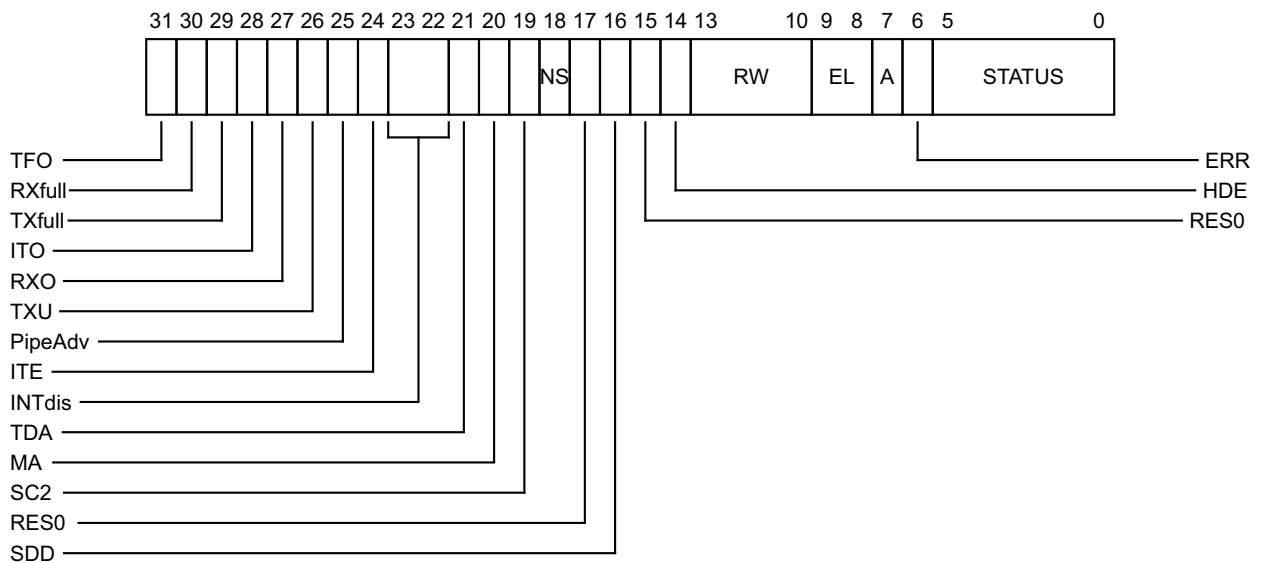

EDSCR is in the Core power domain. Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Attributes

EDSCR is a 32-bit register.

Field descriptions

The EDSCR bit assignments are:

TFO, bit [31]

When ARMv8.4-Trace is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

0b0 Trace Filter controls are not affected.

0b1 Trace Filter controls in [TRFCR_EL1](#), [TRFCR_EL2](#), [TRFCR](#), and [HTRFCR](#) are ignored.

When [OSLSR_EL1.OSLK](#) == 1, this bit can be indirectly read and written through the [MDCSR_EL1](#) and [DBGDSCRext](#) System registers.

This bit is ignored by the PE when `ExternalSecureNoninvasiveDebugEnabled() == FALSE` and the *Effective value* of [MDCR_EL3.STE](#) == 1.

On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full. This bit is RO.

On a Cold reset, this field resets to 0.

TXfull, bit [29]

DTRTX full. This bit is RO.

On a Cold reset, this field resets to 0.

ITO, bit [28]

ITR overrun. This bit is RO.

If the PE is in Non-debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.

RXO, bit [27]

DTRRX overrun. This bit is RO.

On a Cold reset, this field resets to 0.

TXU, bit [26]

DTRTX underrun. This bit is RO.

On a Cold reset, this field resets to 0.

PipeAdv, bit [25]

Pipeline advance. This bit is RO. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to [EDRCR.CSPA](#).

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

ITE, bit [24]

ITR empty. This bit is RO.

If the PE is in Non-debug state, this bit is UNKNOWN. It is always valid in Debug state.

INTdis, bits [23:22]

When ARMv8.4-Debug is implemented:

Interrupt disable. Disables taking interrupts in Non-Debug state.

0b0 Masking of interrupts is controlled by PSTATE and interrupt routing controls.

0b1 If `ExternalSecureDebugEnabled() == TRUE`, then all interrupts, including virtual and SError interrupts, are masked.

If `ExternalSecureDebugEnabled() == FALSE`, then all interrupts targeting Non-secure state are masked.

When `OSLSR_EL1.OSLK == 1`, this field can be indirectly read and written through the [MDSR_EL1](#) and [DBGDSCRext](#) System registers.

This field is ignored by the PE and treated as zero when `ExternalDebugEnabled() == FALSE`.

On a Cold reset, this field resets to 0.

Otherwise:

Interrupt disable.

When `OSLSR_EL1.OSLK == 1`, this field can be indirectly read and written through the [MDSR_EL1](#) and [DBGDSCRext](#) System registers.

0b00 Do not disable interrupts.

- 0b01 Disable interrupts taken to Non-secure EL1.
 - 0b10 Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable interrupts taken to Secure EL1.
 - 0b11 Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable all other interrupts.
- On a Cold reset, this field resets to 0.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: [DBGBCR<n>_EL1](#), [DBGBVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGWVR<n>_EL1](#).
- AArch32: [DBGBCR<n>](#), [DBGBVR<n>](#), [DBGXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).

The possible values of this field are:

- 0b0 Accesses to debug System registers do not generate a Software Access Debug event.
- 0b1 Accesses to debug System registers generate a Software Access Debug event, if [OSLSR_EL1.OSLK](#) is 0 and if halting is allowed.

On a Cold reset, this field resets to 0.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

- 0b0 Normal access mode.
- 0b1 Memory access mode.

On a Cold reset, this field resets to 0.

SC2, bit [19]

When ARMv8.1-VHE is implemented:

Sample [CONTEXTIDR_EL2](#). Controls whether the Sample-based Profiling Extension samples [CONTEXTIDR_EL2](#) or [VTTBR_EL2.VMID](#).

- 0b0 Sample [VTTBR_EL2.VMID](#).
- 0b1 Sample [CONTEXTIDR_EL2](#).

If the PC Sample-based Profiling Extension is not implemented, then this field is RES0.

On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NS, bit [18]

Non-secure status. Read-only. When in Debug state, gives the current Security state:

- 0b0 Secure state, IsSecure() == TRUE.
- 0b1 Non-secure state, IsSecure() == FALSE.

In Non-debug state, this bit is UNKNOWN.

Bit [17]

Reserved, RES0.

SDD, bit [16]

Secure debug disabled. This bit is RO.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Bit [15]

Reserved, RES0.

HDE, bit [14]

Halting debug enable. The possible values of this field are:

- 0b0 Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
- 0b1 Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

On a Cold reset, this field resets to 0.

RW, bits [13:10]

Exception level Execution state status. Read-only. In Debug state, each bit gives the current Execution state of each Exception level:

RW	Meaning
0b1111	All Exception levels are using AArch64.
0b1110	EL0 is using AArch32. All other Exception levels are using AArch64.
0b110x	EL0 and EL1 are using AArch32. EL2, if implemented in the current Security state, and EL3 are using AArch64.
0b10xx	EL0, EL1, and, if implemented in the current Security state, EL2 are using AArch32. EL3 is using AArch64.
0b0xxx	All Exception levels are using AArch32.

However:

- The value of 0b1110 is only permitted at EL0.
- The values 0b110x are not permitted if EL2 is not implemented.
- The values 0b10xx are not permitted if EL3 is not implemented.

In Non-debug state, this field is RAO.

EL, bits [9:8]

Exception level. Read-only. In Debug state, this gives the current EL of the PE.

In Non-debug state, this field is RAZ.

A, bit [7]

System Error interrupt pending. Read-only. In Debug state, indicates whether a SError interrupt is pending:

- If `HCR_EL2.{AMO, TGE} = {1, 0}` and in Non-secure EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

0b0 No SError interrupt pending.

0b1 SError interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

ERR, bit [6]

Cumulative error flag. This field is RO. It is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

On a Cold reset, this field resets to 0.

STATUS, bits [5:0]

Debug status flags. This field is RO.

The possible values of this field are:

0b000001 PE is restarting, exiting Debug state.

0b000010 PE is in Non-debug state.

0b000111 Breakpoint.

0b010011 External debug request.

0b011011 Halting step, normal.

0b011111 Halting step, exclusive.

0b100011 OS Unlock Catch.

0b100111 Reset Catch.

0b101011 Watchpoint.

0b101111 HLT instruction.

0b110011 Software access to debug register.

0b110111 Exception Catch.

0b111011 Halting step, no syndrome.

All other values of STATUS are reserved.

Accessing the EDSCR:

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` access to this register is RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` access to this register is RW.

- Access to this register is ERROR.

H9.2.43 EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading [EDPCSR\[31:0\]](#).

Usage constraints

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see [Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN](#) on page H7-6534

Configurations

EDVIDSR is in the Core power domain.

Fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

———— Note ————

[ARMv8.2-PCSample](#) implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

If [ARMv8.1-VHE](#) is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

Field descriptions

The EDVIDSR bit assignments are:

When ARMv8.2-PCSample is implemented:

Bits [31:0]

Reserved, RES0.

When ARMv8.1-VHE is not implemented:

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent **EDPCSR** sample.

If EL3 is not implemented, this bit indicates the *Effective value* of **SCR.NS**.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E2, bit [30]

Exception level 2 status sample. Indicates whether the most recent **EDPCSR** sample was associated with EL2.

If EL2 is not implemented, this bit is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E3, bit [29]

Exception level 3 status sample. Indicates whether the most recent **EDPCSR** sample was associated with EL3 using AArch64.

If **EDVIDSR.NS** == 1 or the PE was in AArch32 state when **EDPCSRlo** (**EDPCSR**[31:0]) was read, this bit is 0.

If EL3 is not implemented, this bit is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

HV, bit [28]

EDPCSRhi (**EDPCSR**[63:32]) valid. Indicates whether bits [63:32] of the most recent **EDPCSR** sample might be nonzero:

0b0 Bits[63:32] of the most recent **EDPCSR** sample are zero.

0b1 Bits[63:32] of the most recent **EDPCSR** sample might be nonzero.

An **EDVIDSR.HV** value of 1 does not mean that the value of **EDPCSRhi** is nonzero.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:8]

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent **EDPCSRlo** (**EDPCSR**[31:0]) sample.

If EL2 is using AArch64 and the value of **EDVIDSR.NS** is 0 or the value of **EDVIDSR.E2** is 1 this field is RES0.

If EL2 is not implemented, then this field is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ARMv8.1-VHE is implemented and **EDSCR.SC2 == 0:**

This format applies in all ARMv8.0 implementations.

NS, bit [31]

From ARMv8.1:

Non-secure state sample. Indicates the Security state associated with the most recent [EDPCSR](#) sample.

If EL3 is not implemented, this bit indicates the *Effective value* of SCR.NS.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2, bit [30]

From ARMv8.1:

Exception level 2 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL2.

If EL2 is not implemented, this bit is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]

From ARMv8.1:

Exception level 3 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL3 using AArch64.

If EDVIDSR.NS = 1 or the PE was in AArch32 state when EDPCSRlo ([EDPCSR\[31:0\]](#)) was read, this bit is 0.

If EL3 is not implemented, this bit is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

From ARMv8.1:

EDPCSRhi ([EDPCSR\[63:32\]](#)) valid. Indicates whether bits [63:32] of the most recent [EDPCSR](#) sample might be nonzero:

0b0 Bits[63:32] of the most recent EDPCSR sample are zero.

0b1 Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi ([EDPCSR\[63:32\]](#)) does not need to be read.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [27:16]

Reserved, RES0.

VMID, bits [15:0]

From ARMv8.1:

VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample.

- If EL2 is using AArch64 and the value of EDVIDSR.NS is 0 or the value of EDVIDSR.E2 is 1 this field is RES0.
- If EL2 is not implemented, this field is RES0.
- If EL2 is implemented and is using AArch64, the VMID is held in VTTBR_EL2.VMID.
- If EL2 is implemented and is using AArch32, the VMID is held in VTTBR.VMID.
- If 16-bit VMIDs are not supported, EDVIDSR.VMID[15:8] is RES0.
- If 16-bit VMIDs are supported, but VTTBRx.VMID[15:8] are not used, EDVIDSR.VMID[15:8] is set to 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When ARMv8.1-VHE is implemented and EDSCR.SC2 == 1:

CONTEXTIDR_EL2, bits [31:0]

From ARMv8.1:

Context ID.

- If EL2 is using AArch64 and if the value of EDPCSR.NS is 0, the value of CONTEXTIDR_EL2 as associated with the most recent EDPCSR sample.
- If the value of EDPCSR.NS is 0, then this field is set to an UNKNOWN value.
- If neither of the above conditions are true, this field is set to an UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the EDVIDSR:

EDVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A8	EDVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to this register is RO.
- Access to this register is ERROR.

H9.2.44 EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Usage constraints

There are no usage constraints.

Configurations

EDWAR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Attributes

EDWAR is a 64-bit register.

Field descriptions

The EDWAR bit assignments are:

Bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the [DC ZVA](#) block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See [Determining the memory location that caused a Watchpoint exception on page D2-2322](#)

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDWAR:

EDWAR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x030	EDWAR	31:0

EDWAR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x034	EDWAR	63:32

These interfaces are accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to EDWAR[31:0] is RO.
- Access to EDWAR[31:0] is ERROR.
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to EDWAR[63:32] is RO.
- Access to EDWAR[63:32] is ERROR.

Hex representation	ISO8859-1 representation	Implementer
0x50	P	Applied Micro Circuits Corporation
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

Architecture, bits [19:16]

The permitted values of this field are:

0b0001	ARMv4.
0b0010	ARMv4T.
0b0011	ARMv5 (obsolete).
0b0100	ARMv5T.
0b0101	ARMv5TE.
0b0110	ARMv5TEJ.
0b0111	ARMv6.
0b1111	Architectural features are individually identified in the ID_* registers, see ID registers on page K13-7414 .

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

Accessing the MIDR_EL1:

MIDR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD00	MIDR_EL1

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() access to this register is RO.
- Access to this register is IMPDEF.

H9.2.46 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS lock.

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register OSLAR_EL1[31:0] is architecturally mapped to AArch64 System register [OSLAR_EL1](#)[31:0].

External register OSLAR_EL1[31:0] is architecturally mapped to AArch32 System register [DBGOSLAR](#)[31:0].

OSLAR_EL1 is in the Core power domain.

In ARMv8.0 and ARMv8.1 implementations, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when any of:

- ExternalInvasiveDebugEnabled() == FALSE.
- ExternalSecureInvasiveDebugEnabled() == FALSE and any of:
 - EL3 is not implemented and the PE is in Secure state.
 - EL3 is implemented and is using AArch64 and [MDCR_EL3.EDAD](#) == 1
 - EL3 is implemented and is using AArch32 and [SDCR.EDAD](#) == 1.

From ARMv8.2, it is mandatory that external debug accesses to OSLAR_EL1 are ignored and return an error when any of these conditions hold.

Attributes

OSLAR_EL1 is a 32-bit register.

Field descriptions

The OSLAR_EL1 bit assignments are:

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS lock.

Use [EDPRSR.OSLK](#) to check the current status of the lock.

Accessing the OSLAR_EL1:

OSLAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x300	OSLAR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() access to this register is WI.
- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() access to this register is WO.
- Access to this register is IMPDEF.

H9.3 Cross-Trigger Interface registers

This section lists the Cross-Trigger Interface registers.

H9.3.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

———— **Note** —————

The architecturally-defined triggers must not be multiplexed.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

Attributes

ASICCTL is a 32-bit register.

Field descriptions

The ASICCTL bit assignments are:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ASICCTL:

ASICCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x144	ASICCTL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() access to this register is RO.

- Access to this register is IMPDEF.

H9.3.2 CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

Purpose

Clears bits of the Application Trigger register.

Usage constraints

There are no usage constraints.

Configurations

CTIAPPCLEAR is in the Debug power domain.

There are no configuration notes.

Attributes

CTIAPPCLEAR is a 32-bit register.

Field descriptions

The CTIAPPCLEAR bit assignments are:

APPCLEAR<x>, bit [x], for x = 0 to 31

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Writing to this bit has the following effect:

0b0	No effect.
0b1	Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use [CTIAPPULSE](#).

Accessing the CTIAPPCLEAR:

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x018	CTIAPPCLEAR

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is WI.
- When !SoftwareLockStatus() access to this register is WO.

H9.3.3 CTIAPPULSE, CTI Application Pulse register

The CTIAPPULSE characteristics are:

Purpose

Causes event pulses to be generated on ECT channels.

Usage constraints

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

Configurations

CTIAPPULSE is in the Debug power domain.

There are no configuration notes.

Attributes

CTIAPPULSE is a 32-bit register.

Field descriptions

The CTIAPPULSE bit assignments are:

APPULSE<x>, bit [x], for x = 0 to 31

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Writing to this bit has the following effect:

- | | |
|-----|------------------------------------|
| 0b0 | No effect. |
| 0b1 | Channel <x> event pulse generated. |

———— Note ————

- The CTIAPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

Accessing the CTIAPPULSE:

CTIAPPULSE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x01C	CTIAPPULSE

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is WI.
- When !SoftwareLockStatus() access to this register is WO.

H9.3.4 CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets bits of the Application Trigger register.

Usage constraints

There are no usage constraints.

Configurations

CTIAPPSET is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions

The CTIAPPSET bit assignments are:

APPSET<x>, bit [x], for x = 0 to 31

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0b0 Reading this means the application trigger is inactive. Writing this has no effect.
- 0b1 Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use [CTIAPPULSE](#).

On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIAPPSET:

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x014	CTIAPPSET

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is RO.
- When !SoftwareLockStatus() access to this register is RW.

H9.3.5 CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Usage constraints

There are no usage constraints.

Configurations

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

The CTIAUTHSTATUS bit assignments are:

Bits [31:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as [DBGAUTHSTATUS_EL1.SNID](#).

Otherwise, holds the same value as [DBGAUTHSTATUS_EL1.NSNID](#).

NSID, bits [1:0]

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as [DBGAUTHSTATUS_EL1.SID](#).

Otherwise, holds the same value as [DBGAUTHSTATUS_EL1.NSID](#).

Accessing the CTIAUTHSTATUS:

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFB8	CTIAUTHSTATUS

This interface is accessible as follows:

- Access to this register is RO.

H9.3.6 CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

Usage constraints

There are no usage constraints.

Configurations

CTICHINSTATUS is in the Debug power domain.

There are no configuration notes.

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions

The CTICHINSTATUS bit assignments are:

CHIN<n>, bit [n], for n = 0 to 31

Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0b0 Input channel <n> is inactive.
- 0b1 Input channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing the CTICHINSTATUS:

CTICHINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x138	CTICHINSTATUS

This interface is accessible as follows:

- Access to this register is RO.

H9.3.7 CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

Purpose

Provides the status of the ECT channel outputs from the CTI.

Usage constraints

There are no usage constraints.

Configurations

CTICHOUTSTATUS is in the Debug power domain.

There are no configuration notes.

Attributes

CTICHOUTSTATUS is a 32-bit register.

Field descriptions

The CTICHOUTSTATUS bit assignments are:

CHOUT<n>, bit [n], for n = 0 to 31

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0b0 Output channel <n> is inactive.
- 0b1 Output channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

————— Note —————

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see [CTIGATE](#).

Accessing the CTICHOUTSTATUS:

CTICHOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x13C	CTICHOUTSTATUS

This interface is accessible as follows:

- Access to this register is RO.

H9.3.8 CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

CTICIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions

The CTICIDR0 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble. Must read as 0x00.

Accessing the CTICIDR0:

CTICIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF0	CTICIDR0

This interface is accessible as follows:

- Access to this register is RO.

H9.3.9 CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

CTICIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR1 is a 32-bit register.

Field descriptions

The CTICIDR1 bit assignments are:

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class. Reads as 0x9, debug component.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Accessing the CTICIDR1:

CTICIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF4	CTICIDR1

This interface is accessible as follows:

- Access to this register is RO.

H9.3.10 CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

CTICIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions

The CTICIDR2 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble. Must read as 0x05.

Accessing the CTICIDR2:

CTICIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF8	CTICIDR2

This interface is accessible as follows:

- Access to this register is RO.

H9.3.11 CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

CTICIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions

The CTICIDR3 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble. Must read as 0xB1.

Accessing the CTICIDR3:

CTICIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFFC	CTICIDR3

This interface is accessible as follows:

- Access to this register is RO.

H9.3.12 CTICLAIMCLR, CTI Claim Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear these bits to 0.

Usage constraints

There are no usage constraints.

Configurations

CTICLAIMCLR is in the Debug power domain.

This register is not affected by a Warm reset, and is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

The CTICLAIMCLR bit assignments are:

CLAIM[x], bit [x], for x = 0 to 31

CLAIM tag clear bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, reads return the value of CLAIM[x] and the behavior on writes is:

0b0 No action.

0b1 Indirectly clear CLAIM[x] to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

An External Debug reset clears the CLAIM tag bits to 0.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing the CTICLAIMCLR:

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is RO.
- When !SoftwareLockStatus() access to this register is RW.

H9.3.13 CTICLAIMSET, CTI Claim Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Usage constraints

There are no usage constraints.

Configurations

CTICLAIMSET is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions

The CTICLAIMSET bit assignments are:

CLAIM[x], bit [x], for x = 0 to 31

CLAIM tag set bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, the bit is RAO and the behavior on writes is:

0b0 No action.

0b1 Indirectly set CLAIM[x] tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing the CTICLAIMSET:

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA0	CTICLAIMSET

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is RO.
- When !SoftwareLockStatus() access to this register is RW.

H9.3.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

Usage constraints

There are no usage constraints.

Configurations

CTICONTROL is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

Attributes

CTICONTROL is a 32-bit register.

Field descriptions

The CTICONTROL bit assignments are:

Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

- 0b0 CTI mapping functions and application trigger disabled.
- 0b1 CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

On a External debug reset, this field resets to 0.

Accessing the CTICONTROL:

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is RO.

- When !SoftwareLockStatus() access to this register is RW.

H9.3.15 CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

If this register is implemented, then [CTIDEVAFF1](#) must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Usage constraints

There are no usage constraints.

Configurations

CTIDEVAFF0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions

The CTIDEVAFF0 bit assignments are:

MPIDR_EL1 low half, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the CTIDEVAFF0:

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA8	CTIDEVAFF0

This interface is accessible as follows:

- Access to this register is RO.

H9.3.16 CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

If this register is implemented, then [CTIDEVAFF0](#) must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Usage constraints

There are no usage constraints.

Configurations

CTIDEVAFF1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

The CTIDEVAFF1 bit assignments are:

MPIDR_EL1 high half, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the CTIDEVAFF1:

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

This interface is accessible as follows:

- Access to this register is RO.

H9.3.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

If this register is not implemented, [CTIDEVAFF0](#) and [CTIDEVAFF1](#) are also not implemented.

Usage constraints

There are no usage constraints.

Configurations

CTIDEVARCH is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

The CTIDEVARCH bit assignments are:

ARCHITECT, bits [31:21]

Defines the architecture of the component. For CTI, this is ARM Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For CTI, the revision defined by ARMv8 is 0x0.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

Accessing the CTIDEVARCH:

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFBC	CTIDEVARCH

This interface is accessible as follows:

- Access to this register is RO.

H9.3.18 CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

Usage constraints

There are no usage constraints.

Configurations

CTIDEVID is in the Debug power domain.

There are no configuration notes.

Attributes

CTIDEVID is a 32-bit register.

Field descriptions

The CTIDEVID bit assignments are:

Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented, this field is RAZ.

0b00 CTIGATE does not mask propagation of input events from external channels.

0b01 CTIGATE masks propagation of input events from external channels.

All other values are reserved.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. IMPLEMENTATION DEFINED. For ARMv8, valid values are:

0b000011 3 channels (0..2) implemented.

0b000100 4 channels (0..3) implemented.

0b000101 5 channels (0..4) implemented.

0b000110 6 channels (0..5) implemented.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Number of triggers implemented. IMPLEMENTATION DEFINED. This is one more than the index of the largest trigger, rather than the actual number of triggers.

For ARMv8, valid values are:

0b000011 Up to 3 triggers (0..2) implemented.

0b001000 Up to 8 triggers (0..7) implemented.

0b001001 Up to 9 triggers (0..8) implemented.

0b001010 Up to 10 triggers (0..9) implemented.

and so on up to 0b100000, 32 triggers (0..31) implemented.

All other values are reserved. If the contains a Trace extension, this field must be at least 0b001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, [ASICCTL](#).

Accessing the CTIDEVID:

CTIDEVID can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC8	CTIDEVID

This interface is accessible as follows:

- Access to this register is RO.

H9.3.19 CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Usage constraints

There are no usage constraints.

Configurations

CTIDEVID1 is in the Debug power domain.

There are no configuration notes.

Attributes

CTIDEVID1 is a 32-bit register.

Field descriptions

The CTIDEVID1 bit assignments are:

Bits [31:0]

Reserved, RES0.

Accessing the CTIDEVID1:

CTIDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC4	CTIDEVID1

This interface is accessible as follows:

- Access to this register is RO.

H9.3.20 CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Usage constraints

There are no usage constraints.

Configurations

CTIDEVID2 is in the Debug power domain.

There are no configuration notes.

Attributes

CTIDEVID2 is a 32-bit register.

Field descriptions

The CTIDEVID2 bit assignments are:

Bits [31:0]

Reserved, RES0.

Accessing the CTIDEVID2:

CTIDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC0	CTIDEVID2

This interface is accessible as follows:

- Access to this register is RO.

H9.3.21 CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's cross-trigger interface.

Usage constraints

There are no usage constraints.

Configurations

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions

The CTIDEVTYPE bit assignments are:

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Must read as 0x1 to indicate this is a component within a PE.

MAJOR, bits [3:0]

Major type. Must read as 0x4 to indicate this is a cross-trigger component.

Accessing the CTIDEVTYPE:

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFCC	CTIDEVTYPE

This interface is accessible as follows:

- Access to this register is RO.

H9.3.22 CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

Usage constraints

There are no usage constraints.

Configurations

CTIGATE is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

Attributes

CTIGATE is a 32-bit register.

Field descriptions

The CTIGATE bit assignments are:

GATE<x>, bit [x], for x = 0 to 31

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0b0 Disable output and, if [CTIDEVID.INOUT](#) == 0b01, input channel <x> propagation.
- 0b1 Enable output and, if [CTIDEVID.INOUT](#) == 0b01, input channel <x> propagation.

If GATE[x] is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIGATE:

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x140	CTIGATE

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is RO.
- When !SoftwareLockStatus() access to this register is RW.

H9.3.23 CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Usage constraints

There are no usage constraints.

Configurations

CTIINEN<n> is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

If input trigger n is not connected, the behavior of CTIINEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions

The CTIINEN<n> bit assignments are:

INEN<x>, bit [x], for x = 0 to 31

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0b0 Input trigger <n> will not generate an event on output channel <x>.
- 0b1 Input trigger <n> will generate an event on output channel <x>.

On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIINEN<n>:

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x020 + 4n	CTIINEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is RO.
- When !SoftwareLockStatus() access to this register is RW.

H9.3.24 CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to deactivate the output triggers.

Usage constraints

A debugger must read [CTITRIGOUTSTATUS](#) to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPULSE to activate another trigger.

Configurations

CTIINTACK is in the Debug power domain.

There are no configuration notes.

Attributes

CTIINTACK is a 32-bit register.

Field descriptions

The CTIINTACK bit assignments are:

ACK<n>, bit [n], for n = 0 to 31

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the [CTIDEVID.NUMTRIG](#) field.

If any of the following is true, writes to ACK<n> are ignored:

- $n \geq$ [CTIDEVID.NUMTRIG](#), the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by [CTIOUTEN<n>](#), is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

- | | |
|-----|-------------------------|
| 0b0 | No effect |
| 0b1 | Deactivate the trigger. |

Accessing the CTIINTACK:

CTIINTACK can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x010	CTIINTACK

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is WI.
- When !SoftwareLockStatus() access to this register is WO.

H9.3.25 CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions

The CTIITCTRL bit assignments are:

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0b0 Normal operation.

0b1 Integration mode enabled.

On a Implementation reset, this field resets to 0.

Accessing the CTIITCTRL:

CTIITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xF00	CTIITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is IMPDEF.

H9.3.26 CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

Usage constraints

There are no usage constraints.

Configurations

CTILAR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software Lock can be implemented as part of CoreSight compliance.

CTILAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

The CTILAR bit assignments are:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Accessing the CTILAR:

CTILAR can be accessed through a memory-mapped interface access to the external debug interface:

Component	Offset	Instance
CTI	0xFB0	CTILAR

This interface is accessible as follows:

- Access to this register is WO.

H9.3.27 CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

Usage constraints

There are no usage constraints.

Configurations

CTILSR is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software Lock can be implemented as part of CoreSight compliance.

CTILSR is RAZ if the Software Lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses [CTILAR](#) to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions

The CTILSR bit assignments are:

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

0b0 Lock clear. Writes are permitted to this component's registers.

0b1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On a External debug reset, this field resets to 1.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

- 0b0 Software Lock not implemented or not memory-mapped access.
- 0b1 Software Lock implemented and memory-mapped access.

Accessing the CTILSR:

CTILSR can be accessed through a memory-mapped interface access to the external debug interface:

Component	Offset	Instance
CTI	0xFB4	CTILSR

This interface is accessible as follows:

- Access to this register is RO.

H9.3.28 CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Usage constraints

There are no usage constraints.

Configurations

CTIOUTEN<n> is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

If output trigger n is not connected, the behavior of CTIOUTEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions

The CTIOUTEN<n> bit assignments are:

OUTEN<x>, bit [x], for x = 0 to 31

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

0b0 An event on input channel <x> will not cause output trigger <n> to be asserted.

0b1 An event on input channel <x> will cause output trigger <n> to be asserted.

On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIOUTEN<n>:

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x0A0 + 4n	CTIOUTEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() access to this register is RO.
- When !SoftwareLockStatus() access to this register is RW.

H9.3.29 CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

CTIPIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR0 is a 32-bit register.

Field descriptions

The CTIPIDR0 bit assignments are:

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

Accessing the CTIPIDR0:

CTIPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE0	CTIPIDR0

This interface is accessible as follows:

- Access to this register is RO.

H9.3.30 CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

CTIPIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR1 is a 32-bit register.

Field descriptions

The CTIPIDR1 bit assignments are:

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is 0b1011.

PART_1, bits [3:0]

Part number, most significant nibble.

Accessing the CTIPIDR1:

CTIPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE4	CTIPIDR1

This interface is accessible as follows:

- Access to this register is RO.

H9.3.31 CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

CTIPIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions

The CTIPIDR2 bit assignments are:

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is 0b011.

Accessing the CTIPIDR2:

CTIPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE8	CTIPIDR2

This interface is accessible as follows:

- Access to this register is RO.

H9.3.32 CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

CTIPIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR3 is a 32-bit register.

Field descriptions

The CTIPIDR3 bit assignments are:

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [CTIPIDR2.REVISION](#) as an extension to the Part number must use this field as a major revision number.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

Accessing the CTIPIDR3:

CTIPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFEC	CTIPIDR3

This interface is accessible as follows:

- Access to this register is RO.

H9.3.33 CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

CTIPIDR4 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR4 is a 32-bit register.

Field descriptions

The CTIPIDR4 bit assignments are:

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. RAZ. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is 0b0100.

Accessing the CTIPIDR4:

CTIPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFD0	CTIPIDR4

This interface is accessible as follows:

- Access to this register is RO.

H9.3.34 CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

Usage constraints

There are no usage constraints.

Configurations

CTITRIGINSTATUS is in the Debug power domain.

There are no configuration notes.

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions

The CTITRIGINSTATUS bit assignments are:

TRIN<n>, bit [n], for n = 0 to 31

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the [CTIDEVID.NUMTRIG](#) field.

Possible values of this bit are:

0b0 Input trigger n is inactive.

0b1 Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

Accessing the CTITRIGINSTATUS:

CTITRIGINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x130	CTITRIGINSTATUS

This interface is accessible as follows:

- Access to this register is RO.

H9.3.35 CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

Usage constraints

There are no usage constraints.

Configurations

CTITRIGOUTSTATUS is in the Debug power domain.

There are no configuration notes.

Attributes

CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions

The CTITRIGOUTSTATUS bit assignments are:

TROUT<n>, bit [n], for n = 0 to 31

Trigger output <n> status.

Bits [31:N] are RAZ. N is the value in [CTIDEVID.NUMTRIG](#).

If $n < N$, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

0b0 Output trigger n is inactive.

0b1 Output trigger n is active.

Otherwise when $n < N$ it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

Accessing the CTITRIGOUTSTATUS:

CTITRIGOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x134	CTITRIGOUTSTATUS

This interface is accessible as follows:

- Access to this register is RO.

Part I

Memory-mapped Components of the ARMv8 Architecture

Chapter I1

Requirements for Memory-mapped Components

This chapter provides some additional information about memory-mapped components. It contains the following sections:

- *Supported access sizes on page I1-6714.*
- *Synchronization of memory-mapped registers on page I1-6716.*
- *Access requirements for reserved and unallocated registers on page I1-6718.*

I1.1 Supported access sizes

The information in this section applies to all accesses to memory-mapped components of the ARMv8 architecture, unless a register or component description explicitly states otherwise.

The memory access sizes that are supported by any peripheral are IMPLEMENTATION DEFINED by the peripheral.

When `HaveSecureExtDebugView() == TRUE`, each debug component has a Secure and Non-secure view. The Secure view of a debug component is mapped into Secure physical memory and the Non-secure view of a debug component is mapped into Non-secure memory. Apart from access conditions, the Non-secure and Secure views of the debug components are identical.

An implementation of a memory-mapped component that is compatible with the ARMv8 architecture must support the following:

- Word-aligned 32-bit accesses to access 32-bit registers.
- If any PE in the system implements AArch32, word-aligned 32-bit accesses to either half of a 64-bit register that is mapped to a doubleword-aligned pair of adjacent 32-bit locations.

———— **Note** ————

Some memory-mapped components of the ARMv8 architecture require support for word-aligned 32-bit accesses to either half of a 64-bit memory mapped register regardless of whether any PE in the system implements AArch32. These include:

- The memory-mapped interface to the external debug and CTI registers that are described in [Chapter H9 External Debug Register Descriptions](#).
- The memory-mapped interfaces to the Generic Timer registers that are described in [Chapter I2 System Level Implementation of the Generic Timer](#).
- The memory-mapped interfaces to the Performance Monitors registers that are described in [Chapter I3 Recommended External Interface to the Performance Monitors](#).

- Doubleword-aligned 64-bit accesses to access 64-bit registers that are mapped to a doubleword-aligned pair of adjacent 32-bit locations.

All registers are only single-copy atomic at word granularity. This means that for 64-bit accesses to a 64-bit register, the system might generate a pair of 32-bit accesses. The order in which the two halves are accessed is not specified.

The following accesses are not supported:

- Byte accesses.
- Halfword accesses.
- Unaligned word accesses. These accesses are not word single-copy atomic.
- Unaligned doubleword accesses. These accesses are not doubleword single-copy atomic.
- Doubleword accesses to a pair of 32-bit locations that are not a doubleword-aligned pair that forms a 64-bit register.
- Quadword accesses or higher accesses.
- Exclusive accesses.

For unsupported accesses, it is CONSTRAINED UNPREDICTABLE whether:

- The access generates an External abort or not.
- The defined side-effects of a read occur or not. A read returns UNKNOWN values.
- A write is ignored or sets the accessed register or registers to UNKNOWN.
- The access generates a fault handling interrupt or not. A read returns UNKNOWN data.

For memory-mapped accesses from a PE that complies with an ARM architecture, the single-copy atomicity rules for the instruction, the type of instruction, and the type of memory that is accessed, determine the size of the access that is made by an instruction. [Example I1-1](#) shows this.

Example I1-1 Access sizes for memory-mapped accesses

Two Load Doubleword instructions that are made to consecutive doubleword-aligned locations generate a pair of single-copy atomic doubleword reads. However, if the accesses are made to Normal memory or Device-GRE memory they might appear as a single quadword access that is not supported by the peripheral.

The ARMv8 architecture does not require the size of each element that is accessed by a multi-register load or store instruction to be identifiable by the memory system beyond the PE. Unless otherwise specified by the component, any access to a memory-mapped component of the ARMv8 architecture is defined to be beyond the PE.

Software must use a Device-nGRE or stronger memory type, and only single register load and store instructions, to create memory accesses that are supported by the peripheral. For more information, see [Memory types and attributes on page B2-122](#).

I1.2 Synchronization of memory-mapped registers

This section describes the synchronization requirements for the memory-mapped accesses to System registers.

This section refers to accesses to external system control registers as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads and indirect writes.

———— **Note** —————

Synchronization requirements for AArch64 System registers on page D12-2675 and Synchronization of changes to AArch32 System registers on page G8-5632 define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads and external writes as indirect writes.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. Unless otherwise stated, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

Explicit synchronization is not required for an external read or an external write by an external agent to be observable to a following external read or external write by that agent to the same register using the same address, and so is never required for registers that are accessible as external system control registers.

Unless required to be observable to all observers in finite time, without explicit synchronization, explicit synchronization is normally required following an external write to any register for that write to be observable by:

- A direct access.
- An indirect read by an instruction.
- An external read of the register using a different address.

This means that an external write by an external agent is guaranteed to have an effect on subsequent instructions executed by the PE only if all of the following are true:

- The write has completed.
- The PE has executed a Context synchronization event.
- The Context synchronization event was executed after the write completed.

The order and synchronization of direct reads and direct writes of System registers is defined by:

- *Synchronization requirements for AArch64 System registers on page D12-2675*
- *Synchronization of changes to AArch32 System registers on page G8-5632*

The external agent must be able to guarantee completion of a write. For example, the agent can:

- Mark the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- If the register is read/write and reads are not destructive, read back the value written.
- Use some guaranteed property of the connection between the PE and the external agent.

The external agent and PE can guarantee ordering by, for example, passing messages in an ordered way with respect to the external write and the Context synchronization event, and relying on the memory ordering rules provided by the memory model.

External reads and external write complete in the order in which they arrive at the PE. For accesses to different register locations the external agent must create this order. The agent can:

- Mark the memory as Device-nGnRnE or Device-nGnRE.
- Use the appropriate memory barriers.
- Rely on some guaranteed property of the connection between the PE and the external agent.

However, the external agent cannot force the synchronization of completed writes.

In a simple sequential execution, an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

Without explicit synchronization to guarantee the order of the accesses, where the same register is accessed by two or more of a System register access instruction, and external agent, and autonomous asynchronous event, or as a result of a memory-mapped access, the behavior must be as if the accesses occurred atomically and in any order. This applies even if the accesses occur simultaneously.

For example, some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means the simultaneous writes must be merged.

I1.3 Access requirements for reserved and unallocated registers

This section describes the access requirements for reserved and unallocated memory-mapped components.

The following information relates to certain types of reserved accesses:

- Reads and writes of unallocated locations. These accesses are reserved for the architecture.
- Reads and writes of locations for features that are not implemented, including:
 - OPTIONAL features that are not implemented.
 - Breakpoints and watchpoints that are not implemented.
 - Performance Monitors counters that are not implemented.
 - CTI triggers that are not implemented.
 - Error records that are not implemented.

These accesses are reserved.

- Reads of WO locations. These accesses are reserved for the architecture.
- Writes to RO locations. These accesses are reserved for the architecture.

Reserved accesses are normally RAZ/WI. However, software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture. Software must treat reserved accesses as RES0.

Chapter I2

System Level Implementation of the Generic Timer

This chapter defines the system level implementation of the Generic Timer. It contains the following sections:

- [About the Generic Timer specification on page I2-6720.](#)
- [Memory-mapped counter module on page I2-6722.](#)
- [Memory-mapped timer components on page I2-6726.](#)

Note

- [Generic Timer memory-mapped register descriptions on page I5-6855](#) describes the System level Generic Timer registers. These registers are memory-mapped.

 - [Chapter D10 The Generic Timer in AArch64 state](#) gives a general description of the AArch64 state view of the Generic Timer, and describes the AArch64 System register interface to the Generic Timer.
 - [Chapter G6 The Generic Timer in AArch32 state](#) gives a general description of the AArch32 state view of the Generic Timer, and describes the AArch32 System register interface to the Generic Timer.
-

I2.1 About the Generic Timer specification

[Chapter D10 The Generic Timer in AArch64 state](#) describes the ARM Generic Timer and its implementation as seen from AArch64 state. [Chapter G6 The Generic Timer in AArch32 state](#) describes the ARM Generic Timer and its implementation as seen from AArch32 state. These chapters include the definition of the low-latency System register interface to the Generic Timer. However, the ARM Generic Timer architecture also defines a memory-mapped component, that comprises:

- A memory-mapped counter module, that controls the generation of the Count value used by the Generic Timer.
This memory-mapped counter module is required in any ARM Generic Timer implementation that requires software control of the Count value of the Generic Timer.
- Optional memory-mapped timer modules. These give a standardized way of providing timers for programmable system components other than PEs that implement the ARM architecture.

[The full set of Generic Timer components on page D10-2647](#) summarizes these components as seen from AArch64 state, and [The full set of Generic Timer components on page G6-5595](#) summarizes them as seen from AArch32 state. [The system level components of the Generic Timer on page I2-6721](#) summarizes the system level components.

I2.1.1 Registers in the system level implementation of the Generic Timer

Registers that control components of the system level implementation of the Generic Timer are grouped into *frames*. This specification defines the registers in each frame, and their offsets within the frame. The system defines the position of each frame in the memory map. This means the base addresses for each frame is IMPLEMENTATION DEFINED.

———— **Note** —————

The final 12 words of the first or only 4KB block of a register memory frame is an ID block.

Each frame must be in its own memory page, or memory protection region, and must be aligned to the size of the translation granule or protection granule.

———— **Note** —————

When a system level implementation of the Generic Timer is accessed by a PE:

- Using a VMSA, each frame is in its own memory page, aligned to the size of the translation granule.
- Using a PMSA, each frame is in its own memory protection region, aligned to the size of the memory protection granule.

The following sections give more information about the requirements for the system level Generic Timer component:

- [Endianness and supported access sizes](#).
- [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Endianness and supported access sizes

All memory-mapped peripherals defined in the ARM architecture must be little-endian. This means the system-level Generic Timer registers, and the register frames, are little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the memory-mapped Generic Timer registers implementations must:

- Comply with the requirements of [Supported access sizes on page I1-6714](#).
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

Power and reset domains for the system level implementation of the Generic Timer

The power and reset domains of the system level implementation of the Generic Timer are IMPLEMENTATION DEFINED as part of the system implementation. These domains can be outside the PE power and reset domains defined by the remainder of this manual.

The ARM architecture requires that the `CNTCR`.{FCREQ, EN} and `CNTRSR`.FCACK fields reset to 0. These reset values apply only on powerup of the power domain in which the registers are implemented or a reset of the reset domain in which they are implemented.

Every other register, or register field, of a system level implementation of the Generic Timer resets to a value that is architecturally UNKNOWN if it has a meaningful reset value. This applies on powerup of the power domain in which the register is implemented, and on a reset of the reset domain in which it is implemented.

I2.1.2 The system level components of the Generic Timer

Each system level component has one or two register frames. The possible system level components are:

The memory-mapped counter module, required

This module controls the system counter. It has two frames:

- A control frame, `CNTControlBase`.
- A status frame, `CNTReadBase`.

Memory-mapped counter module on page I2-6722 describes this component.

The memory-mapped timer control module, required

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:

- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, `CNTCTLBase`.

The CNTCTLBase frame on page I2-6727 describes this frame.

Memory-mapped timers, optional

An implemented memory-mapped timer:

- Must provide a privileged view of the timer, in the `CNTBaseN` frame.
- Optionally provides an unprivileged view of the timer in the `CNTEL0BaseN` frame.

N is the timer number, and the corresponding frame number, in the range 0-7.

The CNTBaseN and CNTEL0BaseN frames on page I2-6728 describes these frames.

I2.2 Memory-mapped counter module

The memory-mapped counter module provides top-level control of the system counter. The `CNTControlBase` frame holds the registers for the memory-mapped counter, and provides:

- An RW control register `CNTCR`, that provides:
 - An enable bit for the system counter.
 - An enable bit for Halt-on-debug. For more information, see [Halt-on-debug on page I2-6724](#).
 - A field that can be written to request a change to the update frequency of the system counter, with a corresponding change to the increment made at each update. This mechanism means that, for example, if the update frequency is halved, the increment at each update is doubled.
For more information, see [Control of counter operating frequency and increment on page I2-6723](#).Writes to this register are rare. In a system that supports two Security states, this register is writable only by Secure writes.
- A RO status register, `CNTSR`, that provides:
 - A bit that indicates whether the system counter is halted because of an asserted Halt-on-debug signal.
 - A field that indicates the current update frequency of the system counter. This field can be polled to determine when a requested change to the update frequency has been made.
- Two contiguous 32-bit RW registers that hold the current system counter value, `CNTCV`. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.
The system counter must be disabled before writing to these registers, otherwise the effect of the write is UNPREDICTABLE.
Writes to these registers are rare. In a system that supports two Security states, these registers are writable only by Secure writes.
- A *Frequency modes table* of one or more 32-bit entries, where:
 - The first entry in the table defines the *base frequency* of the system counter. This is the maximum frequency at which the counter updates.
 - Each subsequent entry in the table defines an alternative frequency of the system counter, that must be an exact divisor of the base frequency.A 32-bit zero entry immediately follows the last table entry.
This table can be RO or RW. For more information, see [The Frequency modes table on page I2-6723](#).

In addition, the `CNTReadBase` frame includes a read-only copy of the system counter value, `CNTCV`, as two contiguous 32-bit RO registers. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

[Counter module control and status register summary on page I2-6724](#) describes `CNTReadBase` and `CNTControlBase` memory maps, and the registers in each frame.

I2.2.1 Control of counter operating frequency and increment

The system counter has a fixed *base frequency*, and must maintain the required counter accuracy, meaning ARM recommends that it does not gain or lose more than ten seconds in a 24-hour period, see [The system counter on page D10-2648](#). However, the counter can increment at a lower frequency than the base frequency, using a correspondingly larger increment. For example, it can increment by four at a quarter of the base frequency. Any lower-frequency operation, and any switching between operating frequencies, must not reduce the accuracy of the counter.

Control of the system counter frequency and increment is provided only through the memory-mapped counter module. The following sections describe this control:

- [The Frequency modes table](#).
- [Changing the system counter and increment](#).

The Frequency modes table

The Frequency modes table starts at offset 0x20 in the [CNTControlBase](#) frame.

Table entries are 32-bits, and each entry specifies a system counter update frequency, in Hz.

The first entry in the table specifies the base frequency of the system counter.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

$$\text{increment} = (\text{base_frequency}) / (\text{selected_frequency})$$

A 32-bit word of zero value marks the end of the table. That is, the word of memory immediately after the last entry in the table must be zero.

The only required entry in the table is the entry for the base frequency.

Typically, the Frequency modes table is in RO memory. However, a system implementation might use RW memory for the table, and initialize the table entries as part of its startup sequence. Therefore, the [CNTControlBase](#) memory map shows the table region as RO or RW.

ARM strongly recommends that the Frequency modes table is not updated once the system is running.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the maximum number of entries is IMPLEMENTATION DEFINED, up to this limit.

Note

- ARM considers it likely that implementations will require significantly fewer entries than the architectural limit.
 - In the [CNTControlBase](#) frame, the offset range 0x0C0-0x0FC can be used for IMPLEMENTATION DEFINED registers. If any registers are defined in this space, then the Frequency modes table cannot extend beyond offset 0x0B8, with a zero word at offset 0x0BC. This means that if any IMPLEMENTATION DEFINED registers are defined the maximum number of entries in the table is 40, including the zero-word end marker.
-

Changing the system counter and increment

The value of the [CNTCR.FCREQ](#) field specifies which entry in the Frequency modes table specifies the system counter update frequency.

Changing the value of [CNTCR.FCREQ](#) requests a change to the system counter update frequency. To ensure the frequency change does not affect the overall accuracy of the counter, a change is made as follows:

- When changing from a higher frequency to a lower frequency, the counter:
 1. Continues running at the higher frequency until the count reaches an integer multiple of the required lower frequency.
 2. Switches to operating at the lower frequency.

- When changing from a lower frequency to a higher frequency, the counter:
 1. Waits until the end of the current lower-frequency cycle.
 2. Makes the counter increment required for operation at that lower frequency.
 3. Switches to operating at the higher frequency.

When the frequency has changed, [CNTSR](#) is updated to indicate the new frequency. Therefore, a system component that is waiting for a frequency change can poll [CNTSR](#) to detect the change.

I2.2.2 Halt-on-debug

The [CNTCR](#) register provides an enable bit for an OPTIONAL Halt-on-debug signal.

When the [CNTCR.HDBG](#) bit is set to 1, and the Halt-on-debug signal is implemented and asserted, the system counter is halted. Otherwise, the system counter ignores the state of this signal.

ARM recommends that a system counter implements a Halt-on-debug signal that can be controlled by a debugger using the Embedded Cross-Trigger (ECT) using a system-level cross-trigger interface that includes:

- A debug request output trigger event that asserts the Halt-on-debug signal.
- A restart request output trigger event that deasserts the Halt-on-debug signal.

For more information, see [About the Embedded Cross-Trigger \(ECT\) on page H5-6502](#).

———— **Note** —————

Software must use the Halt-on-debug enable bit to ensure that the timers cannot be halted maliciously in an attempt to prohibit progress.

For more information about Halt-on-debug, contact ARM.

I2.2.3 Counter module control and status register summary

The Counter module control and status registers are memory-mapped registers in the following register memory frames:

- A control frame, with base address [CNTControlBase](#).
- A status frame, with base address [CNTReadBase](#).

Each of these register memory frames is in its own [memory page](#) or [memory protection region](#), and the frame base address points to the start of this region. Each base address must be aligned to the size of the translation granule or protection granule.

———— **Note** —————

Each frame of a memory-mapped Generic Timer takes the name of its base address.

In each register memory frame, the memory at offset [0xFD0-0xFFF](#) is reserved for twelve 32-bit IMPLEMENTATION DEFINED ID registers, see the [CounterID<n>](#) register descriptions for more information.

———— **Note** —————

The ARM architecture requires memory-mapped peripherals to be little-endian, and therefore the counter is little-endian.

In an implementation that supports Secure and Non-secure memory maps, [CNTControlBase](#) is accessible only by Secure accesses.

[Table I2-1 on page I2-6725](#) shows the [CNTControlBase](#) control registers, in order of their offsets from the [CNTControlBase](#) base address, for an implementation that includes registers in the implementation defined register space [0x0C0-0x0FC](#), and also has fewer than 39 [CNTFID<n>](#) registers. [The Frequency modes table on page I2-6723](#) describes how this memory map differs if more [CNTFID<n>](#) registers are implemented.

[Generic Timer memory-mapped register descriptions on page I5-6855](#) describes each of these registers.

Table I2-1 CNTControlBase memory map

Offset	Name	Type	Description
0x000	CNTCR	RW	Counter Control Register.
0x004	CNTSR	RO	Counter Status Register.
0x008	CNTCV[31:0]	RW	Counter Count Value register.
0x00C	CNTCV[63:32]	RW	
0x010-0x01C	-	RES0	Reserved.
0x020	CNTFID0	RO or RW	Frequency modes table, and end marker.
0x020+4n	CNTFID<n>	RO or RW	For more information, see The Frequency modes table on page I2-6723 .
0x024+4n	-	RO or RW, RAZ	
(0x028+4n)-0x0BC	-	RO, RES0	Reserved.
0x0C0-0x0FC	-	IMPLEMENTATION DEFINED	Reserved for IMPLEMENTATION DEFINED registers.
0x100-0xFCC	-	RO, RES0	Reserved.
0xFD0-0xFFC	CounterID<n>	RO	Counter ID registers 0-11.

[Table I2-2](#) shows the [CNTReadBase](#) control registers, in order of their offsets from the [CNTReadBase](#) base address. [Generic Timer memory-mapped register descriptions on page I5-6855](#) describes each of these registers.

Table I2-2 CNTReadBase memory map

Offset	Name	Type	Description
0x000	CNTCV[31:0]	RO	Counter Count Value register
0x004	CNTCV[63:32]	RO	
0x008-0xFCC	-	RES0	Reserved
0xFD0-0xFFC	CounterID<n>	RO	Counter ID registers 0-11

I2.3 Memory-mapped timer components

This part of the ARM Generic Timer specification defines an optional memory-mapped timer component. This can be implemented as part of any programmable system component that does not incorporate a System register mapped ARM Generic Timer, to provide that system component with the timer functionality of an ARM Generic Timer.

The memory map consists of up to eight timer *frames*. The base address of a frame is `CNTBaseN`, where *N* numbers from 0 up to a maximum permitted value of 7.

Each `CNTBaseN` timer frame:

- Provides its own set of timers and associated interrupts.
- Is implemented in its own [memory page](#) or [memory protection region](#).
- Is implemented at a base address, identified as `CNTBaseN`, that is aligned to the size of the [translation granule](#) or [memory protection region](#).

For each implemented `CNTBaseN` frame the system can optionally provide an unprivileged view of the frame, described as the EL0 view of the frame. The base address of this second view of the `CNTBaseN` frame is `CNTELOBaseN`.

———— **Note** —————

In the naming of the registers associated with a `CNTBaseN` or `CNTELOBaseN` frame, the value of *N* is represented as `<n>`, for example `CNTACR<n>`.

If a `CNTELOBaseN` frame is implemented:

- Is implemented in its own [memory page](#) or [memory protection region](#) and is aligned to the size of the [translation granule](#) or [memory protection region](#).
- All registers visible in `CNTBaseN`, except for `CNTVOFF` and `CNTELOACR`, can be visible in `CNTELOBaseN`.
 - Control fields in `CNTELOACR` determine whether each register is visible.
- The offsets of all visible registers are the same as their offsets in the `CNTBaseN` frame.

In addition to the implemented `CNTBaseN` and `CNTELOBaseN` frames, the system must provide a single control frame at base address `CNTCTLBase`. `CNTCTLBase` must be implemented in its own [memory page](#) or [memory protection region](#) and is aligned to the size of the [translation granule](#) or [memory protection region](#).

The system defines the position of each frame in the memory map. This means the values of each of the `CNTBaseN`, `CNTELOBaseN`, and `CNTCTLBase` base addresses is IMPLEMENTATION DEFINED.

———— **Note** —————

The ARM architecture requires memory-mapped peripherals to be little-endian, and therefore the memory-mapped timers are little-endian.

The following sections describe the implementation of a memory-mapped view of the counter and timer:

- [The `CNTCTLBase` frame on page I2-6727.](#)
- [The `CNTBaseN` and `CNTELOBaseN` frames on page I2-6728.](#)

———— **Note** —————

[Providing a complete set of features in a system level implementation on page K5-7272](#) gives an implementation example for a system level Generic Timer implementation that provides equivalent features to a System registers Generic Timer implementation in a PE that includes all of the Exception levels.

I2.3.1 The CNTCTLBase frame

The CNTCTLBase frame contains:

- An identification register for the features of the memory-mapped counter and timer implementation.
- Access controls for each CNTBaseN frame.
- A virtual offset register for frames that implement a virtual timer.

Table I2-3 shows the CNTCTLBase registers, in order of their offsets from the CNTCTLBase base address.

———— **Note** —————

CNTFRQ and CNTVOFF registers are also implemented in a System register interface to the Generic Timer.

Generic Timer memory-mapped register descriptions on page I5-6855 describes each of these registers.

Table I2-3 CNTCTLBase memory map

Offset	Register	Type	Security ^a	Description
0x000	CNTFRQ ^b	RW	Secure only	Counter Frequency register.
0x004	CNTNSAR	RW	Secure only	Counter Non-Secure Access register.
0x008	CNTTIDR	RO	Both	Counter Timer ID register.
0x00C- 0x03F	-	RES0	-	Reserved.
0x040+4N ^c	CNTACR<n>	RW	Configurable ^d	Counter Access Control register N.
0x060- 0x07F	-	RES0	-	Reserved.
0x080+8N ^c	CNTVOFF<n>[31:0] ^b	RW ^e	Configurable ^d	Virtual Offset register N. If the CNTBaseN frame has virtual timer capability then CNTVOFF is implemented as an RW register, otherwise its location is RAZ/WI.
0x084+8N ^c	CNTVOFF<n>[63:32] ^b	RW ^e		
0x0C0-0x0FC	-	RES0	-	Reserved.
0x100-0x7FC	-	-	-	IMPLEMENTATION DEFINED.
0x800-0xFBC	-	RES0	-	Reserved.
0xFC0-0xFCF	-	-	-	IMPLEMENTATION DEFINED.
0xFD0- 0xFFC	CounterID<n>	RO	Both	Counter ID registers 0-11.

- Access security requirement in an implementation that supports two Security states. In an implementation that does not support multiple Security states all registers are accessible as shown in the *Type* column.
- These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in *Generic Timer registers on page D12-3441* and *Generic Timer registers on page G8-6356*. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.
- Implemented for each value of N from 0 to 7 for which a CNTBaseN frame is implemented.
- The CNTNSAR determines the Non-secure accessibility of the CNTACR<n>s and the CNTVOFF in the CNTCTLBase frame. For more information, see the register descriptions.
- Address is reserved, RAZ/WI if register not implemented.

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the CNTVOFF register that defines the virtual offset between the physical count and the virtual count. If a memory-mapped Generic Timer component does not distinguish between real time and virtual time, then it can implement CNTVOFF as RAZ/WI. Otherwise CNTVOFF is an RW register, and ARM strongly recommends that the system only permits access to CNTVOFF from EL2 or higher.

12.3.2 The CNTBaseN and CNTEL0BaseN frames

Each CNTBaseN frame, or {CNTBaseN, CNTEL0BaseN} pair of frames, provides a memory-mapped counter and timer, see:

- [The CNTBaseN frame.](#)
- [The CNTEL0BaseN frame on page I2-6729.](#)
- [CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-6729.](#)

The CNTBaseN frame

Table I2-4 shows the CNTBaseN registers, in order of their offsets from the CNTBaseN base address. Whether a frame includes a virtual timer is IMPLEMENTATION DEFINED. If it does not, then memory at offsets 0x030-0x03C is RAZ/WI. Except for CNTEL0ACR and the CounterID<n> registers, equivalent registers are also implemented in a System register interface to the timer component of a Generic Timer.

[Generic Timer memory-mapped register descriptions on page I5-6855](#) describes each of these registers.

Table I2-4 CNTBaseN memory map

Offset	Register	Type	Description
0x000	CNTPCT[31:0] ^a	RO	Physical Count register.
0x004	CNTPCT[63:32] ^a	RO	
0x008	CNTVCT[31:0] ^a	RO	Virtual Count register.
0x00C	CNTVCT[63:32] ^a	RO	
0x010	CNTFRQ ^a	RO ^c	Counter Frequency register.
0x014	CNTEL0ACR	RW ^b	Counter EL0 Access Control Register, optional in the CNTBaseN memory map.
0x018	CNTVOFF[31:0] ^a	RO ^c	Virtual Offset register. If CNTVOFF in the CNTCTLBase frame is an RW register, a read of this register returns the value of that register. Otherwise is RAZ.
0x01C	CNTVOFF[63:32] ^a	RO ^c	
0x020	CNTP_CVAL[31:0] ^a	RW	Physical Timer CompareValue register.
0x024	CNTP_CVAL[63:32] ^a	RW	
0x028	CNTP_TVAL ^a	RW	Physical TimerValue register.
0x02C	CNTP_CTL ^a	RW	Physical Timer Control register.
0x030	CNTV_CVAL[31:0] ^a	RW ^b	Virtual Timer CompareValue register, optional in the CNTBaseN memory map.
0x034	CNTV_CVAL[63:32] ^a	RW ^b	
0x038	CNTV_TVAL ^a	RW ^b	Virtual TimerValue register, optional in the CNTBaseN memory map.
0x03C	CNTV_CTL ^a	RW ^b	Virtual Timer Control register, optional in the CNTBaseN memory map.
0x040-0xFCF	-	RES0	Reserved.
0xFD0-0xFFC	CounterID<n>	RO	Counter ID registers 0-11.

a. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in [Generic Timer registers on page D12-3441](#) and [Generic Timer registers on page G8-6356](#). The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.

b. Address is reserved, RAZ/WI if register not implemented.

c. The CNTCTLBase frame includes an RW view of this register.

The CNTEL0BaseN frame

For any value of N , the layout of the registers in the CNTEL0BaseN frame is identical to the CNTBaseN frame, except that, in the CNTEL0BaseN frame:

- CNTVOFF is never visible, and the memory at 0x018-0x01C is RAZ/WI.
- CNTEL0ACR is never visible, and the memory at 0x014 is RAZ/WI.
- If implemented in the CNTBaseN frame, CNTEL0ACR controls whether CNTPCT, CNTVCT, CNTFRQ, the Physical Timer, and the Virtual Timer registers are visible in the CNTEL0BaseN frame.
If CNTEL0ACR is not implemented then these registers are not visible in the CNTEL0BaseN frame, and their addresses in that frame are RAZ/WI.

If an implementation supports 64-bit atomic accesses, then CNTPCT, CNTVCT, CNTVOFF, CNTP_CVAL, and CNTV_CVAL must be accessible as atomic 64-bit values.

CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames

In the CNTCTLBase frame:

CNTTIDR controls:

- Whether each CNTBaseN frame is implemented.
- If a CNTBaseN frame is implemented, whether:
 - That CNTBaseN frame has virtual timer capability.
 - A corresponding CNTEL0BaseN frame is implemented.

CNTNSAR controls:

In an implementation that recognizes two Security states, determines whether each implemented CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

This control also determines whether, in the CNTCTLBase frame, the CNTACR<n> and CNTVOFF<n> registers are accessible by Non-secure accesses.

The CNTACR<n> registers control:

For each implemented CNTBaseN frame, the accessibility of the following registers in that frame:

- CNTP_CTL, CNTP_CVAL, and CNTP_TVAL.
- CNTV_CTL, CNTV_CVAL, and CNTV_TVAL.
- CNTVOFF.
- CNTFRQ.
- CNTPCT.
- CNTVCT.

For CNTACR<n>, the value of <n> corresponds to the value of N for the controlled CNTBaseN frame.

The CNTVOFF<n> registers provide:

For each implemented CNTBaseN frame that has virtual capability, the RW copy of the CNTVOFF register for that frame.

————— Note —————

In a CNTBaseN frame that has virtual timer capability the CNTVOFF register is RO.

For CNTVOFF<n>, the value of <n> corresponds to the value of N for the controlled CNTBaseN frame.

Chapter I3

Recommended External Interface to the Performance Monitors

This chapter describes the recommended external interface to the Performance Monitors. It contains the following section:

- [About the external interface to the Performance Monitors registers on page I3-6732.](#)

———— **Note** —————

[Performance Monitors external register descriptions on page I5-6745](#) describes the external view of the Performance Monitors registers.

I3.1 About the external interface to the Performance Monitors registers

ARM recommends that:

- An implementation provides the OPTIONAL external debug interface to the Performance Monitors registers.

———— **Note** —————

A debugger can use this interface to access counters in the Performance Monitors.

- The implementation includes the OPTIONAL support for memory-mapped access to the External debug interface.

———— **Note** —————

— Software running on any PE in a system can use this interface to access counters in the Performance Monitors.

— Privileged software should use the MMU to control access to this interface.

- The external debug interface is implemented as defined in [Appendix K2 Recommended External Debug Interface](#).

The following sections describe the memory-mapped views of the Performance Monitors registers:

- [Differences in the external views of the Performance Monitors registers](#).
- [Synchronization of changes to the memory-mapped views on page I3-6733](#).
- [Access permissions for external views of the Performance Monitors on page I3-6733](#).

In this section, unless the context explicitly indicates otherwise, any reference to a *memory-mapped view* applies equally to a register view using:

- An access through an external debug interface.
- A memory-mapped access.

I3.1.1 Endianness and supported access sizes

When an implementation supports memory-mapped access to the external debug interface the interface is accessed as a little-endian memory-mapped peripheral. [External Performance Monitors registers summary on page I5-6742](#) gives the memory map of these registers.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the external interface to the Performance Monitors registers implementations must:

- Comply with the requirements of [Supported access sizes on page I1-6714](#).
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

I3.1.2 Differences in the external views of the Performance Monitors registers

An external view of the Performance Monitors registers accesses the same registers as the System registers interface described in [Performance Monitors Extension registers on page D6-2585](#), except that:

1. The [PMSELR](#) is accessible only in the System registers interface.
2. The following registers are accessible only in external views:
 - [PMCFGR](#)
 - [PMDEVAFF0](#)
 - [PMDEVAFF1](#)
 - [PMLAR](#)
 - [PMLSR](#)

- [PMAUTHSTATUS](#)
- [PMDEVARCH](#)
- [PMDEVTYPE](#)
- [PMPIDR0](#)
- [PMPIDR1](#)
- [PMPIDR2](#)
- [PMPIDR3](#)
- [PMPIDR4](#)
- [PMCIDR0](#)
- [PMCIDR1](#)
- [PMCIDR2](#)
- [PMCIDR3](#)

[Performance Monitors external register descriptions on page 15-6745](#) describes these registers.

3. The following controls do not affect the external views:
 - [PMSELR](#).
 - [PMUSERENR](#).
 - [HDCR](#). {TPM, TPMCR, HPMN}.

Instead, see the register descriptions in [Chapter I5 External System Control Register Descriptions](#).

13.1.3 Synchronization of changes to the memory-mapped views

Synchronization must comply with [Synchronization of memory-mapped registers on page 11-6716](#).

In particular, if a Performance Monitor is visible in both System register and an external view, and is accessed simultaneously through these two mechanisms, the behavior must be as if the access occurred atomically in any order. For more information, see [Synchronization of changes to the external debug registers on page H8-6538](#).

13.1.4 Access permissions for external views of the Performance Monitors

For more information, see [External debug interface register access permissions on page H8-6545](#).

[Table I3-1 on page I3-6734](#) shows the access permissions for the Performance Monitors registers in a v8 Debug implementation. This table uses the following terms:

DLK	When the OS Double Lock is implemented and locked, DoubleLockStatus() == TRUE, accesses to some registers produce an error. Applies to both interfaces.
EPMAD	When AllowExternalPMUAccess() == FALSE, external debug access is disabled for the access. If ARMv8.4-Debug is implemented, this applies only for Non-secure access to the register. See also Behavior of a not permitted memory-mapped access on page H8-6543 .
Error	Indicates that the access gives an error response.
Default	This shows the default access permissions, if none of the conditions in this list prevent access to the register.
Off	The Core power domain is completely off, or in a low-power state where the Core power domain registers cannot be accessed, and EDPRSR.PU will read as zero.
<hr/> Note <hr/>	
If debug power is off, then all external debug interface accesses return an error.	
OSLK	When the OS Lock is locked, OSLAR_EL1.OSLK == 1, accesses to some registers produces an error. This column shows the effect of this control on accesses using the external debug interface.

- SLK** This indicates the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the optional Software Lock is locked. See [Register access permissions for memory-mapped accesses on page H8-6542](#).
 For all other accesses, this column is ignored.
- Indicates that the control has no effect on the behavior of the access:
- If no other control affects the behavior, the Default access behavior applies.
 - However, another control might determine the behavior.

Table I3-1 Access permissions for the Performance Monitors registers

Offset	Register	Domain	Off	DLK	OSLK	EPMAD	Default	SLK
0x000+8xn	PMEVCNTR<n>_EL0 ^a	Core	Error	Error	Error	Error	RW	RO
0x0F8	PMCCNTR_EL0[31:0]	Core	Error	Error	Error	Error	RW	RO
0x0FC	PMCCNTR_EL0[63:32]	Core	Error	Error	Error	Error	RW	RO
0x200	PMPCSR[31:0] ^b	Core	Error	Error	Error	-	RO	RO
0x204	PMPCSR[63:32] ^b	Core	Error	Error	Error	-	RO	RO
0x208	PMCID1SR ^b	Core	Error	Error	Error	-	RO	RO
0x20C	PMVIDSR ^b	Core	Error	Error	Error	-	RO	RO
0x220	PMPCSR[31:0] ^b	Core	Error	Error	Error	-	RO	RO
0x224	PMPCSR[63:32] ^b	Core	Error	Error	Error	-	RO	RO
0x228	PMCID1SR ^b	Core	Error	Error	Error	-	RO	RO
0x22C	PMCID2SR ^b	Core	Error	Error	Error	-	RO	RO
0x400+4xn	PMEVTYPER<n>_EL0 ^a	Core	Error	Error	Error	Error	RW	RO
0x47C	PMCCFILTR_EL0	Core	Error	Error	Error	Error	RW	RO
0x600-0x6FC	-	-	Access is IMPLEMENTATION DEFINED					
0xA00-0xBFC	-	-	Access is IMPLEMENTATION DEFINED					
0xC00	PMCNTENSET_EL0	Core	Error	Error	Error	Error	RW	RO
0xC20	PMCNTENCLR_EL0	Core	Error	Error	Error	Error	RW	RO
0xC40	PMINTENSET_EL1	Core	Error	Error	Error	Error	RW	RO
0xC60	PMINTENCLR_EL1	Core	Error	Error	Error	Error	RW	RO
0xC80	PMOVSCCLR_EL0	Core	Error	Error	Error	Error	RW	RO
0xCA0	PMSWINC_EL0 ^c	Core	Error	Error	Error	Error	WO	WI
0xCC0	PMOVSSET_EL0	Core	Error	Error	Error	Error	RW	RO
0xD80-0xDFC	-	-	Access is IMPLEMENTATION DEFINED					
0xE00	PMCFGR	Core	Error	Error	Error	Error	RO	RO
0xE04	PMCR_EL0	Core	Error	Error	Error	Error	RW	RO

Table I3-1 Access permissions for the Performance Monitors registers (continued)

Offset	Register	Domain	Off	DLK	OSLK	EPMAD	Default	SLK
0xE20	PMCEID0	Core	Error	Error	Error	Error	RO	RO
0xE24	PMCEID1	Core	Error	Error	Error	Error	RO	RO
0xE40	PMMIR	Core	Error	Error	Error	Error	RO	RO
0xE80-0xEFC	Integration registers	-	Access is IMPLEMENTATION DEFINED					
0xF00-0xFFC	Management registers and CoreSight compliance on page K2-7241							

- a. Implemented counters only. *n* is the counter number.
- b. Implemented only if [ARMv8.2-PCSample](#) is implemented. See [Chapter H7 The PC Sample-based Profiling Extension](#).
- c. Only if the OPTIONAL PMSWINC_EL0 register is implemented in the external debug interface.

13.1.5 Power domains and Performance Monitors registers reset

For ARMv8-A implementations, ARM recommends that Performance Monitors are implemented as part of the core power domain, not as part of a separate debug power domain. There is no interface to access the Performance Monitors registers when the core power domain is powered down.

A Warm or Cold reset sets the Performance Monitors registers to their reset values. An External Debug reset does not change the values of the Performance Monitors registers.

For more information about the reset scheme recommended for a v8 Debug implementation see [Chapter H6 Debug Reset and Powerdown Support](#).

[Table I3-2 on page I3-6736](#) shows the Performance Monitors register resets for writable register fields. The column headings use the following terms:

- 64** This is the architectural reset value when resetting into AArch64 state.
- 32** This is the architectural reset value when resetting into AArch32 state.
- This indicates an IMPLEMENTATION DEFINED reset value on the specified reset. This might be UNKNOWN.

———— **Note** —————

This table does not include:

- Read-only identification registers and fields that have a fixed value. In this case, the reset value is that fixed value. An example of this is [PMCR_EL0.N](#).
- Write-only registers and fields that only have an effect on writes. These do not have a reset value. An example of this is [PMSWINC_EL0](#).
- IMPLEMENTATION DEFINED registers. In this case, the reset domains are IMPLEMENTATION DEFINED. The reset values are IMPLEMENTATION DEFINED and might be UNKNOWN.

Table I3-2 Performance Monitors System register resets

Register	Domain	Field	64	32	Description
PMCR_ELO	Warm	DP	-	0	Disable PMCCNTR_ELO when prohibited
		X	-	0	Export enable
		D	-	0	Clock divider
		E	0	0	Performance Monitors enable
PMCNTENSET_ELO PMCNTENCLR_ELO	Warm	-	-	-	All fields in register
PMOVSSET_ELO PMOVSCLR_ELO	Warm	-	-	-	All fields in register
PMSELR_ELO	Warm	SEL	-	-	Selected event counter
PMCCNTR_ELO	Warm	-	-	-	All fields in register
PMEVTYPEPER<n>_ELO	Warm	-	-	-	All fields in register
PMCCFILTR_ELO	Warm	[31:26]	-	0x00	PMCCNTR_ELO filtering controls
PMEVCNTR<n>_ELO	Warm	-	-	-	All fields in register
PMUSERENR_ELO	Warm	ER	-	0	Enable counter read access in ELO
		CR	-	0	Enable PMCCNTR_ELO read access in ELO
		SW	-	0	Enable PMSWINC_ELO write access in ELO
		EN	-	0	Enable Performance Monitors access in ELO
PMINTENSET_EL1 PMINTENCLR_EL1	Warm	-	-	-	All fields in register

Chapter I4

Recommended External Interface to the Activity Monitors

This chapter describes the optional external interface to the Activity Monitors Extension registers. It contains the following section:

- [About the external interface to the Activity Monitors Extension registers on page I4-6738](#)

———— **Note** —————

[Activity Monitors external register descriptions on page I5-6818](#) describes the external view of the Activity Monitors Extension registers.

14.1 About the external interface to the Activity Monitors Extension registers

If an implementation supports the Activity Monitors Extension, it may optionally support an external memory-mapped interface to the Activity Monitors Extension, and, if so, may further optionally support CoreSight device registers and ID registers.

The memory access sizes supported by the memory-mapped interface are IMPLEMENTATION DEFINED and comply with the requirements of [Supported access sizes on page 11-6714](#).

The base address of the memory-mapped view are aligned to a 4KB boundary, but is otherwise IMPLEMENTATION DEFINED. The address offsets for the memory-mapped view are given in [Table 15-2 on page 15-6816](#).

14.1.1 Differences in the external views of the Activity Monitors Extension registers

The external memory-mapped interface view of the Activity Monitors Extension registers accesses the same registers as the System registers interface to the registers, except that:

- [AMUSERENR](#) is accessible only in the System registers interface.
- If implemented, the following registers are accessible only in the memory-mapped view:
 - [AMIIDR](#).
 - [AMDEVAFF0](#).
 - [AMDEVAFF1](#).
 - [AMDEVARCH](#).
 - [AMDEVTYPE](#).
 - [AMPIDR0](#).
 - [AMPIDR1](#).
 - [AMPIDR2](#).
 - [AMPIDR3](#).
 - [AMPIDR4](#).
 - [AMCIDR0](#).
 - [AMCIDR1](#).
 - [AMCIDR2](#).
 - [AMCIDR3](#).

[Activity Monitors external register descriptions on page 15-6818](#) describes these registers.

14.1.2 Access during reset and power transitions

As described in [Power and reset domains on page D7-2589](#), the power and reset domains of the activity monitoring unit are IMPLEMENTATION DEFINED, and when a Cold reset of the power domain of the activity monitoring unit occurs, the activity monitoring unit is reset and the counters are reset to zero.

If the power domain of the activity monitoring unit is an always-on power domain, while the PE is reset or powered down counter values may be preserved and might be accessible by memory-mapped access.

If the power domain of the activity monitoring unit is the Core power domain, while the PE is reset or powered down and when a memory-mapped access occurs, the access reads as zero and the bus access completes without an error.

Chapter I5

External System Control Register Descriptions

This chapter describes the external system control registers. It excludes the External debug registers that are described in [Chapter H9 External Debug Register Descriptions](#). It contains the following sections:

- [About the external system control register descriptions](#) on page I5-6740.
- [External Performance Monitors registers summary](#) on page I5-6742.
- [Performance Monitors external register descriptions](#) on page I5-6745.
- [External Activity Monitors Extension registers summary](#) on page I5-6816.
- [Activity Monitors external register descriptions](#) on page I5-6818.
- [Generic Timer memory-mapped registers overview](#) on page I5-6854.
- [Generic Timer memory-mapped register descriptions](#) on page I5-6855.

15.1 About the external system control register descriptions

This chapter describes the external system control registers other than the external debug registers. That is, it describes:

An external view of the Performance Monitors registers

ARM recommends that implementations provide access to the Performance Monitors registers through the OPTIONAL External debug interface, and provide the OPTIONAL memory-mapped interface to this interface:

- [External Performance Monitors registers summary on page I5-6742](#) lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
- [Performance Monitors external register descriptions on page I5-6745](#) describes each of the memory-mapped registers.

[Chapter I3 Recommended External Interface to the Performance Monitors](#) describes the recommended interface to these registers.

Note

[Chapter D6 The Performance Monitors Extension](#) describes the Performance Monitors. The following sections describe the System register interfaces to the Performance Monitors:

- [Performance Monitors registers on page D12-3299](#), for accesses from an Exception level that is using AArch64.
 - [Performance Monitors registers on page G8-6231](#), for accesses from an Exception level that is using AArch32.
-

An external view of the Activity Monitors Extension registers

An implementation which supports the Activity Monitors Extension may support an optional external memory-mapped interface to the Activity Monitors Extension registers.

- [External Activity Monitors Extension registers summary on page I5-6816](#) lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
- [Activity Monitors external register descriptions on page I5-6818](#) describes each of the memory-mapped registers.

[Chapter I3 Recommended External Interface to the Performance Monitors](#) describes the recommended interface to these registers.

Note

[Chapter D7 The Activity Monitors Extension](#) describes the Activity Monitors. The following sections describe the System register interfaces to the Activity Monitors:

- [Activity Monitors registers on page D12-3343](#), for accesses from an Exception level that is using AArch64.
 - [Activity Monitors registers on page G8-6283](#), for accesses from an Exception level that is using AArch32.
-

The registers for the system level Generic Timer component

Any implementation that includes the Generic Timer must include the memory-mapped system level component described in [Chapter I2 System Level Implementation of the Generic Timer](#). In this chapter:

- [Generic Timer memory-mapped registers overview on page I5-6854](#) gives an overview of the registers, referring to [Chapter I2](#) for more information.
- [Generic Timer memory-mapped register descriptions on page I5-6855](#) describes each of the memory-mapped registers.

Note

Chapter D10 *The Generic Timer in AArch64 state* describes the Generic Timer component that is accessible using the System registers. The following sections describe the System register interfaces to that component:

- *Generic Timer registers on page D12-3441*, for accesses from an Exception level that is using AArch64.
 - *Generic Timer registers on page G8-6356*, for accesses from an Exception level that is using AArch32.
-

Note

Chapter H9 *External Debug Register Descriptions* describes the external debug registers.

I5.2 External Performance Monitors registers summary

When an implementation provides access to the Performance Monitors registers through the External debug interface, that interface provides access to:

- Performance Monitors System registers.
- A read-only configuration register, [PMCFGR](#).
- The OPTIONAL CoreSight registers for the Performance Monitors, if they are implemented.

The locations of the registers are defined as offsets from a system-defined base address. [Performance Monitors external register views](#) defines this memory map.

I5.2.1 Performance Monitors external register views

[Table I5-1](#) shows the external view of the Performance Monitors registers. All other entries are reserved.

———— **Note** ————

- Counters that are reserved because [HDCR.HPMN](#) has been changed from its reset value remain visible in any external view.
- The registers that relate to an implemented event counter, PMN_x, are [PMEVCNTR<n>](#) and [PMEVTYPER<n>](#).
- The mapping of the *Performance Monitors Event Counter Registers*, at offsets 0x000-0x0F4, has changed compared to the mappings of the equivalent registers in ARMv7.

Each entry in the Name column links to the register description in [Performance Monitors external register descriptions](#) on page I5-6745, and:

- If the *System register?* column of the table shows that the register is a System register, the memory-mapped interface provides a view of the System register described in:
 - [Performance Monitors registers](#) on page D12-3299, for the AArch64 System register.
 - [Performance Monitors registers](#) on page G8-6231, for the AArch32 System register.
- Otherwise, the register is accessible only using the external interface.

Table I5-1 Performance Monitors external register views

Name	Type	Description	System register?	Offset
PMEVCNTR<n>_EL0	RW	Performance Monitors Event Counter Register.	Yes	0x000+8n
PMCCNTR_EL0[31:0] PMCCNTR_EL0[63:32]	RW	Performance Monitors Cycle Counter Register ^a	Yes	0x0F8 0x0FC

PMPIDR4 ^c	RO	Peripheral ID registers	No	0xFD0
PMPIDR0 ^c	RO			0xFE0
PMPIDR1 ^c	RO			0xFE4
PMPIDR2 ^c	RO			0xFE8
PMPIDR3 ^c	RO			0xFEC

Table I5-1 Performance Monitors external register views (continued)

Name	Type	Description	System register?	Offset
PMCIDR0^c	RO	Component ID registers	No	0xFF0
PMCIDR1^c	RO			0xFF4
PMCIDR2^c	RO			0xFF8
PMCIDR3^c	RO			0xFFC

- a. The interface must support at least single-copy atomic 32-bit accesses. If single-copy atomic 64-bit access to the registers is not possible, software must use a high-low-high read access to read the counter value if the counter is enabled.
- b. PC Sample-based Profiling Extension registers. Implemented only when [ARMv8.2-PCSample](#) is implemented, except that from ARMv8.2 [PMDEVIDt](#) is required regardless of whether [ARMv8.2-PCSample](#) is implemented. Before ARMv8.2, the PC Sample-based Profiling Extension can, instead, be implemented in the memory-mapped debug registers space, see [Chapter H7 The PC Sample-based Profiling Extension](#).
- c. CoreSight interface registers, see [Management registers and CoreSight compliance on page K2-7241](#).
- d. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.

15.3 Performance Monitors external register descriptions

This section describes the external view of the Performance Monitors registers. *External Performance Monitors registers summary* on page 15-6742 lists these registers in offset order.

15.3.1 PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMAUTHSTATUS is implemented in the Core power domain or in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. ARM recommends that this register is implemented.

Attributes

PMAUTHSTATUS is a 32-bit register.

Field descriptions

The PMAUTHSTATUS bit assignments are:

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as [DBGAUTHSTATUS_EL1.SNID](#).

SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

0b00 Not implemented.

All other values are reserved.

NSNID, bits [3:2]

Holds the same value as [DBGAUTHSTATUS_EL1.NSNID](#).

NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

0b00 Not implemented.

All other values are reserved.

Accessing the PMAUTHSTATUS:

PMAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFB8	PMAUTHSTATUS

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.2 PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMCCFILTR_EL0[31:0] is architecturally mapped to AArch64 System register [PMCCFILTR_EL0](#)[31:0].

External register PMCCFILTR_EL0[31:0] is architecturally mapped to AArch32 System register [PMCCFILTR](#)[31:0].

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset RW fields in this register reset:

- To architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
- To 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

Attributes

PMCCFILTR_EL0 is a 32-bit register.

Field descriptions

The PMCCFILTR_EL0 bit assignments are:

P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit. The possible values of this bit are:

- 0b0 Count cycles in EL1.
- 0b1 Do not count cycles in EL1.

U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit. The possible values of this bit are:

- 0b0 Count cycles in EL0.

0b1 Do not count cycles in EL0.

NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

NSH, bit [27]

EL2 (Hypervisor) filtering bit. Controls counting in EL2. If EL2 is not implemented, this bit is RES0. If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

0b0 Do not count cycles in EL2.

0b1 Count cycles in EL2.

M, bit [26]

Secure EL3 filtering bit. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

———— Note —————

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Bit [25]

Reserved, RES0.

SH, bit [24]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is not implemented or is disabled, this field is RES0.

———— Note —————

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bits [23:0]

Reserved, RES0.

Accessing the PMCCFILTR_EL0:

PMCCFILTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x47C	PMCCFILTR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

15.3.3 PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See [Time as measured by the Performance Monitors cycle counter on page D6-2539](#) for more information.

[PMCCFILTR_EL0](#) determines the modes and states in which the PMCCNTR_EL0 can increment.

Usage constraints

———— Note —————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMCCNTR_EL0[63:0] is architecturally mapped to AArch64 System register [PMCCNTR_EL0\[63:0\]](#).

External register PMCCNTR_EL0[63:0] is architecturally mapped to AArch32 System register [PMCCNTR\[63:0\]](#).

PMCCNTR_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

The PMCCNTR_EL0 bit assignments are:

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR_EL0](#).{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR_EL0](#).C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCCNTR_EL0:

PMCCNTR_EL0[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x0F8	PMCCNTR_EL0	31:0

PMCCNTR_EL0[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x0FC	PMCCNTR_EL0	63:32

These interfaces are accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to PMCCNTR_EL0[31:0] is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to PMCCNTR_EL0[31:0] is RW.
- Access to PMCCNTR_EL0[31:0] is ERROR.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to PMCCNTR_EL0[63:32] is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to PMCCNTR_EL0[63:32] is RW.
- Access to PMCCNTR_EL0[63:32] is ERROR.

15.3.4 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D6-2557](#).

———— Note ————

- ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
- This view of the register was previously called PMCEID0_EL0.

Usage constraints

———— Note ————

AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMCEID0[31:0] is architecturally mapped to AArch64 System register [PMCEID0_EL0](#)[31:0].

External register PMCEID0[31:0] is architecturally mapped to AArch32 System register [PMCEID0](#)[31:0].

PMCEID0 is in the Core power domain.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

The PMCEID0 bit assignments are:

ID<n>, bit [n], for n = 0 to 31

ID[n] corresponds to common event n.

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

———— **Note** ————

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID0:

PMCEID0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE20	PMCEID0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() access to this register is RO.
- Access to this register is ERROR.

15.3.5 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D6-2557](#).

Note

- ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
- This view of the register was previously called PMCEID1_EL0.

Usage constraints

Note

AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMCEID1[31:0] is architecturally mapped to AArch64 System register [PMCEID1_EL0](#)[31:0].

External register PMCEID1[31:0] is architecturally mapped to AArch32 System register [PMCEID1](#)[31:0].

PMCEID1 is in the Core power domain.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

The PMCEID1 bit assignments are:

ID<n>, bit [n], for n = 0 to 31

ID[n] corresponds to common event (0x020 + n).

For each bit:

- 0b0 The common event is not implemented, or not counted.
- 0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID1:

PMCEID1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE24	PMCEID1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() access to this register is RO.
- Access to this register is ERROR.

15.3.6 PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

———— Note ————

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D6-2557](#).

Usage constraints

———— Note ————

AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMCEID2[31:0] is architecturally mapped to AArch64 System register [PMCEID0_EL0](#)[63:32].

External register PMCEID2[63:32] is architecturally mapped to AArch32 System register [PMCEID2](#)[31:0].

PMCEID2 is in the Core power domain.

This register is present only from ARMv8.1. Otherwise, direct accesses to PMCEID2 are RES0.

This register is introduced in ARMv8.1.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

The PMCEID2 bit assignments are:

IDhi<n>, bit [n], for n = 0 to 31

From ARMv8.1:

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

———— **Note** ————

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

Accessing the PMCEID2:

PMCEID2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE28	PMCEID2

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() access to this register is RO.
- Access to this register is ERROR.

15.3.7 PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

———— Note ————

ARM recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D6-2557](#).

Usage constraints

———— Note ————

AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMCEID3[31:0] is architecturally mapped to AArch64 System register [PMCEID1_EL0](#)[63:32].

External register PMCEID3[63:32] is architecturally mapped to AArch32 System register [PMCEID3](#)[31:0].

PMCEID3 is in the Core power domain.

This register is present only from ARMv8.1. Otherwise, direct accesses to PMCEID3 are RES0.

This register is introduced in ARMv8.1.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions

The PMCEID3 bit assignments are:

IDhi<n>, bit [n], for n = 0 to 31

From ARMv8.1:

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

Accessing the PMCEID3:

PMCEID3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE2C	PMCEID3

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() access to this register is RO.
- Access to this register is ERROR.

15.3.8 PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Usage constraints

———— Note ————

AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

PMCFGR is in the Core power domain.

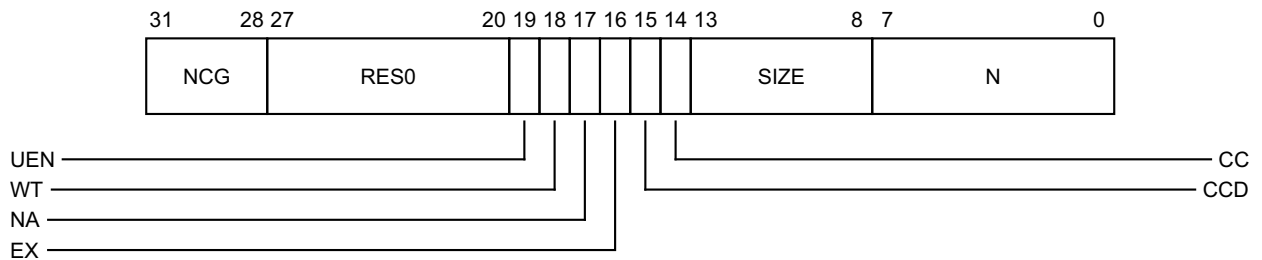

There are no configuration notes.

Attributes

PMCFGR is a 32-bit register.

Field descriptions

The PMCFGR bit assignments are:

NCG, bits [31:28]

This feature is not supported, so this field is RAZ.

Bits [27:20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. [PMUSERENR_EL0](#) is not visible in the external debug interface, so this bit is RAZ.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

0b0 [PMCR_ELO.X](#) is RES0.

0b1 [PMCR_ELO.X](#) is read/write.

CCD, bit [15]

Cycle counter has prescale. This is RES1 if AArch32 is supported at any EL, and RAZ otherwise.

0b0 [PMCR_ELO.D](#) is RES0.

0b1 [PMCR_ELO.D](#) is read/write.

CC, bit [14]

Dedicated cycle counter (counter 31) supported. This bit is RAO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

In ARMv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. In ARMv8, the counters are a doubleword-aligned addresses.

N, bits [7:0]

Number of counters implemented in addition to the cycle counter, [PMCCNTR_ELO](#). The maximum number of event counters is 31.

0x00 Only [PMCCNTR_ELO](#) implemented.

0x01 [PMCCNTR_ELO](#) plus one event counter implemented.

and so on up to 0b00011111, which indicates [PMCCNTR_ELO](#) and 31 event counters implemented.

Accessing the PMCFGR:

PMCFGR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE00	PMCFGR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `AllowExternalPMUAccess()` access to this register is RO.
- Access to this register is ERROR.

15.3.9 PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMCIDR0 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

PMCIDR0 is a 32-bit register.

Field descriptions

The PMCIDR0 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble. Must read as 0x0D.

Accessing the PMCIDR0:

PMCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF0	PMCIDR0

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

I5.3.10 PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMCIDR1 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

PMCIDR1 is a 32-bit register.

Field descriptions

The PMCIDR1 bit assignments are:

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class. Reads as 0x9, debug component.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Accessing the PMCIDR1:

PMCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF4	PMCIDR1

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.11 PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMCIDR2 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

PMCIDR2 is a 32-bit register.

Field descriptions

The PMCIDR2 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble. Must read as 0x05.

Accessing the PMCIDR2:

PMCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF8	PMCIDR2

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

I5.3.12 PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see [About the Component Identification scheme on page K2-7249](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMCIDR3 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

PMCIDR3 is a 32-bit register.

Field descriptions

The PMCIDR3 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble. Must read as 0xB1.

Accessing the PMCIDR3:

PMCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFFC	PMCIDR3

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.13 PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL1](#), captured on reading [PMPCSR](#)[31:0].

Usage constraints

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-6534

Configurations

PMCID1SR is in the Core power domain.

Fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only from ARMv8.2. Otherwise, direct accesses to PMCID1SR are RES0.

Implemented only when [ARMv8.2-PCSample](#) is implemented.

Note

Before ARMv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

This register is introduced in ARMv8.2.

Attributes

PMCID1SR is a 32-bit register.

Field descriptions

The PMCID1SR bit assignments are:

CONTEXTIDR_EL1, bits [31:0]

From ARMv8.2:

Context ID. The value of [CONTEXTIDR](#) that is associated with the most recent [PMPCSR](#) sample.

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register and PMCID1SR samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent [PMPCSR](#) sample.

Because the value written to PMCID1SR is an indirect read of [CONTEXTIDR](#), therefore it is CONSTRAINED UNPREDICTABLE whether PMCID1SR is set to the original or new value if a read of [PMPCSR](#) samples:

- An instruction that writes to [CONTEXTIDR_EL1](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the PMCID1SR:

PMCID1SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x208	PMCID1SR
PMU	0x228	PMCID1SR

These interfaces are accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to PMCID1SR[:] is RO.
- Access to PMCID1SR[:] is ERROR.
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to PMCID1SR[:] is RO.
- Access to PMCID1SR[:] is ERROR.

15.3.14 PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL2](#), captured on reading [PMPCSR](#)[31:0].

Usage constraints

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-6534

Configurations

PMCID2SR is in the Core power domain.

Fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only from ARMv8.2. Otherwise, direct accesses to PMCID2SR are RES0.

Implemented only when [ARMv8.2-PCSample](#) is implemented.

Note

Before ARMv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

If EL2 is not implemented, this register is RES0.

This register is introduced in ARMv8.2.

Attributes

PMCID2SR is a 32-bit register.

Field descriptions

The PMCID2SR bit assignments are:

CONTEXTIDR_EL2, bits [31:0]

From ARMv8.2:

Context ID. The value of [CONTEXTIDR](#) that is associated with the most recent [PMPCSR](#) sample.

- If EL2 is using AArch64, then the Context ID sampled from [CONTEXTIDR_EL2](#).
- If EL2 is using AArch32, then this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of [CONTEXTIDR](#), therefore it is CONSTRAINED UNPREDICTABLE whether PMCID2SR is set to the original or new value if a read of [PMPCSR](#) samples:

- An instruction that writes to [CONTEXTIDR_EL2](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the PMCID2SR:

PMCID2SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x22C	PMCID2SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to this register is RO.
- Access to this register is ERROR.

15.3.15 PMCNTENCLR_ELO, Performance Monitors Count Enable Clear register

The PMCNTENCLR_ELO characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR_ELO](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMCNTENCLR_ELO[31:0] is architecturally mapped to AArch64 System register [PMCNTENCLR_ELO](#)[31:0].

External register PMCNTENCLR_ELO[31:0] is architecturally mapped to AArch32 System register [PMCNTENCLR](#)[31:0].

PMCNTENCLR_ELO is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

PMCNTENCLR_ELO is a 32-bit register.

Field descriptions

The PMCNTENCLR_ELO bit assignments are:

C, bit [31]

[PMCCNTR_ELO](#) disable bit. Disables the cycle counter register. Possible values are:

- 0b0 When read, means the cycle counter is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter disable bit for [PMEVCNTR<n>_ELO](#).

Bits [30:N] are RAZ/WI. N is the value in [PMCFGR.N](#).

Possible values of each bit are:

- 0b0 When read, means that [PMEVCNTR<n>_ELO](#) is disabled. When written, has no effect.
- 0b1 When read, means that [PMEVCNTR<n>_ELO](#) is enabled. When written, disables [PMEVCNTR<n>_ELO](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENCLR_EL0:

PMCNTENCLR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC20	PMCNTENCLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

15.3.16 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMCNTENSET_EL0[31:0] is architecturally mapped to AArch64 System register [PMCNTENSET_EL0](#)[31:0].

External register PMCNTENSET_EL0[31:0] is architecturally mapped to AArch32 System register [PMCNTENSET](#)[31:0].

PMCNTENSET_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

PMCNTENSET_EL0 is a 32-bit register.

Field descriptions

The PMCNTENSET_EL0 bit assignments are:

C, bit [31]

[PMCCNTR_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

- 0b0 When read, means the cycle counter is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter is enabled. When written, enables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter enable bit for [PMEVCNTR<n>_EL0](#).

Bits [30:N] are RAZ/WI. N is the value in [PMCFGR.N](#).

Possible values of each bit are:

- 0b0 When read, means that [PMEVCNTR<n>_EL0](#) is disabled. When written, has no effect.
- 0b1 When read, means that [PMEVCNTR<n>_EL0](#) event counter is enabled. When written, enables [PMEVCNTR<n>_EL0](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENSET_ELO:

PMCNTENSET_ELO can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC00	PMCNTENSET_ELO

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

DP, bit [5]

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

0b0 [PMCCNTR_ELO](#), if enabled, counts when event counting is prohibited.

0b1 [PMCCNTR_ELO](#) does not count when event counting is prohibited.

Counting events is never prohibited in Non-secure state. However, there are some restrictions on counting events in Secure state. For more information about the interaction between the Performance Monitors and EL3, see [Interaction with EL3 on page D6-2545](#).

When EL3 is not implemented, this field is RES0:

- When [ARMv8.1-PMU](#) is not implemented.
- When [ARMv8.1-PMU](#) is implemented, only if EL2 is not implemented.

Otherwise this field is RW.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

X, bit [4]

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:

0b0 Do not export events.

0b1 Export events where not prohibited.

This field enables the exporting of events over an event bus to another device, for example to an OPTIONAL PE trace unit. If the implementation does not include such an event bus then this field is RAZ/WI, otherwise it is an RW field.

In an implementation that includes an event bus, no events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

D, bit [3]

Clock divider. The possible values of this bit are:

0b0 When enabled, [PMCCNTR_ELO](#) counts every clock cycle.

0b1 When enabled, [PMCCNTR_ELO](#) counts once every 64 clock cycles.

In an AArch64 only implementation this field is RES0, otherwise it is an RW field. If $PMCR_ELO.LC = 1$, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of $PMCR_ELO.D = 1$.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

C, bit [2]

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

- 0b0 No action.
- 0b1 Reset [PMCCNTR_EL0](#) to zero.

This bit is always RAZ.

Resetting [PMCCNTR_EL0](#) does not change the cycle counter overflow bit.

P, bit [1]

Event counter reset. This bit is WO. The effects of writing to this bit are:

- 0b0 No action.
- 0b1 Reset all event counters, not including [PMCCNTR_EL0](#), to zero.

This bit is always RAZ.

Resetting the event counters does not change the event counter overflow bits.

E, bit [0]

Enable. The possible values of this bit are:

- 0b0 All counters, including [PMCCNTR_EL0](#), are disabled.
- 0b1 All counters are enabled by [PMCNTENSET_EL0](#).

This bit is RW.

On a Warm reset, this field resets to 0.

Accessing the PMCR_EL0:

PMCR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE04	PMCR_EL0

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalPMUAccess()` and `SoftwareLockStatus()` access to this register is RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalPMUAccess()` and `!SoftwareLockStatus()` access to this register is RW.
- Access to this register is ERROR.

I5.3.18 PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMDEVAFF0 is implemented in the Core power domain or in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

Field descriptions

The PMDEVAFF0 bit assignments are:

MPIDR_EL1 low half, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the PMDEVAFF0:

PMDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFA8	PMDEVAFF0

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

I5.3.19 PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMDEVAFF1 is implemented in the Core power domain or in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

Field descriptions

The PMDEVAFF1 bit assignments are:

MPIDR_EL1 high half, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the PMDEVAFF1:

PMDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFAC	PMDEVAFF1

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.20 PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMDEVARCH is implemented in the Core power domain or in the Debug power domain.

There are no configuration notes.

Attributes

PMDEVARCH is a 32-bit register.

Field descriptions

The PMDEVARCH bit assignments are:

ARCHITECT, bits [31:21]

Defines the architecture of the component. For Performance Monitors, this is ARM Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For Performance Monitors, the revision defined by ARMv8 is 0x0.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For Performance Monitors:

- Bits [15:12] are the architecture version, 0x2.
- Bits [11:0] are the architecture part number, 0xA16.

This corresponds to Performance Monitors architecture version PMUv3.

———— **Note** —————

The PMUv3 memory-mapped programmers' model can be used by devices other than ARMv8 processors. Software must determine whether the PMU is attached to an ARMv8 processor by using the [PMDEVAFF0](#) and [PMDEVAFF1](#) registers to discover the [affinity](#) of the PMU to any ARMv8 processors.

Accessing the PMDEVARCH:

PMDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFBC	PMDEVARCH

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.21 PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

Purpose

Provides information about features of the Performance Monitors implementation.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMDEVID is implemented in the Core power domain or in the Debug power domain.

This register is required from ARMv8.2 and in any implementation that includes [ARMv8.2-PCSample](#). Otherwise, its location is RES0.

———— **Note** —————

Before ARMv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Attributes

PMDEVID is a 32-bit register.

Field descriptions

The PMDEVID bit assignments are:

Bits [31:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers. Permitted values of this field are:

- 0b0000 PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.
- 0b0001 PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.

All other values are reserved.

[ARMv8.2-PCSample](#) implements the functionality identified by the value 0b0001.

Accessing the PMDEVID:

PMDEVID can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFC8	PMDEVID

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.22 PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMDEVTYPE is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

PMDEVTYPE is a 32-bit register.

Field descriptions

The PMDEVTYPE bit assignments are:

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Must read as 0x1 to indicate this is a component within a PE.

MAJOR, bits [3:0]

Major type. Must read as 0x6 to indicate this is a performance monitor component.

Accessing the PMDEVTYPE:

PMDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFCC	PMDEVTYPE

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.23 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Usage constraints

External accesses to the performance monitors ignore [PMUSERENR_EL0](#) and, if implemented, [MDCR_EL2](#).{TPM, TPMCR, HPMN} and [MDCR_EL3](#).TPM. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMEVCNTR<n>_EL0[31:0] is architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0](#)[31:0].

External register PMEVCNTR<n>_EL0[31:0] is architecturally mapped to AArch32 System register [PMEVCNTR<n>](#)[31:0].

PMEVCNTR<n>_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. The field descriptions identify when the reset values apply.

Attributes

PMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

The PMEVCNTR<n>_EL0 bit assignments are:

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

This field resets to an architecturally UNKNOWN value.

Accessing the PMEVCNTR<n>_EL0:

PMEVCNTR<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x000 + 8n	PMEVCNTR<n>_EL0

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalPMUAccess()` and `SoftwareLockStatus()` access to this register is RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalPMUAccess()` and `!SoftwareLockStatus()` access to this register is RW.
- Access to this register is ERROR.

15.3.24 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMEVTYPER<n>_EL0[31:0] is architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0\[31:0\]](#).

External register PMEVTYPER<n>_EL0[31:0] is architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

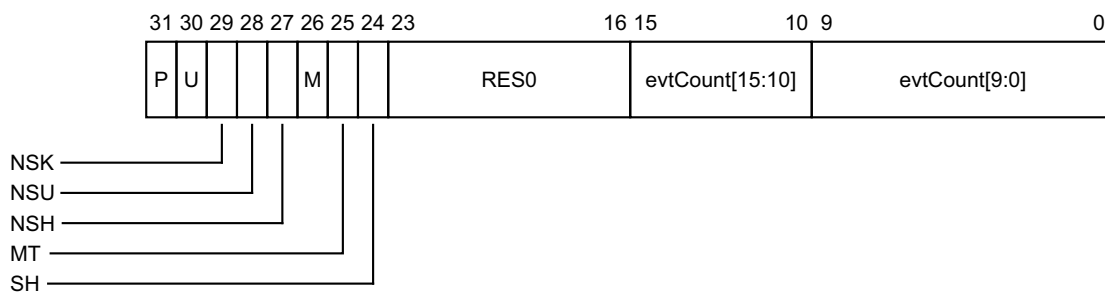

PMEVTYPER<n>_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

PMEVTYPER<n>_EL0 is a 32-bit register.

Field descriptions

The PMEVTYPER<n>_EL0 bit assignments are:

P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit. The possible values of this bit are:

- 0b0 Count events in EL1.
- 0b1 Do not count events in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit. The possible values of this bit are:

- 0b0 Count events in EL0.
- 0b1 Do not count events in EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.P` bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.U` bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSH, bit [27]

EL2 (Hypervisor) filtering bit. Controls counting in EL2. If EL2 is not implemented, this bit is RES0. If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the `PMEVTYPER<n>_EL0.SH` bit.

0b0 Do not count events in EL2.

0b1 Count events in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M, bit [26]

Secure EL3 filtering bit. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.P` bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

———— Note —————

This field is not visible in the AArch32 `PMEVTYPER<n>` System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MT, bit [25]

Multithreading. When the implementation is multi-threaded, the valid values for this bit are:

0b0 Count events only on controlling PE.

0b1 Count events from any PE with the same affinity at level 1 and above as this PE.

When the implementation is not multi-threaded, this bit is RES0.

———— Note —————

- When the lowest level of [affinity](#) consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent. On such an implementation, the value of the `MPIDR_EL1.MT` bit, when read at the highest implemented Exception level, is 0b1.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bit [24]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the `PMEVTYPEPER<n>_EL0.NSH` bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

If Secure EL2 is not implemented or is disabled, this field is RES0.

———— **Note** —————

This field is not visible in the AArch32 `PMEVTYPEPER<n>` System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

From ARMv8.1:

Extension to `evtCount[9:0]`. See `evtCount[9:0]` for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter `PMEVCNTR<n>_EL0`.

Software must program this field with an event that is supported by the PE being programmed.

There are three types of event:

- Common architectural and microarchitectural events.
- ARM recommended common architectural and microarchitectural events.
- IMPLEMENTATION DEFINED events.

The ranges of event numbers allocated to each type of event are shown in [Table D6-6 on page D6-2557](#).

If `evtCount` is programmed to an event that is reserved or not supported by the PE, the behavior depends on the event type:

- For the range `0x000` to `0x03F`, no events are counted, and the value returned by a direct or external read of the `evtCount` field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the `evtCount` field is UNKNOWN.

———— **Note** —————

UNPREDICTABLE means the event must not expose privileged information.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on `evtCount` is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVTYPEPER<n>_EL0:

PMEVTYPEPER<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x400 + 4n	PMEVTYPEPER<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

15.3.25 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_ELO](#), and the event counters [PMEVCNTR<n>_ELO](#). Reading the register shows which overflow interrupt requests are enabled.

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMINTENCLR_EL1[31:0] is architecturally mapped to AArch64 System register [PMINTENCLR_EL1](#)[31:0].

External register PMINTENCLR_EL1[31:0] is architecturally mapped to AArch32 System register [PMINTENCLR](#)[31:0].

PMINTENCLR_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

PMINTENCLR_EL1 is a 32-bit register.

Field descriptions

The PMINTENCLR_EL1 bit assignments are:

C, bit [31]

[PMCCNTR_ELO](#) overflow interrupt request disable bit. Possible values are:

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>_ELO](#).

Bits [30:N] are RAZ/WI. N is the value in [PMCFGR.N](#).

Possible values are:

- 0b0 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is disabled. When written, has no effect.
- 0b1 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is enabled. When written, disables the [PMEVCNTR<n>_ELO](#) interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMINTENCLR_EL1:

PMINTENCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC60	PMINTENCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

15.3.26 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_ELO](#), and the event counters [PMEVCNTR<n>_ELO](#). Reading the register shows which overflow interrupt requests are enabled.

Usage constraints

———— Note —————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMINTENSET_EL1[31:0] is architecturally mapped to AArch64 System register [PMINTENSET_EL1](#)[31:0].

External register PMINTENSET_EL1[31:0] is architecturally mapped to AArch32 System register [PMINTENSET](#)[31:0].

PMINTENSET_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

PMINTENSET_EL1 is a 32-bit register.

Field descriptions

The PMINTENSET_EL1 bit assignments are:

C, bit [31]

[PMCCNTR_ELO](#) overflow interrupt request enable bit. Possible values are:

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>_ELO](#).

Bits [30:N] are RAZ/WI. N is the value in [PMCFGR.N](#).

Possible values are:

- 0b0 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is disabled. When written, has no effect.
- 0b1 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is enabled. When written, enables the [PMEVCNTR<n>_ELO](#) interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMINTENSET_EL1:

PMINTENSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC40	PMINTENSET_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

15.3.27 PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

Attributes

PMITCTRL is a 32-bit register.

Field descriptions

The PMITCTRL bit assignments are:

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0b0 Normal operation.

0b1 Integration mode enabled.

On a Implementation reset, this field resets to 0.

Accessing the PMITCTRL:

PMITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xF00	PMITCTRL

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` access to this register is RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` access to this register is RW.
- Access to this register is IMPDEF.

15.3.28 PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMLAR is implemented in the Core power domain or in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software Lock can be implemented as part of CoreSight compliance.

PMLAR ignores writes if the Software Lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses PMLAR to set or clear the lock, and [PMLSR](#) to check the current status of the lock.

Attributes

PMLAR is a 32-bit register.

Field descriptions

The PMLAR bit assignments are:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Accessing the PMLAR:

PMLAR can be accessed through its memory-mapped interface:

Component	Offset	Instance
PMU	0xFB0	PMLAR

This interface is accessible as follows:

- Access to this register is WO.
- Access to this register is ERROR.

15.3.29 PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMLSR is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software Lock can be implemented as part of CoreSight compliance.

PMLSR is RAZ if the Software Lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses [PMLAR](#) to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

Field descriptions

The PMLSR bit assignments are:

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:

- 0b0 Lock clear. Writes are permitted to this component's registers.
- 0b1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On a reset, this field resets to 1.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED.

Permitted values are:

- 0b0 Software Lock not implemented or not memory-mapped access.
- 0b1 Software Lock implemented and memory-mapped access.

Accessing the PMLSR:

PMLSR can be accessed through its memory-mapped interface:

Component	Offset	Instance
PMU	0xFB4	PMLSR

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.30 PMOVSLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMOVSLR_EL0[31:0] is architecturally mapped to AArch64 System register [PMOVSLR_EL0](#)[31:0].

External register PMOVSLR_EL0[31:0] is architecturally mapped to AArch32 System register [PMOVSr](#)[31:0].

PMOVSLR_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

PMOVSLR_EL0 is a 32-bit register.

Field descriptions

The PMOVSLR_EL0 bit assignments are:

C, bit [31]

Cycle counter overflow clear bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow set bit for [PMEVCNTR<n>_EL0](#).

Bits [30:N] are RAZ/WI. N is the value in [PMCFGR.N](#).

0b0 When read, means that [PMEVCNTR<n>_EL0](#) has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>_EL0](#) has overflowed since this bit was last cleared. When written, clears the [PMEVCNTR<n>_EL0](#) overflow bit to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMOVSLR_EL0:

PMOVSLR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC80	PMOVSLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

15.3.31 PMOVSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMOVSET_EL0[31:0] is architecturally mapped to AArch64 System register [PMOVSET_EL0](#)[31:0].

External register PMOVSET_EL0[31:0] is architecturally mapped to AArch32 System register [PMOVSET](#)[31:0].

PMOVSET_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

PMOVSET_EL0 is a 32-bit register.

Field descriptions

The PMOVSET_EL0 bit assignments are:

C, bit [31]

Cycle counter overflow set bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow set bit for [PMEVCNTR<n>_EL0](#).

Bits [30:N] are RAZ/WI. N is the value in [PMCFGR.N](#).

0b0 When read, means that [PMEVCNTR<n>_EL0](#) has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>_EL0](#) has overflowed since this bit was last cleared. When written, sets the [PMEVCNTR<n>_EL0](#) overflow bit to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMOVSSET_EL0:

PMOVSSET_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCC0	PMOVSSET_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to this register is RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to this register is RW.
- Access to this register is ERROR.

15.3.32 PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Usage constraints

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-6534

Configurations

PMPCSR is in the Core power domain.

Fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

This register is present only when ARMv8.2-PCSample is implemented. Otherwise, direct accesses to PMPCSR are UNDEFINED.

Note

Before ARMv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

Attributes

PMPCSR is a 64-bit register.

Field descriptions

The PMPCSR bit assignments are:

NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

- 0b00 Sample is from EL0.
- 0b01 Sample is from EL1.
- 0b10 Sample is from EL2.
- 0b11 Sample is from EL3.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

PC Sample[55:32], bits [55:32]

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

PC Sample[31:0], bits [31:0]

Bits[31:0] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the access has no side-effects.

In any other cases, a read of PMPCSR[31:0] has the side-effect of indirectly writing to PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#):

- If the PE is in Debug state, or PC Sample-based profiling is prohibited, PMPCSR[31:0] reads as 0xFFFFFFFF, and PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) become UNKNOWN.
- If the PE is in Reset state, the sampled value is UNKNOWN and PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) become UNKNOWN.
- If no instruction has been sampled since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited, the sampled value is 0xFFFFFFFF, and PMPCSR.[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) become UNKNOWN. Any subsequent read will return an instruction address value.

Accessing the PMPCSR:

PMPCSR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x200	PMPCSR	31:0
PMU	0x220	PMPCSR	31:0

PMPCSR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x204	PMPCSR	63:32
PMU	0x224	PMPCSR	63:32

These interfaces are accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to PMPCSR[31:0] is RO.
- Access to PMPCSR[31:0] is ERROR.
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to PMPCSR[63:32] is RO.
- Access to PMPCSR[63:32] is ERROR.
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to PMPCSR[31:0] is RO.

- Access to PMPCSR[31:0] is ERROR.
- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to PMPCSR[63:32] is RO.
- Access to PMPCSR[63:32] is ERROR.

15.3.33 PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMPIDR0 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions

The PMPIDR0 bit assignments are:

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

Accessing the PMPIDR0:

PMPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE0	PMPIDR0

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

I5.3.34 PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMPIDR1 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

PMPIDR1 is a 32-bit register.

Field descriptions

The PMPIDR1 bit assignments are:

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is 0b1011.

PART_1, bits [3:0]

Part number, most significant nibble.

Accessing the PMPIDR1:

PMPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE4	PMPIDR1

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.35 PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMPIDR2 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

PMPIDR2 is a 32-bit register.

Field descriptions

The PMPIDR2 bit assignments are:

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is 0b011.

Accessing the PMPIDR2:

PMPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE8	PMPIDR2

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

I5.3.36 PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMPIDR3 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

PMPIDR3 is a 32-bit register.

Field descriptions

The PMPIDR3 bit assignments are:

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

Accessing the PMPIDR3:

PMPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFEC	PMPIDR3

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

15.3.37 PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see [About the Peripheral identification scheme on page K2-7247](#).

Usage constraints

There are no usage constraints.

Configurations

It is IMPLEMENTATION DEFINED whether PMPIDR4 is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

PMPIDR4 is a 32-bit register.

Field descriptions

The PMPIDR4 bit assignments are:

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. RAZ. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is 0b0100.

Accessing the PMPIDR4:

PMPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFD0	PMPIDR4

This interface is accessible as follows:

- Access to this register is RO.
- Access to this register is ERROR.

I5.3.38 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see [SW_INCR](#).

Usage constraints

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from ARMv8.4. Refer to the Pseudocode definitions for more information.

Configurations

External register PMSWINC_EL0[31:0] is architecturally mapped to AArch64 System register [PMSWINC_EL0](#)[31:0].

External register PMSWINC_EL0[31:0] is architecturally mapped to AArch32 System register [PMSWINC](#)[31:0].

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONstrained UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

Attributes

PMSWINC_EL0 is a 32-bit register.

Field descriptions

The PMSWINC_EL0 bit assignments are:

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 0 to 30

Event counter software increment bit for [PMEVCNTR<n>_EL0](#).

Bits [30:N] are WI. N is the value in [PMCR_EL0.N](#).

For other values of n, the effects of writing to this bit are:

0b0 No action. The write to this bit is ignored.

0b1 It is CONstrained UNPREDICTABLE whether a SW_INCR event is generated for event counter n.

Accessing the PMSWINC_EL0:

PMSWINC_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCA0	PMSWINC_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() access to this register is WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() access to this register is WO.
- Access to this register is ERROR.

- If 16-bit VMIDs are supported, but VTTBR_x.VMID[15:8] are not used, PMVIDSR.VMID[15:8] is set to RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the PMVIDSR:

PMVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x20C	PMVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() access to this register is RO.
- Access to this register is ERROR.

15.4 External Activity Monitors Extension registers summary

The memory-mapped interface to the Activity Monitors Extension registers provides read-only access to:

- Read-only copies of the Activity Monitors Extension System registers, with the exception of [AMUSERENR](#).
- An implementation identification register, [AMIIDR](#).
- If they are implemented, the OPTIONAL Activity Monitors CoreSight and ID registers.

The locations of the registers are defined as offsets from a base address. The base address of the memory-mapped view must be aligned to a 4KB boundary, but is otherwise IMPLEMENTATION DEFINED. [Activity Monitors external register views](#) defines this memory map.

15.4.1 Activity Monitors external register views

[Table I5-2](#) shows the external view of the Activity Monitors registers. All implemented registers are RO. Offsets within the 4KB region not defined in this table are [RAZ/WI](#).

Each entry in the Name column links to the register description in [Activity Monitors external register descriptions](#) on page I5-6818, and:

- If the [System register?](#) on page I5-6742 column of the table shows that the register is a System register, the memory-mapped interface provides a view of the System register described in:
 - [Activity Monitors registers](#) on page D12-3343, for the AArch64 System register.
 - [Activity Monitors registers](#) on page G8-6283, for the AArch32 System register.
- Otherwise, the register is accessible only using the external memory-mapped interface.

Table I5-2 Activity Monitors external register views

Name	Description	System register?	Offset
AMEVCNTR0<n> [31:0]	Activity Monitor Event Counter registers 0	Yes	0x000+8n
AMEVCNTR0<n> [63:32]			0x004+8n
AMEVCNTR1<n> [31:0]	Activity Monitor Event Counter registers 1	Yes	0x100+8n
AMEVCNTR1<n> [63:32]			0x104+8n
AMEVTYPER0<n>	Activity Monitor Event Type registers 0	Yes	0x400+4n
AMEVTYPER1<n>	Activity Monitor Event Type registers 1	Yes	0x480+4n
AMCNTENSET0	Activity Monitors Counter Enable Set register 0	Yes	0xC00
AMCNTENSET1	Activity Monitors Counter Enable Set register 1	Yes	0xC04
AMCNTENCLR0	Activity Monitors Counter Enable Clear register 0	Yes	0xC20
AMCNTENCLR1	Activity Monitors Counter Enable Clear register 1	Yes	0xC24
AMCGCR	Activity Monitors Counter Group ConfigurationRegister	Yes	0xCE0
AMCFGR	Activity Monitors Configuration Register	Yes	0xE00
AMCR	Activity Monitors Control Register	Yes	0xE04
AMIIDR	Activity Monitors Implementation IdentificationRegister	No	0xE08
AMDEVAFF0^a	Device Affinity registers	No	0xFA8
AMDEVAFF1^a		No	0xFAC
AMDEVARCH^a		No	0xFBC

Table I5-2 Activity Monitors external register views (continued)

Name	Description	System register?	Offset
AMDEVTYPE^a	Device Type register	No	0xFCC
AMPIDR4^a	Peripheral ID registers	No	0xFD0
AMPIDR0^a		No	0xFE0
AMPIDR1^a		No	0xFE4
AMPIDR2^a		No	0xFE8
AMPIDR3^a		No	0xFEC
AMCIDR0^a		Component ID registers	No
AMCIDR1^a	No		0xFF4
AMCIDR2^a	No		0xFF8
AMCIDR3^a	No		0xFFC

a. CoreSight interface registers, see [Management registers and CoreSight compliance on page K2-7241](#).

I5.5 Activity Monitors external register descriptions

This section lists the external Activity Monitors registers.

15.5.1 AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Usage constraints

There are no usage constraints.

Configurations

External register AMCFGR[31:0] is architecturally mapped to AArch64 System register [AMCFGR_EL0](#)[31:0].

External register AMCFGR[31:0] is architecturally mapped to AArch32 System register [AMCFGR](#)[31:0].

The power domain of AMCFGR is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

The AMCFGR bit assignments are:

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is defined as $[AMCFGR.NCG + 1]$.

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of $0b0000$. Otherwise, this field has a value of $0b0001$.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

In ARMv8, this feature must be supported, and so this bit is $0b1$.

$0b0$ [AMCR.HDBG](#) is RES0.

$0b1$ [AMCR.HDBG](#) is read/write.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as [AMCFGR.SIZE + 1].

In ARMv8, the counters are 64-bit, and so this field is 0b111111.

———— **Note** —————

Software also uses this field to determine the spacing of counters in the memory-map. In ARMv8, the counters are at doubleword-aligned addresses.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as [AMCFGR.N + 1].

Accessing the AMCFGR:

AMCFGR can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xE00	AMCFGR

This interface is accessible as follows:

- Access to this register is RO.

I5.5.2 AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Usage constraints

There are no usage constraints.

Configurations

External register AMCGCR[31:0] is architecturally mapped to AArch64 System register [AMCGCR_EL0](#)[31:0].

External register AMCGCR[31:0] is architecturally mapped to AArch32 System register [AMCGCR](#)[31:0].

The power domain of AMCGCR is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

Attributes

AMCGCR is a 32-bit register.

Field descriptions

The AMCGCR bit assignments are:

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group. In AMUv1, the permitted range of values is 0 to 16.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group. In AMUv1, the value of this field is 4.

Accessing the AMCGCR:

AMCGCR can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xCE0	AMCGCR

This interface is accessible as follows:

- Access to this register is RO.

15.5.3 AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Component Identification scheme on page K2-7249](#) in the ARMv8 ARM.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMCIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCIDR0 are RES0.

Attributes

AMCIDR0 is a 32-bit register.

Field descriptions

The AMCIDR0 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble. Must read as 0x0D.

Accessing the AMCIDR0:

AMCIDR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFF0	AMCIDR0

This interface is accessible as follows:

- Access to this register is RO.

I5.5.4 AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Component Identification scheme on page K2-7249](#) in the ARMv8 ARM.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMCIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCIDR1 are RES0.

Attributes

AMCIDR1 is a 32-bit register.

Field descriptions

The AMCIDR1 bit assignments are:

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class. Reads as 0x9, CoreSight component.

PRMBL_1, bits [3:0]

Preamble. Reads as 0x0.

Accessing the AMCIDR1:

AMCIDR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFF4	AMCIDR1

This interface is accessible as follows:

- Access to this register is RO.

15.5.5 AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Component Identification scheme on page K2-7249](#) in the ARMv8 ARM.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMCIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCIDR2 are RES0.

Attributes

AMCIDR2 is a 32-bit register.

Field descriptions

The AMCIDR2 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble. Reads as 0x05.

Accessing the AMCIDR2:

AMCIDR2 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFF8	AMCIDR2

This interface is accessible as follows:

- Access to this register is RO.

15.5.6 AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Component Identification scheme on page K2-7249](#) in the ARMv8 ARM.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMCIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCIDR3 are RES0.

Attributes

AMCIDR3 is a 32-bit register.

Field descriptions

The AMCIDR3 bit assignments are:

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble. Reads as 0xB1.

Accessing the AMCIDR3:

AMCIDR3 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFFC	AMCIDR3

This interface is accessible as follows:

- Access to this register is RO.

15.5.7 AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected s event counters, [AMEVCNTR0<n>](#).

Usage constraints

There are no usage constraints.

Configurations

External register AMCNTENCLR0[31:0] is architecturally mapped to AArch64 System register [AMCNTENCLR0_ELO](#)[31:0].

External register AMCNTENCLR0[31:0] is architecturally mapped to AArch32 System register [AMCNTENCLR0](#)[31:0].

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

The AMCNTENCLR0 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR.CG0NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR0<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR0<n>](#) is enabled. When written, disables [AMEVCNTR0<n>](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR0:

AMCNTENCLR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xC20	AMCNTENSET0

This interface is accessible as follows:

- Access to this register is RO.

I5.5.8 AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Usage constraints

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

The number of auxiliary activity monitor event counters implemented is zero exactly when [AMCFGCR.NCG](#) == 0b0000.

Configurations

External register AMCNTENCLR1[31:0] is architecturally mapped to AArch64 System register [AMCNTENCLR1_EL0](#)[31:0].

External register AMCNTENCLR1[31:0] is architecturally mapped to AArch32 System register [AMCNTENCLR1](#)[31:0].

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

The AMCNTENCLR1 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR1<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR1<n>](#) is enabled. When written, disables [AMEVCNTR1<n>](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR1:

AMCNTENCLR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xC24	AMCNTENCLR1

This interface is accessible as follows:

- Access to this register is RO.

15.5.9 AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Usage constraints

There are no usage constraints.

Configurations

External register AMCNTENSET0[31:0] is architecturally mapped to AArch64 System register [AMCNTENSET0_EL0](#)[31:0].

External register AMCNTENSET0[31:0] is architecturally mapped to AArch32 System register [AMCNTENSET0](#)[31:0].

The power domain of AMCNTENSET0 is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

The AMCNTENSET0 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter enable bit for [AMEVCNTR0<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR.CG0NC](#).

Possible values of each bit are:

- 0b0 When read, means that [AMEVCNTR0<n>](#) is disabled. When written, has no effect.
- 0b1 When read, means that [AMEVCNTR0<n>](#) is enabled. When written, enables [AMEVCNTR0<n>](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENSET0:

AMCNTENSET0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xC00	AMCNTENSET0

This interface is accessible as follows:

- Access to this register is RO.

I5.5.10 AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Usage constraints

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

The number of auxiliary activity monitor counters implemented is zero exactly when [AMCFGR.NCG](#) == 0b0000.

Configurations

External register AMCNTENSET1[31:0] is architecturally mapped to AArch64 System register [AMCNTENSET1_EL0](#)[31:0].

External register AMCNTENSET1[31:0] is architecturally mapped to AArch32 System register [AMCNTENSET1](#)[31:0].

The power domain of AMCNTENSET1 is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are RES0.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions

The AMCNTENSET1 bit assignments are:

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter enable bit for [AMEVCNTR1<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR1<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [AMEVCNTR1<n>](#) is enabled. When written, enables [AMEVCNTR1<n>](#).

On a Cold reset, this field resets to 0.

Accessing the AMCNTENSET1:

AMCNTENSET1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xC04	AMCNTENSET1

This interface is accessible as follows:

- Access to this register is RO.

15.5.11 AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Usage constraints

There are no usage constraints.

Configurations

External register AMCR[31:0] is architecturally mapped to AArch64 System register [AMCR_EL0](#)[31:0].

External register AMCR[31:0] is architecturally mapped to AArch32 System register [AMCR](#)[31:0].

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCR are RES0.

Attributes

AMCR is a 32-bit register.

Field descriptions

The AMCR bit assignments are:

Bits [31:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

0b0 Activity monitors do not halt counting when the PE is halted in Debug state.

0b1 Activity monitors halt counting when the PE is halted in Debug state.

Bits [9:0]

Reserved, RAZ/WI.

Accessing the AMCR:

AMCR can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xE04	AMCR

This interface is accessible as follows:

- Access to this register is RO.

I5.5.12 AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMDEVAFF0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMDEVAFF0 are RES0.

Attributes

AMDEVAFF0 is a 32-bit register.

Field descriptions

The AMDEVAFF0 bit assignments are:

MPIDR_EL1 low half, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the AMDEVAFF0:

AMDEVAFF0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFA8	AMDEVAFF0

This interface is accessible as follows:

- Access to this register is RO.

I5.5.13 AMDEVAFF1, Activity Monitors Device Affinity Register 1

The AMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMDEVAFF1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMDEVAFF1 are RES0.

Attributes

AMDEVAFF1 is a 32-bit register.

Field descriptions

The AMDEVAFF1 bit assignments are:

MPIDR_EL1 high half, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the AMDEVAFF1:

AMDEVAFF1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFAC	AMDEVAFF1

This interface is accessible as follows:

- Access to this register is RO.

I5.5.14 AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the AMU component.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMDEVARCH are RES0.

Attributes

AMDEVARCH is a 32-bit register.

Field descriptions

The AMDEVARCH bit assignments are:

ARCHITECT, bits [31:21]

Defines the architecture of the component. For AMU, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

0b0000 Architecture revision is AMUv1.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.

For AMU:

- Bits [15:12] are the architecture version, 0x0.
- Bits [11:0] are the architecture part number, 0xA66.

This corresponds to AMU architecture version AMUv1.

Accessing the AMDEVARCH:

AMDEVARCH can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFBC	AMDEVARCH

This interface is accessible as follows:

- Access to this register is RO.

I5.5.15 AMDEVTYPE, Activity Monitors Device Type Register

The AMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMDEVTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMDEVTYPE are RES0.

Attributes

AMDEVTYPE is a 32-bit register.

Field descriptions

The AMDEVTYPE bit assignments are:

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Reads as 0x1, to indicate this is a component within a PE.

MAJOR, bits [3:0]

Major type. Reads as 0x6, to indicate this is a performance monitor component.

Accessing the AMDEVTYPE:

AMDEVTYPE can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFCC	AMDEVTYPE

This interface is accessible as follows:

- Access to this register is RO.

15.5.16 AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Usage constraints

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n> are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

Configurations

External register AMEVCNTR0<n>[63:0] is architecturally mapped to AArch64 System register [AMEVCNTR0<n>_EL0](#)[63:0].

External register AMEVCNTR0<n>[63:0] is architecturally mapped to AArch32 System register [AMEVCNTR0<n>](#)[63:0].

The power domain of AMEVCNTR0<n> is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are RES0.

Attributes

AMEVCNTR0<n> is a 64-bit register.

Field descriptions

The AMEVCNTR0<n> bit assignments are:

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

Accessing the AMEVCNTR0<n>:

AMEVCNTR0<n>[31:0] can be accessed through its memory-mapped interface:

Component	Offset	Instance	Range
AMU	0x000 + 8n	AMEVCNTR0<n>	31:0

AMEVCNTR0<n>[63:32] can be accessed through its memory-mapped interface:

Component	Offset	Instance	Range
AMU	0x004 + 8n	AMEVCNTR0<n>	63:32

These interfaces are accessible as follows:

- Access to AMEVCNTR0<n>[31:0] is RO.
- Access to AMEVCNTR0<n>[63:32] is RO.

15.5.17 AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Usage constraints

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are CONstrained UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Configurations

External register AMEVCNTR1<n>[63:0] is architecturally mapped to AArch64 System register [AMEVCNTR1<n>_EL0](#)[63:0].

External register AMEVCNTR1<n>[63:0] is architecturally mapped to AArch32 System register [AMEVCNTR1<n>](#)[63:0].

The power domain of AMEVCNTR1<n> is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions

The AMEVCNTR1<n> bit assignments are:

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

Accessing the AMEVCNTR1<n>:

AMEVCNTR1<n>[31:0] can be accessed through its memory-mapped interface:

Component	Offset	Instance	Range
AMU	0x100 + 8n	AMEVCNTR1<n>	31:0

AMEVCNTR1<n>[63:32] can be accessed through its memory-mapped interface:

Component	Offset	Instance	Range
AMU	$0x104 + 8n$	AMEVCNTR1<n>	63:32

These interfaces are accessible as follows:

- Access to AMEVCNTR1<n>[31:0] is RO.
- Access to AMEVCNTR1<n>[63:32] is RO.

15.5.18 AMEVTYPEPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 15

The AMEVTYPEPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>](#) counts.

Usage constraints

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPEPER0<n> are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

Configurations

External register AMEVTYPEPER0<n>[31:0] is architecturally mapped to AArch64 System register [AMEVTYPEPER0<n>_EL0](#)[31:0].

External register AMEVTYPEPER0<n>[31:0] is architecturally mapped to AArch32 System register [AMEVTYPEPER0<n>](#)[31:0].

The power domain of AMEVTYPEPER0<n> is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPEPER0<n> are RES0.

Attributes

AMEVTYPEPER0<n> is a 32-bit register.

Field descriptions

The AMEVTYPEPER0<n> bit assignments are:

Bits [31:25]

Reserved, RAZ.

Bits [24:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

- 0x0011 **When n == 0** Processor frequency cycles
- 0x4004 **When n == 1** Constant frequency cycles
- 0x0008 **When n == 2** Instructions retired
- 0x4004 **When n == 3** Memory stall cycles

Accessing the AMEVTYPER0<n>:

AMEVTYPER0<n> can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	$0x400 + 4n$	AMEVTYPER0<n>

This interface is accessible as follows:

- Access to this register is RO.

I5.5.19 AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>](#) counts.

Usage constraints

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Configurations

External register AMEVTYPER1<n>[31:0] is architecturally mapped to AArch64 System register [AMEVTYPER1<n>_EL0](#)[31:0].

External register AMEVTYPER1<n>[31:0] is architecturally mapped to AArch32 System register [AMEVTYPER1<n>](#)[31:0].

The power domain of AMEVTYPER1<n> is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are RES0.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions

The AMEVTYPER1<n> bit assignments are:

Bits [31:25]

Reserved, RAZ.

Bits [24:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

Note

The event counted by `AMEVCNTR1<n>` might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter `AMEVCNTR1<n>` is enabled, writes to this register have UNPREDICTABLE results.

Accessing the AMEVTYPER1<n>:

AMEVTYPER1<n> can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	$0x480 + 4n$	AMEVTYPER1<n>

This interface is accessible as follows:

- Access to this register is RO.

15.5.20 AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

Purpose

Defines the implementer and revisions of the AMU.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

Attributes

AMIIDR is a 32-bit register.

Field descriptions

The AMIIDR bit assignments are:

31	20 19	16 15	12 11	0
ProductID	Variant	Revision	Implementer	

ProductID, bits [31:20]

This field is an AMU part identifier.

The value of this field is IMPLEMENTATION DEFINED.

If [AMPIDR0](#) is implemented, [AMPIDR0.PART_0](#) matches bits [27:20] of this field.

If [AMPIDR1](#) is implemented, [AMPIDR1.PART_1](#) matches bits [31:28] of this field.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

The value of this field is IMPLEMENTATION DEFINED.

If [AMPIDR2](#) is implemented, [AMPIDR2.REVISION](#) matches AMIIDR.Variant.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

The value of this field is IMPLEMENTATION DEFINED.

If [AMPIDR3](#) is implemented, [AMPIDR3.REVAND](#) matches AMIIDR.Revision.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the AMU.

For an Arm implementation, this field reads as 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer.

Bit 7 is RES0

Bits [6:0] contain the JEP106 identity code of the implementer.

If [AMPIDR4](#) is implemented, [AMPIDR4.DES_2](#) matches bits [11:8] of this field.

If [AMPIDR2](#) is implemented, [AMPIDR2.DES_1](#) matches bits [6:4] of this field.

If [AMPIDR1](#) is implemented, [AMPIDR1.DES_0](#) matches bits [3:0] of this field.

Accessing the AMIIDR:

AMIIDR can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xE08	AMIIDR

This interface is accessible as follows:

- Access to this register is RO.

15.5.21 AMPIDR0, Activity Monitors Peripheral Identification Register 0

The AMPIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Peripheral identification scheme on page K2-7247](#) in the ARMv8 ARM.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMPIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMPIDR0 are RES0.

Attributes

AMPIDR0 is a 32-bit register.

Field descriptions

The AMPIDR0 bit assignments are:

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

The value of this field is IMPLEMENTATION DEFINED.

Accessing the AMPIDR0:

AMPIDR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFE0	AMPIDR0

This interface is accessible as follows:

- Access to this register is RO.

I5.5.22 AMPIDR1, Activity Monitors Peripheral Identification Register 1

The AMPIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Peripheral identification scheme on page K2-7247](#) in the ARMv8 ARM.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMPIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMPIDR1 are RES0.

Attributes

AMPIDR1 is a 32-bit register.

Field descriptions

The AMPIDR1 bit assignments are:

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code.

The value of this field is IMPLEMENTATION DEFINED. For Arm Limited, this field is 0b1011.

PART_1, bits [3:0]

Part number, most significant nibble.

The value of this field is IMPLEMENTATION DEFINED.

Accessing the AMPIDR1:

AMPIDR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFE4	AMPIDR1

This interface is accessible as follows:

- Access to this register is RO.

This interface is accessible as follows:

- Access to this register is RO.

15.5.24 AMPIDR3, Activity Monitors Peripheral Identification Register 3

The AMPIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Peripheral identification scheme on page K2-7247](#) in the ARMv8 ARM.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMPIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMPIDR3 are RES0.

Attributes

AMPIDR3 is a 32-bit register.

Field descriptions

The AMPIDR3 bit assignments are:

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [AMPIDR2.REVISION](#) as an extension to the Part number must use this field as a major revision number.

The value of this field is IMPLEMENTATION DEFINED.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

The value of this field is IMPLEMENTATION DEFINED.

Accessing the AMPIDR3:

AMPIDR3 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFEC	AMPIDR3

This interface is accessible as follows:

- Access to this register is RO.

I5.5.25 AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Peripheral identification scheme on page K2-7247](#) in the ARMv8 ARM.

Usage constraints

There are no usage constraints.

Configurations

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMPIDR4 are RES0.

Attributes

AMPIDR4 is a 32-bit register.

Field descriptions

The AMPIDR4 bit assignments are:

31	8 7	4 3	0
RES0	SIZE	DES_2	

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. \log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

This field reads as 0b0000.

DES_2, bits [3:0]

Designer. JEP106 continuation code, least significant nibble.

The value of this field is IMPLEMENTATION DEFINED. For Arm Limited, this field is 0b0100.

Accessing the AMPIDR4:

AMPIDR4 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFD0	AMPIDR4

This interface is accessible as follows:

- Access to this register is RO.

I5.6 Generic Timer memory-mapped registers overview

The Generic Timer memory-mapped registers are implemented as multiple register frames, with each register frame having its own base address, as follows:

- A single CNTCTLBase register frame, at base address CNTCTLBase.
- Between one and seven CNTBaseN register frames, each with its own base address CNTBaseN.
- For each CNTBaseN register frame, if required, a CNTEL0BaseN register frame, at base address CNTEL0BaseN, that provides an EL0 view of the CNTBaseN register frame.

For more information, see:

- [Memory-mapped timer components on page I2-6726.](#)
- [The CNTBaseN and CNTEL0BaseN frames on page I2-6728.](#) This section includes the memory map of the CNTBaseN and CNTEL0BaseN register frames.
- [The CNTCTLBase frame on page I2-6727.](#) This section includes the memory map of the CNTCTLBase register frame.

———— **Note** —————

[Providing a complete set of features in a system level implementation on page K5-7272](#) gives an implementation example for a system level implementation of the Generic Timer.

15.7 Generic Timer memory-mapped register descriptions

This section describes the Generic Timer registers. [Generic Timer memory-mapped registers overview on page I5-6854](#) gives an overview of these registers, and includes links to their memory maps.

15.7.1 CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Usage constraints

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

Configurations

The power domain of CNTACR<n> is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which it is implemented, RW fields in this register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see *Power and reset domains for the system level implementation of the Generic Timer on page I2-6721*.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions

The CNTACR<n> bit assignments are:

Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers [CNTP_CVAL](#), [CNTP_TVAL](#), and [CNTP_CTL](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
- 0b1 Read/write access to the EL1 Physical Timer registers in frame <n>.

This field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Read/write access to the Virtual Timer register [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to the Virtual Timer registers in frame <n>. The registers are RES0.
- 0b1 Read/write access to the Virtual Timer registers in frame <n>.

This field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to [CNTVOFF](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to [CNTVOFF](#) in frame <n>. The register is RES0.
- 0b1 Read-only access to [CNTVOFF](#) in frame <n>.

This field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to [CNTFRQ](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to [CNTFRQ](#) in frame <n>. The register is RES0.
- 0b1 Read-only access to [CNTFRQ](#) in frame <n>.

This field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to [CNTVCT](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to [CNTVCT](#) in frame <n>. The register is RES0.
- 0b1 Read-only access to [CNTVCT](#) in frame <n>.

This field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to [CNTPCT](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to [CNTPCT](#) in frame <n>. The register is RES0.
- 0b1 Read-only access to [CNTPCT](#) in frame <n>.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTACR<n>:

CNTACR<n> can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x040 + 4n	CNTACR<n>

This interface is accessible as follows:

- Access to this register is RW.

15.7.2 CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Usage constraints

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

Configurations

The power domain of CNTCR is IMPLEMENTATION DEFINED. Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.

Attributes

CNTCR is a 32-bit register.

Field descriptions

The CNTCR bit assignments are:

Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select. Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see [The Frequency modes table on page 12-6723](#). An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

This field resets to 0.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]

When ARMv8.4-CNTSC is implemented:

Scale Enable.

0b0 Scaling is not enabled. The counter value is incremented by 0x1.0000000 for each counter tick.

0b1 Scaling is enabled. The counter is incremented by `CNTSCR.ScaleVal` for each counter tick.

The SCEN bit can only be changed when the counter is disabled, when `CNTCR.EN == 0`.

If the value of `CNTCR.SCEN` changes when `CNTCR.EN == 1` then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

————— Note —————

When the `CNTCV` register in the `CNTControl` Base frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

0b0 System counter ignores Halt-on-debug.

0b1 Asserted Halt-on-debug signal halts system counter update.

This field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

0b0 System counter disabled.

0b1 System counter enabled.

This field resets to 0.

Accessing the CNTCR:

CNTCR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x000	CNTCR

This interface is accessible as follows:

- Access to this register is RW.

15.7.3 CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Usage constraints

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

Configurations

The power domain of CNTCV is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTCV is a 64-bit register.

Field descriptions

The CNTCV bit assignments are:

CountValue, bits [63:0]

Indicates the counter value.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTCV:

CNTCV[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Accessibility	Offset	Instance
Timer	CNTControlBase	RW	0x008	CNTCV
Timer	CNTReadBase	RO	0x000	CNTCV

CNTCV[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Accessibility	Offset	Instance
Timer	CNTControlBase	RW	0x00C	CNTCV
Timer	CNTReadBase	RO	0x004	CNTCV

15.7.4 CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

Purpose

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the [CNTPCT](#), [CNTVCT](#), [CNTFRQ](#), EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

Usage constraints

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers [CNTFRQ](#), [CNTP_CTL](#), [CNTP_CVAL](#), [CNTP_TVAL](#), [CNTPCT](#), [CNTV_CTL](#), [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTVCT](#) are not visible in that frame.

Configurations

The power domain of CNTEL0ACR is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which it is implemented, RW fields in this register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Implementation of this register is OPTIONAL.

Attributes

CNTEL0ACR is a 32-bit register.

Field descriptions

The CNTEL0ACR bit assignments are:

Bits [31:10]

Reserved, RES0.

EL0PTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the [CNTP_CVAL](#), [CNTP_TVAL](#), and [CNTP_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

- 0b0 No access. Registers are RES0 in the second view.
- 0b1 Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

This field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

- 0b0 No access. Registers are RES0 in the second view.
- 0b1 Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for [CNTVCT](#) and [CNTFRQ](#). The possible values of this bit are:

- 0b0 [CNTVCT](#) is not visible in the second view.
If EL0PCTEN is set to 0, [CNTFRQ](#) is not visible in the second view.
- 0b1 Access permitted. If [CNTVCT](#) and [CNTFRQ](#) are visible in the current frame then they are visible in the second view.

This field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for [CNTPCT](#) and [CNTFRQ](#). The possible values of this bit are:

- 0b0 [CNTPCT](#) is not visible in the second view.
If EL0VCTEN is set to 0, [CNTFRQ](#) is not visible in the second view.
- 0b1 Access permitted. If [CNTPCT](#) and [CNTFRQ](#) are visible in the current frame then they are visible in the second view.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTEL0ACR:

CNTEL0ACR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x014	CNTEL0ACR

This interface is accessible as follows:

- Access to this register is RW.

15.7.5 CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Usage constraints

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

Configurations

The power domain of CNTFID0 is IMPLEMENTATION DEFINED.

If this register is implemented as an RW register, on a reset of the reset domain in which it is implemented, RW fields in this register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information see [The Frequency modes table on page I2-6723](#).

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, ARM strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions

The CNTFID0 bit assignments are:

Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTFID0:

CNTFID0 can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020	CNTFID0

This interface is accessible as follows:

- Access to this register is RO or RW.

15.7.6 CNTFID<n>, Counter Frequency IDs, n > 0

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter update frequencies.

Usage constraints

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

Configurations

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED.

If this register is implemented as an RW register, on a reset of the reset domain in which it is implemented, RW fields in this register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see [The Frequency modes table on page I2-6723](#).

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, ARM strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions

The CNTFID<n> bit assignments are:

Frequency, bits [31:0]

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. ARM strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

$$\text{increment} = (\text{base frequency}) / (\text{selected frequency})$$

This field resets to an architecturally UNKNOWN value.

Accessing the CNTFID<n>:

CNTFID<n> can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020 + 4n	CNTFID<n>

This interface is accessible as follows:

- Access to this register is RO or RW.

15.7.7 CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Usage constraints

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RFRQ](#) is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
 - CNTFRQ is accessible in the corresponding CNTBaseN frame.
 - Either the value of [CNTEL0ACR.EL0VCTEN](#) is 1 or the value of [CNTEL0ACR.EL0PCTEN](#) is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

Configurations

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

The CNTFRQ bit assignments are:

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.
This field resets to an architecturally UNKNOWN value.

Accessing the CNTFRQ:

CNTFRQ can be accessed through its memory-mapped interface:

Component	Frame	Accessibility	Offset	Instance
Timer	CNTBaseN	RO	0x010	CNTFRQ
Timer	CNTELOBaseN	RO	0x010	CNTFRQ
Timer	CNTCTLBase	RW	0x000	CNTFRQ

15.7.8 CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Usage constraints

In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

Configurations

The power domain of CNTID is IMPLEMENTATION DEFINED.

This register is present only when ARMv8.4-CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions

The CNTID bit assignments are:

Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented

0b0000 Counter scaling is not implemented.

0b0001 Counter scaling is implemented.

All other values are reserved.

Accessing the CNTID:

CNTID can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x1C	CNTID

This interface is accessible as follows:

- Access to this register is RO.

I5.7.9 CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Usage constraints

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

Configurations

The power domain of CNTNSAR is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which it is implemented, RW fields in this register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

The CNTNSAR bit assignments are:

Bits [31:8]

Reserved, RES0.

NS<n>, bit [n], for n = 0 to 7

Non-secure access to frame n. The possible values of this bit are:

- 0b0 Secure access only. Behaves as RES0 to Non-secure accesses.
- 0b1 Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, [CNTACR<n>](#) and [CNTVOFF](#) are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTNSAR:

CNTNSAR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x004	CNTNSAR

This interface is accessible as follows:

- Access to this register is RW.

15.7.10 CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Usage constraints

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTELOBaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTP_CTL is accessible in that frame if both:
 - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTELOACR.ELOPTEN](#) is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

Configurations

The power domain of CNTP_CTL is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

The CNTP_CTL bit assignments are:

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D10-2653](#) and [Operation of the TimerValue views of the timers on page D10-2653](#).

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CTL:

CNTP_CTL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL
Timer	CNTELOBaseN	0x02C	CNTP_CTL

These interfaces are accessible as follows:

- Access to CNTP_CTL[:] is RW.
- Access to CNTP_CTL[:] is RW.

15.7.11 CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Usage constraints

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTELOBaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTP_CVAL is accessible in that frame if both:
 - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTELOACR.ELOPTEN is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

Configurations

The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

The CNTP_CVAL bit assignments are:

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When `CNTP_CTL.ENABLE` is 1, the timer condition is met when `(CNTPCT - CompareValue)` is greater than or equal to zero. This means that `CompareValue` acts like a 64-bit upcounter timer.

When the timer condition is met:

- `CNTP_CTL.ISTATUS` is set to 1.
- An interrupt is generated if `CNTP_CTL.IMASK` is 0.

When `CNTP_CTL.ENABLE` is 0, the timer condition is not met, but `CNTPCT` continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the `CNTP_CVAL`:

`CNTP_CVAL[31:0]` can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x020	CNTP_CVAL	31:0
Timer	CNTELOBaseN	0x020	CNTP_CVAL	31:0

`CNTP_CVAL[63:32]` can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x024	CNTP_CVAL	63:32
Timer	CNTELOBaseN	0x024	CNTP_CVAL	63:32

These interfaces are accessible as follows:

- Access to `CNTP_CVAL[31:0]` is RW.
- Access to `CNTP_CVAL[63:32]` is RW.
- Access to `CNTP_CVAL[31:0]` is RW.
- Access to `CNTP_CVAL[63:32]` is RW.

15.7.12 CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Usage constraints

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTELOBaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTP_TVAL is accessible in that frame if both:
 - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTELOACR.ELOPTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

Configurations

The power domain of CNTP_TVAL is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

The CNTP_TVAL bit assignments are:

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to $(CNTPCT + \text{TimerValue})$, where TimerValue is treated as a signed 32-bit integer.

When `CNTP_CTL.ENABLE` is 1, the timer condition is met when $(CNTPCT - \text{CompareValue})$ is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- `CNTP_CTL.ISTATUS` is set to 1.
- If `CNTP_CTL.IMASK` is 0, an interrupt is generated.

When `CNTP_CTL.ENABLE` is 0, the timer condition is not met, but `CNTPCT` continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_TVAL:

CNTP_TVAL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL
Timer	CNTELOBaseN	0x028	CNTP_TVAL

These interfaces are accessible as follows:

- Access to `CNTP_TVAL[:]` is RW.
- Access to `CNTP_TVAL[:]` is RW.

15.7.13 CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Usage constraints

CNTPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTELOBaseN frame, as a RO register.

[CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTPCT is accessible in that frame, as a RO register, if the value of `CNTACR<n>.RPCT` is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTPCT is accessible in that frame if both:
 - CNTPCT is accessible in the corresponding CNTBaseN frame.
 - The value of `CNTELOACR.EL0PCTEN` is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

Configurations

The power domain of CNTPCT is IMPLEMENTATION DEFINED.

For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTPCT is a 64-bit register.

Field descriptions

The CNTPCT bit assignments are:

Bits [63:0]

Physical count value.

Accessing the CNTPCT:

CNTPCT[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x000	CNTPCT	31:0
Timer	CNTEL0BaseN	0x000	CNTPCT	31:0

CNTPCT[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x004	CNTPCT	63:32
Timer	CNTEL0BaseN	0x004	CNTPCT	63:32

These interfaces are accessible as follows:

- Access to CNTPCT[31:0] is RO.
- Access to CNTPCT[63:32] is RO.
- Access to CNTPCT[31:0] is RO.
- Access to CNTPCT[63:32] is RO.

I5.7.14 CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Usage constraints

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

Configurations

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

Some or all fields in this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-6721.

This register is present only from ARMv8.4, when ARMv8.4-CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

This register is introduced in ARMv8.4.

Attributes

CNTSCR is a 32-bit register.

Field descriptions

The CNTSCR bit assignments are:

ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTSCR:

CNTSCR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x10	CNTSCR

This interface is accessible as follows:

- Access to this register is RW.

15.7.15 CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter frequency status information.

Usage constraints

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

Configurations

The power domain of CNTSR is IMPLEMENTATION DEFINED.

Some or all fields in this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain. For more information see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-6721.

Attributes

CNTSR is a 32-bit register.

Field descriptions

The CNTSR bit assignments are:

FCACK, bits [31:8]

Frequency change acknowledge. Indicates the currently selected entry in the Frequency modes table, see *The Frequency modes table* on page I2-6723.

This field resets to 0.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

0b0 Counter is not halted.

0b1 Counter is halted.

This field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing the CNTSR:

CNTSR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x004	CNTSR

This interface is accessible as follows:

- Access to this register is RO.

15.7.16 CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

Purpose

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

Usage constraints

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses.

Configurations

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTTIDR is a 32-bit register.

Field descriptions

The CNTTIDR bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
Frame7	Frame6	Frame5	Frame4	Frame3	Frame2	Frame1	Frame0	

Frame<n>, bits [4n+3:4n], for n = 0 to 7

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

Bit[2]	Meaning
0b0	Frame<n> does not have a second view. The CNTEL0ACR register in the first view of the frame is RES0
0b1	Frame<n> has a second view, CNTEL0Base<n>.

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#).
- This CNTCTLBase frame implements the virtual timer offset register [CNTVOFF](#)

The possible values of bit[1] are:

Bit[1]	Meaning
0b0	Frame<n> does not have virtual capability. The virtual time and offset registers are RES0.
0b1	Frame<n> has virtual capability. The virtual time and offset registers are implemented

If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

Bit[0]	Meaning
0b0	Frame<n> is not implemented. All registers associated with the frame are RES0.
0b1	Frame<n> is implemented

Accessing the CNTTIDR:

CNTTIDR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x008	CNTTIDR

This interface is accessible as follows:

- Access to this register is RO.

15.7.17 CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Usage constraints

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTELOBaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of [CNTACR<n>.RWVT](#) is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTV_CTL is accessible in that frame if both:
 - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTELOACR.EL0VTEN](#) is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

Configurations

The power domain of CNTV_CTL is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

The CNTV_CTL bit assignments are:

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D10-2653](#) and [Operation of the TimerValue views of the timers on page D10-2653](#).

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL](#) continues to count down.

————— Note —————

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CTL:

CNTV_CTL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x03C	CNTV_CTL
Timer	CNTELOBaseN	0x03C	CNTV_CTL

These interfaces are accessible as follows:

- Access to CNTV_CTL[:] is RW.
- Access to CNTV_CTL[:] is RW.

When `CNTV_CTL.ENABLE` is 1, the timer condition is met when `(CNTVCT - CompareValue)` is greater than or equal to zero. This means that `CompareValue` acts like a 64-bit upcounter timer.

When the timer condition is met:

- `CNTV_CTL.ISTATUS` is set to 1.
- An interrupt is generated if `CNTV_CTL.IMASK` is 0.

When `CNTV_CTL.ENABLE` is 0, the timer condition is not met, but `CNTVCT` continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the `CNTV_CVAL`:

`CNTV_CVAL[31:0]` can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x030	CNTV_CVAL	31:0
Timer	CNTELOBaseN	0x030	CNTV_CVAL	31:0

`CNTV_CVAL[63:32]` can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x034	CNTV_CVAL	63:32
Timer	CNTELOBaseN	0x034	CNTV_CVAL	63:32

These interfaces are accessible as follows:

- Access to `CNTV_CVAL[31:0]` is RW.
- Access to `CNTV_CVAL[63:32]` is RW.
- Access to `CNTV_CVAL[31:0]` is RW.
- Access to `CNTV_CVAL[63:32]` is RW.

15.7.19 CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Usage constraints

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTELOBaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of [CNTACR<n>.RWVT](#) is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTV_TVAL is accessible in that frame if both:
 - CNTV_TVAL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTELOACR.EL0VTEN](#) is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

Configurations

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

The CNTV_TVAL bit assignments are:

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV_CTL.ENABLE](#) is 1, the value returned is (CompareValue - [CNTVCT](#)).

On a write of this register, CompareValue is set to $(CNTVCT + \text{TimerValue})$, where TimerValue is treated as a signed 32-bit integer.

When `CNTV_CTL.ENABLE` is 1, the timer condition is met when $(CNTVCT - \text{CompareValue})$ is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- `CNTV_CTL.ISTATUS` is set to 1.
- If `CNTV_CTL.IMASK` is 0, an interrupt is generated.

When `CNTV_CTL.ENABLE` is 0, the timer condition is not met, but `CNTVCT` continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_TVAL:

CNTV_TVAL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x038	CNTV_TVAL
Timer	CNTEL0BaseN	0x038	CNTV_TVAL

These interfaces are accessible as follows:

- Access to `CNTV_TVAL[:]` is RW.
- Access to `CNTV_TVAL[:]` is RW.

15.7.20 CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Usage constraints

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTELOBaseN frame, as a RO register.

[CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RVCT](#) is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTVCT is accessible in that frame if both:
 - CNTVCT is accessible in the corresponding CNTBaseN frame.
 - The value of [CNTELOACR.EL0VCTEN](#) is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

Configurations

The power domain of CNTVCT is IMPLEMENTATION DEFINED.

For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Attributes

CNTVCT is a 64-bit register.

Field descriptions

The CNTVCT bit assignments are:

Bits [63:0]

Virtual count value.

Accessing the CNTVCT:

CNTVCT[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x008	CNTVCT	31:0
Timer	CNTEL0BaseN	0x008	CNTVCT	31:0

CNTVCT[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x00C	CNTVCT	63:32
Timer	CNTEL0BaseN	0x00C	CNTVCT	63:32

These interfaces are accessible as follows:

- Access to CNTVCT[31:0] is RO.
- Access to CNTVCT[63:32] is RO.
- Access to CNTVCT[31:0] is RO.
- Access to CNTVCT[63:32] is RO.

15.7.21 CNTVOFF{<n>}, Counter-timer Virtual Offset

The CNTVOFF{<n>} characteristics are:

Purpose

Holds the 64-bit virtual offset.

Usage constraints

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability.

———— Note ————

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-6729](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVOFF is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

———— Note ————

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF<n> register must be accessible as an atomic 64-bit value.

Configurations

The power domain of CNTVOFF is IMPLEMENTATION DEFINED.

On a reset of the reset domain in which an RW instance of this register is implemented, RW fields in the register reset to UNKNOWN values. The register is not affected by a reset of any other reset domain. For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

Implementation of CNTVOFF<n> is OPTIONAL.

Attributes

CNTVOFF<n> is a 64-bit register.

Field descriptions

The CNTVOFF<n> bit assignments are:

Bits [63:0]

Virtual offset.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTVOFF{<n>}:</h4>

CNTVOFF<n> can be accessed through its memory-mapped interface:

Component	Mnemonic	Frame	Accessibility	Offset
Timer	CNTVOFF<n>[31:0]	CNTCTLBase	RW	0x080+8n
Timer	CNTVOFF<n>[63:32]	CNTCTLBase	RW	0x084+8n
Timer	CNTVOFF[31:0]	CNTBaseN	RO	0x018
Timer	CNTVOFF[63:32]	CNTBaseN	RO	0x01C

15.7.22 CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Usage constraints

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure memory maps the frame is implemented only in the Secure memory map, meaning these registers are implemented only in the Secure memory map.

For the CNTBaseN frames, [CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-6729](#) describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

Configurations

The power domain of CounterID<n> is IMPLEMENTATION DEFINED.

For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-6721](#).

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the ARM Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions

The CounterID<n> bit assignments are:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the CounterID<n>:

CounterID<n> can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0xFD0 + 4n	CounterID<n>
Timer	CNTReadBase	0xFD0 + 4n	CounterID<n>
Timer	CNTBaseN	0xFD0 + 4n	CounterID<n>
Timer	CNTELOBaseN	0xFD0 + 4n	CounterID<n>
Timer	CNTCTLBase	0xFD0 + 4n	CounterID<n>

These interfaces are accessible as follows:

- Access to CounterID<n>[:] is RO.
- Access to CounterID<n>[:] is RO.
- Access to CounterID<n>[:] is RO.
- Access to CounterID<n>[:] is RO.
- Access to CounterID<n>[:] is RO.

Part J

Architectural Pseudocode

Chapter J1

ARMv8 Pseudocode

This chapter contains pseudocode that describes many features of the ARMv8 architecture. It contains the following sections:

- *Pseudocode for AArch64 operations on page J1-6902.*
- *Pseudocode for AArch32 operation on page J1-7008.*
- *Shared pseudocode on page J1-7086.*

J1.1 Pseudocode for AArch64 operations

This section holds the pseudocode for execution in AArch64 state. Functions that are listed in this section are identified as `AArch64.FunctionName`. Some of these functions have an equivalent AArch32 function, `AArch32.FunctionName`. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example `aarch64/debug/breakpoint`.

The top-level sections of the AArch64 pseudocode hierarchy are:

- [aarch64/debug](#).
- [aarch64/exceptions](#) on page J1-6912.
- [aarch64/functions](#) on page J1-6930.
- [aarch64/instrs](#) on page J1-6979.
- [aarch64/translation](#) on page J1-6987.

J1.1.1 aarch64/debug

This section includes the following pseudocode functions:

- [aarch64/debug/breakpoint/AArch64.BreakpointMatch](#).
- [aarch64/debug/breakpoint/AArch64.BreakpointValueMatch](#) on page J1-6903.
- [aarch64/debug/breakpoint/AArch64.StateMatch](#) on page J1-6904.
- [aarch64/debug/enables/AArch64.GenerateDebugExceptions](#) on page J1-6905.
- [aarch64/debug/enables/AArch64.GenerateDebugExceptionsFrom](#) on page J1-6905.
- [aarch64/debug/pmu/AArch64.CheckForPMUOverflow](#) on page J1-6906.
- [aarch64/debug/pmu/AArch64.CountEvents](#) on page J1-6906.
- [aarch64/debug/statisticalprofiling/CheckProfilingBufferAccess](#) on page J1-6907.
- [aarch64/debug/statisticalprofiling/CheckStatisticalProfilingAccess](#) on page J1-6907.
- [aarch64/debug/statisticalprofiling/CollectContextIDR1](#) on page J1-6908.
- [aarch64/debug/statisticalprofiling/CollectContextIDR2](#) on page J1-6908.
- [aarch64/debug/statisticalprofiling/CollectPhysicalAddress](#) on page J1-6908.
- [aarch64/debug/statisticalprofiling/CollectRecord](#) on page J1-6908.
- [aarch64/debug/statisticalprofiling/CollectTimeStamp](#) on page J1-6909.
- [aarch64/debug/statisticalprofiling/OpType](#) on page J1-6909.
- [aarch64/debug/statisticalprofiling/ProfilingBufferEnabled](#) on page J1-6909.
- [aarch64/debug/statisticalprofiling/ProfilingBufferOwner](#) on page J1-6909.
- [aarch64/debug/statisticalprofiling/ProfilingSynchronizationBarrier](#) on page J1-6909.
- [aarch64/debug/statisticalprofiling/StatisticalProfilingEnabled](#) on page J1-6910.
- [aarch64/debug/statisticalprofiling/SysRegAccess](#) on page J1-6910.
- [aarch64/debug/statisticalprofiling/TimeStamp](#) on page J1-6910.
- [aarch64/debug/takeexceptiondbg/AArch64.TakeExceptionInDebugState](#) on page J1-6910.
- [aarch64/debug/watchpoint/AArch64.WatchpointByteMatch](#) on page J1-6911.
- [aarch64/debug/watchpoint/AArch64.WatchpointMatch](#) on page J1-6912.
